1 Introduction

1.1 Background

- 1.1.1 This report relates to an area of land potentially affected by contamination (CL-27) known as the 'Elver Pill Reen and Green Moor Landfill' and hereinafter referred to as the Site.
- **1.1.2** The Site is located between chainage 16,400 and 17,900 (See Figure 1) and covers an area of historical landfill and infilling of the Elver Pill Reen.

1.2 Reporting Context

- 1.2.1 The Site has been assessed as part of investigations and monitoring associated with the wider works for the M4 Corridor around Newport (M4CaN) (hereafter referred to as the 'Scheme'). This report informs the baseline for the environmental impact assessment (EIA) for the Scheme. The EIA is reported in the M4CaN Environmental Statement (ES) of which this document is an appendix to the chapter on Geology and Soils.
- In 2014, a Preliminary Sources Study Report (2014 PSSR) was prepared as an initial land contamination appraisal (Ove Arup & Partners, 2014) as part of DMRB Stage 2 Assessments for this Scheme. This identified a number of individual areas that may have been affected by contamination as a result of historical activities at the Site. In addition, this report draws upon the 2015 Supplementary Ground Investigation Works undertaken on behalf of the Welsh Government (Geotechnical Engineering, 2015). This report relates to the area defined on the Site Location Plan Figure 1.
- 1.2.3 The overarching rationale and approach for the assessment of areas of land along the Scheme with potential contamination is detailed in the Land Contamination Assessment Report (Appendix 11.1 of the ES).

1.3 Objectives

- **1.3.1** The key objectives of this report are as follows:
 - Undertake a risk assessment of the Site and determine whether potential risks to human health or controlled waters could exist based upon the Scheme.
 - Identify the need for further assessment and investigation in order to refine potential land contamination risks and inform the need for remediation/mitigation.
 - To provide information to support the Ground Investigation Report (GIR) and Geotechnical Design Report (GDR) required under DMRB HD22/08 (Highways Agency, 2008).

1.4 Report Structure

1.4.1 The remainder of this report is structured as follows:

- Section 2: Site Location and Description This section summarises the Site description.
- Section 3: The Scheme This section details the alignment of the new section of motorway and associated features at the Site.
- Section 4: Site History This section summarises the history of the Site based on historical maps and historical land photographs.
- Section 5: Environmental Setting This section summarises the Site description, published geology, hydrology and hydrogeology and any relevant environmental information presented in the 2014 PSSR.
- Section 6: Scope of Ground Investigations Work This section describes the previous and supplementary ground investigation data available for the Site.
- Section 7: Ground Conditions This section describes the main findings of the intrusive site investigations including the ground conditions encountered and significant visual or olfactory evidence of contamination identified.
- Section 8: Contamination Assessment This section describes the findings of the Tier 1 and Tier 2 contamination risk assessment based upon potential contamination sources, potential receptors and potential contamination linkages and presents the human health and controlled waters screening assessments.
- Section 9: Refined Conceptual Site Model This section presents the CSM for the Site and identifies potential contaminant linkages, based upon the findings of the data presented within Sections 2 to 7.
- Section 10: Conclusions and Recommendations This section provides conclusions concerning the likelihood of land contaminant associated with the Site affecting the Scheme and requirements for remediation / mitigation.
- Section 11: References This section summarises the key documents referred to in this report.
- Section 12: Glossary This section provides a summary of the terms used in this report.

2 Site Location and Description

- 2.1.1 The Site is located to the east of the Llanwern Steel Works former lagoon areas (CL-26 report, Annex D of Appendix 11.1 of the ES) and south of the steel works itself. It is centred at National Grid Reference ST386 854 and covers an area of approximately 1 km².
- 2.1.2 The Site is located within a low lying area comprising fields intersected by reens and drainage ditches. Corus Reed bed No. 2 is situated to the north of the Site. Much of the Site is generally used for agriculture.
- 2.1.3 It is understood parts of the Site have historically been used as a landfill for steel works waste comprising slag, clinker, stone and ash. The landfilling activities relate to three areas:
 - An area of a historical landfill area called 'Llanwern Steelworks Land Adjacent to 1-3 Blast Furnace'; According to the Natural Resources Wales (NRW) records, this historical landfill covers the entire Site area.
 - Areas of known in-filling in the vicinity of the Elver Pill Reen (later referred to as the 'Elver Pill Reen site'), The Elver Pill Reen site is an area surrounding and to the west of the reen and was identified as a potential contaminant source due to the presence of slag fill used to create roadways. The Site includes two main tracks, the eastern track is 'L'-shaped and the western track traverses north-south parallel to the Elver Pill Reen on its eastern side as shown on Figure 1.
 - Green Moor Lane landfill (later referred to as the 'Green Moor Lane site'). The
 Green Moor Lane site comprises three small (750-1,600 m² each) locations of
 buried steel works waste of slag, clinker, stone and ash to the east of the Elver
 Pill Reen site.
- 2.1.4 A site walkover was planned to be undertaken in January 2014, however no access could be gained.
- 2.1.5 A walkover survey in 2015 identified that the Site comprises a number of fields, ditches and reens and is largely in agricultural use as semi-improved grassland and scrub. Photographs are provided in Appendix 7.

3 The Scheme

- 3.1.1 The proposed new section of motorway would cross the Site centrally from east to west. The approximate chainage is 16,400 to 17,900. Refer to Figure 1 for the Site location in relation to the Scheme.
- 3.1.2 The current Scheme design crosses the Site on an earth embankment some 2 m to 3 m high. A proposed new overbridge to accommodate North Row road also cuts through the eastern part of the Site.
- 3.1.3 The alignment would transect the western Elver Pill Reen track and encroach on the northern end of the existing eastern track. The road construction would also cross the Green Moor landfill areas.
- 3.1.4 An area of permanent land take is proposed in the north eastern corner of the Site which includes a water treatment area, an attenuation pond and associated landscaping.

4 Site History

- 4.1.1 The 2014 PSSR historical searches have been based on Ordnance Survey plans, literature reviews, information provided by Natural Resources Wales (NRW) (formally Environment Agency Wales) and Newport City Council and interpretation of aerial photography.
- **4.1.2** This is supplemented by a review of historical maps obtained in 2015 from Welsh Government. Relevant extracts are presented in Appendix 8.
- **4.1.3** A summary of the Site's history is presented in Table 1 below.

Table 1: Site History Summary

1995 Feature ID / Date	Use / Observation	Source of Information
1843 - 1893	The Site comprises a number of fields traversed by reens and drainage ditches. Middle Road and Middle Road Reen run northeast-southwest through the centre of Site. The Elver Pill Reen runs north-south in the west of Site and Newcut Reen runs northwest-southeast through the centre of Site. A road runs along the southern and eastern boundary. Prides Bridge is located in the northwest corner.	1:10,560 Historical Mapping
1891 - 1912	No significant change.	1:10,560 Historical Mapping
1904 - 1939	No significant change.	1:10.560 Historical Mapping
1964 – 1965	A cattle shelter is present in the south.	1:10,560 Historical Mapping
1969	A steelworks including settling ponds beyond the Site to the north.	Aerial Photography
1970 - 1973	Two overhead wires and associated masts are located running northeast-southwest along the Site southern boundary. The cattle shelter is no longer present.	1: 10,000 Historical Mapping
1979	No significant change	Aerial Photography
1985 - 1996	A pond / area of <u>infilling</u> is located in the southwest corner of Site. A <u>pipeline</u> (assumed associated with the steelworks, above or below ground status unknown) runs along the western boundary of the Site.	1 : 10,000 Historical Mapping
1991	Landfill activity observed on the Site including stockpiling of material / construction of a bund along the southern and eastern boundary of the Site. Tracks observed in the western area of the Site. Area of disturbed ground with ponding water in the south western corner. Evidence of stockpiling adjacent to a track along the western boundary.	Aerial Photography

1995 Feature ID / Date	Use / Observation	Source of Information
1998	Three settling ponds are located in the north western area of the Site. A further track is located along the northern boundary. Areas of bare ground and stockpiling observed in discrete areas across the Site.	Aerial Photography
2006	One of the three settling ponds appears infilled and vegetated. Further ponds / areas of disturbed ground identified in the south western area of the Site. An area of bare ground with stockpiles is located along the northern boundary. Areas of bare ground with white material observed adjacent to track south of the settling ponds (described as a 'white spill' in the 1995 PSSR, however this is not captured in the 1998 image).	Aerial Photography
2009 - 2010	No significant change	Aerial Photography
2014	The northernmost settling pond appears infilled / covered by patchy vegetation. White material partially overgrown.	Aerial Photography

^{*}Notes. Potential sources of contamination are underlined. Those within temporary and permanent land take are shown in bold.

- 4.1.4 The sources of information presented above supplement those used in the 2014 PSSR. Relevant extract of the photographs are presented in Appendix 8.
- 4.1.5 Consultation with Newport City Council and NRW has revealed that a large area encompassing Elver Pill Reen and Green Moor Lane sites was a licensed landfill (Reference: 6935/0026) and bounded to the north by Llanwern Works East, Queensway and to the south by Rush Wall road.
- 4.1.6 The Site commenced to accept waste in 1981. The tip was licensed to accept 49 tonnes of sludge per day before the licence was revoked in 1984. It is understood that only the north west corner of the licensed area has been used for sludge disposal and this includes Reedbed No 2, part of the Llanwern Steelworks former lagoon site (CL- 26).
- **4.1.7** Evidence of large scale landfilling across the entire Site is not present from the historical maps and aerial photographs.
- 4.1.8 Historically, the Site was used as bombing decoy site during World War II which is described in detail within the 2014 PSSR (Ove Arup 2014) and the Explosive Ordnance Threat Assessment Report (Bactec, 2014). The risk from unexploded ordnance at the Site is categorised as medium risk (Bactec, 2014).

5 Environmental Setting

5.1 Geology

- 5.1.1 The British Geological Survey (BGS) geological maps show relatively impermeable Tidal Flat Deposits underlying the Site and bands of peat are likely to be present within these.
- 5.1.2 The BGS geological records show bedrock beneath the Site is that of the Mercia Mudstone Group comprising weathered mottled and often fractured mudstones.

5.2 Hydrology

5.2.1 A number of drainage ditches traverse the Site. Middle Road Reen runs northeast-southwest through the Site centre, Elver Pill Reen runs north-south in the west and a number of settling ponds are present in the west of Site as shown in Figure 1.

5.3 Hydrogeology

- 5.3.1 NRW classifies the Mercia Mudstone Group as a Secondary B Aquifer. The Tidal Flat Deposits are classified as non productive (negligibly permeable) strata.
- **5.3.2** The Site does not lie within a groundwater source protection zone.
- 5.3.3 Groundwater is anticipated to be present between the interface of the bedrock strata and Tidal Flat Deposits. Further, perched water may be encountered at shallow depth within any fill material above the Tidal Flat Deposits.

5.4 Environmental Information

- **5.4.1** NRW reports the following information within the study area:
 - No pollutant incidents, abstraction licences or discharge consents within the Site or within 300 m of the Site.
 - One historic landfill site has been recorded within the Site boundary.

Table 2: Historic Landfills within Site Boundary

Landfill Name	Location	Material Type	Date Waste First and Last Received
Llanwern Steelworks Land Adjacent to 1-3 Blast Furnace, Corus, Llanwern Works	Over whole Site	Industrial waste and liquid sludge	16/11/1981 20/06/1984

• Three authorised landfills are recorded within 300 m of the Site.

Table 3: Authorised Landfills within 300 m of Site

Landfill Name	Operator's Name	Location	Licence Type	Licence Status
Llanwern Landfill: South Side of Queensway	Corus Strip Products PPC	Adjacent to the west of the Site	Industrial Waste Landfill	Modified
South Side of Queensway Llanwern Landfill	Tata Steel UK Limited	Adjacent to the west of the Site	Waste landfilling; >10 T/D with capacity >25,000T excluding inert waste	Effective
Llanwern Works East	Corus Strip Products	Adjacent to the north eastern Site boundary	Industrial Waste Landfill	Issued

- 5.4.2 The Site lies within the Gwent Levels Whitson and Redwick and Llandevenny Site of Special Scientific Interest.
- **5.4.3** Residual levels of potential contamination associated with the historical landfilling may be present.

6 Scope of Investigations

6.1 General

6.1.1 Five intrusive ground investigations have been undertaken at the Site since 1997 and these have been summarised in the following sections.

6.2 Scope of Works

6.2.1 The various intrusive ground investigations undertaken within the Site area are summarised in Table 4 and are shown on Figure 1.

Table 4: Ground Investigation Summary

Date	Contractor	Site Location	Boreholes	Trial Pits	Sampling
1997	Norwest Holst	South	BHK2, BHK3, BHK4, BHK5, BHL1, BHL2	-	Soil
2000	Exploration Associates	South	-	CH51, CH52, CH52A, CH53, CH53A, CH54, CH54A	Soil and leachate
2002	Enviros	Unknown	RBBH3 , RBBH4, RBBH5	-	Soil & groundwater
2008	Norwest Holst	Central area	SBHK01CP, SBHK02CP, SBHK03CP, SBHK04CP, SBHL01CP, SBHL02CP, SBHL02RC	STPK01, STPK02, STPL01	Soil, leachate & groundwater
2015	Geotechnical Engineering	South	BH526, BH527, BH528, BH529, BH530	TP510, TP11, TP12, TP13	Soil

6.2.2 The construction details of all boreholes installed with monitoring wells on the Site are summarised in Table 5 below and shown on Figure 1.

Base of Total **Top of Slotted Slotted Well Borehole Diameter Drilled** Well Casing / **Targeted** Casing / ID (mm) Depth **Gravel Pack** Geology **Gravel Pack** (m bGL) (m) (m bGL) Tidal Flat SBHK01CP 50 13.5 4.8 6.8 Deposits Tidal Flat SBHK02CP 50 13.7 7.2 11.2 Deposits Tidal Flat SBHK03CP 50 11.5 4.9 5.9 **Deposits** TFD / Mercia SBHK04CP 50 12.2 10.2 12.2 Mudstone Group Mercia SBHL02CP 19 20.3 14.8 15.4 Mudstone Tidal Flat 35 4.9 9 **Deposits** BH527 19.1 Mercia 12.9 19 50 Mudstone 35 7 Peat / TFD 6 17 BH528 Mercia 50 11.8 17 Mudstone 35 5 8 Peat / TFD

6.3 Surface Water Quality Monitoring

50

21

- 6.3.1 Surface water quality monitoring has been undertaken at a number of locations surrounding the Site which are shown in Figure 1. Sampling has also been undertaken during 2015 (Geotechnical Engineering, 2015) and by RPS (Appendix 16.2 of the ES) as part of the supplementary works commissioned by Welsh Government.
- Further sampling has previously been undertaken between 2007 and 2008 as part of the Titan surface water sampling regime (Titan, 2008).
- **6.3.3** These surface water monitoring locations are shown in Table 6.

Mercia

Surface Water **Location Description Comments Location ID** Flow was noted as slack to Located Elver Pill Reen approximately 50 m R14 south of the Site. slow Located on Greenmoor Triangle Flow was noted as slack to R15 approximately 50m north of the Site. slow Located on Windmill Reen on the southern Flow was noted as slack to R16 Site boundary. slow Located on 100 Perches Reen approximately Slow slow noted, little 17.1 150 m north of the Site. vegetation Located on Middle Road Reen Diversion on Shallow with significant 17.2 the southern Site boundary. vegetation Located Elver Pill Reen approximately 50m Low to no flow, duck weed on 17.3 south of the Site. surface of water Located on field drain on the western SW506 boundary of the Site. Located on Middle Road Reen Diversion on SW507 the eastern boundary of the Site. Located on Middle Road Reen Diversion on SW508 the north eastern boundary of the Site.

Table 6: Surface water monitoring locations

6.4 Field Testing

6.4.1 Monitoring of VOCs was undertaken on soil samples at locations STPK01, STPK02, SBHK02CP and SBHK04CP (Norwest Holst, 2008), and BH526, BH527, BH528, BH529, BH530, TP510, TP511, TP512 and TP513 (Geotechnical Engineering 2015).

6.5 Groundwater Monitoring

6.5.1 The groundwater sampling, groundwater monitoring and ground gas monitoring rounds are shown in Table 7.

Table 7: Summary of Monitoring Rounds

6.6 Laboratory Chemical Testing

6.6.1 A summary of all laboratory analysis undertaken on soil, groundwater, leachate and surface water is summarised in Table 8 and Table 9 below.

Table 8: Summary of Previous Investigation Sampling - Intrusive Exploratory Locations

Site Investigation Date	No. of Soil Samples	No. of Leachate Samples	No. of Water Samples	Suites of Testing
1997	4	0	0	Metals, pH, sulphate, cyanide, PAH screening, phenols, mineral oil
2000	6	2	0	Metals, pH, sulphate, cyanide, PAH screening, TPH, oil, phenol, PCBs
2002	3	0	9	Metals, pH, phenol, sulphate, cyanide, asbestos, TOC, TPH and PAH speciated, PCBs, BTEX, SVOCs

Site Investigation Date	No. of Soil Samples	No. of Leachate Samples		Suites of Testing
2008	10	6	8	Metals, pH, sulphate, asbestos, cyanide, phenol, MTBE, BTEX, TPH, PAH
2015	14	4	18	Metals, PAH, TPH, asbestos, pH, cyanide, organic matter, sulphate, sulphur, VOCs, SVOCs, nitrate, BTEX, phenols, PCBs

Table 9: Summary of Previous Investigation Sampling - Surface Water

Site Investigation date	No. of water sample locations / number of rounds	Suites of testing
2007/2008	3 locations / 4 rounds	Metals, inorganics, quality
2015	3 locations / three rounds	Inorganics, PAH, TPH, BTEX, VOCs, Phenols, quality
2015	3 locations / 1 round	Inorganics, PAH, TPH, BTEX, quality

Soil Analysis

- 6.6.2 The following sections summarise the laboratory analytical results for soil samples collected during the various intrusive investigation phases. The available data set has been tabulated and is presented in Appendix 3 with the supporting laboratory certificates available in the relevant original ground investigation reports (See Table 4).
- 6.6.3 To inform the conceptual ground model, the analytical data from the Made Ground has been segregated from those of the natural soils (Tidal Flat Deposits specifically).
- 6.6.4 For the purpose of meeting the requirements of Volume 4, Section 1, Part 2 of the DMRB (HD22/08 Managing Geotechnical Risk 2008 (Highway Agency, 2008), the historical data used to support the PSSR and the additional 2015 information (Geotechnical Engineering, 2015) have been differentiated in the following sections.
- **6.6.5** The available information has been summarised in Table 10.

Table 10: Summary of Analytical Soil Data

Formation	Number of Soil Analysis per Analytical Suite - 2015 data/ All Gl data								
Unit	Metals & Inorganics	Asbestos	PAH	ТРН	Phenol	BTEX	VOCs	SVOCs	
Made Ground	7 / 22	7 / 11	7 / 15	7 / 15	0 / 15	3/7	3/3	1/1	
Natural Soils	7 / 15	1/7	7 / 15	4 / 12	0/8	3/9	3/3	1/1	

Soil Leaching Analysis

6.6.6 Similarly to the soils data, the soil leachate results have been considered for the Made Ground and natural soils separately. The available information is presented in Appendix 6 and summarised in Table 11.

Table 11: Summary of Soil Leaching Analytical Data

Formation	Number of Soil Leachate Analysis per Analytical Suite - 2015 data / All Gl data								
Unit	Metals & inorganics	PAH	ТРН	Phenol	BTEX	VOCs	SVOCs	PCBs	
Made Ground	3/9	3/3	3/3	3/3	3/3	0/0	0/0	0/0	
Natural Soils	1/3	1/1	1/1	1/1	1/1	1/1	1/1	1/1	

Groundwater Analysis

- 6.6.7 The following section summarises the laboratory analytical results for groundwater samples collected during the various intrusive investigation phases. The available data set has been tabulated and is presented in Appendix 4 with supporting laboratory certificates available in the relevant original ground investigation reports.
- 6.6.8 The available data relates to groundwater samples taken from wells installed within the groundwater of the Tidal Flat Deposits and/or Mercia Mudstone and is summarised in Table 12.

Table 12: Summary of Analytical Groundwater Data

	Number of Groundwater Analysis per Analytical Suite (number of well locations) – 2015 data / All Gl data								
Groundwater Unit	Metals & Inorganics	PAH	ТРН	РСВ	втех	voc	SVOC	Non Metal Inorganics	Phenois

^{*} Some samples relate to grab samples obtained within trial pits during 2000 ground investigation.

Surface water Analysis

6.6.9 The following section summarises the laboratory analytical results for surface water samples collected during the various intrusive investigation phases. The available data set has been tabulated in a table format and is presented in

Appendix 5 with supporting laboratory certificates available in the relevant original ground investigation reports.

Table 13: Summary of Analytical Surface Water Data

Surface	Number of Water Analysis per Analytical Suite (number of locations) – 2015 data / All Gl data							
Water System	Metals & Inorganics	Water Quality Parameters	Polycyclic Aromatic Hydrocarbons	Total Petroleum Hydrocarbon	втех			
Elver Pill Reen	5 (2)/ 1 (2)	5 (2)/ 1 (2)	1 (1) / 0 (1)	5 (2)/ 1 (2)	1 (1) / 0 (1)			
Greenmoor Triangle	4 (1) / 0 (1)	4 (1) / 0 (1)	0 (1) / 0 (1)	4 (1) / 0 (1)	0 (1) / 0 (1)			
Windmill Reen	4 (1) / 0 (1)	4 (1) / 0 (1)	0 (1) / 0 (1)	4 (1) / 0 (1)	0 (1) / 0 (1)			
Middle Road Reen Diversion	6 (3) / 3 (3)	6 (3) / 3 (3)	6 (3) / 3 (3)	6 (3) / 3 (3)	6 (3) / 3 (3)			
100 Perches Reen	1 (1) / 1 (1)	1 (1) / 1 (1)	1 (1) / 1 (1)	1 (1) / 1 (1)	1 (1) / 1 (1)			

6.7 Gap Analysis of Available Data

6.7.1 The investigation data available for the Site is considered reasonable as there has been sampling along the length of the new section of motorway. However, no investigation data is available within the Green Moor landfill (three areas of tipping) and within the proposed water treatment area. The latter are located adjacent to the Llanwern Works East Landfill and Llanwern Steelworks main operation areas.

7 Ground Conditions

7.1 Geology

7.1.1 The geological logs for all available exploratory holes on the Site are provided in Appendix 1. The observed geological sequence is consistent with that discussed in the 2014 PSSR report and is summarised in the following sections. Information from the Supplementary Ground Investigation (Geotechnical Engineering, 2015) has also been used.

Topsoil

7.1.2 Topsoil was encountered at nine locations across the Site. It was generally at ground level above the superficial deposits and ranged between 0.05 to 0.3 m thickness. One exception was in CH52A where the topsoil was encountered at 1.1 m bGL below the Made Ground.

Made Ground

- 7.1.3 Made Ground was encountered in eighteen exploratory locations at ground level at thicknesses ranging between 0.8 3.2 m. It is considered the majority of Made Ground relates to construction material for the existing access roads which cross the Site and is generally at 1 m above surrounding ground levels. Made Ground was also identified in the ponded area in the north west of Site. It commonly comprised a grey / black coarse material comprising slag, ash and occasionally bricks.
- **7.1.4** Made ground was not identified in seventeen locations on the Site, the majority of which were located in the south and east.
- **7.1.5** The investigation data has not identified Made Ground which may be associated with landfilling. However, it is noted that no exploratory hole has targeted the Green Moor Landfill areas.

Superficial Deposits

- 7.1.6 Unconsolidated superficial deposits were encountered beneath the Made Ground or topsoil in all locations. These comprised Tidal Flat Deposits, generally firm bluish grey clays becoming soft or very soft with occasional gravel.
- 7.1.7 The deposits included one or two layers of peat beneath the Site with an upper layer encountered at typically 4.6 6 m bGL and a second layer at typically 5.25 8 m bGL. The horizontal continuity of these layers remains unproven. The thickness of the peat layers was variable between 0.1 2.8 m.
- 7.1.8 Sand and gravel material considered to represent Glaciofluvial Deposits was found to be generally absent beneath the Site, although some boreholes proved the base of the Tidal Flat Deposits to include a coarse fraction. A discrete pocket of the Glaciofluvial Deposits (identified as River Terrace Deposits in the borehole log) was found in SBHL01CP at a depth of 8.5 m bGL with a thickness of 1.9 m.

Solid Geology

- **7.1.9** Below the Superficial Deposits, the Mercia Mudstone Group was encountered at a depth of between 8.1 and 11.2 m bGL. The Mercia Mudstone Group was typically described as very stiff weathered reddish brown clay.
- **7.1.10** Borehole BHL2 in the Mercia Mudstone Group encountered siltstone formation below 10.5 m bGL to an unknown thickness (0.5 m proven).

Geological Sequence Summary

7.1.11 The general geological sequence identified during the previous ground investigations are summarised in Table 14 below.

Table 14: Summary of Geological Sequence

Unit	Description	Thickness Range (m)	Basal Depth m bGL)
Topsoil	-	0.05 - 0.3	0.05 - 1.2
Made Ground (associated with road construction)	Predominantly coarse to including ash, clinker, brick and slag.	0.5 - 3.2	0.5 - 3.2 (road generally 1m raised above surrounding ground level)
Superficial Deposits (Tidal Flat Deposits)	Silty clay, organic in places with at least one defined peat layer	7.45 - 11.2	8.1 - 11.2
Superficial Deposits (Glaciofluvial Deposits) – Discrete pockets	Gravel (SBHL01 only)	Generally absent – 1.9 m at SBHL01	10.4
Mercia Mudstone Group (Mudstone)	Very stiff clays becoming weak completely fractured Mudstone	unproven (>0.5)	unproven

7.1.12 The conceptual ground model included within the 2014 PSSR report has been amended in light of the 2015 information and is included within Figure 2.

7.2 Visual and Olfactory Evidence of Contamination

7.2.1 A summary of visual and olfactory evidence of potential contamination encountered during the previous ground investigations is summarised in Table 15.

Table 15: Visual and Olfactory Evidence of Contamination Summary

Location ID	Depth (m bGL)	Strata	Evidence of Potential Contamination
Most exploratory locations in the west	GL to 0.5 - 3.2	Made Ground	Ash, clinker, brick and slag.

7.2.2 No visual or olfactory evidence of hydrocarbon contamination was identified during any of the previous ground investigations. The PID meter recorded generally zero or low levels of VOCs with greatest concentrations recorded within BH529 within the Tidal Flat Deposits in which frequent rootlets were identified (15 to 24 ppm). In the absence of any significant source of contamination, the levels identified are considered to be naturally occurring.

7.3 Gas Monitoring

7.3.1 The ground gas monitoring dataset collected during each of the three monitoring rounds in 2015 is summarised on the summary field data sheets provided in Appendix 2. The maximum concentrations (minimum for oxygen) are presented in Table 16.

Table 16: Summary of Gas Monitoring Data

Location	Flow (I/hr)	VOCs (ppm)	CH4 (%/vol)	Peak LEL (%)	CO2 (%/ vol)	O2 (%/vol)	CO (ppm)	H2S (ppm)
ID	Max	Max	Max	Max	Max	Min	Max	Max
BH527 35mm	1.3	3.2	3.4	61	0.0	19.6	0	0
BH528 35mm	0.4	0.4	31	>100	8.1	11.8	5	0
BH530 35mm	0.0	1.1	14.8	>100	5.3	15.0	10	0

7.4 Groundwater

Groundwater Encountered During Investigation

7.4.1 Groundwater strikes were encountered during the drilling of most boreholes and are detailed on the geological logs provided in Appendix 1. These are summarised in Table 17.

Table 17: Summary of Groundwater Level Data during Drilling

Location	Strike Depth (m bGL)	Geological Formation	Level after 20 Minutes (m bGL)
BHK2	6.8	Tidal Flat Deposits	6.8
DHKZ	10.75	Mercia Mudstone	9.5
BHK3	10.8	Mercia Mudstone	7.1
BHK4	1.1	Made Ground	1
BHK5	9.2	Mercia Mudstone	5.4
	1.68	Tidal Flat Deposits	1.68
BHL1	6.1	Tidal Flat Deposits	5.8
	10.4	Mercia Mudstone	8.8
BHL2	10.4	Mercia Mudstone	9.05

Location	Strike Depth (m bGL)	Geological Formation	Level after 20 Minutes (m bGL)
CH51	0.8	Made Ground	not recorded
CH52A	0.8	Made Ground	not recorded
CH53	1.5	Tidal Flat Deposits	not recorded
CH54	1.6	Tidal Flat Deposits	not recorded
RBBH3	0.7	Made Ground	0.7
RBBH5	1.5	Made Ground	1.3
SBHK02CP	1	Made Ground	0.8
SBHL01CP	8.5	Tidal Flat Deposits	5.2
SBHL02CP	10.8	Mercia Mudstone	10.8
SBHL02RC	12	Mercia Mudstone	not recorded
STPK01	0.89	Tidal Flat Deposits	not recorded
STPK02	1.12	Made Ground	not recorded
STPL01	1.39	Tidal Flat Deposits	not recorded
BH526	2.5	Tidal Flat Deposits	2.1
BH528	0.25	Tidal Flat Deposits	0.20
BH529	0.9	Tidal Flat Deposits	0.52
TD540	1.05	Made Ground	not recorded
TP510	3.8	Tidal Flat Deposits	not recorded
TP511	1.05	Made Ground	not recorded
TP512	1.5	Tidal Flat Deposits	not recorded
TP513	2.9	Tidal Flat Deposits	not recorded

7.4.2 Groundwater was not recorded in any other boreholes and trial pits during the previous investigations.

Groundwater Levels During Monitoring Rounds

Table 18: Summary of Groundwater Level Data

Location	Installation #1	Depth of Response Zone (m bGL) and Geological Formation	No. Measurements	Min Depth (m bGL)	Max Depth (m bGL)
SBHK01C P	50 mm	4.8 - 6.8 TFD	6	0.70	1.06
SBHK02C P	50 mm	7.2 - 11.2 TFD	6	1.33	1.48
SBHK03C P	50 mm	4.9 - 5.9 TFD	6	0.87	1.07
SBHK04C P	50 mm	10.2 - 12.2 TFD / MMG	6	1.45	1.67
SBHL02R C	19 mm	14.8 - 15.4 MMG	6	2.27	2.45
BH527	35 mm (S)	4.9 - 9 TFD	4	0.67	2.74

Location	Installation #1	Depth of Response Zone (m bGL) and Geological Formation	No. Measurements	Min Depth (m bGL)	Max Depth (m bGL)
	50 mm (D)	12.9 - 19 MMG	4	1.71	3.10
BH528	35 mm (S)	6 - 7 Peat / TFD	4	0.49	1.63
БП326	50 mm (D)	11.8 - 17 MMG	4	1.28	2.90
DUISO	35 mm (S)	5 - 8 Peat / TFD	4	1.52	2.62
BH530	50 mm (D)	12 - 21 MMG	4	2.00	3.49

^{#1} S denotes a shallow installation and D denotes deep installation;

Groundwater Summary

- 7.4.3 A perched water body was typically encountered within the Made Ground during the investigations between 0.7 and 1.3 m bGL.
- 7.4.4 The main groundwater body is within the granular Mercia Mudstone Group, which is confined by the intervening Tidal Flat Deposits representing an aquitard limiting vertical groundwater flow.
- 7.4.5 Perched groundwater is observed within the upper Tidal Flat Deposits associated with limited zones of permeability associated with more granular lithologies and peat. This 'groundwater' is regarded as 'pore water' which does not contribute to advective flow within these strata.

8 Contamination Assessment

8.1 Introduction

- **8.1.1** The following sections provide details of the assessment of land contamination at the Site.
- 8.1.2 The outline Conceptual Site Model (CSM) presented within the 2014 PSSR has been reviewed and updated based on data from the Supplementary Ground Investigation (Geotechnical Engineering, 2015) and the Scheme. The main alteration to the 2014 PSSR model are summarised below:
 - Addition of gas dataset from borehole monitoring wells on Site.
 - Proposed use of band drains to accelerate surcharging of soft soils during construction. These are anticipated to be vertical drains installed in a close grid pattern through the Made Ground and underlying Tidal Flat Deposits and into the Glaciofluvial Deposits.
 - Piled foundations proposed for the bridge / link road junction.
 - Inclusion of a defined peat horizon.
 - Update of the source/pathway/receptor linkages.

8.2 Preliminary Risk Assessments

Potential Sources

- **8.2.1** The potential sources of contamination and associated contaminants which may be present within the Site are detailed below:
 - Made Ground used for road construction across the Site.
 - Waste material associated with landfill activity (Green Moor Landfill) details not known in the absence of intrusive investigation data although extent anticipated to be limited based on historical mapping and aerial photographs.
 - There is the possibility of ground gas generation from infilled ground and the presence of ground gas generated by natural organic rich soils beneath the Site.
 - The quality of surface water drainage, perched water and the deep aquifer within the Glaciofluvial Deposits and Mercia Mudstone may influence or impact the quality of the others. Surface water, perched groundwater and aquifer could therefore be regarded as a source of possible contaminants as well as receptors. The waters associated with the Glaciofluvial deposits, Mercia Mudstone and Tidal Flat Deposits are saline whereas the surface water is not.
- 8.2.2 The north-west corner of the Site includes the Reedbed No.2 of the Llanwern Steelworks which receives all surface waters from the factory and lagoons prior to being discharged within the estuary.
- **8.2.3** The Site is also surrounded by three potential sources of contamination:
 - To the north of the Site beyond Queen's Way (A4810) is Llanwern Steelworks.

- At the north eastern end of the Site is the Llanwern Works East Landfill which accepted industrial waste.
- To the west of the Site lies Llanwern Lagoon 26. The information related to the lagoon is discussed in more detail in the Land Contamination Assessment Report CL-26 Lagoons (Annex D of Appendix 11.1 of the ES). Whilst Lagoon 26 is a permitted landfill, previous ground investigation proved minimal waste to be present, comprising mainly slag material with brick and concrete inclusions to typically 1-3 m in thickness. The soil contamination was associated with high pH and discrete areas of heavy metals (arsenic and nickel). Groundwater quality is considered to be similar to the overall baseline seen in this general area of the Gwent Levels as defined within the Baseline Water Environment Report (RPS, 2015).
- 8.2.4 In addition to the above sources, the quality of surface waters, perched groundwater and the deeper aquifer within the Glaciofluvial Deposits and Mercia Mudstone bodies may influence or impact the quality of the others (for instance the groundwater within the Glaciofluvial Deposits and Mercia Mudstone is saline whilst the surface water is not). Surface water, perched groundwater and deeper aquifer are therefore regarded as a source of possible contaminants as well as receptors.

Potential Receptors

8.2.5 The following potential receptors have been identified:

Construction

- Construction workers during Site development works.
- General public and workers adjacent to construction works.
- Groundwater within the Glaciofluvial Deposits / Mercia Mudstone.
- Onsite and nearby surface waters including the reens and existing surface water ditches within the Site and bordering the surrounding fields. This land drainage is part of the Gwent Levels SSSI wider network of reens and ditches, which extends to the south of the Scheme.

Operational

- Maintenance workers.
- · General public end users.
- Groundwater within the Glaciofluvial Deposits and/or Mercia Mudstone.
- The Gwent Levels SSSI surface water network of ditches and reens.

Potential Pathways

- Dermal contact, ingestion, inhalation pathways possible during development and maintenance works.
- Inhalation pathways for general public future end users.
- Contaminated surface water run-off into existing / new drainage system.
- Leaching of contaminants from Made Ground to perched water.

- Vertical migration of perched water within the Made Ground and/or leachate from the Made Ground into Tidal Flat Deposits and/or Mercia Mudstone aguifer due to band drain / pile installation.
- Lateral migration of perched water within the Made Ground to land drainage (surface waters).
- Leaching of contaminants from the Made Ground to shallow groundwater and then migration to land drainage (surface waters).
- Vertical or lateral migration of ground gas associated with Made Ground and peat and organic soils.

8.3 Risk Evaluation

- 8.3.1 Source-pathway-receptor linkages were considered in the 2014 PSSR using the historical data available up to 2008. With review of the new data described herein, the following risk evaluation has been reconsidered:
 - Proposed 2–3 m motorway embankment and overlying hardstanding (carriage way) is to be constructed at the Site which is to cover most of the motorway corridor reducing pathways from any contamination in shallow soils left in situ.
 - Tidal Flat Deposits are classified as non-productive and overlie an underlying secondary B aquifer associated with the Mercia Mudstone.
 - The low permeability Tidal Flat Deposits (of over 10 m thickness) separates the various onsite and offsite Made Ground and deeper aquifer. Main groundwater body identified as being confined by the Tidal Flat Deposits.
 - Perched groundwater within the Tidal Flat Deposits is not considered a water resource due to its anticipated low vertical hydraulic continuity with the aquifer beneath, low permeability and low storage capacity.
 - Hardstanding cover which is proposed in some areas of the new motorway corridor is likely to limit infiltration thus reducing leaching.
 - Creation of new drainage system may increase leaching of any contaminants from the Made Ground with associated increase in the risk for migration into surface waters.
 - Piled and band drain foundations may create pathways to groundwater at depth. Pathways may allow increase in the influx of water within the Made Ground, given the recorded sub-artesian pressures.
 - Motorway users will be within open environment with no proposed structures or other confined spaces.
 - Risk of increase flux of gas emission due to induced consolidation of the Made Ground and peat from the proposed surcharge loading. However, potential receptors are limited, primarily associated to accumulation in confined spaces (such as underground services).
 - Waters within the Tidal Flat Deposits and deeper aquifer of the Mercia Mudstone are saline whereas surface water is not.

8.4 Human Health Risk Assessment

8.4.1 The rationale and approach for the human health (Tier 2) screening assessment is detailed in the Land Contamination Preliminary Assessment Report (Appendix 11.1 of the ES). Soil chemical results and the findings of the generic tier 2 human health risk assessment are presented in Appendix 3. All exceedances to the relevant criteria are summarised in Table 19 below.

Determinant	Units	Range	Screening Criteria	No. Samples Exceeding Screening Criteria (Total Number of Results)	Locations of Exceedances
Chromium	mg/kg	32 - 1,800	33	33 (37)	BHK3 (x2), BHK4 (x2), CH51, CH52A (x2), CH53A (x2), CH54A, RBBH3, RBBH4, RBBH5, SBHK03CP (x2), SBHK02CP, SBHK04CP (x2), STPK01 (x2), STPK02 (x2), BH526 (x3), BH527 (x2), BH528, BH530 (x2), TP510 (x3)
рН	pH units	7.1 - 12.9	6 - 9	20 (37)	BHK4 (x2), CH51, CH52A, CH53A, CH54A, RBBH3, RBBH4, RBBH5, SBHK03Cp, SBHK02CP, STPK02, BH526 (x3), BH527 (x2), TP510 (x 3)
PAH	mg/kg	<10 - 82	3.5	4 (6)	CH51, CH52A (x2), CH53A

- **8.4.2** Elevated alkaline soil conditions have been identified in over half of the samples, mainly within the Made Ground material but also in three samples of the Tidal Flat Deposit material.
- 8.4.3 Although exceedances to chromium are widespread in both Made Ground and natural soils, the criterion relates to the hexavalent. The majority of the results are considered to be within normal background data range (<95 mg/kg) and therefore are not considered to represent a contaminant of concern (RPS, 2015a). However, nineteen locations including a distinct cluster around TP510, STPK02 and SBHK03, exceed this background range with maximum of up to 1,800 mg/kg. It is likely that the elevated chromium concentrations are related to the slag used to construct access roads. Further sampling and analysis is needed to determine whether the elevated levels relate to hexavalent chromium.
- **8.4.4** PAHs are identified in exceedances over half of the samples analysed without speciation. In this instance the criterion for total PAH has been taken considering

- the most stringent PAH compound (Dibenzo(ah)anthracene) and the elevated PAHs are mainly associated with Made Ground used for road construction.
- 8.4.5 All phenols, BTEX, VOCs and SVOCs were at levels below the laboratory limit of detection. PAHs and TPH were identified at low levels at both locations, however, this is considered unlikely to pose a risk to human health.
- 8.4.6 No other exceedances of the applied assessment criteria have been identified and no asbestos fibres were detected visually or in samples analysed in the laboratory.

8.5 Controlled Waters Screening Assessment

- 8.5.1 The rationale and approach for the controlled waters (Tier 1) screening assessment is detailed in the Land Contamination Assessment Report (Appendix 11.1 of the ES) and the groundwater chemical results are presented in Appendix 4. All exceedances to the relevant generic criteria are summarised in Table 20, 21 and 22 for soil leachate, groundwater and surface water, respectively.
- Where an EQS is dependent on water hardness i.e. some heavy metals, the hardness of the surface water receptor should normally be used. The Groundwater Baseline Report (Appendix 16.2 of the ES) indicates surface water to be generally moderately hard with hardness concentrations within a range of 100 to 150 mg/l as calcium carbonate. Therefore EQSs within this water hardness range have been used for screening purposes.

Soil Leaching Results

8.5.3 Twelve soil samples were subjected to leaching analysis. The majority of the soilleaching results were all below the applied screening criteria, with the exception of the contaminants in Table 20.

Table 20: Controlled Waters screening exceedances – soil leaching

Determinant	Units	Range	EQS	DWS	No. Exceeded EQS Screening Criteria (Total Number of Results)	Location	No. Exceeded DWS Screening Criteria (Total Number of Results)	Location (Formation)
Arsenic	µg/l	<1 - 27	50	10	0 (10)	-	3 (10)	SBHK03CP, BH526, TP510 (All Made Ground)
Boron	μg/l	<10 - 1,200	2,000	1,000	0 (10)	-	1 (10)	SBHK03CP (Made Ground)
Copper	μg/l	<1 - 14	10	2,000	2 (10)	STPK01, BH526 (Both Made Ground)	0 (10)	-

Determinant	Units	Range	EQS	DWS	No. Exceeded EQS Screening Criteria (Total Number of Results)	Location	No. Exceeded DWS Screening Criteria (Total Number of Results)	Location (Formation)
Nickel	μg/l	<1 - 20	4	20	5 (10)	SBHK03CP, STPK01, STPK02, BH526 (all Made Ground), SBHK04CP (Tidal Flat Deposits)	0 (10)	-
Lead	μg/l	<1 - 1,500	1.2	10	5 (10)	SBHK02CP, SBHK03CP, STPK01, STPK02 (All Made Ground), SBHK04CP (Tidal Flat Deposits)	3 (10)	SBHK02CP, SBHK03CP (Made Ground), SBHK04CP (Tidal Flat Deposits)
Antimony	μg/l	<5 - 8		5	-	-	1 (6)	SBHK03CP (Made Ground)
рН	pH Units	10.9 - 11.8	6 - 9	6.5 - 10	2 (2)	CH51, CH53A (Made Ground)	2 (2)	CH51, CH53A (Made Ground)

- 8.5.4 The leaching analysis in some samples of Made Ground indicates that arsenic, copper, nickel and lead are leachable such that concentrations would exceed EQS's. Similarly pH in leachate is alkaline (10.9-11.8) The leachable concentrations are generally associated with slag materials in the Made Ground used to construct the roadways. However, it is noticeable that although potential leachate could be generated, surface water sampling has not identified similar concentrations or pH levels and the roadways constructed from slag do not appear to currently be impacting surface water quality. This indicates there is no currently active pathway from the Made Ground to surface waters.
- 8.5.5 The laboratory detection levels for cadmium, mercury, cyanide, some PAH, VOC and SVOC compounds are higher than applied screening criteria. This is considered unlikely to pose a risk to controlled waters.

Groundwater Results

8.5.6 The groundwater results assessment includes data from three grab samples taken from within the Made Ground during the 2000 investigation, three monitoring rounds at boreholes RBBH3, RBBH4 and RBBH5 in 2002, two monitoring rounds at boreholes SBHK01, SBHK02, SBHK03 and SBHK04 in 2008 and three monitoring rounds from boreholes BH527, BH528 and BH530 in 2015. These groundwater samples were taken from the aquifer body within the

Mercia Mudstone and from perched groundwater within the Tidal Flat Deposits. Samples were also collated from other monitoring wells but results were not differentiated between each groundwater body and are presented as 'undifferentiated'.

8.5.7 The summary of the exceedances of the applied assessment criteria is presented in Table 21 and discussed below.

Table 21: Groundwater screening exceedances

Determinant	Units	Range	EQS	DWS	No. exceeded Screening Criteria (Total Number of Results) against EQS	Location of Exceedances	No. Exceeded Screening Criteria (Total Number of Results) against DWS	Location of Exceedances
Perched Water	(Made Gro	und)						
Nickel	μg/l	2 - 5	4	20	1 (3)	CH52	0 (3)	-

- 8.5.8 The review of the water chemical testing results indicated that the perched water within the Made Ground at the Site (based on three samples) has discrete areas of elevated levels of nickel, cyanide and some PAH compounds including benzo[a]pyrene, benzo[b]fluoranthene and fluoranthene (all found at CH52A). In addition to these exceedances of the screening criteria, elevated levels of TPH were identified, with a maximum concentration of 5,700 μg/l found at location CH51. Both CH51 and CH52A are associated with high pH. These two locations are located about 150 m south of the new section of motorway and associated land take and are not expected to be disturbed during construction of the Scheme.
- 8.5.9 The groundwater within the Tidal Flat Deposits is identified to have elevated levels of metals (arsenic, boron, chromium, copper, iron, lead, manganese, nickel, selenium, cadmium, mercury and zinc) and inorganics above screening criteria. TPH was generally below the laboratory limit of detection, however two boreholes BH527 and BH530 were identified to have concentrations of 1,900 μ g/l and 23 μ g/l, respectively. For both boreholes, the results were associated with the first round, with the subsequent two monitoring rounds giving concentrations below laboratory limit of detection. All PAH, VOCs, SVOCs, phthalates, phenols, organics and PCB results were found below limit of detection.
- 8.5.10 The groundwater within the Mercia Mudstone beneath the Site has elevated levels of metals (arsenic, boron, chromium, copper, nickel, selenium and mercury) and inorganics. All PAH, VOCs, SVOCs, phthalates, phenols, organics and PCB results were found below the limit of detection. Total Petroleum Hydrocarbons (TPH) was also found below the limit of detection with the exception of BH530 where the first round gave a concentration of 100 μg/l (subsequent two gave non-detects).
- 8.5.11 The chemical analysis results for the undifferentiated waters within the Tidal Flat Deposits or the Mercia Mudstone indicate elevated levels of metals (iron, lead and nickel) and inorganics and are of similar quality to that of the groundwater within the Tidal Flat Deposits. It is noted the laboratory detection levels for some metals, PAH compounds, VOCs and SVOCs are higher than applied screening criteria. This is not considered to pose a risk to controlled waters, given the low concentrations.
- **8.5.12** Presence of high chloride concentrations indicates saline conditions exist within the perched and deep aquifers.

Surface Water

- 8.5.13 A total of nine surface water samples have been collected from the reens surrounding the Site. These have been collected from between 2007 2008, and most recently in 2015 (Appendix 16.2 of the ES and Geotechnical Engineering, 2015) as part of RPS sampling regime and included within the supplementary works commissioned by Welsh Government.
- **8.5.14** The full results are presented in the Baseline Water Quality Monitoring Report (Appendix 16.2 of the ES).

- **8.5.15** The water quality within Elver Pill Reen and Middle Road Reen Diversion are generally similar, both of which recorded exceedances above the EQS for phosphorous and single occurrences of heavy metal exceedances such as cadmium and nickel.
- **8.5.16** Nitrates and Total Oxidised Nitrogen exceeded their respective CCW trigger levels on a number of occasions primarily at Elver Pill Reen, 100 Perches Reen, Windmill Reen and Greenmoor Triangle.
- **8.5.17** TPHwas recorded below its laboratory limit of detection throughout all sampling regimes, as were BTEX organics.

8.6 Ground Gas Risk Assessment

- 8.6.1 The ground gas data available relates to three boreholes, (BH527, BH528 and BH530), drilled during the 2015 investigation with response zones within the Tidal Flat Deposits and including peat horizons (4.9 9 m bGL, 6 7 m bGL and 5 8 m bGL respectively). Of the 4 no monitoring rounds available, the below observations have been made:
 - No monitoring was undertaken during low barometric pressure (less than 1000 mb), with the lowest conditions being 1001 mb. As such worst case atmospheric conditions for potential ground gas generation may have not been monitored.
 - Gas flow was generally recorded absent, with the exception of the first round in BH527 which recorded a peak flow of 1.3 l/hr and the first round in BH528 which recorded a flow of 0.4 l/hr before rapidly stabilising to zero.
 - Methane has been recorded up to 3.41 % on the third round in BH527, up to 31% in the third round in BH528 and absent for the other three monitoring rounds in these boreholes. In BH530 methane was absent in the first round and recorded up to 14.8% in the other three monitoring rounds. When encountered, methane concentrations were seen to reduce through the first minute's reading intervals, indicating a limited amount of gas is present within the soils. The concentrations are above the screening criterion of 1 %.
 - Carbon dioxide is absent in BH527, identified at up to 8.1 % in BH528 and up to 5.3 % in BH530. These concentrations are above the screening criteria of 5 %.
 - Trace of Volatile Organic Compounds of up to 3.2 ppm has been recorded.
 - Hydrogen sulphide was not detected throughout the monitoring.
 - Carbon monoxide was recorded at a maximum of 10 ppm in the second monitoring round at BH530. These concentrations are below the screening criteria of 30 ppm.
 - Oxygen has been recorded to be at ambient concentrations of between 19.6 -20.4 % in BH527. In BH530 it is recorded at lower concentrations during the second round at concentrations of 15 - 15.6 % and within BH528 during the third round at concentrations of 11.8 and 12.1 %.
 - Ground gas data from the Made Ground has not been collected.
- **8.6.2** The available data identifies elevated methane concentration and raised carbon dioxide that are higher than the screening criteria with ambient or depleted

oxygen conditions and these are considered representative of peat deposits with low gas generation potential.

8.6.3 A gas risk assessment has been undertaken and is set out in the Land Contamination Assessment Report Appendix 11.1 of the ES).

8.7 Summary

- 8.7.1 Made Ground has been shown to have elevated chromium concentrations above background range with maximum of up to 1,900 mg/kg. The elevated concentrations generally relate to the slag material used in the construction of roads at the Site. This material could represent a potential human health risk to future site workers and remediation may be necessary. Further sampling and analysis of these soils is recommended to determine if the chromium detected is the more toxic hexavalent form and whether remediation is needed.
- 8.7.2 Elevated alkaline soil conditions have been identified in over half of the samples, mainly within the Made Ground material but also in three samples of the Tidal Flat Deposit material. However, the pH in nearby surface water receptors is not noted to be elevated.
- 8.7.3 Made Ground tested at the Site was identified to have leachable contaminants with exceedances of arsenic, boron, copper, nickel, lead, antimony and pH. The natural soils were identified to have limited leachability with marginal exceedances of nickel and lead limited to one sample out of three. Similar elevated levels of these metals were not observed in surface water samples.
- 8.7.4 Perched water within the Made Ground has high levels of metals, pH and PAHs. Elevated TPH concentrations are also identified within the perched water. However, the area where perched groundwater within Made Ground has been identified is not going to be affected by the Scheme.
- 8.7.5 Both the perched groundwater within the Tidal Flat Deposits and the aquifer have been identified to have elevated metals and inorganics contaminants when compared to the Environment Quality Standards or the Drinking Water Standards. Localised and sporadic presence of TPH contamination is identified. The pore waters within the Tidal Flat Deposits and groundwater within the Mercia Mudstone is saline. These groundwater qualities are considered to be within the baseline of this area within the Gwent levels as defined within the Baseline Water Environment Report (RPS, 2015).
- 8.7.6 Surface waters at the boundary of the Site are generally of good quality and are comparable to the baseline surface water quality (Appendix 16.2 of the ES).
- 8.7.7 Elevated concentrations of methane along with depleted oxygen levels identified are likely attributed to the presence of organic material including peat and are consistent with the expected gas regime given the types of natural soils present beneath the Site.

9 Refined Conceptual Site Model

- 9.1.1 The results of the Supplementary Ground Investigation have enabled the original CSM presented in the 2014 PSSR to be updated. The assessment is based on the Scheme during its construction and operation phases.
- 9.1.2 A CSM to represent general ground conditions, overall Scheme layout and relevant source-pathway-receptors (each of which having a specific alphanumerical symbol attached) is presented in Figure 2.

Table 23: Conceptual Site Model

Potential Source	Potential Receptor	Possible Pathway	Likelihood	Severity	Risk	Comment
	Construction Stage					
		Direct dermal (1) Ingestion (3)	Likely Likely	Moderate Moderate	Moderate Moderate	Construction workers will possibly be exposed to Made Ground materials during Site construction works; however
		Inhalation of soil dust (2)	Likely	Moderate	Moderate	exposure duration will be short term only. Prior to construction, a specific risk assessment will be required in line with CDM and H&S guidance. This will enable safe
On Site Metals, inorganics and organic contaminants associated with slag and industrial rubble from the nearby steel works in particular. Sludge and industrial waste within the Green Moor Land Landfill. Road construction material (slag) in particular Off site Llanwern Lagoon26 (CL-26); Llanwern Works East Landfill; Llanwern steelworks main operation	Construction Workers (B)	Inhalation of ground gas / VOCs / hydrocarbon vapours (2)	Unlikely	Moderate	Low	methods of work and appropriate level of PPE to be put in place. As such all risks will be duly considered and suitably mitigated to protect construction workers. The contamination status is not foreseen to represent abnormal constraints to construction workers' health and safety over and above those typical of a brownfield site. A construction mat will be placed over the length and width of the proposed embankment to enable piling and band drain installation as well as general construction. This will break dermal, ingestion and inhalation pathways once placed. Made Ground comprising ash and slag used to make up the existing access roads will require removal to facilitate construction. The materials may be appropriate for reuse within the Scheme subject to meeting suitability for re-use criteria. Gap in the data has been identified and further investigations are required to delineate any potential contamination associated with the known areas of tipping associated with Green Moor Lane Landfill and along the new route of North Row and the proposed Water Treatment Area.
·	General public/site	Dermal contact with soil dust(1)	Unlikely	Moderate	Low	During construction period there is the possibility of inhalation/ ingestion of soil dust. Dust suppression
	neighbours during construction works	Ingestion of soil dust (3)	Unlikely	Moderate	Low	measures will be required during construction works. Potential contamination sources extend well beyond the
	(C)	Inhalation of soil dust (2)	Unlikely	Moderate	Low	land take. A construction mat will be placed over the length and width

Potential Source	Potential Receptor	Possible Pathway	Likelihood	Severity	Risk	Comment
		Inhalation of soil gas or vapours (2)	Unlikely	Moderate	Low	of the proposed embankment to enable piling and band drain installation as well as general construction. This will break dermal, ingestion and inhalation pathways once placed. Gap in the data has been identified and further investigations are required to delineate any potential contamination and confirm the risks.
		Saturated flow within perched water and groundwaters (4)	Low likelihood	Moderate	Moderate to Low	Leachable organics and inorganics identified within the Made Ground. Surface waters at the boundary of the Site are generally of good quality. The quality of perched groundwater may
	Surface water (land drainage, reens), part of Gwent Levels SSSI (C)	Contaminated surface water run-off (5)	Likely	Moderate	Moderate	become impacted by contamination during the construction works, particularly in the area where excavation is undertaken (new drains and piling). Made Ground comprising ash and slag used to make up the existing access roads will require removal to facilitate construction. The materials may be appropriate for re-use within the Scheme subject to meeting suitability for re-use criteria. Perched groundwater is likely to have very low flow and may be absent seasonally. Perched water within the Made Ground has elevated metals and organics, albeit in an area not to be affected by the Scheme. Application of appropriate surface water run-off control measures will be required.
	Deep groundwater within Mercia Mudstone(Da)	Vertical migration (4)	Low likelihood	Moderate	Moderate to low	Displacement of potentially impacted made ground possible during piling, however this is subject to selected piling technique. Furthermore, Made Ground comprising ash and slag used to make up the existing access roads will require removal to facilitate construction. The materials may be appropriate for reuse within the Scheme subject to meeting suitability for re-use criteria. A thick mantle of predominantly very low permeability Tidal Flat Deposits overlie the Mercia Mudstone aquifer,

Potential Source	Potential Receptor	Possible Pathway	Likelihood	Severity	Risk	Comment
						reducing risk of downward migration. Groundwater (aquifer) quality identified to be impacted by metal and inorganic contaminants of concern and of same quality as the Tidal Flat Deposit perched groundwater. Groundwater characterised with saline intrusion. Perched groundwater in Made Ground has been impacted with hydrocarbons in CH52A. This is anticipated to be discrete feature rather than widespread across the Site and is also not going to be affected by the Scheme. A piling risk assessment will be required to mitigate risks from piling and band drain installation to controlled waters. Gap in the data has been identified and further investigations are required to delineate any potential contamination and confirm the risks.
Groundwater – Aquifer from the Glaciofluvial Deposits and/or Mercia Mudstone	Surface water (land drainage) (E)	Piles and band drains (4)	Unlikely	High	Moderate to Low	Groundwater (aquifer) is saline. The hydrostatic pressure of the aquifer is likely to be near base of Made Ground and band drains and piles could create potential vertical pathways connecting aquifer with surface water. Controls and a piling risk assessment are required to mitigate the risks.
	Construction Workers (B)	Inhalation of soil gas / explosion (2)	Low likelihood	High	Moderate	High methane concentrations associated with peat / organic clays but with low or absent flux. Gas flux likely to increase during surcharge loading.
Peat and organic soils	Off site users during construction works (C)	Inhalation of soil gas/ explosion (2)	Unlikely	High	Moderate to low	New pathways to be created with band drain. Construction to be largely within open space. Any earthworks within confined space would require specific risk assessment, control measures and PPE. Gas control measures would be needed during piling and band drain installation. Risks to offsite general public during construction considered very low as no enclosed spaces or buildings within public access and low permeability of Tidal Flat Deposits will inhibit migration. Gap in the data has been identified and further investigations are required to assess any potential gas and confirm the risks.

Potential Source	Potential Receptor	Possible Pathway	Likelihood	Severity	Risk	Comment
						Piling and band drain installations could result in explosive risks during operations and risk assessment and gas mitigation measures will be needed.
	Operational		•		•	
		Direct dermal (1)	Low likelihood	Low	Very low	Made Ground to be largely encapsulated by the
		Ingestion (3)	Low likelihood	Low	Very low	embankment or removed and therefore the exposure to
		Inhalation of soil dust (2)	Low likelihood	Low	Very low	contamination will be limited outside the motorway embankment along existing tracks albeit outside the
On Site Metals, inorganic and organic contaminants associated with slag and industrial rubble from the nearby steel works. Sludge and industrial waste within the Green Moor Land Landfill. Ground gas Off site Llanwern Lagoon26 (CL-26); Llanwern Works East Landfill; Llanwern steelworks main operation	Maintenance Workers (B)	Inhalation of soil gas or vapours (2)	Low likelihood	Low	Very low	permanent land take. Areas outside the motorway hardstanding will receive topsoil and / or subsoil cover for planting further reducing pathways. Exposure duration will be short term only. Site specific risk assessment will be required in line with health and safety legislation. This will enable safe methodology and appropriate level of PPE to be put in place. As such all risks will be duly considered and suitably mitigated for instance during future excavations required during maintenance. Current data set identifies limited exceedances above the selected generic screening criteria. Existing contamination levels are not foreseen to represent abnormal constraints to maintenance workers' health and safety over and above those typical of a brown field site redevelopment. Surcharge of superficial soils may temporary increase gas flux. Maintenance works to be largely within open space. Any works within confined space would require specific risk assessment, control measures and PPE to meet legislative requirements. Gap in the data has been identified and further investigations are required to delineate any potential contamination and confirm the risks associated with potential waste deposition in the three areas at Green Moor Lane Landfill.

Potential Source	Potential Receptor	Possible Pathway	Likelihood	Severity	Risk	Comment
		Dermal contact with soil dust (1)	Unlikely	Low	Very low	Potential contamination sources in soil are limited to the existing roadways constructed from ash and slag and the
		Ingestion of soil dust (3)	Unlikely	Low	Very low	Made Ground is to be largely encapsulated by the embankment. Exposure duration will be short term only for
		Inhalation of soil dust (2)	Unlikely	Low	Very low	Motorway users. The human health screening criteria is considered conservative when considering exposure and pathway
	Future Motorway users (A) and other off site users (C)	Inhalation of soil gas or vapours (2)	Unlikely	Low	Very low	mechanisms to future Site users. Limited potential for lateral gas migration given the presence of low permeability Tidal Flat Deposits to shallow depth. Off-site receptors adjacent to proposed earthworks at the link road but some 450 m from the main motorway section and this is not considered at risk. Gap in the data has been identified and further investigations are required to delineate any potential contamination and confirm the risks associated with potential waste deposition in the three areas at Green Moor Lane Landfill.
	Deep groundwater within Mercia Mudstone(Da)	Vertical migration (4)	Low likelihood	Moderate	Moderate to Low	Leaching of contaminants from the Made Ground materials used to construct existing roadways could migrate via piling and band drains; however the Made Ground comprising ash and slag will require removal to facilitate construction. The materials may be appropriate for reuse within the Scheme subject to meeting suitability for reuse criteria. Thick mantle of predominantly very low permeability Tidal Flat Deposits overlying aquifer, reducing risk of downward migration. Groundwater (aquifer) quality already identified to be impacted by metal and inorganic contaminants of same quality than the perched groundwater. Groundwater characterized with saline intrusion. Water in Made Ground impacted with hydrocarbons (CH52A). This is anticipated to be discrete feature rather than widespread across the Site and is also not going to be affected by the Scheme.

Potential Source	Potential Receptor	Possible Pathway	Likelihood	Severity	Risk	Comment
						Piling risk assessment will be required to mitigate risks from piling and band drain installation to controlled waters. Gap in the data has been identified and further investigations are required to delineate any potential contamination and confirm the risks associated with potential waste deposition in the three areas at Green Moor Lane Landfill.
	Surface water (land drainage) (E)	Leaching / migration of contaminants to surface waters (4)	Likely	Moderate	Moderate	Leachable organics and inorganics identified within the Made Ground. Made Ground comprising ash and slag used to make up the existing access roads will require removal to facilitate construction. The materials may be appropriate for reuse within the Scheme subject to meeting suitability for re-use criteria. Perched groundwater is likely to have very low flow and may be absent seasonally. Perched water within the Made Ground has elevated metals and organics, albeit in an area not to be affected by the Scheme. Application of appropriate surface water run-off control measures will be required.
Groundwater – Aquifer from the Glaciofluvial Deposits and/or Mercia Mudstone	Surface water (land drainage) (E)	Piles (4)	Likely	High	High	Groundwater (aquifer) is saline. The hydrostatic pressure of the aquifer is near base of Made Ground and band drains and piles could create potential vertical pathways connecting aquifer with surface water. Controls and a piling risk assessment are required to mitigate these risks.
Peat and organic soils	Maintenance Workers (B)	Inhalation of soil gas / explosion (2)	Unlikely	High	Moderate to Low	Although elevated methane concentrations are known within the natural soils of the Tidal Flat Deposits, the low permeability soils will result in limited gas generation post construction. Risks to maintenance workers low but entry into any confined spaces will need to adhere to health and safety legislation requirements. Pathways along piles likely to "heal" with increase in soil contact along pile shaft preventing gas migration. However

I	Potential Source	Potential Receptor	Possible Pathway	Likelihood	Severity	Risk	Comment
							band drains could still allow localised gas migration. Gap in the data has been identified and further investigations are required to assess any potential gas and confirm the risks.
		Future motorway users (A) and off-site users (C)	Inhalation of soil gas / explosion (2)	Unlikely	High	Moderate to Low	Ground gas data from the peat horizons within the superficial deposits identify concentrations of methane, carbon dioxide and trace VOCs. New pathways to be created with piles and band drains. Limited potential for lateral gas migration given the presence of low permeability Tidal Flat Deposits to shallow depth. Motorway to be built on raised embankment providing a further barrier to migration gases. Pathways along piles likely to "heal" with increase in soil contact along pile shaft preventing gas migration. However band drains could still allow localised gas migration. Gap in the data has been identified and further investigations are required to assess any potential gas and confirm the risks.

10 Conclusions and Recommendations

10.1 Conclusions

- 10.1.1 Ground investigations have been undertaken at the Site to assess risks from land contamination associated with the construction and operation of the Scheme including human health and controlled waters risks.
- 10.1.2 Widespread gross contamination associated with the Site's historical use has not been identified. The risk assessment has identified that some residual risks to human health and controlled waters could exist and control measures are required to facilitate the construction and ongoing operation of the Scheme.
- 10.1.3 The laboratory testing results from previous ground investigations confirm the on site observations and field testing, and indicate that the materials encountered within the Site are at tolerable levels of risk to human health both during construction and operational phases. Materials are also likely to be suitable for reuse subject to provision of reuse criteria under a Material Management Plan.
- 10.1.4 Contaminated materials appear to be confined to existing tracks that cross the Site that have been constructed from slag and ash materials. There are three areas of suspected tipping that have not been intrusively investigated that require additional assessment.
- **10.1.5** During the construction phase, specific mitigation measures will be required to prevent inhalation pathways of dust to off site and work force receptors, although such measures would be no more than typically expected on a construction site.
- 10.1.6 Impacted perched groundwaters likely to be in continuity with land drainage will require suitable water management strategy to prevent potential impact to surface waters from contaminant run-offs.
- During the operational phase, the embankment will cover part of the Site which will significantly limit the infiltration of rainwater through the soils and potentially leaching any soil contaminants into the groundwater. However, perched groundwater may be within the Made Ground materials and could remain beneath the embankment.
- 10.1.8 Surface waters at the boundary of the Site are generally of good quality with limited evidence of impact on quality that can be be associated with the Site. The surface water quality appears similar to that seen elsewhere across the Gwent Levels.
- 10.1.9 Adoption of band drain and piles may provide new pathways which may lead to groundwater within the Tidal Flat Deposits and possibly any water bodies within the Made Ground to enter the currently confined aquifer within the Glaciofluvial Deposits and Mercia Mudstone.
- 10.1.10 The deep aquifer is identified to be impacted with metals, organic and inorganic contaminants which may reduce surface water quality if the band drain pathways allow direct or indirect linkage. Further consideration and a piling risk assessment will be undertaken to mitigate the potential impact of the band drains to allow specific mitigation measures to be implemented.

10.1.11 Post construction, the embankment itself and topsoil and subsoil cover along the motorway corridor will break potential human health pathways to end-users and maintenance workers. However, topsoil materials placed at the surface will need to be checked for contamination.

10.2 Recommendations

- 10.2.1 Given the identified gap in the data, in particular associated with potentially contaminated land use (landfills and steelworks) an additional ground investigation works is required to verify risk levels described in this report. Upon completion this report shall be reviewed and updated accordingly once the findings of the additional investigation are made available. The additional investigation will include the following:
 - Trial pits and boreholes to collect soil samples including targeting the three suspected areas of tipping.
 - Installation of groundwater monitoring wells to collect groundwater samples and gas monitoring.
- Upon review and assessment of the additional ground investigation information, any contamination identified that could cause an unacceptable risk to the identified receptors will require appropriate remedial mitigation measures to be implemented. These measures would be identified within a remedial strategy for the Scheme. The remediation strategy is anticipated to include but is not limited to the below:
 - Addressing uncertain human health risk and controlled waters risk identified by the proposed additional ground investigation.
 - Risk assessment of piles / band drains and associated construction works creating pathways enabling contaminants migration.
 - Dealing with unexpected contamination.
 - Verification sampling strategy to confirm suitability for soils for retention / reuse.
 - Control measures to prevent risks to construction workers and the general public during construction.
 - Verification of imported topsoils for suitability of use.
- 10.2.3 The remediation strategy should include a remediation options appraisal, remediation implementation plan and remediation verification plan. The remediation strategy should be supported by a Scheme wide Material Management Plan prepared in accordance with CL:AIRE Code of Practice (CL:AIRE, 2011).

EQUIPMENT: Light cable percussive (shell and auger) rig and Geotechnical Pioneer rig. METHOD: Cable percussion (200mm) 0.00-2.00m and (150mm) 2.00-12.20m. Waterflush rotary core drilled (116mm) 12.20-22.70m. CASING: 200mm diam to 2.00m, 150mm diam to 12.20m.

BACKFILL: On completion, borehole backfilled with bentonite pellets 22.70-11.80m. A slotted standpipe (50mm) with geo-sock was installed to 11.60m, granular response zone 11.80-9.80m and bentonite seal 9.80-2.80m. A second slotted standpipe (35mm) with geo-sock was installed to 2.60m, granular response zone 2.80-0.50m, bentonite seal 0.50-0.25m, concrete and stopcock cover 0.25-0.00m.

REMARKS: Hole advanced by chiselling 0.00-1.00m (1hr10mins) and 10.90-12.20m (2hr). Downhole magnetometry for UXO risk mitigation undertaken 0.00-11.00m. No anomalies encountered. Bentonite seal for aquifer protection installed during drilling 1.00-2.00m, prior to reduction in casing diameter. Permeability test undertaken at 7.00m-8.00m.

MMG = Mercia Mudstone Group. Weathering zone after Chandler RJ and Forster CIRIA C570; Engineering in Mercia Mudstone (2001).

EQUIPMENT: Light cable percussive (shell and auger) rig and Geotechnical pioneer rig.

METHOD: Hand dug inspection pit 0.00-1.00m. Cable percussion (200mm) 1.00-2.00m and (150mm) 2.00m to 13.10m. Waterflush rotary core drilled (116mm) 13.10-19.10m. CASING: 200mm diam to 2.00m and 150mm diam to 12.60m.

BACKFILL: On completion, borehole backfilled with bentonite pellets 19.10-19.00m. A slotted standpipe (50mm) with geo-sock was installed to 19.00m, granular response zone 19.00-12.90m and bentonite seal 12.90-9.00m. A second slotted standpipe (35mm) with geo-sock was installed to 9.00m, granular response zone 9.00-4.90m, bentonite seal 4.90-0.50m, concrete and stopcock cover 0.50-0.00m.

REMARKS: Downhole magnetometry for UXO risk mitigation undertaken 0.00-11.00m. No anomalies encountered. Bentonite seal for aquifer protection installed during drilling 2.00m, prior to reduction in casing diameter. MMG = Mercia Mudstone Group. Weathering zone after Chandler RJ and Forster CIRIA C570; Engineering in Mercia Mudstone (2001).

Ground level

EQUIPMENT: Geotechnical Pioneer rig.

METHOD: Hand dug inspection pit 0.00-1.00m. Dynamic sampled (128mm) 1.00-4.00m and (113mm) 4.00-10.60m. Waterflush rotary core drilled (116mm) 10.60-21.00m.

CASING: 140mm diam to 9.80m.

BACKFILL: On completion, a slotted standpipe (50mm) was installed to 21.00m, granular response zone 21.00-12.00m and bentonite seal 12.00-8.00m. A second slotted standpipe (35mm) was installed to 8.00m, granular response zone 8.00-5.00m, bentonite seal 5.00-0.20m, concrete and stopcock cover 0.20-0.00m.

REMARKS: Downhole magnetometry for UXO risk mitigation undertaken 0.00-10.60m. No anomalies encountered. Falling head permeability test undertaken at 8.00m- 9.50m. MMG = Mercia Mudstone Group. Weathering zone after Chandler RJ and Forster CIRIA C570; Engineering in Mercia Mudstone (2001).

Project Name New M4 Preliminary Ground Investigation
Project No. F15056
Engineer Ove Arup & Partners Ltd
Client Transport Wales, Welsh Assembly Government

Groundwater Readings
For Installations

Fig no.

NOTES: SPIE=Piezometer, SP=Standpipe

For multiple installations, use different Installation IDs.

For piezometers installation depth = tip depth. For standpipes = base of pipe

COMMENTS

Unable to locate LGBH05 and RBBH08. LGBH06 was blocked All groundwater levels are recorded from ground level

Screening Values and Assessment

Exceeds S4ULs criteria

X Laboratory detection level higher than screening criterion

Notes

Sample Reference
Location Type
Specimen Depth (m)
OD Level (m)
Sample Type
Geology Code
Uni

NFD = No Fibres Detected NAD = No Asbestos Detected Chromium VI criteria used

Elemental Mercury criteria used

Screening criterion for lead is C4SL in the absence of a S4UL

1 Introduction

1.1 Background

- **1.1.1** This report relates to an area of land potentially affected by contamination (CL-29) known as the 'Spoil Heaps, Llanwern Approach Road' herein referred to as the 'Site'.
- **1.1.2** The Site is located at approximate chainage 20,100 upon an existing spoil heap adjacent to the north of the railway line (see Figure 1).

1.2 Reporting Context

- 1.2.1 The Site has been assessed as part of ground investigations and monitoring associated with the wider works for the M4 Corridor around Newport (M4CaN) (hereafter referred to as the 'Scheme') and informs the baseline for the environmental impact assessment (EIA) for the Scheme. The EIA is reported in the M4CaN Environmental Statement (ES) of which this document is an appendix to the chapter on Geology and Soils.
- In 2014, a Preliminary Sources Study Report (2014 PSSR) was prepared as an initial land contamination appraisal (Ove, Arup & Partners, 2014) as part of Design Manual for Roads and Bridges (DMRB) Stage 2 Assessments for a number of potential route options. This identified a number of individual areas that may have been affected by contamination as a result of historical activities at the Site. In addition, this report draws upon the 2015 Supplementary Ground Investigation report on behalf of the Welsh Government (Geotechnical Engineering, 2015). This report relates to the area defined on the Site Location Plan Figure 1.
- 1.2.3 The overarching rationale and approach for the assessment of areas of land along the proposed new section of motorway with potential contamination is detailed in the Land Contamination Assessment Report (Appendix 11.1 of the ES).

1.3 Objectives

- **1.3.1** The key objectives of this report are set out below:
 - Undertake a risk assessment of the Site and determine whether potential risks to human health or controlled waters could exist based upon the Scheme.
 - Identify the need for further assessment and investigation in order to refine potential land contamination risks and inform the need for remediation/mitigation.
 - To provide information to support the Ground Investigation Report (GIR) and Geotechnical Design Report (GDR) required under DMRB HD22/08 (Highways Agency, 2008).

1.4 Report Structure

1.4.1 The subsequent report structure is as follows:

- Section 2: Site Location and Description.
- Section 3: The Scheme This section details the new section of motorway alignment and associated features at the Site.
- Section 4: Site History This section summarises the history of the Site based on historical maps and historical land photographs.
- Section 5: Environmental Setting This section summarises the Site description, published geology, hydrology and hydrogeology and any relevant environmental information presented in the 2014 PSSR.
- Section 6: Scope of Ground Investigation Works This section describes the previous and supplementary ground investigation data available for the Site.
- Section 7: Ground Conditions This section describes the main findings of the intrusive site investigation including the ground conditions encountered and any visual or olfactory evidence of contamination identified.
- Section 8: Contamination Assessment This section describes the findings of the Tier 1 and Tier 2 contamination risk assessment based upon potential contamination sources, potential receptors and potential contaminant linkages and presents the human health and controlled waters assessments.
- Section 9: Refined Conceptual Site Model This section presents the Conceptual Site Model (CSM) for the Site and identifies potential contaminant linkages, based upon the findings of the data presented within Sections 2 to 7.
- Section 10: Conclusions and Recommendations This section provides conclusions concerning the likelihood of land contamination associated with the Site affecting the Scheme and requirements for remediation/mitigation.

2 Site Location and Description

- 2.1.1 The Site is located in the eastern part of the new section of motorway, where the A4810 crosses the mainline railway, with a centre point at National Grid Reference ST 415 820. The Site location is shown on Figure 1.
- 2.1.2 The Site is situated within an agricultural field and is bounded to the west by the A4180 and the south by the railway cutting. Access was not possible during the 1995 or 2015 Site walkover survey. A single storey ruined building has been identified among brambles and scrub using the historical information available.
- 2.1.3 It is noted that the 2014 PSSR included a second parcel of land within the Site, south of the railway line. This comprised an old quarry. Given the new section of motorway and associated land take does not include this area and the quarry is separated from the alignment by the railway cutting and the A4810 embankment, no potential contamination linkages are considered applicable. The former quarry is no longer considered as a potential source of contamination for the purpose of the Land Contamination Assessment Report (Appendix 11.1 of the ES).
- **2.1.4** The Site will be assessed in terms of the suitability of materials to remain *in situ*.

3 The Scheme

- **3.1.1** The Site is situated at approximate chainage 20,100.
- 3.1.2 The section of highway impacting the Site is proposed to be on embankment with a carriageway approximately 10 m above existing ground level.
- **3.1.3** Given the absence of soft compressible strata, the use of piles is not being considered and instead, foundation would be taken onto the shallow rockhead.
- **3.1.4** The highway verges are to be soft landscaped, incorporating highway drainage predominantly as open swales/channels.
- **3.1.5** Subject to suitability of the materials encountered, it is currently proposed that all existing ground will be left *in situ* with the embankment constructed above.

4 Site History

- 4.1.1 The 2014 PSSR historical searches were based on Ordnance Survey (OS) plans, literature reviews, information provided by British Steel, Natural Resources Wales (NRW) (formerly Environment Agency Wales), Newport City Council and aerial photographic interpretation.
- **4.1.2** This is supplemented by a review of historical maps obtained in 2015 from the Welsh Government.
- **4.1.3** A summary of the Site's history is summarised below in Table 1.

Table 1: Site History

Date	Use	Source of Information			
1843 - 1893	Site shown as an agricultural field, bounded to the south by a <u>railway</u> (running east – west).	1:10,560 Historical Mapping			
1882	No significant change.	1882 OS Plan			
1891 - 1912	No significant change.	1:10,560 Historical Mapping			
1901	No significant change.	1901 OS plan			
1904 - 1939	No significant change.	1:10,560 Historical Mapping			
1921	No significant change.	1921 OS Plan			
1964 - 1965	The embankment of the railway has extended.	1:10,560 Historical Mapping			
1969	The A4810 is now evident.	Aerial Photography			
1969 - 1971	No significant change.	1:10,560 Historical Mapping			
1981	Evidence of a possible structure in the eastern area of the Site.	Aerial Photography			
1985 - 1991	No significant change.	Aerial Photography			
1998	The south-western area appears vegetated with bushes and trees	Aerial Photography			
2006	Storage of unknown materials / rubble in the northern area of the Site.	Aerial Photography			
2009 - 2010	A pylon is present in the north-east corner. Rough vegetation in northern area with no obvious evidence of rubble being present.	Aerial Photography			
2014	No significant change.	High Resolution Aerial Photography			
		<u> </u>			

Notes: Potential sources of contamination are <u>underlined</u>. Those within the temporary and permanent land take are shown in **bold**.

- 4.1.4 The 1995 PSSR identified a spoil heap as a potential source of contamination. The sources of information presented above supplement those used in the 2014 PSSR. In particular, the 2006 aerial photograph has identified a second heap of material and as a result, the Site boundary was revised to include the area to the north. Relevant extracts of the photographs are presented in Appendix 5.
- 4.1.5 Historically the Site is located in proximity to areas which may have been bombed during World War II which is discussed in the Explosive Ordnance Threat Assessment Report (Bactec, 2014). This categorises the site as low risk with respect to unexploded ordnance.

5 Environmental Setting

5.1 Geology

5.1.1 British Geological Survey (BGS) records indicate that the Site is underlain by Head Deposits of clay, silt, sand and gravel. These are underlain by the solid deposits of the Tintern Sandstone Formation, comprising sandstone with localised pebbles and subordinate marls.

5.2 Hydrology

5.2.1 The nearest water body is Bareland Street Reen East located 50 m south, on the other side of the A4180. This road also forms the northern boundary of the Gwent Levels Site of Specific Scientific Interest (SSSI).

5.3 Hydrogeology

- 5.3.1 NRW classifies the Tintern Sandstone Formation as a principal aquifer. The Head Deposits overlying the bedrock is classified by NRW as Unproductive Strata.
- **5.3.2** The Site does not lie within a groundwater source protection zone.

5.4 Environmental Information

5.4.1 No pollution incidents, abstraction licences, discharge points or landfills have been recorded within 300 m of the Site.

6 Scope of Investigations

6.1 General

6.1.1 No previous ground investigations are available for this Site. However a number of exploratory holes were advanced within 100 m of the Site. These have been considered in order to support an understanding of ground conditions beneath the Site and inform the groundwater quality and gas regime.

6.2 Scope of Works

6.2.1 The various off site intrusive ground investigations undertaken in the near vicinity of the Site are summarised in Table 2.

Table 2: Off Site Investigation Summary (Off Site)

Date	Contractor	Boreholes	Location from Site	Sampling
1997	Norwest Holst	ВНМ6	10 m north-east of the Site	None
2015	Geotechnical Engineering Ltd	BH539, BH540, BH541	80 m south-east, 8 m north-east and 50 m east of the Site, respectively	Groundwater

6.2.2 The well construction details of the off site boreholes are summarised below.

Table 3: Summary of Off Site Borehole Construction Details

Borehole ID	Diameter (mm)	Total Drilled Depth (m)	Top of Slotted Well Casing / Gravel Pack (mbGL)	Base of Slotted Well Casing / Gravel Pack (mbGL)	Targeted Geology
BHM6	-	10	5	7.5	Tintern Sandstone
BH539	35	14.2	1	3	Head Deposits
DI 1339	50	14.2	5	14.2	Tintern Sandstone
BH541	50	11.5	2	11.5	Tintern Sandtsone

6.3 Surface Water Quality Monitoring

6.3.1 Surface water quality monitoring was not undertaken during the previous ground investigations of the Site.

6.4 Field Testing

- **6.4.1** Monitoring of Volatile Organic Compounds (VOCs) was undertaken on:
 - three soil samples from BH539 at 0.2-0.5 mbGL, 0.5-1.0 mbGL and 1.0-1.2 mbGL;
 - two soil samples from BH540 at 0.2-0.5 mbGL and 0.5-1.0 mbGL; and
 - three soil samples from BH541 at 0.2-0.6 mbGL, 0.6-0.8 mbGL and 0.8-1.0 mbGL.

6.5 Groundwater Monitoring

A summary of the groundwater sampling, groundwater/monitoring and ground gas monitoring from the selected off site boreholes is shown in Table 4.

Table 4: Summary of Monitoring Rounds (Off Site)

Location Ref.	Number of Rounds (Date of Sampling)	Monitoring Details	Notes
внм6	5 no . (15 th November 1997, 25 th November 1997, 2 nd December 1997, 10 th December 1997, 16 th December 1997)	Groundwater level	-
BH539	4 no . (24 th March 2015 , 31 st March 2015, 16 th April 2015, 8 th May 2015)	Groundwater level / sampling Soil gas	Gas monitoring in 35 mm shallow installation only
BH541	4 no. (31 st March 2015, 16 th April 2015, 21 st April 2015, 8 th May 2015)	Groundwater level / sampling Soil gas	-

6.6 Laboratory Chemical Testing

A summary of laboratory analysis undertaken from the selected off site boreholes on groundwater is shown in Table 5.

Table 5: Summary of Previous Investigation Sampling

Site Investigation Date	No. of Soil Samples	No. of Leachate Samples	No. of Water Samples	Suites of Testing
2015	N/A	0		Metals, PAH, TPH, pH, cyanide, PCBs, VOCs, SVOCs, BTEX, phenols, inorganics

Soil Analysis

6.6.2 No soil data is available for the Site.

Soil Leaching Analysis

6.6.3 No soil leaching data is available for the Site.

Groundwater Analysis

- 6.6.4 The following sections summarise the laboratory analytical results for groundwater samples collected during the various intrusive investigation phases within the selected off site boreholes. The available data set has been tabulated and is presented in Appendix 3 with supporting laboratory certificates available in the relevant original reports.
- 6.6.5 The available data relates to samples taken from wells installed within the groundwater of the Head Deposits and Tintern Sandstone.

6.6.6 The available information is summarised in Table 6.

Table 6: Summary of Analytical Groundwater Data (Off Site)

Cusumduratan	Number of C 2015 data	Number of Groundwater Analyses per Analytical Suites (number of well locations) – 2015 data										
Groundwater Unit	Metals & Inorganics	РАН	Total Petroleum Hydrocarbons	Phenol	втех	SVOCs	VOCs	PCBs				
Perched Groundwater (Head Deposits)	3 (1)	3 (1)	3 (1)	3 (1)	3 (1)	2 (1)	3 (1)	1 (1)				
Groundwater (Tintern Sandstone Formation)	6 (2)	6 (2)	6 (2)	6 (2)	6 (2)	4 (2)	6 (2)	3 (2)				

6.7 Gap Analysis of Available Data

6.7.1 There is no investigation data available for the Site.

7 Ground Conditions

7.1 Geology

7.1.1 The geological logs for all available exploratory holes excavated on or in close proximity to the Site are provided in Appendix 1. The observed geological sequence is consistent with that described in the 2014 PSSR report and is summarised in the following sections. Information from the Supplementary Ground Investigation (Geotechnical Engineering, 2015) has also been used.

Superficial Deposits

- **7.1.2** Unconsolidated superficial deposits were encountered beneath the topsoil. These comprised Head Deposits, predominantly sand and gravel, encountered to 0.5 to 1.3 mbGL.
- **7.1.3** In borehole (BH539), a thin veneer of Tidal Flat Deposits to 2.35 mbGL was recorded. This was encountered as very soft clay.

Solid Geology

7.1.4 Beneath the superficial deposits the Tintern Sandstone Formation was encountered. This typically comprised sandstone with some interbedded thin mudstones/marls.

Geological Sequence Summary

7.1.5 The anticipated general geological sequence beneath the Site based on the nearby off site previous ground investigation is summarised Table 7.

Table 7: Summary of Geological Sequence (Off Site)

Unit	Description	Thickness Range (m)	Basal Depth (mbGL)
Made Ground	Unknown	unproven	unproven
Superficial Deposits (Head Deposits)	Typically sand and graveland cobbles within a clay matrix	0.5* - 1.3*	0.6* - 1.3*
Superficial Deposits (Tidal Flat Deposits)	Soft clay	Absent*	-
Tintern Sandstone Formation	Sandstone with occasional bands of mudstone	>9.39* - >19.6*	Unproven*

Note: * inferred from off site exploratory holes.

7.2 Visual and Olfactory Evidence of Contamination

- **7.2.1** No records are available for the Site during the previous ground investigations.
- 7.2.2 PID monitoring was undertaken from three off site boreholes, three soil samples from BH539, two soil samples from BH540 and three soil samples from BH541. The PID meter recorded levels of between zero and 5.1 ppm within either the Tidal Flat Deposits or Head Deposits indicating the presence of low level naturally occurring VOCs.

7.3 Gas Monitoring

- 7.3.1 The gas monitoring data set collected during each of the previous monitoring rounds at the off site boreholes is summarised on the field data sheets provided in Appendix 2. The maximum concentrations are presented in Table 8.
- **7.3.2** Boreholes BH539 and BH541 are also considered to assess the gas regime for CL-30, located approximately 110 m to the east.

Table 8: Summary of Gas Monitoring Data (Off Site)

Location	Flow (I/hr)	VOCs (ppm)	CH ₄ (%/vol) ¹	Peak LEL (%)	CO ₂ (%/vol) ²	O ₂ (%/vol) ³	CO (ppm) ⁴	H ₂ S (ppm)
ID	Maximum	Maximum	Maximum	Maximum	Maximum	Minimum	Maximum	Maximum
BH539 (S)	2.1	4.7	0.1	1.0	0.4	20.0	1.0	0.0
BH541	0.0	6.0	0.1	18.9	1.0	19.2	64	0.0

7.4 Groundwater

Groundwater Encountered During Investigation

7.4.1 Groundwater strikes were encountered during the advancement of borehole BHM6 and BH539 and are summarised in Table 9.

Table 9: Summary of Groundwater Strike Data (Off Site)

Location	Strike Depth (mbGL)	Geological Formation	Level after 20 minutes (mbGL)	Comments
BHM6	6.5	Tintern Sandstone	0.0 (log indicate time taken to rise as 0)	Unclear if the recorded level and time for the rise is accurate.
BHIVIO	-	-	-	Water level recorded at 4.21 mbGL when borehole completed within the Tintern Sandstone (10 mbGL).
BH539	1.2	Tidal Flat Deposits	1.0	-

Groundwater Level During Monitoring Rounds

- **7.4.2** No groundwater level monitoring has been undertaken on site during the previous investigations.
- **7.4.3** The entire groundwater level data set gathered at the off site boreholes is provided in Appendix 2 and summarised in Table 10.

Table 10: Summary of Groundwater Level Data (Off Site)

Location	Installation #1	Depth of Response Zone (mbGL) and Geological Formation	No. Measurements	Minimum Depth (mbGL)	Maximum Depth (mbGL)	Comments (Indicative Water Levels - mOD)
ВНМ6	-	5 - 7.5 Tintern Sandstone	5	1.67	3.52	9.38 - 7.53
BH539	35 mm (S)	1 - 3 Head Deposits	4	0.56	2.03	5.79 - 4.32
рпооя	50 mm(D) 5 - 14.2 Tintern Sandstone		4	1.09	3.39	5.26 - 2.96
BH541	50 mm	2 - 11.5 Tintern Sandstone	4	6.67	8.15	4.68 - 3.20

Notes: #1 S denotes a shallow installation and D denotes deep installation.

Groundwater Summary

- 7.4.4 The main groundwater body present is anticipated to be within the Tintern Sandstone, with the resting levels recorded as variable in-between the monitoring visits. The resting groundwater as recorded in the 1997 borehole (BHM6) is seen to be above the levels recorded in the 2015 boreholes. The reason for this difference in water levels is unclear.
- **7.4.5** The Tintern Sandstone may be considered to be in hydraulic continuity with the groundwater within the Head Deposits.

8 Contamination Assessment

8.1 Introduction

- **8.1.1** The following sections provide details of the assessment of land contamination at the Site.
- 8.1.2 The outline Conceptual Site Model (CSM) presented within the 2014 PSSR has been reviewed and updated based on data from the Supplementary Ground Investigation (Geotechnical Engineering, 2015) and the proposed Scheme. The main amendments to the 2014 PSSR model are summarised as follows:
 - Removal of the backfill quarry as a source (off site and separated from the new section of motorway by the railway cutting).
 - Removal of Bareland Street Reen East as a potential receptor (separated from the Site by the A4180 embankment).
 - Update of the source-pathway-receptor linkage taking account of the above and more detailed assessments.
 - Alteration of the site boundary and additional stockpiled material identified.

8.2 Preliminary Risk Assessments

Potential Sources

8.2.1 The two identified spoil mound materials are a potential source of contamination. It is probable that the older mound materials are residual earthworks material from the construction of the railway or road. The more recent stockpile is identified to be no longer present based on the aerial photograph. It is considered unlikely that these materials pose a significant risk to human health or controlled waters. However, this would require confirmation through additional investigation.

Potential Receptors

8.2.2 Receptors during the construction and the operational stages of the Scheme have been considered:

Construction

- Construction workers during Site development works.
- Groundwater within the Head Deposits and/or Tintern Sandstone.
- Site neighbours (railway/A4180 users) adjacent to construction works.

Operational

- Groundwater within the Head Deposits and/or Tintern Sandstone.
- Spoil materials, should any remain within the new section of motorway, are likely to be encapsulated or removed during the construction of the proposed bridge and embankment and therefore no direct exposure to potential contaminants would be possible. Therefore, general public, maintenance workers or neighbours of the Site are not considered potential receptors.

Potential Pathways

- **8.2.3** Pathways during the construction and the operational stages of the Scheme have been considered:
 - Dermal contact, ingestion, inhalation pathways of potentially contaminated soils possible during construction works.
 - Leaching of contaminants from the backfill materials and/or spoil heaps to groundwater.

8.3 Risk Evaluation

- 8.3.1 Source-pathway-receptor linkages were considered in the 2014 PSSR using the historical data available up to 2008. With review of the other data described herein, the following risk evaluation has been reconsidered and included:
 - The Site has been subject to potential contaminating uses, including presence of a spoil mound comprising unknown materials.
 - The construction of the embankment is likely to require excavation through Head Deposits into the top of the Tintern Sandstone. It is anticipated much of the spoil will be removed during that process.
 - Site materials are to be reused subject to passing reuse criteria, or disposed off site.
 - Groundwater levels within the principal aquifer associated with the sandstone are indicated to be at resting level within the Head Deposits.
 - There is risk of increased potential soil leaching and migration to the shallow groundwater during spoil removal.

8.4 Human Health Risk Assessment

8.4.1 No screening assessment has been undertaken as no soil analysis data is available for the Site.

8.5 Controlled Water Screening Assessment

- 8.5.1 The rationale and approach for the controlled waters (Tier 1) screening assessment is detailed in the Land Contamination Assessment Report (Appendix 11.1 of the ES) and the groundwater chemical results are presented in Appendix 3. No soil leachate or surface water data is available. All exceedances to the relevant generic criteria are summarised in Table 11 for groundwater.
- Where an Environmental Quality Standard (EQS) is dependent on water hardness, i.e. some heavy metals, the hardness of the surface water receptor should normally be used. The Baseline Water Environment Report (Appendix 16.2 of the ES) indicates surface water to be generally moderately hard with hardness concentrations within a range of 100 to 150 mg/l as calcium carbonate. Therefore, EQSs within the water hardness range have been used for screening purposes.

Soil Leachate Results

8.5.3 No chemical soils leachate data is available for the Site.

Groundwater Results

- 8.5.4 Groundwater analysis results have been assessed from samples collected over number of rounds of groundwater monitoring results from off site boreholes BH539 and BH541 constructed in 2015. The groundwater samples were taken from the perched groundwater within the Head Deposits and from the aquifer associated with the Tintern Sandstone.
- **8.5.5** A summary of the exceedances of the screening criteria from all available ground results relating to the site is presented in Table 11 and discussed below.

Table 11: Groundwater Screening Exceedances (Off Site)

Determinant	Units	Range	EQS ¹	DWS ²	No. exceeded Screening Criteria (Total number of results) against EQS	Location	No. exceeded Screening Criteria (Total number of results) against DWS	Location
Perched Gro	oundwa	ater						
Copper	µg/l	<1 - 21	10	2000	1 (3)	BH539	0 (3)	_
Mercury	µg/l	<0.5 - 0.65	0.07	1	1 (3)	BH539	0 (3)	-
Nickel	μg/l	2.3 - 7	4	20	1 (3)	BH539	0 (3)	-
Phenols	µg/l	<0.03 - 0.03	0.007 7	-	1 (3)	BH539	0 (3)	-
Aquifer								
Copper	µg/l	<1 - 16	10	2000	1 (60	BH539	0 (6)	-
Arsenic	µg/l	<1 - 25	50	10	0 (6)	-	1 (6)	BH541
Mercury	µg/l	<0.5 - 1.3	0.07	1	1 (6)	BH539	1 (6)	BH539
Nickel	µg/l	<1 - 6.2	4	20	2 (6)	BH539	0 (6)	-
Chloride	mg/l	13 - 620	250	250	1 (6)	BH541	1 (46)	BH541
Ammoniacal Nitrogen	mg/l	0 - 1.4	0.6	-	2 (6)	BH541, BH539	-	-

Notes: 1. Environmental Quality Standard. 2. Drinking Water Standards.

- 8.5.6 The review of the groundwater chemical testing results indicated that the deep groundwater off site has elevated levels of metals (arsenic, copper, mercury and nickel) and inorganics (chloride and ammoniacal nitrogen).
- 8.5.7 The perched groundwater within the Head Deposits is shown to have elevated metals (mercury, copper and nickel) and phenols.

- 8.5.8 All Polycyclic Aromatic Hydrocarbons (PAH), Volatile Organic Compounds (VOCs), Semi-Volatile Organic Compounds (SVOCs), phenols, Benzene, Toluene, Ethylbenzene and Xylene (BTEX), Total Petroleum Hydrocarbons (TPH) and Polychlorinated biphenyl (PCB) results were found below limit of detection within both water bodies.
- **8.5.9** It is noted the laboratory detection levels for mercury, cyanide, some PAH compounds, VOCs and SVOCs are higher than the applied screening criterion.

8.6 Ground Gas Risk Assessment

- 8.6.1 The only ground gas data available relates to off site boreholes BH539 and BH541. These have response zones within the Head Deposits (between 1 and 3 mbGL) and within the Tintern Sandstone (between 2 and 11.5 mbGL), respectively. Of the four rounds available, the following comments may be made:
 - No monitoring was undertaken during low barometric pressure (less than 1000 millibars (mb)), with the lowest conditions being 1002 mb. As such worst case atmospheric conditions for potential ground gas generation may have not been monitored.
 - Gas flow was generally recorded absent, with the exception of the second round for BH539 which peaked at 2.1 l/hr.
 - Methane has been recorded nil or up to 0.1 % during all four rounds, below the screening criteria of 1 %. However, the Lower Explosion Limit (LEL) of up to 18.9 % is noted. Given the lack of correlation between methane concentration per volume and per LEL, it is considered these marginal readings to be caused by equipment inaccuracy rather than representative of the presence of actual methane gas.
 - Carbon dioxide is identified between 0 and 1 %, below the screening criteria of 5 %.
 - Trace of VOCs of up to 6 ppm has been recorded.
 - Hydrogen sulphide was recorded zero throughout.
 - Carbon monoxide was recorded absent on all rounds for BH539. The first round for BH541 identified a maximum concentration of up to 64 ppm, falling to 1 ppm on the second round and zero on the following two rounds. The maximum recorded concentration is above the screening criteria of 30 ppm. Given the obvious falling trend and absence of obvious source, this is considered likely to be caused by the installation works rather than indicative of carbon monoxide flux within the soils.
 - Oxygen has been recorded to be ambient with concentrations between 19.2 and 20.7 %.
- **8.6.2** On the basis of the above, off site boreholes have not identified obvious soil gas sources. Given the nature of the potential source of contamination at the Site spoil heaps, the risks from ground gas associated with this feature, during construction and operation, are considered very low.
- A gas risk assessment for natural soils has been undertaken and is set out within the Land Contamination Assessment Report (Appendix 11.1 of the ES).

Whilst the gas regime within the spoil heap remains unknown, its removal for the construction of the embankment is likely to remove much of the potential source. Depending on the nature of the material and the extent to remain *in situ*, additional investigation may be required to confirm risks.

8.7 Summary

- 8.7.1 The quality of the perched groundwater within the Head Deposits and the aquifer within the Tintern Sandstone are similar and shown to have elevated metals and inorganics (data from within 50 m of the Site). Hydrostatic linkage between the perched groundwater and the aquifer within the Tintern Sandstone is identified.
- 8.7.2 The elevated levels of metals and inorganics recorded in off site monitoring wells are considered unlikely to be evidence of contamination migrating from the mounds. However, verification sampling and testing should be undertaken to confirm this.
- 8.7.3 It is considered unlikely that any potential ground gases from former activities at the Site (spoil heaps) would cause a risk during the construction or operation of the Scheme. The risk from ground gas from natural sources at the Site is also considered very low.

.

9 Refined Conceptual Site Model

- 9.1.1 The incorporation of data from the 2015 Supplementary Ground Investigation has enabled the original CSM presented in the 2014 PSSR to be updated. Relevant contaminant (source-pathway-receptor) linkages are considered within the refined CSM. The assessment is based on the Scheme during construction and operational phases.
- 9.1.2 A CSM representing general ground conditions, overall layout of the new section of motorway and relevant source-pathway-receptors (each of which having a specific alpha-numerical symbol attached) are presented in Figure 2 and is described in Table 12.

Table 12: Refined Conceptual Site Model

Potential Source	Potential Receptor	Possible Pathway	Likelihood	Severity	Risk	Comment
Spoil	Construction			•		
materials (unknown material)	Construction workers (A)	Dermal contact with soil (1)	Likely	Low	Low	Construction workers are likely be exposed to Made Ground materials during Site construction works; however exposure duration will be short term only. Use of appropriate PPE and good hygiene practice throughout earthworks and construction phase is recommended. Dust suppression measures are recommended during construction works.
		Ingestion of soil (2)	Likely	Low	Low	No chemical analysis has been undertaken at the Site however exposed materials at the surface indicate possible backfill with quarry spoil. This is not considered to represent abnormal constraints to construction workers
		Inhalation of soil dust (3)	Likely	Low	Low	health and safety over and above those typical of a brownfield site. Additional investigation is required to confirm the nature of the material within the spoil and associated risks.
		Inhalation of soil gas or vapour (3)	Low	Low	Very low	Construction workers may be exposed to ground gas potentially generated by the spoil heap materials during the excavation works. Works taking place in open atmosphere. No on site ground gas data. Gas monitoring from nearby off site boreholes indicates no abnormal soil gas regime. Additional investigation and soil testing required to confirm the characteristic of the Made Ground and associated risks.
	Off site users during construction	Dermal contact with soil dust (1)	Unlikely	Low	Very low	During construction there is the possibility of dermal contact and inhalation of soil dust, short term exposure only.
	works (B)			Low	Very low	Dust suppression measures are recommended during construction works.

Potential Source	Potential Receptor	Possible Pathway	Likelihood	Severity	Risk	Comment
		Inhalation of soil dust (3)	Unlikely	Low	Very low	
		Inhalation of soil gas or vapour (3)	Unlikely	Low	Very low	Any ground gas source, if present, will be of limited volume. Receptor in open space and of short term exposure. The Scheme will result in the mounds being removed.
	Groundwater within the Head Deposits (Dp) and principal aquifer within the Tintern Sandstone (Da)	Leaching/ migration (4)	Low	Low	Very low	The construction will remove some of the mound and thus reduce any risks to controlled waters. Verification sampling is needed to confirm the low risk to controlled waters and to check arisings are suitable for reuse on the Scheme.
	Operational					
	Groundwater within the Head Deposits (Dp) and Principal Aquifer within the Tintern Sandstone (Da)	Leaching/ migration (4)	Unlikely	Low	Very low	Any potentially contaminated materials are likely to be encapsulated within the proposed embankment (subject to compliance with reuse criteria) or removed. The construction will remove some of the mound and thus reduce any risks to controlled waters.

10 Conclusions and Recommendations

10.1 Conclusions

- 10.1.1 The Site has been subject to localised historical tipping of materials of unknown origin. No ground investigations have been undertaken at the Site, however based on the desk study information, gross contamination is not anticipated.
- 10.1.2 Gross contamination associated with the Site's historical use is not anticipated. Normal construction control measures will be required to facilitate the construction and ongoing operation of the Scheme.
- 10.1.3 There is no analytical data specific to the Site that falls within the footprint of the motorway corridor. This should be mitigated through the provision and implementation of a suitable verification sampling inspection strategy during construction to confirm conditions are as expected and clarify materials are appropriate for reuse.
- **10.1.4** During the construction phase, specific mitigation measures will be required to prevent inhalation pathways of dust to the general public off site and construction workers.
- 10.1.5 A suitable water management strategy will also be required to prevent impact to surface waters from run-off during construction.
- **10.1.6** Materials, including any mounds associated with tipping at the Site, will be partially removed or encapsulated and are considered likely to be suitable for reuse subject to provision of reuse criteria under a Materials Management Plan.
- During the operational phase, the embankment will cover part of the Site, which will limit the infiltration of rainwater through the soils and thus potential leaching of soil contaminants into the groundwater. However, given the relatively high groundwater level within the Head Deposits, part of the Made Ground materials that could remain saturated beneath the embankment may provide a source of ongoing potential leachable contaminants.
- 10.1.8 In order to confirm the low to moderate risks associated with the Site in relation to both construction and operational phases, and the suitability for reuse within the new section of motorway, it is recommended that verification investigations are undertaken, including, as a minimum, testing of soils and soil leachate.

10.2 Recommendations

10.2.1 No ground investigation has been undertaken at the Site and although the likelihood of any contamination at the Site is relatively low, due to the Site's history, localised contamination may have occurred. As such, it is recommended that a limited ground investigation is undertaken to verify risk levels described in this report. Should contamination be identified that could cause an unacceptable risk to the identified receptors, then remedial requirements would be identified within a remediation strategy for the Scheme. Any materials from this Site will require verification testing to check their suitability for reuse.

- **10.2.2** A remediation strategy for the Scheme should be developed for the Site that includes:
 - Addressing potential human health and controlled waters risk identified by the proposed additional ground investigation.
 - · Dealing with unexpected contamination.
 - Verification sampling to confirm suitability of soils for reuse.
 - Control measures (over and above good practise construction management) to prevent risks to construction workers and the general public during construction.
 - Verification of material used as topsoil.
- **10.2.3** The remediation strategy should include a remediation options appraisal, remediation implementation plan and remediation verification plan.
- 10.2.4 The remediation strategy should be supported by a Scheme wide Materials Management Plan prepared in accordance with CL:AIRE Code of Practice (CL:AIRE, 2011).

EQUIPMENT: Geotechnical Pioneer rig.

METHOD: Hand dug inspection pit 0.00-1.00m. Dynamic sampled (113mm) 1.00-1.30m. Waterflush rotary core drilled (116mm) 1.30-11.50m.

CASING: 140mm diam to 3.20m.

BACKFILL: On completion, a slotted standpipe (50mm) was installed to 11.50m, granular response zone 11.50-2.00m, bentonite seal 2.00-0.30m, concrete and raised helmet cover 0.30-0.00m.

REMARKS: Driller noted reduced flush returns 1.30-5.70m (60-80% returned) and loss of flush 5.70-11.50m.

1 Introduction

1.1 Background

- **1.1.1** This report relates to an area of land potentially affected by contamination (CL-30) known as the 'Green Moor Quarry Landfill' herein referred to as the 'Site'.
- **1.1.2** The Site is located between chainage 20,100 and 20,225 (see Figure 1), upon an infilled quarry.

1.2 Reporting Context

- 1.2.1 The Site has been assessed as part of ground investigations and monitoring associated with the wider works for the M4 Corridor around Newport (M4CaN) (hereafter referred to as the 'Scheme'). This report informs the baseline for the environmental impact assessment (EIA) for the Scheme. The EIA is reported in the M4CaN Environmental Statement (ES) of which this document is an appendix to the chapter on Geology and Soils.
- In 2014, a Preliminary Sources Study Report (PSSR) was prepared as an initial land contamination appraisal (Ove Arup & Partners, 2014) as part of Design Manual for Roads and Bridges (DMRB) Stage 2 Assessments for a number of potential routes. This identified a number of individual areas that may have been affected by contamination as a result of historical activities at the Site. In addition, this report draws upon the 2015 Supplementary Ground Investigation Works undertaken on behalf of the Welsh Government (Geotechnical Engineering, 2015). This report relates to the area defined in the Site Plan shown in Figure 1.
- 1.2.3 The overarching rationale and approach for the assessment of areas of land along the Scheme with potential contamination is detailed in the Land Contamination Assessment Report (Appendix 11.1 of the ES).

1.3 Objectives

- **1.3.1** The key objectives of this report are set out below:
 - Undertake a risk assessment of the Site and determine whether potential risks to human health or controlled waters could exist based upon the Scheme.
 - Identify the need for further assessment and investigation in order to refine potential land contamination risks and inform the need for remediation/mitigation.
 - To provide information to support the Ground Investigation Report (GIR) and Geotechnical Design Report (GDR) required under DMRB HD22/08 (Highways Agency, 2008).

1.4 Report Structure

1.4.1 The subsequent report structure is as follows:

- Section 2: Site Location and Description This section summarises the Site's description.
- Section 3: The Scheme This section details the new section of motorway alignment and associated features at the Site.
- Section 4: Site History This section summarises the history of the Site based on historical maps and historical land photographs.
- Section 5: Environmental Setting This section summarises the Site description, published geology, hydrology and hydrogeology and any relevant environmental information presented in the 2014 PSSR.
- Section 6: Scope of Investigations This section describes the previous and supplementary ground investigation data available for the Site.
- Section 7: Ground Conditions This section describes the main findings of the intrusive site investigation including the ground conditions encountered and visual or olfactory evidence of contamination identified.
- Section 8: Contamination Assessment This section describes the findings of the Tier 1 and Tier 2 contamination risk assessment based upon potential contamination sources, potential receptors and potential contaminant linkages and presents the human health and controlled waters assessments.
- Section 9: Refined Conceptual Site Model This section presents the Conceptual Site Model (CSM) for the Site and identifies potential contaminant linkages, based upon the findings of the data presented within Sections 2 to 7.
- Section 10: Conclusions and Recommendations This section provides conclusions concerning the likelihood of land contamination associated with the Site affecting the Scheme and requirements for remediation/mitigation.
- Section 11: References This section details the key reference documents referred to within the text.
- Section 12: Glossary This section details the key terms and acronyms used throughout the report.

2 Site Location and Description Setting

- 2.1.1 The Site is located south of Magor, centred at National Grid Reference (NGR) ST 417 870. The Site comprises an area of in-filled quarry, the location of which is shown on Figure 1.
- 2.1.2 Review of aerial photography and walkover surveys undertaken in 2014 and 2015 indicated that the Site forms part of a field. The field slopes gently southwards from approximately 20 to 10 m AOD towards the South Wales to London Mainline, which is positioned within a cut (at some 8 m AOD) and delineates the southern extent of the Site. A brewery is located approximately 150 m north of the Site and residential dwellings at Magor are approximately 100 m to the east.
- 2.1.3 Underground pipework with a visible chamber in the south of the Site, (understood to be part of effluent treatment drainage from the brewery), runs north-south directly through the Site. The hamlet of Barecroft Common occupies the northern edge of the Caldicot Levels directly to the south of the railway line.
- **2.1.4** The Site's southern boundary with the railway line comprises a soil embankment.
- **2.1.5** Photographs of the Site are included in Appendix 4

3 The Scheme

- **3.1.1** The Site is located between approximate chainage 20,100 to 20,225 as shown in Figure 1.
- 3.1.2 The new section of motorway crosses the northern half of the Site and includes a 10 m high embankment which crosses the north-western part of the Site. A bridge over the South Wales to London Mainline is located approximately 60 m to the north. The remainder of the Site is excluded from the temporary and permanent land take.

4 Site History

- 4.1.1 The 2014 PSSR historical searches have been based on Ordnance Survey plans, literature reviews, information provided by British Steel, Natural Resources Wales (NRW) (formally Environment Agency Wales), Newport City Council and aerial photographic interpretation.
- **4.1.2** This is supplemented by a review of historical maps obtained in 2015 from Welsh Government. No relevant additional information has been identified from this review.
- **4.1.3** A summary of the Site's history is presented in Table 1 below.

Table 1: Site History

Date	Use	Source of Information
1843 - 1893	·	1:10,560 Historical Mapping
1891 - 1912	II no ()IIarry is now marked as '()Id ()IIarry indicating its distise	1:10,560 Historical Mapping
1904 - 1939	No significant change.	1:10.560 Historical Mapping
1964 - 1965	INO SIANIICANI CHANAD	1:10,560 Historical Mapping
1969	The area of the quarry appears to have been infilled.	Aerial Photography
1969 - 1971		1:10,560 Historical Mapping
1981	The pond appears to have been infilled, however the image is not clear.	Aerial Photography
1985 - 1996		Mapping
2006	There is an area of rough vegetation indicated in the south-west corner.	Aerial Photography
2009 - 2010	No significant change.	Aerial Photography
2014	The housing development of Magor to the east has been developed to within approximately 100 m of the Site.	Aerial Photography

Notes. Potential sources of contamination are <u>underlined</u>. Those within the temporary and permanent land take are shown in **bold**.

4.1.4 Historically the site is located in proximity to areas which may have been bombed during World War II which is discussed in the Explosive Ordnance Threat Assessment Report (Bactec, 2014). This report categorises the site as low risk with respect to unexploded ordnance.

5 Environmental Setting

5.1 Geology

5.1.1 British Geological Survey (BGS) data indicate that the Site is underlain by the bedrock of the Tintern Sandstone Formation. There are no superficial deposits in the southern area of the Site, however, River Terrace Deposits are shown to be present within the northern section of the Site.

5.2 Hydrology

5.2.1 There are no surface water features on Site. To the south of the South Wales to London Mainline railway there are a number of drainage ditches and reens, the nearest of which is located approximately 60 m to the south.

5.3 Hydrogeology

- **5.3.1** NRW classifies the River Terrace Deposits as a Secondary A Aquifer and the bedrock as a Principal Aquifer.
- **5.3.2** The Site does not lie within a groundwater Source Protection Zone (SPZ).

5.4 Environmental Information

- 5.4.1 NRW records do not identify any pollution incidents, sewage discharge consents, abstraction licences or any waste management facilities as located on or within 300 m of the Site.
- 5.4.2 The CL-29 Spoil Heap site (Annex D of Appendix 11.1 of the ES) is located 85 m to the west of the Site. This is small material stockpile which is not considered to represent a likely offsite source of potential contamination relative to the Site.

6 Scope of Investigations

6.1 General

6.1.1 No previous intrusive ground investigations have been undertaken at this Site. However a number of exploratory holes were advanced within 100 m of the Site. These have been considered in order to support an understanding of ground conditions beneath the Site and inform the groundwater quality and gas regime if relevant.

6.2 Scope of Works

6.2.1 The intrusive ground investigations undertaken in the vicinity of the Site are summarised in Table 2.

Table 2: Investigation Summary (off site)

Date	Contractor	Boreholes	Location from Site	Sampling
		ВНМ6	100 m west	Groundwater level
1997	Norwest Holst	BHM7	120 m north	No monitoring well installed.
2015		BH539	130 m south-west	Groundwater level,
	Geotechnical Engineering Limited	BH540	110 m west	sampling
		BH541	60 m west	Ground gas (BH540 no monitoring well
		BH542	120 m north	installed)

- 6.2.2 Boreholes BH539 and BH541 are also considered within the CL-29 Spoil Heap site (Annex D of Appendix 11.1 of the ES).
- 6.2.3 The construction details of the above offsite boreholes are summarised in Table 3 below.

Table 3: Summary of Offsite Borehole Construction Details

Borehole ID	Diameter (mm)	Total Drilled Depth (m)	Top of Slotted Well Casing / Gravel Pack (m bGL)	Base of Slotted Well Casing / Gravel Pack (m bGL)	Targeted Geology
BHM6	Unknown	10.0	5	7.5	Tintern Sandstone
BH539	35	14.2	1	3	Head Deposits
ынэээ	50	14.2	5	14.2	Tintern Sandstone
BH541	50	11.5	2	11.5	Tintern Sandstone
BH542	35	16	1	4	Tintern Sandstone
	50		10	16	Tintern Sandstone

6.3 Surface Water Quality Sampling

6.3.1 Surface water quality monitoring was not undertaken during the previous ground investigations of the Site.

6.4 Field Testing

Photo Ionisation Detector (PID) monitoring for Volatile Organic Compounds (VOCs) was not undertaken in any of the selected offsite boreholes during the previous ground investigations.

6.5 Groundwater Monitoring

6.5.1 A summary of the groundwater sampling, groundwater monitoring and ground gas monitoring rounds is shown in Table 4.

Table 4: Summary of Monitoring Rounds (offsite)

Location Ref. (Borehole Diameter)	Number of Rounds (Date of Sampling)	Monitoring Details	Notes
ВНМ6	5 no. 15 th November 1997, 25 th November 1997, 2 nd December 1997, 10 th December 1997, 16 th December 1997	Groundwater level	
BH539 (35mm) BH539 (50mm)	4 no. 24 th March 2015, 31 st March 2015, 16 th April 2015, 8 th May 2015	Groundwater level and sampling Ground Gas	Gas monitoring in 35 mm shallow installation only
BH541 (50mm)	4 no. 31 st March 2015, 16 th April 2015, 21 st April 2015, 11 th May 2015	Groundwater level and sampling Ground Gas	
BH542 (35mm) BH542 (50mm)	3 no. 24 th March 2015, 31 st March 2015, 16 th April 2015	Groundwater level Ground Gas	Gas monitoring in 35 mm shallow installation only

6.6 Laboratory Chemical Testing

6.6.1 A summary of all laboratory analysis undertaken on groundwater offsite is shown in Table 5.

Table 5: Summary of Previous Investigation Sampling (offsite)

Site Investigation Date	No. of Soil Samples	No. of Leachate Samples	No. of Water Samples	Suites of Testing
1997	N/A	N/A	-	
2015	N/A	0	9	Metals, PAH, TPH, pH, cyanide, PCBs, VOCs, SVOCs, BTEX, phenols, inorganics

Soil Analysis

6.6.2 Chemical analytical soil data was not collected during previous ground investigations at the Site.

Soil Leaching Analysis

6.6.3 Chemical analytical leachate data was not collected during previous ground investigations at the Site.

Groundwater Analysis

- The following section summarise the laboratory analytical results for groundwater samples collected during the 2015 ground investigation within the selected offsite boreholes. The available data set has been tabulated and is presented in Appendix 3 with supporting laboratory certificates available in the relevant original report (Geotechnical Engineering, 2015).
- 6.6.5 The available data relate to samples taken from wells installed within the groundwater of the Superficial Deposits and Tintern Sandstone Formation deposits.
- **6.6.6** The available information is summarised in Table 6.

Table 6: Summary of Analytical Groundwater Data (offsite)

Groundwater Unit	Number of Groundwater Analyses per Analytical Suites (Number of Well Locations) – 2015 Data								
Offic	Metals & Inorganics	PAH	ТРН	Phenol	BTEX	SVOCs	VOCs	PCBs	
Perched Groundwater (Superficial Deposits)	3 (1)	3 (1)	3 (1)	3 (1)	3 (1)	2 (1)	2 (1)	1 (1)	
Groundwater (Tintern Sandstone Formation)	6 (2)	6 (2)	6 (2)	6 (2)	6 (2)	4 (2)	4 (2)	3 (2)	

6.7 Gap Analysis of Available Data

6.7.1 There is no ground investigation data available for the Site; as such no chemical analysis data are available and therefore, no quantitative risk assessment can be undertaken.

7 Ground Conditions

7.1 Geology

7.1.1 The geological logs for all available exploratory holes excavated on or in close proximity to the Site are provided in Appendix 1. The observed geological sequence is consistent with that discussed in the 2014 PSSR report and is summarised in the following sections. Information from the Supplementary Ground Investigation (Geotechnical Engineering, 2015) has also been used.

Topsoil

7.1.2 Topsoil was encountered in two exploratory locations to depths of 0.1 - 0.4 m bGL.

Made Ground

7.1.3 Made Ground was not encountered during the previous ground investigations.

Superficial Deposits

- 7.1.4 Unconsolidated superficial deposits were encountered beneath the topsoil. These comprised predominantly sand and gravel, encountered to 0.5 1.3 m bGL. Whilst the field records identify this as 'Head Deposits', it is believed they represent the River Terrace Deposits in line with BGS records.
- 7.1.5 In borehole (BH539) a thin veneer of Tidal Flat Deposits to 2.35 m bGL was recorded. This was encountered as very soft clay. This would indicate that the formation extends further north than indicated by the published geological data. However, the Tidal Flat Deposits are not anticipated to underlie the Site.

Bedrock

7.1.6 Beneath the superficial deposits the Tintern Sandstone Formation was encountered. This typically comprised sandstone with interbedded thin mudstones/marls.

Geological Sequence Summary

7.1.7 The general geological sequence identified during the previous ground investigations at closest vicinity to the Site is summarised in Table 7.

Table 7: Summary of Geological Sequence

Unit	Description	Thickness Range (m)	Basal Depth (m bGL)
Made Ground	Unknown	Unproven	Unproven
River Terrace Deposits	Clayey sandstone gravel or cobbles. Slightly gravelly sand.	Absent*- 1.3*	Absent*-1.3*
Tintern Sandstone	Bedded sandstone. Horizons of clay/silt/conglomerate. Interbedded mudstone and sandstone	>9.39* - >19.6*	Unproven*

Note: * inferred from offsite exploratory holes.

7.1.8 The solid geology beneath the Site is anticipated to be similar to that detailed above although the rockhead is likely to be at a lower elevation given the historical quarrying process. The overlying superficial deposits (Head and/or Tidal Flat Deposits) if formerly present, are likely to have been removed and Made Ground of unknown thickness and composition is likely to overlay the Tintern Sandstone. The Site is currently used as a grazing field and it is assumed a layer of topsoil is present across the Site.

7.2 Visual and Olfactory Evidence of Contamination

7.2.1 No records are available for the Site.

7.3 Gas Monitoring (Off Site)

- **7.3.1** The gas monitoring dataset collected during each of the previous monitoring rounds at the offsite boreholes is summarised on the field data sheets provided in Appendix 2. The maximum ground gas concentrations are presented in Table 8.
- **7.3.2** Boreholes BH539 and BH541 have also been considered during the assessment of the gas regime for CL-29 Spoil Heap site (Annex D of Appendix 11.1 of the ES), located approximately 85 m to the west.

Table 8: Summary of Gas Monitoring Data (offsite)

Location ID (Borehole Diameter)	Flow (I/hr) Max.	VOCs (ppm) Max.	CH₄ (%/vol) Max.	Peak LEL (%) Max.	CO ₂ (%/vol) Max.	O ₂ (%/vol) Min.	CO (ppm) Max.	H ₂ S (ppm) Max.
BH539 (35 mm)	2.1	4.7	0.1	1.0	0.4	20	1.0	0.0
BH541	0.0	6.0	0.1	18.9	1.0	19.2	64	0.0
BH542 (35 mm)	0.2	14.6	0.1	2.0	6.6	0.2	13	0.0

7.4 Groundwater

Groundwater Encountered During Investigation (offsite)

7.4.1 A water strike was encountered during the advancement of the offsite boreholes BHM6 during the 1997 investigation and BH539 during the 2015 investigation, as detailed on the geological logs provided in Appendix 1. This together with additional water level information provided by the exploratory borehole records is summarised below in Table 9.

Table 9: Summary of Groundwater Level Data During Investigation (offsite)

Location	Strike Depth (m bGL)	Geological Formation	Level after 20 minutes (m bGL)	Comments	
BH539	1.2	Tidal Flat Deposits	1.0		
BHM6	6.5	Tintern Sandstone	0.0 (log start time taken to rise is 0)	Uncertain on the accuracy of the recorded resting level	

7.4.2 Groundwater was not encountered in any other offsite boreholes during the previous ground investigations.

Groundwater Level Dataset (offsite)

7.4.3 The groundwater level dataset gathered from the selected boreholes offsite is provided in Appendix 2 and summarised in Table 10.

Table 10: Summary of Groundwater Level During Monitoring Rounds (offsite)

Location	Installation	Depth of response zone (m bGL) and Geological Formation	No. Measurements	Minimum Depth (m bGL)	Maximum Depth (m bGL)	Comments
ВНМ6	Unknown	5 – 7.5 (Tintern Sandstone formation)	5	1.67	3.52	
BH539	35 mm	1 – 3 (Tidal Flat Deposits)	3	0.56	1.06

Groundwater Summary

- **7.4.4** The main groundwater body present is anticipated to be within the Tintern Sandstone, with variable resting levels recorded in between monitoring visits.
- **7.4.5** The Tintern Sandstone formation is considered to be in hydraulic continuity with the groundwater within the Head Deposits.
- **7.4.6** The offsite boreholes are considered to be up gradient to the Site based on a general groundwater flow south-eastwards (Appendix 16.2 of the ES).

8 Contamination Assessment

8.1 Introduction

- **8.1.1** The following sections provide details of the assessment of land contamination at the Site.
- 8.1.2 The Conceptual Site Model (CSM) presented within the 2014 PSSR has been reviewed and updated based on data from the Supplementary Ground Investigation (Geotechnical Engineering, 2015) and the revised design of the Scheme. The main alterations to the 2014 PSSR model are summarised as follows:
 - addition of ground, groundwater and gas datasets from nearby boreholes;
 - consideration of revised land use post construction;
 - · removal of surface water receptor; and
 - update of the source-pathway-receptor linkages taking into account the above, and more detailed assessments.

8.2 Preliminary Risk Assessments

Potential Sources

- **8.2.1** The potential sources of contamination and associated contaminants which may be present within the Site are detailed below.
 - Infill materials of an unknown nature, potentially comprising waste deposited between the late 1960s and early 1980s.
 - Considering the age of the infill materials ground gas and leachate production may still be occurring.
 - Groundwater and surface water potentially impacted by landfill leachate.

Potential Receptors

8.2.2 Receptors during the construction and the operational stages of the Scheme that have been considered are as follows.

Construction

- Construction workers during Site development works.
- General public adjacent to construction works including existing A4180 and railway users and residents located within 100 m of the Site.
- Groundwater within the superficial deposits and/or within the Tintern Sandstone formation.

Operational

- General public end users.
- Site neighbours adjacent to areas of permanent land take.
- Maintenance workers.

Groundwater (principal aquifer) within the bedrock.

Potential Pathways

- **8.2.3** Pathways during the construction and the operational stages of the Scheme that have been considered are as follows.
 - Dermal contact, ingestion, inhalation pathways of potentially contaminated soils possible during construction works and maintenance works.
 - Dermal contact, ingestion, inhalation pathways possible for general offsite public.
 - Leaching of contaminants from the infill material into underlying groundwater aquifer.
 - Vertical or lateral migration of potential ground gases associated with infill material.

8.3 Risk Evaluation

- 8.3.1 Source-pathway-receptor linkages were considered in the 2014 PSSR using the historical data available up to 2008. With review of the other new data described herein, the following risk evaluation has been reconsidered and includes the below.
 - The Site has been subject to backfilling of an unknown material.
 - The proposed 13 m high embankment will encapsulate or remove any contaminated infill materials within its footprint. This will reduce or remove exposure linkages to motorway users and maintenance workers. However, the landfill extends beyond permanent and temporary land take (outside embankment) and any potential linkages will remain.
 - Motorway users will be within an open environment with no proposed structures or other confined spaces. Pathways linkages to M4 users during its operation are therefore limited to air born dust.
 - Bedrock directly beneath the Site is classified as a principal aquifer.
 - Hardstanding cover which is proposed in some areas of the new motorway corridor is likely to limit infiltration thus reducing leaching in these areas.
 - The nearest surface water feature is located 60 m to the south, over the railway line. As such it is considered there is no reasonable pathway between the Site and surface water feature.
 - No onsite investigation has been undertaken.
 - No significant abnormal ground gas regime has been identified in the offsite boreholes.

8.4 Human Health Risk Assessment

8.4.1 No investigation, sampling or analysis was undertaken onsite during the previous investigations and therefore no human health (Tier 2) screening assessment can be undertaken.

8.5 Controlled Waters Screening Assessment

- 8.5.1 The rationale and approach for the controlled waters (Tier 1) screening assessment is detailed in the Land Contamination Assessment Report (Appendix 11.1 of the ES) and the groundwater chemical results are presented in Appendix 3. No soil leachate or surface water data is available. All exceedances of relevant generic criteria are summarised in Table 11 for groundwater.
- Where an Environmental Quality Standard (EQS) is dependent on water hardness, i.e. some heavy metals, the hardness of the surface water receptor should normally be used. The Groundwater Baseline Report (Appendix 16.2 of the ES) indicates surface water to be generally moderately hard with hardness concentrations within a range of 100 to 150 mg/l (reported as calcium carbonate). Therefore EQSs within this water hardness range have been used for screening purposes.

Groundwater Results (offsite)

- 8.5.3 In the absence of onsite data and for the purpose of this report, nearby available groundwater analytical data has been considered. This data was included to help identify the local groundwater quality within the vicinity of the Site in order to identify any obvious contamination fingerprint that could be associated with potential contamination from the Site itself.
- 8.5.4 The groundwater analysis results include data from three rounds of groundwater monitoring results from offsite boreholes, BH541 and BH539, undertaken in 2015. The groundwater samples were taken from the aquifer body within the Tintern Sandstone formation and the perched groundwater within the Head Deposits.
- 8.5.5 A summary of exceedances with respect to the screening criteria is presented in Table 11 and discussed below.

Determinand	Units	Range	EQS	DWS	No. Exceeded Screening Criteria (Total Number of Results) Against EQS	Location of Exceedance	No. Exceeded Screening Criteria (Total Number of Results) Against DWS	Location of Exceedance
Perched Groundwater								
Copper	ug/l	<1 - 21	10	2000	1 (3)	BH539	-	-
Mercury	ug/l	0.65	0.07	1	1 (3)	BH539	-	-
Nickel	ug/l	2.3 - 7	4	20	1 (3)	BH539	-	-
Phenols	ug/l	<0.03 - 0.03	0.007 7	-	1 (3)	BH539	-	-
Aquifer								
Arsenic	ug/l	<1 - 25	50	10	-	-	1 (6)	BH541
Copper	ug/l	<1 - 16	10	2000	1 (6)	BH539	-	-
Mercury	ug/l	<0.5 - 1.3	0.07	1	1 (6)	BH539	1 (6)	BH539
Nickel	ug/l	<1 - 6.3	4	20	2 (6)	BH539 (x2)	-	-
Chloride	mg/l	13 - 620	250	250	1 (6)	BH541	1 (6)	BH541
Ammoniacal Nitrogen	mg/l	<0.01 - 1.4	0.6	-	2 (6)	BH539, BH541	-	-

Table 11: Controlled Waters Screening Exceedances - Groundwater (offsite)

- **8.5.6** Review of the groundwater chemical testing results indicated that the deep groundwater offsite has elevated levels of metals (arsenic, copper, mercury and nickel) and inorganics (chloride and ammoniacal nitrogen).
- 8.5.7 The perched groundwater within the Head Deposits is shown to be impacted by metals (copper, mercury and nickel) and phenols.
- 8.5.8 All PAH, VOCs, SVOCs, phenols, BTEX, TPH and PCB results were found below their respective limits of detection within both water bodies.
- **8.5.9** It is noted that the laboratory detection levels for mercury, cyanide, some PAH compounds, VOCs and SVOCs are higher than the applied screening criterion.

8.6 Ground Gas Risk Assessment

- 8.6.1 The only ground gas data available relates to offsite boreholes BH539, BH541 and BH542. These boreholes have response zones screened within the Head Deposits (between 1 and 3 m bGL) and within the Tintern Sandstone Formation (between 2 and 11.5 m bGL and between 1 and 4 m bGL), respectively. Of the four gas monitoring rounds available for BH539 and BH541 and the three rounds for BH542, the following comments below have been made:
 - No monitoring was undertaken during low barometric pressure (less than 1000 mb), with the lowest conditions being 1010 mb. As such worst case

- atmospheric conditions for potential ground gas generation may have not been monitored.
- Gas flow was generally recorded as absent with the exception of the second round for BH539, with a peak of 2.1 l/hr, and the second round for BH542 with a peak of 0.2 l/hr.
- Methane has been recorded as nil or up to 0.1 % during all four rounds in all three boreholes which is below the initial screening criteria of 1 %. However, the Lower Explosion Limit of up to 18.9 % in BH541 is noted. Given the lack of correlation between methane concentration per volume and per LEL, it is considered these marginal readings to be caused by equipment inaccuracy rather than representative of the presence of actual methane gas. Further monitoring is recommended to confirm gas regime.
- Carbon dioxide is identified between 0 and 1 %, below the screening criteria
 of 5 % in BH539 and BH541. However, in BH542 carbon dioxide is identified
 in concentrations up to 6.6 %, above that of the screening criteria.
- Traces of Volatile Organic Compounds of up to 6 ppm have been recorded in BH539 and BH541. BH542 records VOCs of up to 14.6 ppm.
- Hydrogen sulphide was undetected throughout all monitoring rounds.
- Carbon monoxide was recorded as generally absent on all rounds for BH539. BH542 recorded up to 13 ppm. The first round for BH541 identified a maximum of up to 64 ppm, falling to 1 ppm on the second round and nil on the following two rounds. The maximum recorded concentration is above the screening criteria of 30 ppm. Given the obvious falling trend and absence of obvious source, this is considered to be likely caused by the well installation works rather indicative of carbon monoxide flux within the soils.
- Oxygen has been recorded at ambient levels with concentrations between 19.2 and 20.7 % in BH539 and BH541. It is recorded at low concentrations of between 0.2 and 11.4 % in BH542.
- **8.6.2** On the basis of the above, offsite boreholes have not identified obvious ground gas sources.
- 8.6.3 A gas risk assessment has been undertaken and is set out within the Land Contamination Assessment Report (Appendix 11.1 of the ES). Given the lack of any significant gas source being identified, a summary of potential causes of abnormal gas concentrations is provided below:
 - elevated CO concentrations may be attributed to ambient vehicle emissions;
 - depleted O₂ levels may be the result of natural biological activity;
 - low level VOCs may be considered naturally occurring.
- 8.6.4 The gas regime and nature of the backfill materials within the Site remain unknown and ground investigation to include ground gas monitoring is recommended to confirm possible risks.

8.7 **Summary**

- 8.7.1 The quality of the perched groundwater within the Head Deposits and the aquifer within the sandstone are similar and are shown to have been impacted by metals and inorganics (data from within 100 m from the Site).
- 8.7.2 A Linkage between the perched groundwater and the aquifer within the Tintern Sandstone formation is inferred.
- 8.7.3 The quality in these groundwater bodies are representative of the general baseline conditions seen in this area of Newport as defined within the Baseline Water Environment Report (RPS, 2015). Although no obvious impacts from the Site are identified, the monitoring points are considered to be located upgradient and therefore, may not provide a clear line of evidence. Ground investigation within the Site is recommended to verify possible risks.
- 8.7.4 Offsite boreholes screened within the Head Deposits and Tintern Sandstone Formation have indicated no obvious ground gas source however gas data from the previous ground investigations is not available for the Site itself.

9 Refined Conceptual Site Model

- **9.1.1** The incorporation of data from the 2015 Supplementary Ground Investigation has enabled the original CSM presented in the 2014 PSSR to be updated. The assessment is based on the Scheme during construction and operational phases.
- 9.1.2 A CSM representing general ground conditions, overall Scheme layout and relevant source-pathway-receptors (each of which having a specific alphanumerical symbol attached) is presented in Figure 2 and is described in Table 12.

Table 12: Site Conceptual Model

Potential Source	Potential Receptor	Possible Pathway	Likelihood	Severity	Risk	Comment
	Construction					
		Direct dermal (1)	Likely	Moderate	Moderate	Construction workers may be exposed to the infill materials during Site construction works; however exposure duration will be short term only. Use of PPE and good hygiene practice throughout earthworks and construction phase is considered
		Ingestion (3)	Likely	Moderate	Moderate	sufficient to mitigate risks presented. Current land contamination status at the Site is unknown but not foreseen to
Quarry in-fill materials. Details not known	Construction Workers (C)	Inhalation of soil dust (2)	Likely	Moderate	Moderate	represent abnormal constraints to construction worker's health and safety over and above those typical of a brownfield Site. Dust suppression measures are recommended during construction works. Construction workers may be exposed to ground gas potentially generated by the quarry in-fill materials during the
		Inhalation of ground gas or vapour (2)	Likely	Moderate	Moderate	excavation and ground improvement works. No onsite ground gas data is available. Gas monitoring from nearby offsite boreholes indicates the presence of low concentrations of VOCs and occasional slightly elevated carbon dioxide, with no obvious gas source identified. Ground investigation, ground gas monitoring and soil testing is required to confirm the characteristics of the infill materials and their associated risks.

Potential Source	Potential Receptor	Possible Pathway	Likelihood	Severity	Risk	Comment
		Dermal contact with soil dust (1)	Low	Moderate	Moderate to low	Current land contamination status at the Site is unknown.
		Ingestion of soil dust (3)	Low	Moderate	Moderate to low	During construction there is the possibility of Site neighbours/general public inhaling soil dust. Short term exposure only.
	Offsite users / Barecroft Common residents (B)	Inhalation of soil dust (2)	Low	Moderate	Moderate to low	Dust suppression measures are recommended during construction works. Potential for lateral gas migration through bedrock. Ground investigation, ground gas
		Inhalation of ground gas or vapour (2)	Low	Moderate	Moderate to low	monitoring and soil testing is required to confirm the characteristic of the infill materials and their associated risks.
	Groundwater (Principal Aquifer) (Da)	Leaching/migration of contaminants from backfill materials to groundwater (4)	Low likelihood	Moderate	Moderate to low	The elevation of the quarry base in relation to the water table is unknown and therefore there is a risk of the infill materials being within the groundwater zone. During the embankment construction there is a risk for potential contaminants to be mobilised and migrate to groundwater. Ground improvement techniques may be used to improve geotechnical properties of the infill material. Taking care not to create new/increase vertical pathways. Foundation works risk assessment would be required on confirmation of ground improvement method. Ground investigation is required to confirm the characteristics of the infill materials and their associated risks.
Onsite	Operational					
Quarry in-fill materials.	Maintenance	Direct dermal contact (1)	Low	Low	Very low	Current land contamination status at the
Details not known	Workers (C)	Ingestion (3)	Low	Low	Very low	Site is unknown. Infill material within the footprint of the

Potential Source	Potential Receptor	Possible Pathway	Likelihood	Severity	Risk	Comment
		Inhalation of soil dust (2)	Low	Low	Very low	embankment will be encapsulated and therefore the exposure to contamination will be limited outside of the motorway embankment (outside land take). Areas outside the motorway hardstanding are likely to have topsoil cover and vegetation establishment, reducing the potential for exposure. Exposure duration will be short term only. Site specific risk assessments will be required in line with health and safety guidance. This will enable safe methodologies and appropriate levels of PPE to be put in place. As such all significant risks will be duly considered and suitably mitigated. Additional investigation and soil testing is required to confirm the characteristics of the infill materials and their associated risks. Current contamination status is not foreseen to represent abnormal constraints to maintenance worker's health and safety over and above those typical of a brownfield site.
		Inhalation of ground gas or vapours (2)	Low	Low	Very low	No onsite ground gas data is available. Gas monitoring from nearby offsite boreholes indicates the presence of low concentrations of VOCs and carbon dioxide, with no obvious gas source identified. Additional investigation and soil testing required to confirm the characteristic of the infill materials and associated risks.

Potential Source	Potential Receptor	Possible Pathway	Likelihood	Severity	Risk	Comment
		Direct Dermal contact (1)	Unlikely	Low	Very low	Current land contamination status at the Site is unknown. Infill material within Scheme footprint to be encapsulated by the embankment and therefore the exposure to contamination
	Future Motorway users (A) & Offsite users / Barecroft Common residents) (B)	Ingestion (3)	Unlikely	Low	Very low	will be limited outside the motorway embankment. Areas outside embankment also outside permanent land take. Dermal, inhalation and ingestion pathways
		Inhalation of soil dust (2)	Unlikely	Low	Very low	associated to soil dust only. Areas outside the motorway hardstanding are likely to have topsoil cover and vegetation establishment, reducing the potential for exposure. Off site receptors are located some 100 m from the proposed earthworks. offsite
	Future Motorway users (A)	Inhalation of ground gas or vapours (2)	Low	Low	Very low	No onsite ground gas data is available. Gas monitoring from nearby offsite boreholes indicates the presence of low concentrations of VOCs and carbon dioxide, possibly generated by the infill materials. Motorway end users to be within open space. Proposed 13 m high embankment and limited span over landfill associated with unlikely vertical gas migration. Additional investigation required to confirm the characteristic of the infill materials and associated risks.

Potential Source	Potential Receptor	Possible Pathway	Likelihood	Severity	Risk	Comment
	Offsite users / Barecroft Common residents) (B)	Inhalation of ground gas or vapours (2)	Low	Low	Very low	No onsite ground gas data. Gas monitoring from nearby offsite boreholes indicates presence of low concentrations of VOCs and carbon dioxide, possibly generated by the infill materials. Part of the landfill to be capped with embankment possibly increasing lateral ground gas migration. Additional investigation required to confirm the characteristic of the infill materials and associated risks.
	Groundwater - Aquifer (Da) within Tintern Sandstone formation	Leaching/migration (4) of contamination in infill materials	Low likelihood	Moderate	Moderate to low	The elevation of the quarry base in relation to the water table is unknown and therefore, there is a risk of the infill materials being within the groundwater zone. Ground improvement techniques may be used to improve geotechnical properties of the infill material taking care not to create new/increase vertical pathways. Foundation works risk assessment would be required on confirmation of ground improvement method. Ground investigation is required to confirm the characteristics of the infill materials and their associated risks.

10 Conclusions and Recommendations

10.1 Conclusions

- **10.1.1** No previous ground investigations have been undertaken at the Site, however, based on the desk study information, gross contamination is not anticipated.
- **10.1.2** During the construction phase, specific mitigation measures will be required to prevent inhalation pathways of dust to the general public off site and work force receptors, although such measures would be no more than typically expected on a construction site.
- 10.1.3 There is no analytical data specific to the Site that falls within the footprint of the motorway corridor or wider permanent land take.

10.2 Recommendations

- 10.2.1 Given the identified gap in the data and in order to verify the risk levels associated with the Site in relation to construction and operational phases, a scope of ground investigation works is required. Upon completion this report shall be reviewed and updated accordingly once the findings of the additional investigation are made available. The additional investigation will include:
 - advancement of boreholes to collect soil samples;
 - installation of monitoring wells;
 - collection of groundwater samples; and
 - · gas monitoring.
- 10.2.2 Upon review and assessment of the recommended ground investigation information, any contamination identified that could cause an unacceptable risk to the identified receptors will require appropriate remedial mitigation measures to be implemented. These measures would be identified within a remedial strategy for the Scheme. The remediation strategy is anticipated to include, but is not limited to:
 - Addressing uncertain human health and controlled waters risk identified by the proposed ground investigation.
 - Risk assessment relating to ground improvement creating pathways enabling contaminants to enter surface water courses.
 - Dealing with unexpected contamination.
 - Control measures (over and above good practice construction management) to prevent risks to construction workers and the general public during construction.
 - Verification of material used as topsoil for suitability of use.
- The remediation strategy should include a remediation options appraisal, remediation implementation plan and remediation verification plan. The remediation strategy should be supported by a Scheme wide Material Management Plan prepared in accordance with CL:AIRE Code of Practice (CL:AIRE, 2011).

EQUIPMENT: Geotechnical Pioneer rig.

METHOD: Hand dug inspection pit 0.00-1.00m. Dynamic sampled (113mm) 1.00-1.20m. Waterflush rotary core drilled (116mm) 1.20-16.00m.

CASING: 140mm diam to 6.00m.

BACKFILL: On completion, a slotted standpipe (50mm) was installed to 16.00m, granular response zone 16.00-10.00m and bentonite seal 10.00-4.00m. A second slotted standpipe (35mm) was installed to 4.00m, granular response zone 4.00-1.00m, bentonite seal 1.00-0.20m, concrete and stopcock cover

REMARKS: Driller notes reduced flush returns 1.20-8.50m: 80-90% returned.

EXPLORATORY HOLE LOGS SHOULD BE READ IN CONJUNCTION WITH KEY SHEETS

1 Introduction

1.1 Background

- **1.1.1** This report relates to an area of land potentially affected by contamination (CL-32) known as 'Magor Depot' hereafter referred to as the 'Site'.
- **1.1.2** The Site is located between chainage 20,600 and 20,800 (see Figure 1), upon a former fuel depot.

1.2 Reporting Context

- 1.2.1 The Site has been associated with several phases of ground investigation and monitoring associated with the wider works for the M4 Corridor around Newport (M4CaN) (hereafter referred to as the 'Scheme') and informs the baseline for the environmental impact assessment (EIA) for the Scheme. The EIA is reported in the M4CaN Environmental Statement (ES) of which this document is an appendix to the chapter on Geology and Soils.
- 1.2.2 In 2014, a Preliminary Sources Study Report (PSSR, 2014) was prepared as an initial land contamination appraisal (Ove, Arup & Partners, 2014) as part of the Design Manual for Roads and Bridges (DMRB) Stage 2 Assessments for this Scheme. This identified a number of individual areas that may have been affected by contamination as a result of historical activities at the Site.
- 1.2.3 This report now draws upon information available from the 2015 Supplementary Ground Investigation Works undertaken (Geotechnical Engineering, 2015) as well as an additional targeted ground investigation on behalf of the Welsh Government (RPS, 2015). This report relates to the area defined in the Site Plan shown in Figure 1.
- 1.2.4 The overarching rationale and approach for the assessment of areas of land along the Scheme with potential contamination is detailed in the Land Contamination Assessment Report (Appendix 11.1 of the ES).

1.3 Objectives

- **1.3.1** The key objectives of this report are as follows.
 - Undertake a risk assessment of the Site and determine whether potential risks to human health or controlled waters could exist as a result of the Scheme.
 - Identify any further assessments and investigations that are needed in order to refine land contamination risks and inform on the need for remediation.
 - To provide information to support the Ground Investigation Report and Geotechnical Design Report required under DMRB HD22/08 (Highways Agency, 2008).

1.4 Report Structure

- Section 2: Site Location and Description This section summarises the Site description.
- Section 3: The Scheme This section details the new section of motorway alignment and associated features at the Site.
- Section 4: Site History This section summarises the history of the Site based on historical maps and historical aerial photographs.
- Section 5: Environmental Setting This section summarises the Site description, published geology, hydrology and hydrogeology and relevant environmental information presented in the 2014 PSSR.
- Section 6: Summary of Investigations This section describes previous and supplementary investigations undertaken at the Site.
- Section 7: Ground Conditions This section describes the main findings of the investigations including the ground conditions encountered and significant visual or olfactory evidence of contamination identified.
- Section 8: Contamination Assessment This section describes the findings of the Tier 1 and Tier 2 contamination risk assessment based upon potential contamination sources, potential receptors and potential contaminant linkages and presents the human health and controlled waters assessments.
- Section 9: Refined Conceptual Site Model This section presents the Conceptual Site Model (CSM) for the Site and identifies potential contaminant linkages, based upon the findings of the data presented within Sections 2 to 7.
- Section 10: Conclusions and Recommendations This section provides conclusions concerning the likelihood of land contamination associated with the Site affecting the Scheme and requirements for remediation / mitigation.
- Section 11: References This section summarises the key documents referred to in this report.
- Section 12: Glossary This section provides a summary of terms used in this report.

2 Site Location and Description

- 2.1.1 The Site is located approximately 500 m north west of Magor town centre and approximately 300 m south of the existing M4 Junction 23A. The Site is centred on National Grid Reference ST 419 875. Magor Depot is also known as Wilcrick Depot. The location and layout of the Site is presented on Figure 1.
- 2.1.2 The Site is bounded by the A4810 to the west and associated slip road to the south and east. The B4245 Newport Road forms the northern boundary. The Site is situated at an elevation of approximately 26.9 m AOD in the north-west sloping to approximately 20.5 m AOD in the south east.
- 2.1.3 The South Wales Trunk Road Agency (SWTRA) currently occupies the Site which comprises an office / cafeteria building, a salt hopper and storage sheds. The Site has previously been referred to as a fuel depot.
- 2.1.4 A Site walkover survey undertaken in September 2015 identified the Site as being an operational depot primarily used for the storage of rock salt, understood to be for use on roads during winter periods.
- 2.1.5 The Site was noted as being split level, separated by an embankment, each level having its own vehicular access. The upper level includes site offices, car parking areas, a salt storage building, and the top of the salt hopper. The lower level includes a maintenance building, external stores, the bottom of the salt hopper and external storage/vehicle access areas.
- **2.1.6** The majority of the Site comprises hardstanding with vegetated areas around the periphery and the embankment.

3 The Scheme

- 3.1.1 The Site is located on the proposed new section of motorway at approximate chainage 20,600 to 20,800. Reference should be made to Figure 1 for the Site location in relation to the Scheme proposals.
- 3.1.2 The proposed new section of motorway at this location is at a reduced elevation in relation to existing ground level and therefore, a cut to existing ground level is required. The highway verges are to be landscaped and incorporate highway drainage.
- 3.1.3 The intention is that materials arising from the excavations will be removed from their current location and reused within the Scheme.
- 3.1.4 A potential borrow pit area is located to the south of the Site and to the north Newport Road will be rerouted on an embankment approximately 2-4 m above existing ground level.

4 Site History

- **4.1.1** The 2014 PSSR historical searches were based on Ordnance Survey plans, literature reviews, information from Natural Resources Wales (NRW) (formerly Environment Agency Wales) and Newport City Council and aerial photographic interpretation.
- **4.1.2** This has been supplemented by the review of historical maps obtained in 2015 from the Welsh Government. Relevant extracts are presented in Appendix 6.
- **4.1.3** A summary of the Site's history is presented in Table 1 below.

Table 1: Site History

Date	Use	Source of information				
1843 - 1893	The Site comprises agricultural fields. To the north is a road running north-west to southeast. To the south-east and north-east are old quarries, approximately 90 m and 75 m away respectively.	1:10,560 Historical Mapping				
1891 - 1912	No significant change.	1:10,560 Historical Mapping				
1904 - 1939	No significant change.	1:10.560 Historical Mapping				
1964 - 1965	No significant change.	1:10,560 Historical Mapping				
1962	No significant change.	Aerial photograph				
1966	The Site appears to be under construction with excavation taking place.	Aerial photograph				
1969	A rectangular building is present in the centre of the Site. A road loops the Site running along the east, south and west boundaries. The B4245 now runs along the Site's northern boundary. The M4 J23A has been developed approximately 200 m to the north. The town of Magor has expanded to within 150 m east of the Site.	Aerial photograph				
1981	The majority of the Site appears to comprise a yard laid to hardstanding. A second industrial unit has been developed on the Site in the south-western area. Evidence of material stockpiling in the yard in the north- western area of the Site.	Aerial photograph				
1985 - 1996	The Site is now labelled as a <u>depot</u> . The road running north-south along the western boundary has been extended. A brewery has been developed to the west. The town of Magor has expanded southwards and westwards. A Police Station is now located to the north.	1:10,000 Historical Mapping				
1991	Storage of materials identified on hardstanding. A salt hopper is located in the centre of the Site.	Aerial Photography				

Date	Use	Source of information
2006	Storage of materials on hardstanding. A number of storage containers are present. Two above ground tanks are located central northern site areas.	Aerial Photography
2009 - 2010	No significant change.	Aerial Photography
2013 - 2014	Two rectangular office buildings have been constructed in the north-west corner of the Site.	Aerial Photography

Notes: Potential sources of contamination are <u>underlined</u>. Those within the temporary and permanent land take are shown in **bold**.

- 4.1.4 The sources of information presented above supplement those used in the 2014 PSSR. In particular, the 2006 aerial image shows the presence of above ground tanks. Relevant photographic extracts are presented in Appendix 6.
- **4.1.5** Earthworks associated with the construction of the Motorway Maintenance Depot are identified within the Site history section of the 2014 PSSR. However no dates are given.
- **4.1.6** The Site is currently occupied by the South Wales Trunk Road Agency (SWTRA).
- 4.1.7 Historically the Site is located in proximity to areas which may have been bombed during World War II, which is discussed in the Explosive Ordnance Threat Assessment Report (Bactec, 2014). This report categorises the Site as low risk with respect to unexploded ordnance.

5 Environmental Setting

5.1 Geology

- 5.1.1 The geological map indicates there are no superficial deposits within the Site area. However River Terrace Deposits (sand and gravel) are shown immediately south of the Site.
- 5.1.2 British Geological Survey (BGS) data indicates that the western part of the Site is underlain by bedrock of the Tintern Sandstone Formation, and the eastern part is underlain by the Avon Group Carboniferous Limestones.

5.2 Hydrology

5.2.1 There are no surface water features within the Site boundary or within 500 m of the Site.

5.3 Hydrogeology

- **5.3.1** NRW classifies the Tintern Sandstone Formation and the Avon Group as Principal Aquifers.
- **5.3.2** The Site does not lie within a groundwater Source Protection Zone.

5.4 Environmental Information

- 5.4.1 No pollution incidents, abstraction licences, discharge points or landfill sites have been recorded within the Site or within 300 m of the Site.
- One company located within 300 m to the west of the Site holds an environmental permit as detailed in Table 2.

Table 2: Environmental Permit (off site)

Address/ Licence	Industry	Process	Year	Release Environment	Substances Released
The Brewery, Newport Road, Mangor, Gwent BX7282IS	Other Industry	Animal, vegetable and food	2005 to 2012	Air	Carbon monoxide, carbon dioxide, nitrogen oxides, VOCs, inorganic chlorine compounds, hydrogen chloride, asbestos, ammonia

5.4.3 Residual levels of potential contamination associated with the above environmental permit are considered unlikely to affect the Site.

6 Scope of Investigations

6.1 General

6.1.1 Five intrusive ground investigations are available that include works within the Magor Depot Site. These are summarised below.

6.2 Scope of Works

6.2.1 The various intrusive ground investigations undertaken within the Site area are summarised in Table 3.

Table 3: Site Investigation Summary

Date	Contractor	Site Location	Boreholes	Window Sampler	Trial Pits	Sampling
1997	Norwest Holst	West	BHN3, BHN3A	-	-	Soil
2000	Exploration Associates	South-west	CH55, CH56	-	-	Soil & leachate
2008	Norwest Holst	North-west and south- east	-	SWSN01, SWSN02, SWSN02A	STPN01, STPN02	Soil & leachate
2015	Geotechnical Engineering	South	BH544	-	-	Soil
2015	Costain/Vinci Joint Venture (for Welsh Government)	South	CL32-02, CL32-03, CL32-06, CL32-07, CL32-08, CL32-09	-	-	Soil and groundwater

6.2.2 The construction details of all boreholes installed on the Site are summarised in Table 4.

Table 4: Summary of Borehole Construction Details

Borehole ID	Diameter (mm)	Total Drilled Depth (m)	Top of Slotted Well Casing / Gravel Pack (m bGL)	Base of Slotted Well Casing / Gravel Pack (m bGL)	Targeted Geology
BH544	50	18.4	1	18.4	Bedrock (Tintern Sandstone Formation)
CL32-03	50	12.2	1	7	Bedrock (Tintern Sandstone Formation)
CL32-09	50	10.0	5	10	Bedrock (Tintern Sandstone Formation)

6.3 Surface Water Quality Sampling

6.3.1 Surface water quality monitoring was not undertaken during the previous ground investigations of the Site.

6.4 Field Testing

Photo Ionisation Detector (PID) monitoring for Volatile Organic Compounds (VOCs) was undertaken on shallow soil samples at location STPN01 (see Figure 1 for location).

6.5 Groundwater Monitoring

6.5.1 A summary of the groundwater sampling, groundwater monitoring and ground gas monitoring rounds undertaken at the onsite boreholes is shown in Table 5.

Table 5: Summary of Monitoring Rounds

Location Ref.	Number of Rounds (Date of Sampling)	Monitoring details	Notes
BH544 (50 mm)	5 no. 17 th April 2015, 24 th April 2015, 1 st May 2015, 11 th May 2015,15 th October 2015	Groundwater – level and sampling Soil Gas	
CL32-03	1 no. 15 th October 2015	Groundwater – level and sampling Soil Gas	Borehole dry
CL32-09	1 no. 15 th October 2015	Groundwater – level and sampling Soil Gas	-

6.6 Laboratory Chemical Testing

6.6.1 A summary of all laboratory analysis undertaken on soil, groundwater and leachate samples is summarised in Table 6 below.

Table 6: Summary of Analysis

Site Investigation Date	No. of Soil Samples	No. of Leachate Samples	No. of Water Samples	Suites of Testing
1997	1	0	0	Metals, pH, phenols, sulphate and cyanide
2000	3	1	0	Metals, pH, phenols, sulphate, cyanide, PAH and TPH
2008	7	4	0	Metals, pH, phenol, sulphate, cyanide, asbestos, TPH, PAH, PCBs, BTEX, VOCs and SVOCs
2015	2	0	3	Metals, PAH, TPH, pH, cyanide, sulphate, sulphur, nitrate, MTBE, BTEX, phenols, VOCs, SVOCs, dibenzofurans, asbestos, PCBs, TOC
2015	5	0	2	Metals, GRO, TPH, PAH, pH, asbestos (soils) Metals, TPH, PAH, VOCs, SVOCs, sulphate, PCBs, pH and water quality parameters.

Soil Analysis

- 6.6.2 The following sections summarise the laboratory analytical results for soil samples collected during the various intrusive investigation phases. The available data set has been tabulated and is presented in Appendix 3 with supporting laboratory certificates available in the relevant original ground investigation reports (see Table 3).
- 6.6.3 For assessment, the analytical data from the Made Ground has been assessed separately from those of the natural soils (the various lithologies associated with the Bedrock i.e. Tintern Sandstone and Avon Group Limestones).
- 6.6.4 For the purpose of meeting the requirements of DMRB HD22/08 (Highways Agency, 2008), the historical data used to support the PSSR and the additional 2015 information (Geotechnical Engineering, 2015 and Costain/Vinci Joint Venture, 2015) have been differentiated in the following sections.
- **6.6.5** The available information used in this assessment is summarised in Table 7.

Table 7: Summary of Analytical Soil Data

Formation	Number of Soil Analysis per Analytical Suite - 2015 data/ All Gl data									
Unit	Metals & Inorganics	PCBs	PAH	ТРН	Phenol	BTEX	Pthalates	VOCs	SVOCs	
Made Ground	6 / 11	1/3	6 / 10	5/9	1/6	1/3	1/2	1/3	1/2	
Natural Soils	1/6	0/4	1 / 6	1/6	0/5	0/4	0 / 4	0/5	0 / 4	

Soil Leaching Analysis

6.6.6 The available information is presented in Appendix 5 and summarised in Table 8.

Table 8: Summary of Soil Leaching Analytical Data

Formation Unit	Number of Soil Leachate Analysis per Analytical Suite - 2015 data / All Gl data					
	Metals & Inorganics	Total Petroleum Hydrocarbon				
Made Ground	0/1	0/1				
Natural Soils	0/3	0/0				

Groundwater Results

- 6.6.7 The following sections summarise the laboratory analytical results for groundwater samples collected during the various intrusive investigation phases. The available data has been tabulated and is presented in Appendix 4 with supporting laboratory certificates available in the relevant original reports.
- 6.6.8 The available data relates to groundwater samples taken from the wells installed within the groundwater of the Bedrock (Tintern Sandstone Formation) and is summarised in Table 9.

Table 9: Summary of Analytical Groundwater Data

Groundwater	Number of Groundwater Analysis per Analytical Suite (number of well locations) - 2015 data / All Gl Data							
Unit	Metals & Inorganics	PAH	ТРН	Phenol	втех	VOCs	SVOCs	
Principal Aquifer (Bedrock)	5 (2) / 5 (2)	5 (2) / 5 (2)	5 (2) / 5 (2)	3 (1) / 3 (1)	5 (2) / 5 (2)	5 (2) / 5 (2)	5 (2) / 5 (2)	

6.7 Gap Analysis of Available Data

6.7.1 The most recent ground investigation undertaken by RPS on behalf of Welsh Government (RPS, 2015) has sought to target gaps in the existing ground investigation data.

7 Ground Conditions

7.1 Geology

7.1.1 The geological logs for all available exploratory holes excavated on or in close proximity to the Site are provided in Appendix 1. The observed geological sequence is consistent with that discussed in the 2014 PSSR and is summarised in the following sections. Information from the Supplementary Ground Investigation (Geotechnical Engineering, 2015) and additional ground investigation undertaken on behalf of the Welsh Government (RPS, 2015) has also been used.

Made Ground

- 7.1.2 Made Ground was encountered beneath a concrete slab at all exploratory locations (with the exception of CH55 and CH56) with thicknesses generally ranging between 0.2 m and 0.7 m. At borehole BHN3, a localised thicker layer of 2.7 m was identified overlying 300 mm of topsoil.
- 7.1.3 Made Ground typically comprised limestone gravel representing a sub-base material. At borehole BHN3 the sub-base was underlain by Made Ground which comprised gravel and hardcore rubble with brick fragments.
- **7.1.4** At CH55, a concrete slab was not encountered but loose Made Ground was evident including slag and ash identified to 0.25 m depth.

Superficial Deposits

7.1.5 No superficial deposits were identified on site.

Solid Geology

- **7.1.6** Beneath the Made Ground a sequence of weathered bedrock was encountered.
- 7.1.7 The bedrock encountered comprised predominantly reddish brown occasionally green or yellow mudstone, sandstone, dolomite or siltstone with a discontinuous upper stratum of stiff clay of up to 1.6 m in thickness.

Geological Sequence Summary

7.1.8 The general geological sequence identified during the previous ground investigations is summarised in Table 10.

Table 10: Summary of Geological Sequence

Unit	Description	Thickness Range (m)	Basal Depth (m bGL)
Made Ground (Sub-base)	Hardstanding overlying sub-base with coarse sand and gravel	0.18 - 0.7	0.25 - 0.7
Made Ground	Discrete area including rubble overlying a 300 mm layer of topsoil (BHN3)	2.6 - 2.9	3 - 3.2
Bedrock	Interbedded mudstone, sandstone, dolomite, limestone and siltstone.	>17.8	unproven

7.2 Visual and Olfactory Evidence of Contamination

7.2.1 A summary of visual and olfactory evidence of contamination encountered during the previous ground investigations is summarised in Table 11.

Table 11: Visual and Olfactory Evidence of Contamination Summary

Location ID	Depth (m bGL)	Strata	Evidence of Potential Contamination
Most locations (exception of CH56)	GL to 0.25-3.2	Made Ground	Concrete, tarmacadam and demolition rubbles
CH55	0 - 0.25	Made Ground	Ash and slag
STPN01	0.6	Mercia Mudstone Group Marginal Facies (limestone)	Oil / diesel coming through fractures in the bedrock - buried diesel tank in vicinity.

- **7.2.2** The PID meter recorded zero levels, indicating that no volatiles were present.
- **7.2.3** Full details and observations noted during the drilling and trial pitting are presented on the exploratory logs provided in Appendix 1.
- **7.2.4** The more recent 2015 ground investigations have in part targeted the areas previously associated with evidence of potential contamination. Visual or olfactory evidence of contamination have not been identified in these areas.

7.3 Gas Monitoring

7.3.1 The gas monitoring data available is provided on the field data sheets in Appendix 2. The maximum gas concentrations (minimum for oxygen) are presented in Table 12 below. The gas monitoring data indicates low generation sources.

Table 12: Summary of Gas Monitoring Data

Location ID	Flow (I/hr)	VOCs (ppm)	CH₄ (%/vol)	Peak LEL (%)	CO ₂ (%/vol)	O ₂ (%/vol)	CO (ppm)	H₂S (ppm)
Location ib	Max	Max	Max	Max	Max	Min	Max	Max
BH544	0.0	5.3	0.1	1.0	1.3	11.2	4	0
CL32-09	0.0	-	0.1	1.0	1.0	16.6	0	0
CL32-03	0.0	-	0.0	0.0	1.1	19.3	0	0

7.4 Groundwater

Groundwater Encountered During Investigation

7.4.1 Groundwater strikes were encountered during the construction of a number of boreholes as detailed on the geological logs provided in Appendix 1. These are summarised below in Table 13.

Table 13: Summary of Groundwater and Leachate Water Level Data

Location	Strike Depth (m bGL)	Geological Formation	Level after 20 minutes (m bGL)	Comments
SWSN01	0.4	Made Ground (Sub- base)	0.4	Top of Sandstone
CL32-03	5.5	Tintern Sandstone Formation	-	-
CL32-09	2.7	Tintern Sandstone Formation	-	-

7.4.2 Groundwater was not identified in any other boreholes or trial pits during the previous ground investigations.

Groundwater Level During Monitoring Rounds

7.4.3 Data relating to groundwater levels for the Site are provided in Appendix 2 and summarised in Table 14.

Table 14: Summary of Groundwater Level Data

Location	Installation	Depth of Response Zone (m bGL) and Geological Formation	No. Measurements	Min Level (m bGL)	Max Level (m bGL)	Comments
BH544	Single	1 - 18.4 Bedrock (Tintern Sandstone)	3	8.34	9.72	Good recharge
CL32-09	Single	5 - 10.0 Bedrock (Tintern Sandstone)	1	8.14	8.14	Slow recharge

Groundwater Summary

- **7.4.4** A perched water body, probably discontinuous has been identified at the interface between the Made Ground and the underlying bedrock at the Site.
- **7.4.5** The deep groundwater body within the bedrock has been identified with a water level around 8 m bGL.

8 Contamination Assessment

8.1 Introduction

- **8.1.1** The following sections provide details of the assessment of land contamination at the Site.
- 8.1.2 The Conceptual Site Model (CSM) presented within the 2014 PSSR has been reviewed and updated based on data from the Supplementary Ground Investigation (Geotechnical Engineering, 2015), the 2015 Ground Investigation (RPS, 2015) and the Scheme. The main alterations to the 2014 PSSR model are summarised as follows.
 - Inclusion of groundwater quality and level data.
 - Inclusion of gas monitoring data.
 - Update of the source-pathway-receptor linkages taking account of the above and more detailed assessment.

8.2 Preliminary Risk Assessment

Potential Sources

- 8.2.1 The historical data review and walkover survey indicate the Site has been used as a fuel depot, for storage of chemical drums and as a maintenance depot. The Site also includes the presence of buried fuel tanks. These are a potential source of contamination at the Site. A buried diesel tank was identified in the south west of the Site during the 2007 site investigation.
- 8.2.2 It is anticipated that the Made Ground and fuel tanks and associated hydrocarbon contamination will be removed as part of the construction works and therefore, no source of contamination will remain post construction. However, there is a possibility of residual contamination remaining within the underlying bedrock presenting a risk to maintenance workers and controlled waters. Such impact has been identified near STPN01 where oil/diesel was reported to be evident within fractures in the bedrock.

Potential Receptors

8.2.3 Receptors during the construction and operational stages of the Scheme have been considered:

Construction

- Construction workers during site development works.
- General public adjacent to construction works.
- Groundwater in the Principal aguifer within the bedrock.

Operational

- Maintenance workers.
- General public end users.

- General public adjacent to permanent land take.
- Groundwater in the Principal aquifer within the bedrock.

Potential Pathways

- **8.2.4** Pathways during the construction and the operational stages of the Scheme have been considered.
 - Dermal contact, ingestion, inhalation pathways of potentially contaminated soils possible during development and maintenance works.
 - Inhalation pathways possible for general public end users and adjacent general public/workers.
 - Leaching of contaminants from the Made Ground into the groundwater.
 - Vertical or lateral migration of free phase hydrocarbon product or dissolved product to groundwater.
 - Vertical or lateral migration of ground gas associated with Made Ground and hydrocarbon impacted soils or groundwater.

8.3 Risk Evaluation

- 8.3.1 Source-pathway-receptor linkages were considered in the 2014 PSSR using the historical data available up to 2008. With review of the other data described herein, the following risk evaluation has been reconsidered and included.
 - The Site has been subject to potential contaminative uses, including use as a fuel depot and the presence of at least one buried diesel tank has been identified.
 - Made Ground with perched shallow groundwater is directly overlying a Principal Aquifer.
 - A below ground fuel tank may have impacted underlying soils, rock and groundwater. Given the shallow extent of Made Ground and the absence of superficial deposits, any below ground tanks are likely to be contained within the solid bedrock.
 - Considering the identified land use, organic compounds are considered to be the main contaminants of concern.
 - Made Ground was generally limited to sub-base type material with an overlying concrete slab. The latter would likely act as a barrier against vertical migration of accidental surface spillages, where condition and integrity is good.
 - Details of the surface water drainage system are unknown.
 - Visible oil/diesel has been identified within the bedrock in proximity to a buried diesel tank at the Site (STPN01).
 - The proposed works will include a shallow cutting on the Site which will likely remove any Made Ground materials within the Scheme area. All buried fuel tanks, if present, would also be removed as part of the construction works.
 - Hardstanding cover which is proposed in some areas of the motorway corridor is likely to limit infiltration thereby reducing leaching.

- No surface water features are identified within or in close proximity to the Site.
- Motorway users will be within an open environment with no proposed structures or other confined spaces.

8.4 Human Health Risk Assessment

8.4.1 The rationale and approach for the human health (Tier 2) screening assessment is detailed in the Land Contamination Assessment Report (Appendix 11.1 of the ES). Soil chemical analysis results and the findings of the generic Tier 2 human health risk assessment are presented in Appendix 3. All exceedances of relevant generic risk assessment criteria are summarised in Table 15 and 16.

Table 15: Summary of Human Health Soil Screening Exceedances: Made Ground

Determinand	Units	Range	Screening Criteria	No. Samples Exceeding Screening Criteria (Total Number of Results)	Locations of Exceedances
рН	pH units	7.6 - 11.59	6 - 9	7 (11)	CH55, STPN02, SWSN01, BH544, CL32- 06, CL32-08, CL32-09
Chromium	mg/kg	6.1 - 57.3	33	2 (11)	BHN3, CL32-06
PAH	mg/kg	<0.05 - 4980	1.1	2 (10)	CH55 x 2
TPH	mg/kg	<0.01 - 6100	3200	1 (5)	CH55

Table 16: Summary of Human Health Soil Screening Exceedances: Natural Soils

Determinand	Units	Range	Screening Criteria	No. Samples Exceeding Screening Criteria (Total Number of Results)	Locations of Exceedances
рН	pH units	8.1 - 9.49	6 - 9	3 (6)	STPN01, SWSN01, CL32-07
Chromium	mg/kg	18 - 35	33	1 (6)	SWSN02

- 8.4.2 Alkaline soil conditions have been identified in half of the samples, mainly within the Made Ground material but also within the bedrock at three locations.
- 8.4.3 Although exceedances for chromium are present in both Made Ground and the bedrock, the criterion relates to the hexavalent form. All results are considered to be within normal background range (<95 mg/kg) and therefore are not considered to represent a contaminant of concern (Appendix 11.1 of the ES).

- 8.4.4 The PAH exceedances are reported for samples analysed without speciation. In this instance the criterion for total PAH has been taken considering the most stringent PAH compound (Dibenzo(ah)anthracene). Whilst this is considered to be a conservative initial approach, it is noted that both these exceedances relate to superficial Made Ground material at one location (CH55) and are well above concentrations observed in the remaining data set for the same geological unit. This is likely to represent a discrete area of contamination.
- 8.4.5 In addition to the identified exceedances, elevated oil was identified within the Made Ground at CH55 with a concentration of 15,900 mg/kg. No VOC analysis was undertaken at this location to enable the molecular status of the oil to be determined..
- 8.4.6 The laboratory detection limit was higher than the screening criterion for some PAH and VOC compounds. Risks to human health associated with these are considered to be low given the low concentrations recorded.

8.5 Controlled Waters Screening Assessment

- 8.5.1 The rationale and approach for the controlled waters (Tier 1) screening assessment is detailed in the Land Contamination Assessment Report (Appendix 11.1 of the ES) and the groundwater chemical results are presented in Appendix 4. All exceedances of relevant generic criteria are summarised in Table 17 for soil leachate.
- 8.5.2 Where an Environmental Quality Standard (EQS) is dependent on water hardness i.e. some heavy metals, the hardness of the surface water receptor would normally be used. The Baseline Water Environment Report (Appendix 16.2 of the ES) indicates surface water to be generally moderately hard with hardness concentrations within a range of 100 to 150 mg/l reported as calcium carbonate. Therefore, EQSs within this water hardness range have been used for screening purposes.

Soil Leachate Results

8.5.3 Five soil samples were subjected to leachate analysis. The majority of the soil leachate results were below the applied screening criteria, with the exception of the following contaminants shown in Table 17.

Determinand	Units	Range	EQS	DWS	No. Exceeded EQS Screening Criteria (Total Number of results)	Location (Formation)	No. Exceeded DWS Screening Criteria (Total Number of Results)	Location (Formation)
Arsenic	ug/l	<1 - 22	50	10	0 (8)	1	1 (8)	STPN01 (Bedrock)
Copper	μg/l	<1 - 16	10	2,00 0	1 (8)	SWSN02 (Carbonifero us Bedrock)	0 (8)	-
Nickel	μg/l	<1.5 - 10	4	20	2 (8)	STPN01, SWSN02 (Carbonifero us Bedrock)	0 (8)	STPN02 (Made Ground)
Lead	μg/l	<1 - 3	1.2	10	3 (8)	STPN01, SWSN02 (Carbonifero us Bedrock), SWSN01 (Made Ground)	0 (8)	-
Cyanide	mg/l	<0.05 - 0.61	0.00	0.05	1 (8)	STPN02 (Carbonifero us Bedrock)	1 (8)	STPN02 (Carbonifer ous Bedrock)
рН	pH units	9.8	6 - 9	6 - 9	1 (1)	CH55 (Made Ground)	1 (1)	CH55 (Made Ground)

Table 17: Controlled Waters Screening Exceedances – Soil Leachate

- **8.5.4** The identified exceedances are considered to be minor and unlikely to pose a significant risk to controlled waters.
- **8.5.5** The laboratory detection levels for cadmium and cyanide are higher than the applied screening criterion, within the historical data set.

Groundwater Results

- 8.5.6 The groundwater results assessment includes data from five monitoring rounds from BH544 and one monitoring round from CL32-09 undertaken in 2015. Groundwater samples were taken from the aquifer body within the Bedrock.
- 8.5.7 No exceedances of either the Environmental Quality Standards (EQS) or the Drinking Water Standards (DWS) were recorded.
- **8.5.8** All phenols, BTEX, TPH, PAH, VOCs and SVOCs results were reported as below the limits of detection.
- **8.5.9** However, it is noted that the laboratory detection limits for mercury, cyanide, phenols, some PAH compounds, VOCs and SVOCs were higher than their respective applied screening criteria.
- **8.5.10** The limited data currently indicates that the aquifer beneath the Site is not impacted by contamination associated with the historic land use.

8.6 Ground Gas Risk Assessment

- **8.6.1** The available ground gas data relates to on site boreholes that are associated with response zones screened within the bedrock. Of the rounds available the following comments may be made:
 - One round was undertaken at low barometric pressure (less than 1000 mb), with a pressure reading of 992 mb measured during the fourth monitoring round involving BH544. As such it can be considered that worse case atmospheric conditions have been monitored for this borehole.
 - Gas flow was recorded as absent during each monitoring round.
 - Methane has been recorded at levels of up to 0.1% in BH544 on the first round, was absent for the subsequent three rounds and up to 0.1% in CL32-09. The concentrations are below the initial screening criteria of 1%. The Lower Explosion Limit of up to 1% is noted for each borehole and correlates with the low level methane concentrations reported.
 - Carbon dioxide is identified at between 0.1% and 1.3% during all monitoring rounds. These concentrations are well below the Workplace Exposure Limit (WEL) of 5%.
 - Traces of Volatile Organic Compounds of up to 5.3 ppm have been recorded.
 - Hydrogen sulphide and carbon monoxide was not detected throughout the monitoring rounds.
 - Oxygen has been recorded at low to ambient concentrations of between 11.2-20.8%.
- 8.6.2 Though occasional low levels of oxygen have been identified, the available data does not indicate abnormal gas concentrations and is consistent with the expected gas regime given the ground conditions.
- 8.6.3 A gas risk assessment has been undertaken and is set out within the Land Contamination Assessment Report (Appendix 11.1 of the ES).
- 8.6.4 Potential soil gas from the Site is therefore considered to be of low risk to the Scheme though it should be noted that VOCs may be released during tank removal and/or excavation within hydrocarbon impacted ground.

8.7 Summary

- **8.7.1** Discrete areas of elevated PAH (that would cause a potential risk to human health) have been identified within the Made Ground, however a conservative screening criteria was applied due to the lack of compound speciation within the analytical data.
- 8.7.2 TPH and PAH are also shown to be elevated at location CH55 within the Made Ground, where no concrete slab is evident.
- 8.7.3 STPN01 which was excavated in 2008 reported evidence of hydrocarbons within the bedrock. The 2015 boreholes sunk around the historical trial pit did not identify elevated organic contamination, indicating a localised impact.
- **8.7.4** Moderate leachability of both the Made Ground and bedrock has been identified with marginal exceedances of copper, nickel, lead, cyanide and pH.

8.7.5 The bedrock aquifer has no identifiable contaminant concentrations when compared to the Environment Quality Standards or the Drinking Water Standards. This would indicate that the quality of the aquifer observed beneath the Site has not been impacted by on site soil contamination.

9 Refined Conceptual Site Model

- **9.1.1** The incorporation of data from the 2015 Supplementary Ground Investigation and additional ground investigation on behalf of the Welsh Government has enabled the original CSM presented in the 2014 PSSR to be updated. The assessment is based on the Scheme during construction and operational phases.
- 9.1.2 A CSM representing general ground conditions, overall Scheme layout and relevant source-pathway-receptors (each of which has a specific alpha-numerical symbol attached) are presented in Figure 2 and is described in Table 18.

Table 18: Site Conceptual Model

Potential Source	Potential Receptor	Possible Pathway	Likelihood	Severity	Risk	Comment
On Site	Construction		'			
Localised elevated hydrocarbons identified from possible fuel/ chemical spill. Made G round associated with the depot, chemical and fuel storage.	Construction Workers (B)	Direct dermal (1)	Likely	Moderate	Moderate	Construction workers will be exposed to Made Ground materials, fuel tanks and associated hydrocarbon contamination during Site construction works; however exposure duration will be short term only. Prior to construction, a specific risk assessment will be required in line with CDM and health and safety legislation. This will enable safe methods of work and an
		Ingestion (3)	Likely	Moderate	Moderate	appropriate level of PPE to be put in place. As such all risks will be duly considered and suitably mitigated to protect construction workers. The current data set identified a limited number of exceedances of the selected screening criteria. Overall, current contamination status from the current dataset is not foreseen to represent abnormal constraints to construction workers' health and safety over and above those typical of a brownfield site.
		Inhalation of soil dust and hydrocarbon vapours (2)	Likely	Moderate	Moderate	During the previous ground investigation (Exploration Associates in 2000), discrete areas have been identified to be contaminated with hydrocarbon. Hydrocarbon contamination was not identified during the recent 2015 ground investigations, indicating a localised distribution of the contamination. However, if found to be present specific precautions may be required and possibly specialist contractors to enable remediation.
	General public: footpath users	Dermal contact with soil dust (1)	Unlikely	Moderate	Low	During construction there is the possibility of inhalation of soil dust (short term exposure
	during construction works (C)	Ingestion of soil dust (3)	Unlikely	Moderate	Low	only). Dust suppression measures are recommended during construction works.

Potential Source	Potential Receptor	Possible Pathway	Likelihood	Severity	Risk	Comment
		Inhalation of soil dust (2)	Unlikely	Moderate	Low	VOCs may be released during tank removal and/or excavation within hydrocarbon impacted
		Inhalation of soil gas or hydrocarbon vapours (2)	Unlikely	Moderate	Low	ground.
	Groundwater - Aquifer within the Bedrock (Da)	Leaching/migration of contaminants from Made Ground, buried tank or fuel spill to aquifer (4)	Likely	Moderate	Moderate	Current dataset shows the aquifer not to be impacted by on site contamination. However leachability of contaminants is shown to be moderate. There is a risk of impacting soils and groundwater from fuel tanks and possible spillage. A method statement for the removal of the tanks will be required together with a remediation strategy to include a programme of groundwater monitoring.
	Operational					
	Maintenance Workers (B)	Direct dermal (1)	Unlikely	Low	Very low	Made Ground and some bedrock to be removed by the cutting therefore, exposure to Made Ground will be limited to outside the M4 corridor. Areas outside the motorway hardstanding are likely to receive topsoil cover and vegetation establishment, reducing potential of exposure. Exposure duration will be short term only. Site specific risk assessment will be required in line

Potential Source	Potential Receptor	Possible Pathway	Likelihood	Severity	Risk	Comment
		Ingestion (3)	Unlikely	Low	Very low	with health and safety guidance. This will enable safe methodology and an appropriate level of PPE to be put in place. As such, all risks will be duly considered and suitably mitigated. The current data set identifies a limited number of exceedances of the selected screening
		Ingestion of soil dust (2)	Unlikely	Low	Very low	criteria. Current contamination status is not foreseen to represent abnormal constraints to maintenance worker's health and safety over and above those typical of a brownfield site.
	Future Motorway Users (A)	Inhalation of hydrocarbon vapours (2)	Unlikely	Low	Very low	Motorway hardstanding will provide some level of barrier. Motorway users are within an open space. 2015 investigation identified hydrocarbon contamination to be localised, if still present.
	Groundwater - Aquifer within the bedrock (Da)	Leaching / migration of contaminants from hydrocarbon impacted soils to aquifer. (4)	Likely	Moderate	Moderate	Current dataset shows the aquifer not to be impacted by on site contamination. However leachability of contaminants is shown to be moderate. There is a risk of impacting soils and groundwater from fuel tanks and possible spillage. A method statement for the removal of the tanks will be required together with a remediation strategy to include a programme of groundwater monitoring.

10 Conclusions and Recommendations

10.1 Conclusions

- Investigations at the Site have established that contamination associated with the Site's historical use has been found to be limited to two locations (CH55 and STPN01). In CH55 elevated organic compounds have been identified within the shallow soil. This is in an area of the Site where the concrete slab is absent and impacted soils may be present to greater depth although testing has indicated much reduced concentrations were identified at 0.25 m depth. Visual evidence of oil/fuel contamination within the bedrock has also been identified (STPN01). This would suggest historical leakage or spillage may have occurred. However, hydrocarbon contamination was not identified within surrounding soils during the recent ground investigation, indicating an absence of widespread contamination.
- 10.1.2 The risk assessment has identified that some residual risks to human health and controlled waters could exist in discrete areas of the Site and control measures are required to facilitate the construction and ongoing operation of the Scheme.
- Buried fuel tanks exist that will need to be removed from Site during the works. Further investigation or inspection during construction is recommended to identify and confirm the location of all tanks. Prior to tank removal, a remedial method statement will be required which will require materials around the tank to be inspected for contamination and verification testing undertaken to determine if materials require remediation or are suitable for reuse within the Scheme.
- **10.1.4** The potential for reuse of contaminated materials will need to be verified through compliance with suitability for reuse criteria set out in the remediation strategy.
- **10.1.5** Should contaminated materials be designated for disposal, further waste characterisation and acceptance assessments may be required.
- During the construction phase, specific mitigation measures will be required to prevent inhalation pathways of dust to the general public off site and construction workers, although such measures would be no more than typically expected on a construction site. A suitable water management strategy will also be required to prevent potential impact to surface waters from contaminant run-off.
- **10.1.7** The deep aquifer is currently not identified to be impacted by the Site usage and by on site soil contamination.

10.2 Recommendations

- 10.2.1 It is recommended that as a remediation strategy is required for the Scheme, the following measures should be included within it with respect to this Site;
 - Dealing with unexpected contamination.
 - · Verification sampling to confirm suitability of soils for reuse.
 - Control measures (over and above good practice construction management) to prevent risks to construction workers and the general public during construction.

- Works relating to tank decommissioning / removal and management of hydrocarbon impacted materials.
- Verification of material used as topsoil for suitability of use.
- The remediation strategy should include a remediation options appraisal, remediation implementation plan and remediation verification plan. The remediation strategy should be supported by a Scheme wide Material Management Plan prepared in accordance with CL:AIRE Code of Practice (CL:AIRE, 2011).

1 Introduction

1.1 Background

- **1.1.1** This report relates to an area of land potentially affected by contamination (CL-33) known as the "B4245 Quarry" hereinafter referred to as the Site.
- 1.1.2 The Site is located between chainage 20,800 and 20,900, upon a partially backfilled quarry, within the grounds of a former vicarage (See Figure 1).

1.2 Reporting Context

- 1.2.1 The Site has been assessed as part of ground investigations and monitoring associated with the wider works for the M4 Corridor around Newport (M4CaN) (hereafter referred to as the "Scheme") and informs the baseline for the environmental impact assessment (EIA) for the Scheme. The EIA for Scheme. The EIA is reported in the M4CaN Environmental Statement (ES) of which this document is an appendix to the Chapter on Geology and Soils (Chapter 11).
- 1.2.2 In 2014, a Preliminary Sources Study Report (PSSR 2014) was prepared as an initial land contamination appraisal (Ove Arup & Partners, 2014) as part of Design Manual for Roads and Bridges (DMRB) Stage 2 Assessments for a number of potential route options. This identified a number of individual areas that may have been affected by contamination as a result of historical activities at the site. In addition, this report draws upon the 2015 Supplementary Ground Investigation report on behalf of the Welsh Government (Geotechnical Engineering, 2015). This report relates to the area defined on the Site Location Plan Figure 1.
- 1.2.3 The overarching rationale and approach for the assessment of areas of land along the proposed new section of motorway with potential contamination is detailed in the Land Contamination Assessment Report (Appendix 11.1 of the ES).

1.3 Objectives

- **1.3.1** The key objectives of this report are set out below.
 - Undertake a risk assessment of the Site and determine whether potential risks to human health or controlled waters could exist based upon the Scheme.
 - Identify the need for further assessment and investigation in order to refine potential land contamination risks and inform the need for remediation/mitigation.
 - To provide information to support the Ground Investigation Report (GIR) and Geotechnical Design Report (GDR) required under DMRB HD22/08 (Highways Agency, 2008).

1.4 Report Structure

1.4.1 The subsequent report structure is as follows.

- Section 2: Site Location and Description.
- Section 3: The Scheme This section details the new section of motorway alignment and associated features at the Site.
- Section 4: Site History This section summarises the history of the Site based on historical maps and historical land photographs.
- Section 5: Environmental Setting This section summarises the Site description, published geology, hydrology and hydrogeology and any relevant environmental information presented in the 2014 PSSR.
- Section 6: Scope of Ground Investigations Work This section describes the previous and supplementary ground investigation data available for the Site.
- Section 7: Ground Conditions

 This section describes the main findings of the
 intrusive site investigation including the ground conditions encountered and
 visual or olfactory evidence of contamination identified.
- Section 8: Contamination Assessment This section describes the findings of the Tier 1 and Tier 2 contamination risk assessment based upon potential contamination sources, potential receptors and potential contaminant linkages and presents the human health and controlled waters assessments.
- Section 9: Refined Conceptual Site Model This section presents the Conceptual Site Model (CSM) for the Site and identifies potential contaminant linkages, based upon the findings of the data presented within Sections 2 to 7.
- Section 10: Conclusions and Recommendations This section provides conclusions concerning the likelihood of land contamination associated with the Site affecting the Scheme and requirements for remediation/mitigation.

2 Site Location and Description

- 2.1.1 The Site is located in the eastern part of the study area approximately 500 m north west of Magor town centre and approximately 300 m south of the existing M4 Junction 23A. The Site is centred at National Grid Reference ST 420 876 and covers an area of approximately 0.35 hectares (ha). The location of the Site is shown on Figure 1.
- 2.1.2 The Site comprises a partially backfilled quarry within the grounds of a vicarage, Woodland House, and is surrounded by agricultural fields to the north, residential development to the east and bounded by the B4245 to the south.
- 2.1.3 Previous walkover surveys undertaken in September 1995, January 2014 and more recently in June 2015 found the quarry to be overgrown with trees and rough vegetation. The uneven and undulating topography indicates partial backfilling with a quarry face existing on the north eastern boundary. Details of the infill could not been defined by the walkover surveys. Photographs taken during the 2015 walkover survey are presented in Appendix 6.
- **2.1.4** Ground elevations within the Site range between approximately 17.5 m Above Ordnance Datum (AOD) and 21.0 m AOD.
- **2.1.5** The Site layout is shown in Figure 1.

3 The Scheme

- 3.1.1 The Site is located on the alignment of the new section of motorway at the Magor Junction, at chainage 20,800 to 20,900. Refer to Figure 1 for the Site location in relation to the Scheme.
- **3.1.2** The proposed alignment of the new section of motorway is positioned within a shallow cut at the Site location (depth currently not confirmed).
- 3.1.3 The depth of cut is anticipated to be up to 5 m and some, if not all, of the quarry in-fill material may be removed from its current location and either disposed of off site or, if suitable, reused within the Scheme. Any remaining in-fill materials below cutting level may be left *in situ*.
- 3.1.4 A new 5 m high embankment associated with the overbridge of the B4245 is to be constructed over part of the Site footprint. Here, infill material may be left *in situ* beneath the new embankment.

4 Site History

- 4.1.1 The 2014 PSSR historical searches have been based on Ordnance Survey (OS) plans, literature reviews, information provided by British Steel, Natural Resources Wales (NRW) (formerly Environment Agency Wales), Newport City Council and interpretation of aerial photography.
- **4.1.2** This is supplemented by a review of historical maps obtained in 2015 from Welsh Government. Relevant extracts are presented in Appendix 7.
- **4.1.3** A summary of the Sites history is presented in Table 1 below.

Table 1: Site History

Date	Use	Source of
10.10		Information
		1:10,560 Historical
		Mapping
	Adjacent to the east is a Vicarage and the Site is bound to the	
	south by a road running northwest-southeast. Agricultural fields surround the Site to the north, west and south. Two other old	
1882	quarries are located approximately 125 m to the southeast. No significant change.	OC man (2014
1002	No significant change.	OS map (2014 PSSR
1901 1012	A few residential properties are located to the east.	1:10,560 Historical

2015	The quarry has been partially backfilled with fill of unknown origin	Site walkover
	and is heavily overgrown with mature vegetation.	within the temperary

*Notes. Potential sources of contamination are underlined. Those within the temporary and permanent land take are shown in bold.

4.1.4 The sources of information presented above supplement those used in the 2014 PSSR, in particular broken ground identified in aerial photographs from 1969 - 1981. Relevant extract of the photographs are presented in Appendix 6.

- **4.1.5** The review of historical plans indicated that the Site has been occupied by a disused quarry and a limekiln that were active prior to the 1880s.
- **4.1.6** The historical evidence suggests no change of land use post-quarry closure; the Site has remained derelict.
- 4.1.7 Historically the site is located in proximity to areas which may have been bombed during World War II which is discussed in the Explosive Ordnance Threat Assessment Report (Bactec, 2014). This categorises the site as low risk in respect to unexploded ordnance.

5 Environmental Setting

5.1 Geology

5.1.1 British Geological Survey (BGS) data indicates that superficial deposits are only present to the north of the Site, comprising River Terrace Deposits. The entire Site is underlain by bedrock of the Avon Group Carboniferous Limestones.

5.2 Hydrology

- **5.2.1** There are no surface water features within the Site boundary or in the near vicinity.
- **5.2.2** The nearest surface water body is St Brides Brook, located 560 m to the east, which flows in a north-south direction.

5.3 Hydrogeology

- **5.3.1** NRW classifies the adjacent River Terrace Deposits as a Secondary A Aquifer and the bedrock as a Principal Aquifer.
- 5.3.2 The Site does not lie within a groundwater source protection zone. However it lies within a groundwater vulnerability zone classified as a major aquifer, with intermediate leaching potential.

5.4 Environmental Information

- 5.4.1 NRW have no records of pollution incidents, sewage discharge, abstraction licences, landfills or waste management facilities within the Site area.
- A record of one pollution incident is however shown within a 300 m radius of the Site. It had no impact on either land or water and the pollutant was not identified.
- 5.4.3 A discharge consent is marked some 130 m to the west of the Site. This discharge outlet is likely to be associated with the Magor Services and located on the St Bride's Brook, some 560 m to the east.
- 5.4.4 The Gwent Levels Redwick & Llandevenny SSSI is located approximately 700 m to the south.
- 5.4.5 The presence of any residual contamination at the Site associated with the off site pollution incident is considered highly unlikely.

6 Scope of Investigations

6.1 General

6.1.1 One previous intrusive ground investigation has been undertaken within the Site. The information is summarised below.

6.2 Scope of Works

6.2.1 The intrusive ground investigation undertaken within the Site area is summarised in Table 2:

Table 2: Site Investigation Summary

Date	Contractor	Site Location	Boreholes	Window Sampler	Trial Pits	Sampling
2008	Norwest Holst	Northwest and southeast	-	-	STPN03, STPN04	Soil, leachate

6.2.2 No boreholes were excavated or installed onsite. However, a number of holes were advanced within 65 m of the Site. These have been considered in order to support understanding of ground conditions beneath the Site and the groundwater quality and gas regime if relevant.

Table 3: Investigation Summary (Off Site)

Date	Contractor	Location from Site	Boreholes	Sampling
2008	Norwest Holst	10 m south	SBHN01RC	Groundwater level
2015	Geotechnical Engineering	7m southeast	BH545	Groundwater level,
		65m southeast	BH549	sampling Soil gas

6.2.3 The construction details of the above off site boreholes are summarised in Table 4 below.

Table 4: Summary of Off Site Borehole Construction Details

Borehole ID	Diameter (mm)	Total Drilled Depth (m)	Top of Slotted Well Casing / Gravel Pack (mbGL)	Base of Slotted Well Casing / Gravel Pack (mbGL)	Targeted Geology
SBHN01ARC	19 mm	15	14.4	15	Avon Group (Siltstone / Mudstone)
BH545	50 mm	13.0	3	13	Avon Group (Sandstone / Mudstone)
BH549	35 mm	12	2	4	Avon Group (Sandstone)
	50 mm		8	12	Avon Group (Mudstone)

6.3 Surface Water Quality Sampling

6.3.1 Surface water quality monitoring was not undertaken during the previous ground investigations of the site.

6.4 Field Testing

6.4.1 PID (Photo Ionisation Detector) monitoring for VOCs was undertaken on two soil samples on Site at 0.3 m and 1 m in STPN03 and STPN04 respectively.

6.5 Groundwater Monitoring

6.5.1 A summary of the groundwater sampling, groundwater / monitoring and ground gas monitoring rounds undertaken at the off site boreholes are summarised in Table 5.

Table 5: Summary of Monitoring Rounds (off Site)

Location Ref.	Number of rounds (date of sampling)	Monitoring details
SBHN01ARC	6 no.	Groundwater - level
BH545	4 no. (17 th April 2015, 24 th April 2015, 1 st May 2015, 11 th May 2015)	Groundwater - level and sampling
	• ,	Soil Gas
BH549 (35mm)	No data	
BH549 (50mm)	4 no. (17 th April 2015, 24 th April 2015, 1 st May 2015, 11 th May 2015)	Groundwater – level and sampling Soil Gas

6.6 Laboratory Chemical Testing

A summary of the laboratory analysis undertaken on soil, groundwater, leachate and surface water, onsite and off site is shown below. The results are presented in Appendix 5.

Table 6: Summary of previous investigation sampling (onsite)

Site Investigation date	No. of soil samples	No. of leachate samples	No. of water samples	Suites of testing
2008	4	2	-	Heavy metals, pH, sulphate, asbestos, cyanide, phenol, MTBE, BTEX, speciated PAH, PCBs
2015	-	-		Metals, inorganics, phenols, BTEX, TPH, PAH, VOCs, SVOCs, PCBs

Notes. *off site boreholes only

6.7 Gap Analysis of Available Data

- 6.7.1 The investigation data available for the site is considered limited both in relation to site coverage and in the laboratory analysis.
- It is also noted that the intrusive investigation only refers to two shallow hand dug trial pits dated 2008.

7 Ground Conditions

7.1 Geology

7.1.1 The geological logs for all available exploratory logs excavated on or in close proximity to the Site are provided in Appendix 1. The observed geological sequence is consistent with that discussed in the 2014 PSSR report and is summarised in the following sections. Information from the Supplementary Ground Investigation (Geotechnical Engineering, 2015) has also been used.

Topsoil

7.1.2 Topsoil was encountered in both exploratory holes located on site (STPN03 and STPN04) locations to 0.3 m bGL.

Made Ground

- 7.1.3 Made Ground was encountered beneath the topsoil in both locations (STPN03 and STPN04). It comprised a clay silt with gravel and occasional cobbles of limestone and brick as summarised in Table 7. Basal depth of the Made Ground has not been proven.
- 7.1.4 It is noted that some of the selected off site boreholes identified Made Ground material, e.g. to 0.8 m bGL in SBHN01 and 1.65 m in BH545 located south of the Site. It is currently unclear if this material is associated with the partial infill of the Quarry Site.

Bedrock

7.1.5 Off site boreholes have encountered sandstones, mudstones and limestones of the Avon group formation at shallow depths of between 2.1 and 2.35 m bGL.

Geological Sequence Summary

7.1.6 The general geological sequence identified during the previous ground investigations is summarised in Table 7.

Table 7: Summary of Geological Sequence

Unit	Description	Thickness Range (m)	Basal depth (m bGL)
Topsoil	Clayey topsoil.	0.3	0.3
Made Ground	Slightly sandy, slightly gravelly silt / clay with low cobble content. Gravel/cobbles of limestone and brick.	>1.0 - >1.2	unproven

7.1.7 The conceptual ground model included within the 2014 PSSR report has been revised in light of the 2015 information and is presented within Figure 2.

7.2 Visual and Olfactory Evidence of Contamination

7.2.1 A summary of visual and olfactory evidence of contamination encountered during the previous ground investigation is summarised in Table 8.

Table 8: Visual and Olfactory Evidence of Potential Contamination Summary

Location ID	Depth (m bGL)	Strata	Evidence of Potential Contamination
STPN03 and 04	0.3 - 1 / 1.2	Made Ground	Brick cobbles and gravels
East of the quarry	Surface	Black bound macadam	Visual observation during the 2008 ground investigation works

- **7.2.2** No visual or olfactory evidence of hydrocarbon contamination was identified during the trial pitting. The PID meter recorded zero VOC levels.
- **7.2.3** Full details and observations noted during the trial pitting are presented on the exploratory logs attached in Appendix 1.

7.3 Gas Monitoring (off site)

7.3.1 The gas monitoring dataset collected during each of the previous three monitoring rounds at the off site boreholes is summarised on the field data sheets provided in Appendix 2. The maximum gas concentrations are presented in Table 9.

Table 9: Summary of Gas Monitoring Data (off site)

Location ID	Flow (I/hr) Max	VOCs (ppm) Max	CH₄ (%/vol) Max	Peak LEL (%) Max	CO ₂ (%/vol) Max	O ₂ (%/vol) Min	CO (ppm) Max	H ₂ S (ppm) Max
BH545	0.0	6.3	0.1	1	2.9	17.0	0.0	0.0
BH549 (50 mm)	0.4	9.2	0.1	1	1.3	18.0	3	0.0

7.4 Groundwater

Groundwater Encountered During Investigation

7.4.1 No groundwater was encountered during the excavation of the trial pits onsite, nor the boreholes off site.

Groundwater Level Dataset (off site)

7.4.2 The groundwater level dataset gathered from the selected boreholes off site is provided in Appendix 2 and summarised in Table 10.

Table 10: Summary of Groundwater Level During Monitoring Rounds

Location	Installation ^{#1}	Depth of response zone (m bGL) and Geological Formation	No. Measure- ments	Minimum Depth (m bGL)	Maximum Depth (m bGL)	Comment s
SBHN01 RC	19 mm	14.4-15 (Avon Group – Siltstone & Mudstone)	6	8.49	13.27	
BH540	(S) 35 mm	2 - 4 (Avon Group - Sandstone)	0			No data
BH549	(D) 50 mm	8 - 12 (Avon Group - Mudstone)	4	7.68	9.12	
BH545	50 mm	3-13 m (Avon Group - Sandstone & Mudstone)	4	6.35	7.82	

Notes. #1: S denotes a shallow installation and D denotes deep installation.

Groundwater Summary

- **7.4.3** Notable groundwater beneath the Site is present within the sandstone and mudstone lithology of the Avon Group Bedrock.
- 7.4.4 Ground levels at each of the above borehole locations are similar. The maximum resting groundwater as recorded in the 2008 borehole (SBHN01) is much deeper than other recorded levels. The reason for this is uncertain.
- **7.4.5** The 2015 data indicates the groundwater level in BH549 to be deeper than those seen in borehole BH545 which is likely to be a reflection of the general south eastwards flow.

8 Contamination Assessment

8.1 Introduction

- **8.1.1** The following sections provide details of the assessment of land contamination at the Site.
- 8.1.2 The outline Conceptual Site Model (CSM) presented within the 2014 PSSR has been reviewed and updated based on data from the Supplementary Ground Investigation (Geotechnical Engineering, 2015) and the Scheme. The main alterations to the 2014 PSSR model are summarised as follows.
 - Addition of an embankment on Site as well as the proposed cutting.
 - Addition of ground, groundwater and gas dataset from nearby boreholes.
 - Revision of the source/pathway/receptor linkages.

8.2 Preliminary Risk Assessments

Potential Sources

- 8.2.1 The backfill of the quarry on the Site has been identified as the only potential source of contamination existing at the Site. The majority of the fill materials are likely to be removed as a result of the Scheme; however some may remain beneath the road or exposed as part of the cutting and could pose a risk to human health and underlying groundwater.
- The investigations undertaken to date do not fully characterise the in-filled quarry and therefore the risks remain unconfirmed.

Potential Receptors

8.2.3 Receptors during the construction and the operational stages of the Scheme have been considered:

Construction

- Construction workers during Site development works.
- General public adjacent to construction works including residents located 150 m away from the Site.
- Groundwater (principal aquifer), excavations are unlikely to extend below groundwater level however any ground improvement works undertaken on the residual materials (if left in place) may affect the groundwater quality.

Operational

- General public end users;
- General public adjacent to permanent land take including residents located 150 m away from the Site.
- Maintenance workers.
- Groundwater (principal aquifer) within the bedrock.

Potential Pathways

- **8.2.4** Pathways during the construction and the operational stages of the Scheme have been considered:
 - Dermal contact, ingestion, inhalation pathways of potentially contaminated soils possible during development works and maintenance works.
 - Dermal contact, ingestion, inhalation pathways possible for general public end users and general public including residents located 150 m away from the Site.
 - Leaching of contaminants from the backfill material into underlying groundwater aquifer.
 - Vertical or lateral migration of potential ground gas associated with backfill material.

8.3 Risk Evaluation

- 8.3.1 Source-pathway-receptor linkages were considered in the 2014 PSSR using the historical data available up to 2008. With review of the other data described herein, the following risk evaluation has been reconsidered and included.
 - The Site has been subject to unregulated backfilling of an unknown material, with current data only proven for the top meter.
 - Proposed cut associated with the Scheme will remove a proportion of the infill
 material and that left in situ is likely to be engineered for stability or
 encapsulated by proposed embankment.
 - Superficial Deposits to the north are classified as a Secondary A Aquifer.
 Bedrock directly beneath the Site is classified as a Principal Aquifer.
 - Hardstanding cover proposed in some areas of the new section of motorway is likely to limit infiltration thus reducing leaching.
 - There are no nearby surface water receptors and infill material is confined within a below ground quarry feature. Risks to surface water are not therefore considered further for the purpose of this report.
 - Motorway users will be within an open environment with no proposed structures or other confined spaces.

8.4 Human Health Risk Assessment

- 8.4.1 The rationale and approach for the human health (tier 2) screening assessment is detailed in the Land Contamination Assessment Report (Appendix 11.1 of the ES). Soil chemical analysis results and the findings of the generic Tier 2 human health risk assessment are presented in Appendix 3 of this report. There were no exceedances to the relevant generic risk assessment criteria with the exception of chromium.
- 8.4.2 The total chromium concentrations marginally exceed the screening criteria of 33 mg/kg in 2 samples of the Made Ground. The screening criteria is based upon the more toxic and anthropogenic chromium and thus the criteria is very conservative. Chromium concentrations are considered to be within normal

- background data range (<95 mg/kg) and are not therefore considered to represent a contaminant of concern (Appendix 11.1 of the ES).
- All phenols and BTEX were at levels below the laboratory limit of detection. PAHs and TPH were identified at low levels at both locations (total PAHs ranging from 0.21 to 1.7 mg/kg and total TPH from <0.1 to 17 mg/kg). From the four PCB test results, one was marginally above Limit of Detection (LOD) but remained below screening criteria. These are considered unlikely to pose a risk to human health.
- 8.4.4 No other exceedances of the applied assessment criteria have been identified and no asbestos fibres were detected visually or in samples analysed in the laboratory.

8.5 Controlled Waters Screening Assessment

- 8.5.1 The rationale and approach for the controlled water (Tier 1) screening assessment is detailed in the Land Contamination Assessment Report (Appendix 11.1 of the ES) and the groundwater chemical results are presented in Appendix 4 of this report. All exceedances to the relevant generic criteria are summarised in Table 11 and Table 12 for soil leachate and groundwater, respectively.
- Where an EQS is dependent on water hardness i.e. some heavy metals, the hardness of the surface water receptor should normally be used. The Baseline Water Environment report (Appendix 16.2 of the ES) indicates surface water to be generally moderately hard with hardness concentrations within a range of 100 to 150 mg/l as calcium carbonate. Therefore EQSs within this water hardness range have been used for screening purposes.

Soil Leaching Results

8.5.3 Two soil samples were subjected to leaching analysis the results of which are presented in Appendix 5. The majority of the soil leaching results were all below the applied screening criteria, with the exception of the following contaminants.

Table 11: Controlled Waters screening exceedances – soil leaching

Determinant	Units	Range	EQS	DWS			No. exceeded DWS Screening Criteria (Total number of results)	Location
Lead	μg/l	<1 - 6	1.2	10	1 (4)	STPN03 (Made Ground)	0 (4)	-

Note: DWS - Drinking Water Standards

- 8.5.4 There are no surface water courses identified in the near vicinity, therefore, the identified single occurrence exceedance of the stringent EQS is considered to be minor and unlikely to pose a risk to Controlled Waters.
- **8.5.5** Certain laboratory detection levels in samples used in the previous ground investigation for cadmium and cyanide are higher than screening criteria. This is considered unlikely to pose a risk to controlled waters.

Groundwater Results (off site)

- 8.5.6 In the absence of onsite data and for the purpose of this report, nearby available groundwater analytical data has been considered. This aims to identify the local groundwater quality within the vicinity of the Site in order to identify any obvious contamination fingerprint that could be associated with any potential contamination from the Site itself.
- 8.5.7 The groundwater analysis results include data from three rounds of groundwater monitoring results from off site boreholes BH545 and BH549 undertaken in 2015. The groundwater samples were taken from the aquifer body beneath the Site within the Avon Group bedrock.
- 8.5.8 A summary of the exceedances of the screening criteria from all available results relating to this Site is presented in Table 12 and discussed below.

Determinant	Units	Range	EQS	No. exceeded Screening Criteria (Total number of results) against EQS		Location	No. exceeded Screening Criteria (Total number of results) against DWS	Location	
Aquifer (Avon	Group)								
Mercury	μg/l	<0.5 - 0.55	0.07	1	2 (6)	BH545, BH549	0 (6)	-	
Nickel	µg/l	<1 - 7	4	20	1 (6)	BH545	0 (6)	-	
Chloride	mg/l	190 -	250	250	1 (6)	BH549	1 (6)	BH549	

Table 12: Groundwater screening exceedances (off site)

- 8.5.9 The review of the groundwater chemical testing results indicated that the deep groundwater beneath the Site has elevated levels of mercury, nickel and chloride when compared to Environmental Quality Standards criteria.
- **8.5.10** Against Drinking Water Standards, only chloride is identified in marginal exceedance within the Aquifer.
- **8.5.11** All TPH, PAH, VOCs, SVOCs, BTEX, phenols and PCB results were found below the limit of detection.
- **8.5.12** It is noted the laboratory detection levels for some metals, PAH compounds, VOCs and SVOCs are higher than applied screening criteria. This is considered unlikely to pose a risk to controlled waters.

8.6 Ground Gas Risk Assessment

8.6.1 The only ground gas data available relates to off site boreholes BH545 and BH549. These have a response zone within the Avon Group between depths of 3-13 m bgl and 8-12 m bgl, respectively. No data has been made available from the shallow installation of BH549 (2-4 m bgl). Of the 4 no rounds available, the following may be observed.

- No monitoring was undertaken during low barometric pressure (less than 1000 mb), with the lowest conditions being 1011 mb. As such, the worst case atmospheric conditions for potential ground gas generation may have not been monitored.
- Gas flow was generally recorded absent, with the exception of the May round for BH549 which recorded an initial flow of 0.4 l/hr before returning to 0 l/hr.
- Methane has been recorded as nil or up to 0.1 % during all 4 no. rounds, which is well below the screening criteria of 1 %. The Lower Explosion Limit was recorded of up to 1 %.
- Carbon dioxide is identified between 0.1-2.9 %. The data is below the Work Place exposure limit of 5 %.
- Trace of Volatile Organic Compounds of up to 9.2 ppm has been recorded.
- Hydrogen sulphide was recorded as zero throughout.
- Carbon monoxide was recorded absent on all rounds for BH545. However, in BH549 carbon monoxide was recorded of up to 3 ppm for the first two rounds reducing to zero for the following two. Maximum concentration remains well below the Work Place exposure limit of 30 ppm.
- Oxygen has been recorded to be marginally depleted to ambient with concentrations of 17-20.6 %.
- 8.6.2 The available off-site data does not identify obvious gas sources (trace levels of VOCs are considered to be naturally occurring) and is consistent with the expected gas regime given the ground conditions.
- 8.6.3 However, the gas regime within the backfilled quarry remains unknown and additional investigation is recommended to confirm risks.

8.7 Summary

- **8.7.1** The onsite Made Ground analysed has not identified exceedances and is therefore considered to pose a low risk to human health.
- **8.7.2** Very limited leachability has been identified from the Made Ground with marginal exceedance limited to lead on a single sample.
- 8.7.3 The off site aquifer has been identified to have elevated metals or chloride when compared to the Environment Quality Standards. Chloride is the only contaminant in exceedance of the Drinking Water Standards.
- 8.7.4 The off site groundwater quality status is in general keeping with the baseline quality seen within this area of Newport (Appendix 16.2 of the ES). The current limited information indicates no obvious effect to groundwater from the land use of CL-33.
- **8.7.5** The lack of contaminant linkage between the soil and groundwater data is identified.
- 8.7.6 The ground gas regime at the site is not known. The absence of an abnormal gas regime proven by the nearest off-site boreholes is noted.

9 Refined Conceptual Site Model

- 9.1.1 The incorporation of data from the 2015 Supplementary Ground Investigation has enabled the original CSM presented in the 2014 PSSR to be updated. All relevant contaminant (source-pathway-receptor) linkages are considered within the refined CSM. The assessment is based on the Scheme during its construction and operational phases.
- 9.1.2 A CSM representing general ground conditions, overall Scheme layout and relevant source-pathway-receptors (each of which having a specific alphanumerical symbol attached) is presented in Figure 2 and is described in Table 13.

Table 13: Conceptual Site Model

Potential Source	Potential Receptor	Possible Pathway	Likelihood	Severity	Risk	Comment
Quarry in-fill materials	Construction	<u>. </u>		<u>. </u>		
	Construction	Direct dermal (1)	Likely	Moderate	Moderate	Construction workers will be exposed to the
	Workers (B)	Ingestion (2)	Likely	Moderate	Moderate	infill materials during Site construction works;
		Inhalation of soil derived dust (3)	Likely	Moderate	Moderate	however exposure duration will be short term only. Use of PPE and good hygiene practice throughout earthworks and construction phase is considered sufficient to mitigate risks presented. Current data set identify limited exceedances to the selected screening criteria. Current contamination status is not foreseen to represent abnormal constraints to construction workers health & safety over and above those typical of a brown field Site. Made Ground generally granular and may represent a possible pathway for vertical and lateral migration. Additional investigation and soil testing required to confirm the characteristic of Made Ground and associated risks. Dust suppression measures are recommended during construction works.
		Inhalation of soil gas or vapour (3)	Likely	Moderate	Moderate	Construction workers may be exposed to ground gas potentially generated by the quarry in-fill materials during the excavation and ground improvement works. No onsite ground gas data. Gas monitoring from nearby off site boreholes indicates presence of low concentrations of VOCs and carbon dioxide. However the data does not present evidence of gas source. Additional investigation and soil testing required to confirm the characteristic of the Made Ground and associated risks.
	Site neighbours/	Dermal contact with	Low	Low	Low	During construction there is the possibility of

Foundation works risk assessment would be required on confirmation of ground improvement method.

10 Conclusions and Recommendations

10.1 Conclusions

- 10.1.1 The proposed earthworks include a shallow cut (depth currently unknown) through the south eastern end of the Site. The construction of an embankment is also considered, running over the Site on an east to west trend and bridging over the cutting section.
- **10.1.2** Limited ground investigations have been undertaken to enable the Site to be assessed for the risks of contamination on the Scheme including human health and controlled waters.
- 10.1.3 The nature and extent of the potential contamination has not been confirmed. However, it is unlikely to pose a risk to the Scheme.
- 10.1.4 In order to confirm the moderate to low risks associated with the Site in relation to both construction and operational phases, and the suitability for reuse within the Scheme, it is recommended that supplementary intrusive investigations are undertaken.
- 10.1.5 The results of the recommended supplementary investigations should be assessed in relation to identified receptors and inform the selection of appropriate health and safety and mitigation measures for the construction works and operational phase, if required.

10.2 Recommendations

- Only limited ground investigation has been undertaken at the site and although the likelihood of any contamination at the site is relatively low, due to the site's history, localised contamination may have occurred. As such it is recommended that a supplementary ground investigation is undertaken to verify the risk levels described in this report. Should contamination be identified that could cause an unacceptable risk to the identified receptors, then remedial requirements would be identified within a remedial strategy for the Scheme.
- 10.2.2 A remediation strategy for the Scheme should be developed that for this Site should include the following.
 - Addressing potential human health and controlled waters risk identified by the proposed additional ground investigation.
 - Monitoring and risk assessment of perched water if identified to be present within the backfilled quarry and if applicable of the aquifer beneath.
 - Dealing with unexpected contamination.
 - Verification sampling strategy to confirm suitability for soils for retention / reuse.
 - Control measures (over and above good practice construction management) to prevent risks to construction workers and the general public during construction.
 - Verification of material used as topsoil.

- **10.2.3** The remediation strategy should include a remediation options appraisal, remediation implementation plan and remediation verification plan.
- The remediation strategy should be supported by a Scheme wide Material Management Plan prepared in accordance with CL:AIRE Code of Practice (CL:AIRE, 2011).

Groundwater Readings
For Installations

Fig no.

NOTES: SPIE=Piezometer, SP=Standpipe

For multiple installations, use different Installation IDs.

For piezometers installation depth = tip depth. For standpipes = base of pipe

COMMENTS SBHM01 RC installation extends 0.50m above ground level. - symbol indicates water level is above GL

All groundwater levels are recorded from ground level

				els are recor	ded from	n ground

1 Introduction

1.1 Background

- **1.1.1** This report relates to an area of land potentially affected by contamination (CL-35) known as 'Magor Services' hereinafter referred to as the Site.
- **1.1.2** The Site is located between chainage 20,900 and 21,200 (See Figure 1), upon a motorway service station.

1.2 Reporting Context

- 1.2.1 The Site has been assessed as part of ground investigations and monitoring associated with the wider works for the M4 Corridor around Newport (M4CaN) (hereafter referred to as the "Scheme") and informs the baseline for the environmental impact assessment (EIA) for the Scheme. The EIA is reported in the M4CaN Environmental Statement (ES) of which this document is an appendix to the chapter on Geology and Soils.
- 1.2.2 In 2014, a Preliminary Sources Study Report (2014 PSSR) was prepared as an initial land contamination appraisal (Ove, Arup & Partners, 2014) as part of DMRB Stage 2 Assessments for this Scheme. This identified a number of individual areas that may have been affected by contamination as a result of historical activities at the Site. In addition, this report draws upon the 2015 Supplementary Ground Investigation Works undertaken on behalf of the Welsh Government (Geotechnical Engineering, 2015). This report relates to the area defined on the Site Location Plan Figure 1.
- 1.2.3 The overarching rationale and approach for the assessment of areas of land along the Scheme with potential contamination is detailed in the Land Contamination Assessment Report (Appendix 11.1 of the ES).

1.3 Objectives

- **1.3.1** The key objectives of this report are as follows:
 - Undertake a risk assessment of the site and determine whether potential risks to human health or controlled waters could exist based upon the Scheme.
 - Identify the need for further assessment and investigation in order to refine potential land contamination risks and inform the need for remediation/mitigation.
 - To provide information to support the Ground Investigation Report (GIR) and Geotechnical Design Report (GDR) required under DMRB HD22/08 (Highways Agency, 2008).

1.4 Report Structure

- **1.4.1** The remainder of this report is structured as follows:
 - Section 2: Site Location and Description This section summarises the Site description.

- Section 3: The Scheme This section details the Scheme alignment and associated features and at the Site.
- Section 4: Site History This section summarises the history of the Site based on historical maps and historical land photographs.
- Section 5: Environmental Setting This section summarises the Site description, published geology, hydrology and hydrogeology and any relevant environmental information presented in the 2014 PSSR.
- Section 6: Scope of Ground Investigations Work This section describes the previous and supplementary ground investigation data available for the Site.
- Section 7: Ground Conditions This section describes the main findings of the intrusive site investigation including the ground conditions encountered and visual or olfactory evidence of contamination identified.
- Section 8: Contamination Assessment This section describes the findings of the Tier 1 and Tier 2 contamination risk assessment based upon potential contamination sources, potential receptors and potential contaminant linkages and presents the human health and controlled waters assessments.
- Section 9: Refined Site Conceptual Model This section presents the Conceptual Site Model (CSM) for the Site and identifies potential contaminant linkages, based upon the findings of the data presented within Sections 2 to 7.
- Section 10: Conclusions and Recommendations This section provides conclusions concerning the likelihood of land contamination associated with the Site affecting the Scheme and requirements for remediation/mitigation.

2 Site Location and Description

2.1 Site Location

- 2.1.1 The CL-35 site is located within the eastern part of the Scheme immediately north of Junction 23A of the M4 and is centred on National Grid Reference ST422 880. The location of the Site is presented on Figure 1. The Site covers an area of approximately 7.5 ha.
- **2.1.2** The Site is a service station that broadly comprises a main services building with hotel, a petrol station, car/HGV parking and landscaped/vegetated areas.
- 2.1.3 The slip roads to the M4/A4810 interchange form the southern boundary of the Site. The Site is bounded by minor roads and fields to the northwest and northeast. The services were under construction in 1991 and first opened in 1996, with further development in 1998.
- 2.1.4 Site walkover surveys undertaken in January 2014 and May 2015 identified that the Site appears to have been constructed on a fill platform, some 3 m to 4 m in height. Evidence of minor fly tipping, particularly around the parking areas, was identified and included tyres, plastics and wood. Photographs from the Site walkover are provided in Appendix 4.
- **2.1.5** Site layout is shown in Figure 1.

3 The Scheme

- 3.1.1 The Site is located on the M4 Corridor around Newport at approximate chainage 20,900 and 21,200. Refer to Figure 1 for the Site location in relation to the Scheme.
- 3.1.2 The reconstruction of the Magor Interchange would include realignment of the M48 to the north. This would result in an embankment into the south eastern corner of the CL-35 Site area.
- 3.1.3 The existing St Bridge's Road bounds the eastern boundary of the Site and its alignment would be altered to include so up to 4 m cutting along a short section of the Site. The removed soils may either be reused within the Scheme, if proven to be suitable for reuse, or disposed to a suitable landfill.

4 Site History

- 4.1.1 The 2014 PSSR historical searches have been based on Ordnance Survey plans, literature reviews, information provided by British Steel, Natural Resources Wales (NRW) (formerly Environment Agency Wales), Newport City Council and aerial photographic interpretation.
- **4.1.2** This is supplemented by a review of historical maps opened in 2015 from Welsh Government. Relevant extracts are presented in Appendix 5.
- **4.1.3** A summary of the Site's history is presented in Table 1 below.

Table 1: Summary of Site History

Date	Land Use & Surrounding Land Use (200m)	Source of Information
1843 - 1893	The Site comprises a number of agricultural fields and is bound to the northeast and northwest by minor roads. A small copse is located in the east. St Brides Brook is located running north-south approximately 90m to the east.	1:10,560 Historical Mapping
1891 - 1912	No significant change	1:10,560 Historical Mapping
1904 - 1939	No significant change	1:10,560 Historical Mapping
1964 – 1965	No significant change	1:10,560 Historical Mapping
1969	The M4 motorway and Junction 23A have been constructed along the southern boundary of the Site. The copse onsite is no longer there. The town of Magor has expanded to within 175 m to the south of the Site.	Aerial Photography
1969 - 1971	No significant change	1:10,560 Historical Mapping
1985 - 1996	No significant change	1:10,000 Historical Mapping
1991	Construction of the service station complex is in progress across the Site.	Aerial Photography
1998	A service station has been developed in the centre of the Site with associated landscaping around it. The petrol station is located in the southwest of Site.	Aerial Photography
2006	No significant change	Aerial Photography
2009 - 2010	A hotel is under construction approximately 90 m to the southwest of the Site.	Aerial Photography
2013 - 2014	The vegetation around the areas of hardstanding has matured.	Aerial Photography

^{*}Notes. Potential sources of contamination are underlined. Those within the temporary and permanent land take are shown in bold.

- **4.1.4** The sources of information presented above supplement those used in the 2014 PSSR. Relevant extract of the photographs are presented in Appendix 5.
- **4.1.5** The review of the Site history indicates the Site remained as open fields until the construction of the service station in the late 1990s.
- 4.1.6 Historically the Site is located in proximity to areas which may have been bombed during World War II which is discussed in the Explosive Ordnance Threat Assessment Report (Bactec, 2014). This categorises the Site as low risk with respect to unexploded ordnance

5 Environmental Setting

5.1 Geology

5.1.1 British Geological Survey (BGS) data indicates that superficial deposits are only present along the eastern boundary of the Site comprising River Terrace Deposits. The bedrock underlying the south of the Site comprises dolomitic conglomerate of the Mercia Mudstone Group (marginal facies) and the north of the Site comprises the Avon Group Carboniferous Limestones.

5.2 Hydrology

5.2.1 A drainage pond is present in the southeast corner of the Site which appears to be part of the services drainage system rather than the neighbouring M4 drainage system. St Bride's Brook is located approximately 75 m to the east of the Site.

5.3 Hydrogeology

- 5.3.1 NRW classifies the River Terrace Deposits as a Secondary A Aquifer and the bedrock as a Principal Aquifer.
- 5.3.2 The Site does not lie within a groundwater source protection zone. However it lies within a groundwater vulnerability zone classified as a major aquifer with intermediate leaching potential.

5.4 Environmental Information

- NRW records indicate a single pollution incident occurred within the Site which had minor impact on land and no impact on air and water. The incident was in relation to an unauthorised waste management activity in relation to metal waste. Another pollution incident occurred within the Site but this had no impact on land, air or water. Two further pollution incidents occurred within 300 m of the Site which had no impact on land, however had a minor impact on water due to discharge of oils/fuel to the St Bride's Brook.
- **5.4.2** Based on the above the onsite incident could represent a minor source of potential contamination that should require due consideration in the relation to the Scheme.
- 5.4.3 A discharge consent to an unidentified non-tidal watercourse has been held by the service station since 1995. The discharge point is shown to be located approximately 200 m to the south of the Site. However, there are no watercourses at this location. The location of the discharge consent therefore appears to be different to the one shown but it is anticipated that the discharge consent will be to St Bride's Brook as there are no other watercourses in the vicinity of the Site.
- 5.4.4 NRW records indicate no further pollution incidents, landfills, abstraction or discharge points are located within 300 m of the Site.
- **5.4.5** The Magor Marsh SSSI is located approximately 1 km to the south.

6 Scope of Investigations

6.1 General

- **6.1.1** Two intrusive ground investigations have been undertaken within the Site. The information has been summarised below.
- 6.1.2 For the purpose of meeting the requirements of Volume 4, Section 1, Part 2 of the DMRB (Highways Agency, 2008), the historical data used to support the 2014 PSSR has differentiated from additional 2015 Supplementary Ground Investigation data (Geotechnical Engineering, 2015).

6.2 Scope of Works

6.2.1 The various intrusive ground investigations undertaken within the Site area are summarised in Table 2.

Table 2: Site Investigation Summary

Date	Contractor	Site Location	Boreholes	Window Sampler	Trial Pits	Sampling
1997	Norwest Holst	Southeast	BHN7 BHN8	-	-	None
2015	Geotechnical Engineering	Central	BH551	-	-	Soil

6.2.2 The well construction details of all boreholes installed on the Site are summarised in Table 3.

Table 3: Summary of Borehole Construction Details

Borehole ID	Diameter (mm)	Total Drilled Depth (m)	Top of Slotted Well Casing / Gravel Pack (mbGL)	Base of Slotted Well Casing / Gravel Pack (mbGL)	Targeted Geology
BHN7	50 (unspecified on logs)	20.2	Unspecified	20.2	Mercia Mudstone Group marginal Facies (Dolomite / Sandstone)
BHN8	50 (unspecified on logs)	15	4.5	9.5	Mercia Mudstone Group Marginal Facies (Dolomite)

6.3 Surface Water Quality Sampling

6.3.1 Surface water quality monitoring was undertaken on four occasions at the following location during winter 2007 and spring and summer 2008.

Table 4: Surface Water Monitoring Locations

Surface water location ID	Location description	Comments
R19	Located at St Brides Brook, approximately 230m southeast of the Site.	Fast flow; water brown in colour. SW outfalls draining into reen above sampling point.

- 6.3.2 The surface water chemical results are presented in the baseline surface quality monitoring interim report by Titan Environmental Surveys Limited (Titan Environmental Survey Ltd, 2008) which also presents the baseline water quality monitoring programme of watercourse located near the proposed alignment at the time of the study.
- 6.3.3 The results and a review of all sample locations are also presented in the Baseline Water Environment report (Appendix 16.2 of the ES).

6.4 Field Testing

6.4.1 Monitoring of Volatile Organic Compounds (VOCs) was undertaken on three soil samples from BH551 at 0-0.4 mbGL, 0.4-0.8 mbGL and 0.8-1.2 mbGL

6.5 Groundwater Monitoring

6.5.1 A summary of the groundwater sampling, groundwater / monitoring and ground gas monitoring is shown in Table 6.

Table 5: Summary of Monitoring Rounds

Location Ref.	Number of rounds (Date of sampling)	Monitoring details	Notes
BHN8	6no.	Groundwater level	

6.6 Laboratory Chemical Testing

6.6.1 A summary of the contamination results from the previous site investigations is shown below.

Table 6: Summary of previous investigation sampling

Site Investigation date	No. of soil samples	No. of leachate samples	No. of water samples	Suites of testing
2015	1	0	0	Metals, PAH, pH, cyanide

Soil Analysis

6.6.2 The following sections summarise the laboratory analytical results for the single soil samples collected during the various intrusive investigation phases. The available data set has been tabulated and is presented in Appendix 2. The supporting laboratory certificates available in the relevant original ground investigation report.

6.6.3 The analytical data relates to topsoil material as summarised below:

Table 7: Summary of Analytical Soil Data

	Number of Soil Analysis per Analytical Suite - 2015 data											
Unit Metals & PCB PAH TPH Phenol							Pthalates	voc	SVOC			
Topsoil	1	0	1	0	0	0	0	0	0			

Note: PAH - Polycyclic Aromatic Hydrocarbons, TPH - Total Petroleum Hydrocarbon, VOC - Volatile Organic Compounds, SVOC - Semi Volatile Organic Compounds

Soil Leaching Analysis

6.6.4 No leachate analysis has been undertaken for the Site during the previous ground investigation.

Groundwater Results

6.6.5 No groundwater analysis has been undertaken for the Site or within the immediate vicinity during the previous ground investigation.

Surface Water Results

6.6.6 The following sections summarise the laboratory analytical results for surface water samples collected during the various monitoring rounds. The available data set has been tabulated in a table format and is presented in Appendix 3 with supporting laboratory certificates available in the relevant original reports.

Table 8: Summary of Analytical Surface Water Data

Surface Water System	Number of W All GI data	Number of Water Analysis per Analytical Suite (number of locations) – 2015 data / All Gl data									
	Metals & inorganics	Water quality parameters	Polycyclic Aromatic Hydrocarbons	Total Petroleum Hydrocarbon	BTEX						
St Brides Brook	0 (1) / 4 (1)	0 (1) / 4 (1)	0 (1) / 0 (1)	0 (1) / 4 (1)	0 (1) / 2 (1)						

6.7 Gap Analysis of Available Data

6.7.1 The investigation data available for the Site is limited both in term of intrusive scope of works and analytical data. In particular, the laboratory data does not include full organic analytical suite, despite this being the main contaminants of concerns. Also there is no groundwater data available.

7 Ground Conditions

7.1 Geology

7.1.1 The geological logs for all available exploratory holes excavated on or in close proximity to the Site are provided in Appendix 1. The observed geological sequence is consistent with that discussed in the PSSR report and is summarised in the following sections. Information from the Supplementary Ground Investigation (Geotechnical Engineering, 2015) has also been used.

Superficial Deposits

- 7.1.2 Unconsolidated superficial deposits were encountered in all locations. These comprised Head Deposits, generally comprising a reddish brown sandy clay at thicknesses of 0.8 3 m. A gravelly sand with occasional cobbles was encountered below a clay topsoil within BH551.
- 7.1.3 The 2014 PSSR indicated that these superficial deposits may have been partially reworked during the construction of the service station as engineered fill. Evidence of reworking is not evident from the available borehole records.

Solid Geology

- 7.1.4 The bedrock was encountered at relatively shallow depth below the Head deposits and comprised Marginal Facies of the Mercia Mudstone Group (MFMMG). This included a number of different lithologies; namely sandstone, dolomite, mudstones, conglomerate and breccia.
- **7.1.5** The base of the MFMMG was unproven during either ground investigation.

Geological Sequence Summary

7.1.6 The general geological sequence identified during the previous ground investigations is summarised in Table 9.

Table 9: Summary of Geological Sequence

Unit	Description	Thickness Range (m)	Basal depth (mbGL)
Head Deposits	Reddish brown sandy clay, gravelly sand.	0.8 - 3	1.2 - 3
Marginal Facies of the Mercia Mudstone Group	Dolomite, sandstone, mudstone, conglomerate and breccia.	>12->17.2	unproven

- 7.1.7 Given the limited onsite data, a review of exploratory borehole and trial records outside the Site Boundary has been undertaken to further improve the understanding of ground and groundwater conditions. Boreholes SBHN03RC (Norwest 2008), boreholes BH552 and BH554 (Geotechnical Engineering, 2015) and trial pit STPN05 (Geotechnical Engineering, 2015). These are located some 10-20 m south east of the Site.
- **7.1.8** From this additional information, predominantly coarse material of the river terrace deposits may be present at the south eastern corner of the Site beneath

- the Head Deposits. The River Terrace Deposits are anticipated to be up to 3 m in thickness and overlies the MFMMG bedrock.
- **7.1.9** The conceptual ground model included within the 2014 PSSR report has been revised in light of the 2015 information and is presented within Figure 2.

7.2 Visual and Olfactory Evidence of Contamination

- **7.2.1** No visual or olfactory evidence of contamination was identified during the previous ground investigations.
- 7.2.2 PID monitoring was undertaken on three soil samples from BH551. The PID meter recorded levels of between 1.2 and 1.9 ppm within the Head Deposits and Mercia Mudstone indicating the presence of low level naturally occurring VOCs.
- **7.2.3** Full details and observations noted during the drilling are presented on the exploratory logs attached in Appendix 1.

7.3 Gas Monitoring

7.3.1 No gas monitoring dataset from the previous ground investigations is available for the Site.

7.4 Groundwater

Groundwater Encountered During Investigation

7.4.1 A water strike was encountered during the advancement of borehole BHN7 during the 1997 investigation as detailed on the geological logs provided in Appendix 1. This together with additional water level information provided by the exploratory borehole records is summarised below:

Table 10: Summary of Groundwater & Leachate Water Level Data

Location	Strike Depth (m bGL)	Geological Formation	Level after 20 minutes (mbGL)	Comments
	12.1	Marginal Facies of the Mercia Mudstone Group (Dolomite)	0.0 (log state time taken to rise is 0)	Uncertain on the accuracy of the recorded resting level
BHN7				Water level recorded at 12.1 and 12.51 m bGL (5.49 m AOD) when borehole taken into dolomite within MFMMG (15.7 m bGL)
				Water level recorded at 12.27 m bGL (5.73 m AOD) when borehole taken into sandstone within MFMMG (20.2 m bGL)
BHN8				Water level recorded at 5.2 m bGL (7 m AOD) when borehole taken into conglomerate within MFMMG (10 m bGL)

Location	Strike Depth (m bGL)	Geological Formation	Level after 20 minutes (mbGL)	Comments
				Water level recorded at 5.69 m bGL (6.51 m AOD) when borehole complete within mudstone of MFMMG (15 m bGL)

7.4.2 Groundwater was not encountered in any other boreholes.

Groundwater Level Dataset

7.4.3 The entire groundwater level dataset gathered is provided in Norwest Holst, 1997 report and summarised in Table 11.

Table 11: Summary of Groundwater Level Data

Location	Installation ^{#1}	Depth of response zone (mbGL) and Geological Formation	No. Measurements	Minimum Depth (mbGL)	Maximum Depth (mbGL)	Comments
BHN8	50 mm	4.5 - 9.5 MFMMG (Dolomite & Conglomerate)	6	4.07	5.64	

Notes. #1: S denotes a shallow installation and D denotes deep installation.

Groundwater Summary

- 7.4.4 The main deep groundwater body within the bedrock is likely to be influenced by the variable sequence of mudstone, conglomerates and sandstone. It has been identified with a fairly stable resting water level around 4-5 m bGL (6.5-8 m AOD) within the dolomite of the MFMMG at borehole BHN08.
- 7.4.5 The off site borehole SBHN03 indicating water level at around 0.4-0.8 m bGL during drilling with the river terrace deposits. The piezometric equipment installed 8 m into the MFMMG recorded a resting water level between 1.07-2.37 m bGL (9.39-9.69 m AOD) indicating possible hydraulic continuity between the superficial deposits and bedrock.
- **7.4.6** Perched groundwater is anticipated within the more granular horizons of the Head Deposits and within the river terrace deposits.
- 7.4.7 The various perched and deep groundwater bodies are considered to be in hydraulic continuity with the St Brides Brook, although this would need to be confirmed given the limited groundwater levels available.

8 Contamination Assessment

- **8.1.1** The following sections provide details of the assessment of land contamination at the site.
- 8.1.2 The outline Conceptual Site Model (CSM) presented within the 2014 PSSR has been reviewed and updated based on data from the Supplementary Ground Investigation (Geotechnical Engineering, 2015) and the Scheme. The main alteration to the 2014 PSSR model are summarised as follows:
 - Review of possible sources.
 - Addition of off site groundwater and gas dataset.
 - Alteration of the geological model.
 - Update of the source/pathway/receptor linkages taking account of the above and more detailed assessments.

8.2 Preliminary Risk Assessment

Potential Sources

- 8.2.1 The Site is being used as a service station and any associated potentially contaminated soil, hydrocarbons and buried fuel tanks has been identified as a potential source of contamination. The area of the petrol station does not form part of the Scheme and therefore the liabilities associated with any contamination that it may cause would remain with the current land owner. Also the proposed earthworks associated with the M4 highway relates to the edges of the service station ownership, in undeveloped woodland areas. Potentially contaminated soil, hydrocarbons and buried fuel tanks associated with the service station are therefore considered as "off site" sources in the context of the M4 highway Scheme.
- **8.2.2** Potential contamination sources to the M4 Scheme are therefore migratory by products from contamination soils, hydrocarbon and buried fuel tanks, through soil matrix, perched groundwater or aquifer.
- 8.2.3 Fill material has been used for services development. No evidence of man-made material has been identified in the limited data and it is assumed the fill, if present, consists or reworked soils of the Head Deposits. On the basis of the current information, fill material is not considered a potential source of contamination.
- 8.2.4 As the fly tipping observed during the site walkover in the northern area of the services was only minor, it is not anticipated to be a potential source of contamination and is located away from the Scheme.

Potential Receptors

8.2.5 Receptors during the construction and the operational stages of the Scheme have been considered:

Construction

• Construction workers during site development works.

- Service Station users (staff/personnel and visitors).
- Groundwater in the Secondary A aquifer within the River Terrace Deposits and the Principal aquifer within the bedrock.
- St Brides Brook located approximately 75 m east from the Site.

Operational

- Maintenance workers.
- General public end users.
- Groundwater in the Secondary A aquifer within the River Terrace Deposits and the Principal aquifer within the bedrock.
- St Brides Brook located approximately 75 m east from the Site.

Potential Pathways

- **8.2.6** Pathways during the construction and the operational phases of the Scheme have been considered:
 - Dermal contact, ingestion, inhalation pathways of potentially contaminated soils possible during construction and maintenance works.
 - Dermal contact (dust only), ingestion (dust only) and inhalation (dust and hydrocarbon vapour) pathways possible for general public end users.
 - Lateral migration of hydrocarbon contamination from the underlying perched water (within the Head Deposit) or aquifers (within the superficial deposits and the underlying bedrock) from off site sources onto the Site during any dewatering associated with the construction phase or land drainage during the operation.
 - Lateral migration of perched water with elevated contaminants within the Head Deposit or aquifers to land drainage (surface waters).

8.3 Risk Evaluation

- 8.3.1 Source-pathway-receptor linkages were considered in the 2014 PSSR using the historical data available up to 2008. With review of the other data described herein, the following risk evaluation has been reconsidered and included:
 - Proposed cutting for the St Bridge's Road realignment is to recess the
 existing face closer towards the service station. The M4 slip road at the
 southern end of the Site will require new embankment. The land take as part
 of the earthworks on both highways only relates to undeveloped wooded
 areas of Magor Stations where no potential contaminated land sources area
 anticipated.
 - There have been two recorded pollution incidents within the Site (exact location unknown) although they had either minor or no impact.
 - The main contamination of concern to affect the M4 corridor are associated with hydrocarbons, subject to be a mechanism of transport given the sources are outside the area of cutting.

- The main mechanism of transport is considered to be associated with migration of hydrocarbon from groundwater with elevated concentrations of the river terrace deposits and/or bedrock.
- The presence of hardstanding at ground level within the fuel station and car park and the underlying predominantly cohesive Head Deposits would limit vertical contamination migration from accidental spillage into the aquifer. The buried tanks may however be within or at close proximity to the rockhead.
- The predominantly cohesive Head Deposits would limit lateral contamination migration from accidental spillage or leakages within the soil matrix. The distance source / receptors is noted to be in excess of 50 m. In the absence of viable pathways, the lateral migration in the soil matrix in not considered further in the conceptual model.
- The bedrock beneath the site contains a Principal Aquifer overlain by a thin layer of head deposits. The superficial deposits (river terrace deposits) to the north east contain a Secondary A Aquifer. These are anticipated to be in hydraulic continuity.
- Perched groundwater within the Head Deposits is not considered a water resource due to its anticipated low vertical hydraulic continuity with the aquifer beneath, low permeability and storage capacity. This is considered as pore waters and not as an aquifer.
- New cutting may intersect soils, perched water within the Head Deposits or groundwater within the aquifers with possible elevated hydrocarbon concentrations and increase the risk of migration into new highway drainage.
- Motorway users will be within open environment with no proposed structure or other confined spaces.

8.4 Human Health Risk Assessment

- 8.4.1 The rational and approach for the human health (Tier 2) screening assessment is detailed in the Land Contamination Assessment Report (Appendix 11.1 of the ES). Soil chemical analysis results and the findings of the generic tier 2 human health risk assessment are presented in Appendix 2.
- **8.4.2** There were no exceedances of the single soil sample (topsoil) to the relevant criteria screening criteria onsite.

8.5 Controlled Waters Screening Assessment

- 8.5.1 The rationale and approach for the controlled waters (Tier 1) screening assessment is detailed in the Land Contamination Assessment Report (Appendix 11.1 of the ES) and the surface water chemical results are presented in Appendix 3. All exceedances to the relevant criteria is summarised in Table 12 for surface waters.
- Where an EQS is dependent on water hardness (i.e. some heavy metals), the hardness of the surface water receptor should normally be used. The Baseline Water Environment Report (Appendix 16.2 of the ES) indicates surface water to be generally moderately hard with hardness in a range of 100 to 150 mg/l as calcium carbonate. Therefore EQSs within this water hardness range have been used for screening purposes

Groundwater Results

8.5.3 There is no analytical data available for groundwater beneath or in the vicinity of the Site from the previous ground investigations.

Surface Water

8.5.4 A total of four surface water samples were taken and analysed from St Brides Brook located approximately 230 m southeast of the Site. A summary of the exceedances of the screening criteria are shown in Table 12 below.

Table 12: Summary of Surface Water Screening Assessment

Parameter	Unit	No. Analyses	No. Analyses Above LOD	Minimum Concentration	Max Concentration	Location & Round with Max. Concentration	EQS	No. Analyses Exceeding EQS	DWS	No Analyses Exceeding DWS	CCW Trigger Level	No Analyses Exceeding CCW Trigger Level
Cadmium	ug/l	4	4	<0.5	1.4	R19 / E3	0.15	1	5	0	5	0
Dissolved Oxygen	%	4	4	93.8	106.5	R19 / E2	60	4	-	-	-	-
Nitrate as NO3	mg/l	4	4	10.2	15.1	R19 / E1	-	-	50	0	1	4
Nitrate as N	mg/l	4	4	2.3	3.4	R19 / E1 & E2	-	-	50	0	1	4
TON	mg/l	4	4	2.3	3.4	R19 / E1 & E2	-	-	50	0	2	4

- **8.5.5** The water quality within St Brides Brook is generally good, with cadmium as the only parameter to exceed its EQS.
- 8.5.6 Nitrate (NO₃), Nitrate (as N) and Total Oxidised Nitrogen were consistently recorded above NRW trigger levels throughout all monitoring rounds.
- 8.5.7 Dissolved oxygen was recorded as consistently above the EQS of <60 %.
- 8.5.8 As cadmium has been identified at a low concentration within the single soil sample from the Site, there is no evidence to indicate that the Site is impacting the surface water quality of St Brides Brook. The results are presented in baseline water quality monitoring report Titan Environmental Services Report (Titan Environmental Surveys Ltd, 2008).

8.6 Ground Gas Risk Assessment

8.6.1 No gas data from the previous ground investigations is available for this Site or immediate surrounding and therefore no risk assessment has been undertaken.

8.7 Summary

- **8.7.1** Given the limited intrusive and analytical information to date, further assessment is recommended.
- 8.7.2 The monitoring point located down stream of St Bides Brook relative to the site does not show obvious impact that may be attributed to the Site.

9 Refined Conceptual Model

- 9.1.1 The incorporation of data from the 2015 supplementary Ground Investigation has enabled the original CSM presented in the 2014 PSSR to be updated. Relevant contaminant (Source-Pathway-Receptor) linkages are considered within the refined CSM. The assessment is based on the Scheme during construction and operational phases.
- 9.1.2 A CSM representing general ground conditions, overall Scheme layout and relevant source/pathway/receptors (each of which having a specific alphanumerical symbol attached) are presented in Figure 2 and is described in Table 13.

Table 13: Site Conceptual Model

Potential Source	Potential Receptor	Possible Pathway	Likelihood	Severity	Risk	Comment
On Site	Construction					
Potential hydrocarbon contamination from the area of petrol filling station transported via	Construction Workers (B)	Direct dermal with contaminated soils and groundwater (1)	Low	Moderate	Moderate to low	Current limited data set (visually based) identified no gross contamination to be present. Overall current contamination status is not
groundwater of the aquifers		Ingestion of soils and groundwater (3)	Low Moderate Low Moderate		Moderate to low	foreseen to represent abnormal constraints to construction workers health & safety over and above those typical of a brown field Site.
Services users (staff/personnel and visitors) (A)		Inhalation of soil dust (2)			Moderate to low	Localised areas with elevated hydrocarbon concentrations, if present may however require
		Inhalation of hydrocarbon vapours (2)	Low	Moderate	Moderate to low	specific precautions and possibly specialist contractors to enable remediation. Further investigations are required to delineate the possible presence of hydrocarbon contamination.
	Direct dermal with soil dust(1)	Low	Moderate	Moderate to low	During construction there is the possibility of dermal contact and inhalation of soil dust with	
	Ingestion of soil dust(3)	Low	Moderate	Moderate to low	elevated hydrocarbon concentrations, short term exposure only. Dust suppression measures are recommended	
		Inhalation of soil dust (2)		Moderate	Moderate to low	during construction works. Further investigations are required to delineate the possible presence of hydrocarbon
		Inhalation of hydrocarbon vapours (2)	Low	Moderate	Moderate- to low	contamination.

Potential Source	Potential Receptor	Possible Pathway	Likelihood	Severity	Risk	Comment
	Groundwaters (Ca)	Migration (4)	Low	Moderate	Moderate to low	Potential contaminants in the groundwaters and surround soils may be mobilised during ground disturbance works. Dewatering works to support construction phase may draw additional contamination from the source areas (fuel service). Further investigation is recommended to confirm any potential risk.
	Surface water (land drainage) (D)	Saturated flow within groundwater (4)	Low	Moderate	Moderate to low	Perched (shallow) groundwater may be intercepted by the land drainage. Surface water data does not indicate existing elevated contaminant concentrations that may be attributed to the Site land use. Proposed cutting may increase dewatering effect beneath the service station and increase flux of contamination. Potential contaminants in the groundwaters and surround soils may be mobilised during ground disturbance works. Further investigation is recommended to confirm any potential risk.
		Surface water run-off (5)	Low	Moderate	Moderate to low	Surface water run-off may deteriorate the quality of surface water. Construction process to adopt surface water control and management.
	Operational		1			

Potential Source	Potential Receptor	Possible Pathway	Likelihood	Severity	Risk	Comment				
	Maintenance Workers (B)	Direct dermal(1)	Unlikely	Moderate	Low	Areas outside the motorway hardstanding are likely to receive topsoil cover and vegetation establishment, reducing potential of exposure. Exposure duration will be short term only. Site specific risk assessment will be required in line with H&S guidance. This will enable safe methodology and appropriate level of PPE to be put in place. As such all-risks will be duly considered and suitably mitigated. Hydrocarbon vapours that may be released by the residual hydrocarbon contamination post shallow remedial works would accumulate				
		Ingestion(3)	Unlikely	Moderate	Low	within confined spaces such as inspection manholes. Migration of hydrocarbon from off site sources may				
		Inhalation of soil dust (2)	Unlikely	Moderate	Low	continue following transport mechanism of the groundwaters. Further investigation is recommended to				
		Inhalation of hydrocarbon vapours (2)	Unlikely	Moderate	Low	confirm any potential risk.				
	Future Motorway Users (A) and	Direct dermal (1)	Unlikely	Moderate	Low	During operation there is the possibility of short term exposure only.				
Services users	Services users (staff/personnel) (C)	Ingestion(3)	Unlikely	Moderate	Low	Further investigation is recommended to confirm any potential risk.				
		Inhalation of soil dust (2)	Unlikely	Moderate	Low					
	Groundwater (Ca)	Migration (4)	Low	Moderate	Moderate to low	Dewatering works associated with cutting (if below groundwater level) may draw additional contamination from the source areas (fuel service). Further investigation is recommended to confirm any potential risk.				

Potential Source	Potential Receptor	Possible Pathway	Likelihood	Severity	Risk	Comment
	Surface water (land drainage) (D)	Saturated flow within groundwater (4)	Low	Moderate	Moderate to low	Perched (shallow) groundwater may be intercepted by the land drainage. Surface water data does not indicate existing elevated contaminants that may be attributed to the Site land use. Proposed cutting may increase dewatering effect beneath the service station and increase flux of contamination. Further investigation is recommended to confirm any potential risk.

10 Conclusions and Recommendations

- 10.1.1 Limited ground Investigations have been at the Site to assess risks from land contamination associated with the construction and operation of the Scheme including human health and controlled waters.
- 10.1.2 Gross contamination associated with the Site's historical and current use has not been identified. Visual or olfactory evidence of oil/fuel contamination within the soils or bedrock has not visually been reported within the borehole records.
- 10.1.3 The review of the existing information indicates that the in-fill materials used for the construction of the services, if present, comprises reworked Head Deposits. As such it is unlikely to pose a viable risk to the Scheme.
- 10.1.4 In order to confirm the moderate to low risks associated with the Site in relation to both construction and operational phases, and the suitability for reuse within the Scheme, it is recommended that supplementary intrusive investigations are undertaken.
- **10.1.5** The investigatory works should mainly target the area of proposed works but should also consider the area within the confirmed land take for the Scheme.
- **10.1.6** The results of the recommended supplementary investigations should be assessed in relation to identified receptors and inform the selection of appropriate health and safety and mitigation measures for the construction works and operational phase, if required.

10.2 Recommendations

- 10.2.1 Only limited ground investigation has been undertaken at the Site and although the likelihood of any contamination within the land take at the Site is relatively low, due the remote locations to the potential sources, localised contamination may have occurred. As such it is recommended that a supplementary ground investigation is undertaken to verify risk levels described in this report. Should contamination be identified that could cause an unacceptable risk to the identified receptors, then remedial requirements would be identified within a remedial strategy for the Scheme.
- **10.2.2** A remediation strategy for the Scheme should be developed that for this Site includes:-
 - Addressing potential human health risk and controlled water risk identified by the proposed additional ground investigation.
 - Dealing with unexpected contamination.
 - Verification sampling strategy to confirm suitability for soils for retention / reuse.
 - Control measures to prevent risks to construction workers and the general public during construction.
 - Verification of imported topsoils.
- 10.2.3 The remediation strategy should include a remediation options appraisal, remediation implementation plan and remediation verification plan.

10.2.4 The remediation strategy should be supported by a Scheme wide Material Management Plan prepared in accordance with CL:AIRE Code of Practice (CL:AIRE, 2011).

EQUIPMENT: Geotechnical Pioneer rig.

METHOD: Hand dug inspection pit 0.00-1.20m. Dynamic sampled (113mm) 1.20-1.60m. Waterflush rotary core drilled (116mm) 1.60-

13.00m. CASING: 140mm diam to 3.20m.

BACKFILL: On completion, hole backfilled with bentonite pellets 13.20-0.20m and local materials 0.20-0.00.

REMARKS: Downhole magnetometry for UXO risk mitigation undertaken 0.00-3.20m. No anomalies encountered.

MMG = Mercia Mudstone Group. Weathering zone after Chandler RJ and Forster CIRIA C570; Engineering in Mercia Mudstone (2001).

1 Introduction

1.1 Background

- **1.1.1** This report relates to the contamination area CL-38 known as 'Knollbury Cesspits' hereafter referred to as the 'Site'.
- **1.1.2** The Site is located between chainage 21,650 and 21,800 (see Figure 1) within a caravan park.

1.2 Reporting Context

- 1.2.1 The Site has been assessed as part of ground investigations and monitoring associated with the wider works for the M4 Corridor around Newport (M4CaN) (hereafter referred to as the 'Scheme'). This report informs the baseline for the environmental impact assessment (EIA) for the Scheme. The EIA is reported in the M4CaN Environmental Statement (ES) of which this document is an appendix to the chapter on Geology and Soils.
- 1.2.2 In 2014, a Preliminary Sources Study Report (PSSR) was prepared as an initial land contamination appraisal (Ove Arup & Partners, 2014) as part of Design Manual for Roads and Bridges (DMRB) Stage 2 Assessments for this Scheme. This identified a number of individual areas that may have been affected by contamination as a result of historical activities at the Site.
- 1.2.3 This report now draws upon information available from the 2015 Supplementary Ground Investigation Works undertaken on behalf of the Welsh Government (Geotechnical Engineering, 2015). This report relates to the area defined in the Site Plan shown in Figure 1.
- 1.2.4 The overarching rationale and approach for the assessment of areas of land along the Scheme with potential contamination is detailed in the Land Contamination Assessment Report (Appendix 11.1 of the ES).

1.3 Objectives

- **1.3.1** The key objectives of this report are set out below.
 - Undertake a risk assessment of the Site and determine whether potential risks to human health or controlled waters could exist based upon the Scheme.
 - Identify any further assessment investigations that are needed in order to refine land contamination risks and inform on the need for remediation.
 - To provide information to support the Ground Investigation Report and Geotechnical Design Report required under DMRB HD22/08 (Highways Agency, 2008).

1.4 Report Structure

1.4.1 The subsequent report structure is as follows.

- Section 2: Site Location and Description This section summarises the Site description.
- Section 3: The Scheme This section details the M4 Corridor around Newport alignment and associated features at the Site.
- Section 4: Site History This section summarises the history of the Site based on historical maps and historical aerial photographs.
- Section 5: Environmental Setting This section summarises the Site description, published geology, hydrology and hydrogeology and relevant environmental information presented in the 2014 PSSR.
- Section 6: Scope of Investigations This section describes previous and supplementary investigations undertaken at the Site.
- Section 7: Ground Conditions This section describes the main findings of the investigations including the ground conditions encountered and significant visual or olfactory evidence of contamination identified.
- Section 8: Contamination Assessment This section describes the findings of the Tier 1 and Tier 2 contamination risk assessment based upon potential contamination sources, potential receptors and potential contaminant linkages and presents the human health and controlled waters assessments.
- Section 9: Refined Conceptual Site Model This section presents the Conceptual Site Model (CSM) for the Site and identifies potential contaminant linkages, based upon the findings of the data presented within Sections 2 to 7.
- Section 10: Conclusions and Recommendations This section provides conclusions concerning the likelihood of land contamination associated with the Site affecting the Scheme and requirements for remediation/mitigation.
- Section 11: References This section details the key reference documents referred to within the text.
- Section 12: Glossary This section details the key terms and acronyms used throughout the report.

2 Site Setting

- 2.1.1 The Site comprises the Beeches Farm Caravan Park which is located immediately to the north west of Beeches Farm off Grange Road to the north of the existing M4. The location and layout of the Site is presented on Figure 1 which includes the three potential areas of land contamination as defined by the 2014 PSSR considered to represent the approximate locations of the three cess pits identified during the 1995 walk over survey.
- 2.1.2 A review of aerial photography in 2015 indicated the caravan park site contains static caravans, access roads and grassed areas and is bounded by tree hedging.
- 2.1.3 No access was gained during the 2014 and 2015 walkover surveys. The 1995 walk over survey identified the presence of 3 No. cesspits within the park described as concrete underground tanks.

3 The Scheme

- 3.1.1 The Site is located on the line of the main alignment at approximate chainage 21,650 to 21,800. Reference should be made to Figure 1 for the Site location in relation to the Scheme.
- 3.1.2 In this area, the new section of motorway would join the existing M4, requiring widening of the existing highway with the resulting new highway encroaching over the southern end of the Site. The intention is that materials arising from the excavation would be removed from their current location and reused within the Scheme.
- 3.1.3 A small borrow pit is also proposed adjacent to the western Site boundary and the areas to the north, east and west are to be used for topsoil stockpiling.

4 Site History

- **4.1.1** The 2014 PSSR historical searches were based on Ordnance Survey plans, literature reviews, information provided by British Steel, Natural Resources Wales (NRW) (formerly Environment Agency Wales), Newport City Council and aerial photographic interpretation.
- 4.1.2 This has been supplemented from the review of historical maps obtained in 2015 from the Welsh Government. No relevant additional information has been identified from this review.
- **4.1.3** A summary of the Site's history is presented in Table 1 below.

Table 1: Site History

Date	Use	Source of information
1843 - 1893	The Site is shown within fields.	1:10,560 Historical Mapping
1891 - 1912	No significant change.	1:10,560 Historical Mapping
1904 - 1939	The north western half is shown to be occupied in part by woodland. The north eastern corner of the Site is located within the Beeches Farm (buildings are as current layout).	1:10.560 Historical Mapping
1964- 1965	No significant change.	1:10,560 Historical Mapping
1969 - 1971	The Beeches Farm development is shown to have extended northwards and now includes Beeches Farm Caravan Park. All sites are now included within this development area.	1:10,560 Historical Mapping
1985 - 1996	No significant change.	1:10,000 Historical Mapping
1995	The presence of 3 no. cesspits noted during a site walkover undertaken by Ove Arup and Partners. These are located at the north-western and north-eastern corners and mid-way along the north-eastern boundary of the caravan park.	
2006	No significant change.	Aerial Photography
2009 - 2010	No significant change.	Aerial Photography
2013 - 2014	No significant change.	Aerial Photography

Notes. Potential sources of contamination are <u>underlined</u>. Those within the temporary and permanent land take are shown in **bold**.

4.1.4 Historically the Site is located in proximity to areas which may have been bombed during World War II, which is discussed in the Explosive Ordnance Threat Assessment Report (Bactec, 2014). This categorises the Site as low risk with respect to unexploded ordnance.

5 Environmental Setting

5.1 Geology

5.1.1 British Geological Survey (BGS) data indicates that no superficial deposits underlie the Site. The bedrock beneath the Site comprises the Black Rock Limestone Subgroup (Dolostone).

5.2 Hydrology

5.2.1 There are no surface water features within the Site boundary. The nearest watercourse is St Brides Brook located approximately 260 m west of the Site.

5.3 Hydrogeology

- **5.3.1** NRW classifies the bedrock as a Principal Aquifer.
- 5.3.2 The Site does not lie within a groundwater Source Protection Zone (SPZ). However it lies within a groundwater vulnerability zone classified as a principal aquifer.

5.4 Environmental Information

5.4.1 No pollution incidents, abstraction licences, discharge points or landfill sites have been recorded within the Site or within 300 m of the Site.

6 Scope of Investigations

6.1 General

6.1.1 One intrusive ground investigation (2015) has been undertaken at this Site and this is summarised in Table 2. Furthermore, one borehole (SBHN04) was advanced within 10 m of the Site. This has been considered in order to support understanding of ground conditions beneath the Site and inform on the soil, groundwater quality and gas regime as given its location it may be within the zone of influence of one of the cesspits.

6.2 Scope of Works

6.2.1 The various intrusive ground investigations undertaken within the Site area are summarised in Table 2.

Table 2: Site Investigation Summary

Date	Contractor	Site Location	Boreholes	Window Sampler	Trial Pits	Sampling
2008	Norwest Holst	Western Site	SBHN04	-	1	None
2015	Geotechnical Engineering Limited	South- east	BH557	-	-	

6.2.2 The construction details of all boreholes installed on the Site are summarised in Table 3.

Table 3: Summary of Borehole Construction Details

Borehole ID	Diameter (mm)	Total Drilled Depth (m)	Top of Slotted Well Casing / Gravel Pack (m bGL)	Base of Slotted Well Casing / Gravel Pack (m bGL)	Targeted Geology
SBHN04 RC	19	10.7	9.6	10.0	Carboniferous Limestone Group
BH557	50	16.0	2.0	16.0	Carboniferous Limestone Group

6.3 Surface Water Quality Monitoring

6.3.1 Surface water quality monitoring was not undertaken during previous ground investigations of the Site.

6.4 Field Testing

Photo Ionisation Detector (PID) monitoring for Volatile Organic Compounds (VOCs) was not undertaken in either the on site or off site selected boreholes during the previous ground investigations.

6.5 Groundwater Monitoring

A summary of the groundwater sampling, groundwater monitoring and ground gas monitoring rounds at the selected boreholes is shown in Table 4.

Table 4: Summary of Monitoring Rounds

Location Ref.	Number of Rounds (Date of Sampling)	Monitoring Details	Notes
SBHN04 RC (19mm)	1 no . (31 st January 2008)	Groundwater Level	-
BH557	4 no. (29 th April 2015, 7 th May 2015, 13 th May 2015, 20 th May 2015)	Groundwater Level, Ground Gas	-

6.6 Laboratory Chemical Testing

6.6.1 A summary of all laboratory analysis undertaken on soils, groundwater, leachate and surface water from the previous site investigations is provided below in Table 5.

Table 5: Summary of Previous Investigation Sampling

Site Investigation Date	No. of Soil Samples	No. of Leachate Samples	No. of Water Samples	Suites of Testing
2008	0	0	0	-
2015	2	-	-	Inorganics, pH, MTBE, BTEX, TPH, PAH, Phenols, PCBs, VOCs, SVOCs

Soil Analysis

- 6.6.2 The following sections summarise the laboratory analytical results for soil samples collected onsite during the various intrusive investigation phases. The available data set has been tabulated and is presented in Appendix 3 with the supporting laboratory certificates available in the relevant original ground investigation reports.
- **6.6.3** The available information is summarised below in Table 6.

Table 6: Summary of Analytical Soil Data

	Number of Soil Analysis per Analytical Suite - 2015 Data							
Formation Unit	Inorganics	VOCs & SVOCs	PAH	TPH	Phenol	втех		
Natural Soils	2	1	2	2	2	2		

6.7 Gap Analysis of Available Data

- 6.7.1 The investigation data available for the Site is considered to be limited both in relation to Site coverage and in the laboratory analysis.
- 6.7.2 No chemical analysis of groundwater or soil leachate data is available for this Site and therefore limited quantitative risk assessment has been undertaken.

7 Ground Conditions

7.1 Geology

7.1.1 The two geological exploratory borehole logs (SBHN04 and BH557) for the available intrusive locations on and off site are provided in Appendix 1. The observed geological sequence is broadly consistent with that discussed in the 2014 PSSR report and is now supplemented with information from an additional borehole. This is summarised in the following sections. Information from the Supplementary Ground Investigation (Geotechnical Engineering, 2015) has also been used.

Topsoil

7.1.2 Topsoil was encountered in both boreholes at thicknesses ranging between 0.4 - 0.6 m.

Superficial Deposits

- **7.1.3** Unconsolidated superficial deposits were encountered in both locations. These comprised Head Deposits.
- **7.1.4** Head Deposits generally comprised sandy gravelly clay and were found at thicknesses of between 1.2 1.6 m.

Solid Geology

7.1.5 Below the Head Deposits the Carboniferous Limestone was encountered (at depths of 1.8 – 2 m bGL). The Limestone was typically described as medium strong to strong yellowish grey oolitic or shelly limestone.

Geological Sequence Summary

7.1.6 The general geological sequence identified during the previous ground investigations is summarised in Table 7.

Table 7: Summary of Geological Sequence

Unit	Description	Thickness Range (m)	Basal Depth (m bGL)
Topsoil	Topsoil	0.4 - 0.6	0.4 - 0.6
Head Deposits	Sandy gravelly clay with a low cobble content. Gravels and cobbles of angular to sub angular limestone.	1.2 - 1.6	1.8 - 2
Carboniferous Limestone	Moderately strong to very strong light grey limestone.	>8.3 - >14	Unproven

Note: ">" excess of

7.2 Visual and Olfactory Evidence of Contamination

7.2.1 Visual and olfactory evidence of contamination was not encountered during the drilling of the boreholes.

7.2.2 Full details and observations noted during the drilling are presented on the exploratory logs provided in Appendix 1.

7.3 Gas Monitoring

7.3.1 The gas monitoring dataset collected at BH557 during each of the four monitoring rounds is summarised on the field data sheets provided in Appendix 2. The maximum gas concentrations (minimum for oxygen) are presented in Table 8.

Table 8: Summary of Gas Monitoring Data

Location ID	Flow (I/hr)	VOCs (ppm)	CH ₄ (%/vol)	Peak LEL (%)	CO ₂ (%/vol)	O ₂ (%/vol)	CO (ppm)	H ₂ S (ppm)
	Max.	Max.	Max.	Max.	Max.	Min.	Max.	Max.
BH557	0.0	3.3	0.1	1.0	3.3	16.3	1	0

7.4 Groundwater

Groundwater Encountered During Investigation

7.4.1 Groundwater was not encountered during the previous investigations.

Groundwater Level During Monitoring Rounds

7.4.2 Data relating to groundwater levels for the Site are provided in Appendix 2 and summarised in Table 9.

Table 9: Summary of Groundwater Level Data During Investigation

Location	Installation ^{#1}	Depth of Response Zone (m bGL) and Geological Formation	No. Measurements	Min Level (m bGL)	Max Level (m bGL)	Comments
SBHN04 RC	D	9.6 – 10.0 Carboniferous Limestone	1	9.99	9.99	-
BH557	D	2 - 16 Carboniferous Limestone Group	4	14.02	15.70	-

Notes: #1 S denotes a shallow installation and D denotes deep installation.

Groundwater Summary

7.4.3 A deep groundwater body within the bedrock has been identified with a water level around 10 - 15 m bGL.

8 Contamination Assessment

8.1 Introduction

- **8.1.1** The following sections provide details of the assessment of land contamination at the Site.
- 8.1.2 The Conceptual Site Model (CSM) presented within the 2014 PSSR has been reviewed and updated based on data from the Supplementary Ground Investigation (Geotechnical Engineering, 2015) and the revised design of the Scheme. The main alterations to the 2014 PSSR model are summarised below.
 - Addition of a gas data set.
 - Inclusion of a maintenance worker receptor in the area containing cess pits.
 - Update of the source-pathway-receptor linkages taking into account the above and more detailed assessments.

8.2 Preliminary Risk Assessment

Potential Sources

- **8.2.1** The cesspits are understood to include a concrete underground tank with sewage inlet located below ground level.
- 8.2.2 A potential source of contamination will be soils impacted by sewage which may have leaked over the years of the cesspit's usage. The ground investigation indicated no shallow groundwater to be present in the area of the cesspits. The proposed land take is unlikely to encounter deep groundwater.
- **8.2.3** Any impacted soils are likely to contain sewage related contaminants including:
 - metals e.g. arsenic, cadmium, chromium, copper, iron, lead, mercury, nickel and zinc;
 - inorganic ions e.g. sulphates, chlorides, ammonium, phosphates;
 - pathogenic organisms;
 - acids/alkalis; and
 - hazardous gases (methane, carbon dioxide and hydrogen sulphide).

Potential Receptors

8.2.4 Receptors during the construction and the operational stages of the Scheme that have been considered.

Construction

- Construction workers during site development works.
- General public are unlikely to be in the vicinity of construction works.
- Principal aquifer.

Operational

- Maintenance worker.
- Principal aquifer.

Potential Pathways

- **8.2.5** Pathways during the construction and the operational stages of the Scheme that have been considered.
 - Dermal contact, ingestion, inhalation pathways of potentially contaminated soils possible during development and maintenance works.
 - Leaching of contaminants from the sewage into the underlying groundwater aquifer (in the event of leakage).

8.3 Risk Evaluation

- 8.3.1 Source-pathway-receptor linkages were considered in the 2014 PSSR using the historical data available up to 2008. With review of the other data described herein, the following risk evaluation has been reconsidered and includes:
 - The area of permanent land take encroaches slightly upon the western most cesspit.
 - Leakages may have occurred contaminating surrounding soils.
 - No reported olfactory evidence of sewage reported in the borehole records.

8.4 Human Health Risk Assessment

- 8.4.1 The rationale and approach for the human health (Tier 2) screening assessment is detailed in the Land Contamination Assessment Report (Appendix 11.1). Soil chemical analysis results and the findings of the generic tier 2 human health risk assessments are presented in Appendix 3.
- 8.4.2 No exceedance of the applied assessment criteria have been identified within the topsoil or natural ground samples analysed in the laboratory.

8.5 Controlled Waters Screening Assessment

8.5.1 No chemical analysis of leachate or groundwater was undertaken during previous investigation of the Site and therefore no quantitative risk assessment can be undertaken.

8.6 Ground Gas Risk Assessment

- 8.6.1 The only ground gas data available relates to the borehole BH557 which has a response zone within the Carboniferous Limestone (2 16 m bGL). Of the four monitoring rounds available, the below comments may be made.
 - No monitoring was undertaken during low barometric pressure (less than 1000 mb), with the lowest pressure conditions being 1009 mb. As such gas

- emissions during worst case atmospheric conditions may have not been monitored.
- Gas flow was generally unrecorded with the exception of the fourth round with a negative flow -1.2 l/hr.
- Methane has been recorded at nil or up to 0.1 % during all 4 no. rounds, which are below the screening criteria of 1 % and a correlating LEL of 0.0 %.
- Carbon dioxide was identified between 0.4 3.3 %, which are below the screening criteria of 5 %.
- Trace of Volatile Organic Compounds of up to 3.3 ppm have been recorded.
- Hydrogen sulphide was not recorded during any monitoring round.
- Carbon monoxide was recorded in the first three rounds with a maximum concentration of 1 ppm. This is below the screening criteria of 30 ppm.
- Oxygen has been recorded to be at relatively normal levels (ambient) with concentrations between 16.3-20.1 %.
- 8.6.2 On the basis of the above the gas regime at the Site does not appear to have been influenced by previous historical uses and is instead driven by soil gas within natural soils. A gas risk assessment has been undertaken and is set out within the Land Contamination Assessment Report (Appendix 11.1 of the ES).

9 Refined Conceptual Site Model

- 9.1.1 The incorporation of data from the 2015 Supplementary Ground Investigation has enabled the original CSM presented in the 2014 PSSR to be updated. Relevant contaminant (source-pathway-receptor) linkages are considered within the refined CSM. The assessment is based on the Scheme during construction and operational phases.
- 9.1.2 A CSM representing general ground conditions, overall Scheme layout and relevant source-pathway-receptors (each of which has a specific alpha-numerical symbol attached) is presented in Figure 2 and is described below in Table 10.

Table 10: Conceptual Site Model

Potential Source	Potential Receptor	Possible Pathway	Likelihood	Severity	Risk	Comment	
On Site Sewage, sewage	Construction						
sediments, soils surrounding the cesspits and sewage impacted groundwater	Workers (B)	Direct dermal (1)	Unlikely	Low	Very low	Construction workers may be exposed to soils impacted by sewage during construction works; however exposure duration will be short term only.	
		Ingestion (3)	Unlikely	Low	Very low	Septic tanks located outside areas of construction. Prior to construction, a specific risk assessment will be required in line with CDM and health and safety legislation. This will enable safe methods of work and an appropriate level of PPE to be put in place. As such all risks will be duly considered and suitably mitigated to protect construction workers. Receptors are within open space with no proposed confined space works. No chemical data is available for the Site. However no obvious olfactory evidence of	
		Inhalation of soil derived dust (2)	Unlikely	Low	Very low	sewage reported in exploratory holes. Anticipated contamination status is not foreseen to represent abnormal constraints to maintenance workers health and safety over	
		Inhalation of soil gases (2)	Unlikely	Low	Very low	and above those typical of a brownfield site. Provision and implementation of a suitable verification sampling inspection strategy during	
	Motorway users (A) and off site General Public (C)	Direct Dermal contact of soil dust (1)	Unlikely	Low	Very low	Dermal and ingestion pathways associated to soil dust only. Short term exposure only. End users to be within open space. Dust suppression measures are recommended	
		Ingestion of soil dust (3)	Unlikely	Low	Very low	during construction works. Chemical analysis of soils unknown.	

Potential Source	Potential Recepto	Possible Pathway	Likelihood	Severity	Risk	Comment
		Inhalation of soil dust (2)	Unlikely	Low	Very low	Provision and implementation of a suitable verification sampling inspection strategy during construction to confirm risks is recommended.
		Inhalation of soil gas or vapours (2)	Unlikely	Low	Very low	construction to commit risks is recommended.
	Groundwater - Aquifer within the Bedrock (Da)	Leaching / migration of contaminants to aquifer (4)	Unlikely	Low	Very low	Groundwater some 10 m below ground level. Potential for migration of contaminants from potentially impacted soils during excavation however it is expected that groundwater will not be encountered during construction works. Provision and implementation of a suitable verification sampling inspection strategy during construction to confirm risks is recommended.
	Operational		1	I	I	
	Maintenance Workers (B)	Direct dermal (1)	Unlikely	Low	Very low	Potentially impacted soils will be vegetated within area of permanent land take and therefore the exposure to contamination will be limited. Exposure duration will be short term only.
		Ingestion (3)	Unlikely	Low	Very low	Site specific risk assessment will be required in line with health and safety guidance. This will enable safe methodology and an appropriate level of PPE to be put in place. As such all risks will be duly considered and suitable mitigated.
		Inhalation of soil derived dust (2)	Unlikely	Low	Very low	Provision and implementation of a suitable verification sampling inspection strategy during construction to confirm risks is recommended
	Future motorway users (A) and off site users (C)	Dermal contact with dust (1)	Unlikely	Low	Very low	Potentially impacted soils will be vegetated within area of permanent land take and therefore the exposure to contamination will be

Welsh Government

10 Conclusions and Recommendations

10.1 Conclusions

- 10.1.1 The Scheme proposals include the widening of the existing M4 highway which encompasses the southern end of the Site. A borrow pit is also proposed south west of the Site.
- **10.1.2** Ground investigations have been undertaken adjacent to and at the Site to assess risks from land contamination associated with the construction and operation of the Scheme including human health and controlled waters risks.
- 10.1.3 The status of the underground tanks is not clear but assuming they are still present and operational it is considered there is a low potential for soils impacted by sewage related contamination to be encountered at the Site. Although, no analytical data is available in the area of the cess pits identified during the 1995 walkover, risks to human health and controlled waters have been qualitatively rather than quantitatively assessed.
- 10.1.4 The potential for contamination at the site is likely to present only a low risk to the Scheme. Any areas of significant sewage related contamination are likely to be localised, if indeed any is present at all. The cess pits will not be affected during the construction of the Scheme as they are outside the land take.
- 10.1.5 Due to the proximity of the proposed works to the existing cesspit tanks, there is a very low risk that construction workers may be directly exposed to soils impacted by sewage related contamination. Use of standard health and safety measures is considered sufficient for construction workers in this part of the Scheme.
- 10.1.6 It is anticipated that materials encountered within the Site are unlikely to be contaminated and are likely to pose a very low risk to human health and controlled waters both during construction and operation.
- **10.1.7** Should contaminated soils be encountered; these will be dealt with through adoption of a discovery strategy to be detailed within the remediation strategy.
- **10.1.8** It is expected that groundwater will not be encountered during the construction works.
- **10.1.9** Materials are likely to be suitable for reuse subject to the provision and compliance of reuse criteria under a Material Management Plan.
- 10.1.10 Post construction, the embankment itself and topsoil and subsoil cover along the motorway corridor will break potential human health pathways to end users and maintenance workers. However, topsoil materials placed at the surface will need to be checked for contamination.

10.2 Recommendations

10.2.1 Other than dealing with the unlikely event of encountering unexpected contamination at the Site, remediation is not expected to be required. The site wide remediation strategy being developed for the Scheme will set out the following procedures during construction activities to be undertaken at the Site:

- Dealing with unexpected contamination.
- Verification of imported topsoils for suitability of use.
- 10.2.2 The remediation strategy should be supported by a Scheme wide Material Management Plan prepared in accordance with CL:AIRE Code of Practice (CL:AIRE, 2011).

Project Name New M4 Preliminary Ground Investigation
Project No. F15056
Engineer Ove Arup & Partners Ltd
Client Transport Wales, Welsh Assembly Government

Groundwater Readings
For Installations

Fig no.

NOTES: SPIE=Piezometer, SP=Standpipe

For multiple installations, use different Installation IDs.

For piezometers installation depth = tip depth. For standpipes = base of pipe

COMMENTS

Unable to locate LGBH05 and RBBH08. LGBH06 was blocked All groundwater levels are recorded from ground level

1 Introduction

1.1 Background

- 1.1.1 This report relates to an area of land potentially affected by contamination (CL39) known as 'The Elms Road Old Quarry and Lime Kiln', herein referred to as the 'Site'.
- **1.1.2** The Site is located between chainage 22,500 and 22,600 (shown in Figure 1), associated with a small area of land historically used as a former quarry and limekiln.

1.2 Reporting Context

- 1.2.1 The Site has been assessed as part of ground investigations and monitoring associated with the wider works for the M4 Corridor around Newport (M4CaN) (hereafter referred to as the 'Scheme') and informs the baseline for the environmental impact assessment (EIA) for the Scheme. The EIA is reported in the M4CaN Environmental Statement (ES) of which this document is an appendix to the chapter on Geology and Soils
- 1.2.2 In 2014, a Preliminary Sources Study Report (2014 PSSR) was prepared as an initial land contamination appraisal (Ove Arup & Partners, 2014) as part of Design Manual for Roads and Bridges (DMRB) Stage 2 Assessments for a number of potential route options. This identified a number of individual areas that may have been affected by contamination as a result of historical activities at the Site. In addition, this report draws upon the 2015 Supplementary Ground Investigation report on behalf of the Welsh Government (Geotechnical Engineering, 2015). This report relates to the area defined on the Site Plan in Figure 1.
- 1.2.3 The overarching rationale and approach for the assessment of areas of land along the proposed new section of motorway with potential contamination is detailed in the Land Contamination Assessment Report (Appendix 11.1 of the ES).

1.3 Objectives

- **1.3.1** The key objectives of this report are as follows:
 - Undertake a risk assessment of the Site and determine whether potential risks to human health or controlled waters could exist based upon the Scheme.
 - Identify the need for further assessment and investigation in order to refine potential land contamination risks and inform the need for remediation/mitigation.
 - To provide information to support the Ground Investigation Report (GIR) and Geotechnical Design Report (GDR) required under DMRB HD22/08 (Highways Agency, 2008).

1.4 Report Structure

1.4.1 The remainder of this report is structured as follows:

- Section 2: Site Location and Description This section summarises the Site description.
- Section 3: The Scheme This section details the new section of motorway alignment and associated features at the Site.
- Section 4: Site History This section summarises the history of the Site based on historical maps and land photographs.
- Section 5: Environmental Setting This section summarises the Site description, published geology, hydrology and hydrogeology and relevant environmental information presented in the 2014 PSSR.
- Section 6: Scope of Ground Investigations Work This section describes any previous and supplementary ground investigation data available for the Site.
- Section 7: Ground Conditions This section describes the main findings of the intrusive Site investigation including the ground conditions encountered and visual or olfactory evidence of contamination identified.
- Section 8: Contamination Assessment This section describes the findings of the Tier 1 and Tier 2 contamination risk assessment based upon potential contamination sources, potential receptors and potential contaminant linkages and presents the human health and controlled waters assessments.
- Section 9: Refined Conceptual Site Model This section presents the Conceptual Site Model (CSM) for the Site and identifies potential contaminant linkages, based upon the findings of the data presented within Sections 2 to 7.
- Section 10: Conclusions and Recommendations This section provides conclusions concerning the likelihood of land contamination associated with the Site affecting the Scheme and requirements for remediation/mitigation.
- Section 11: References This section summarises the key documents referred to in this report.
- Section 12: Glossary This section provides a summary of the terms used in this report.

2 Site Location and Description

- 2.1.1 The Site is located some 25 m north of the existing M4 motorway near Magor, with centre point at National Grid Reference (NGR) ST 436 880. The Site comprises a small area of a former quarry and limekiln. The location and layout of the Site is presented in Figure 1.
- 2.1.2 The Site is currently used for agricultural purposes and forms part of a field used for grazing. The Site is oval in shape and covers an area of some 450 m². A public footpath crosses the Site. Agricultural buildings (no residential occupation has been noted) are located some 50 m to the north.
- 2.1.3 The review of aerial photography and a walkover survey undertaken in January 2014 indicated that the Site comprises a partially backfilled quarry with the top section of the quarried face still visible and marking the potential extent of the Site. The backfill materials appear to comprise quarry spoil with an abundance of angular cobbles. The surface of the backfill slopes towards the centre of the Site that forms a depression. Mature trees are present along the perimeter of the quarried area. Two arched entrances cut into to the rock remain and mark shallow (3 m) cuts into the rock, possibly part of the old limekiln, in the north of the Site.

3 The Scheme

- **3.1.1** The Site is located at chainage 22,500 to 22,600. Refer to Figure 1 for the Site location in relation to the Scheme.
- 3.1.2 The Site is on the line of the proposed link road connecting the existing M4 motorway with the new section of motorway. The new link road runs in a part cut and part embankment. The cut (northern boundary) and embankment (southern boundary) are anticipated to be less than 1 m. The link road runs parallel to the existing M4 motorway. No works on the existing motorway are proposed for this part of the Scheme. A slip road supported by a bridge crosses the existing motorway some 110 m to the east of the Site.
- 3.1.3 The shallow cutting would result in the removal of some, if not all, of the infill materials. The preference is for the removed infill materials to be reused within the Scheme.

4 Site History

- 4.1.1 The 2014 PSSR historical searches were based on Ordnance Survey plans, literature reviews, information provided by British Steel, Natural Resources Wales (NRW) (formerly Environment Agency Wales), Newport City Council and aerial photographic interpretation.
- **4.1.2** This is supplemented with the review of historical maps obtained in 2015 from Welsh Government. Relevant extracts are presented in Appendix 3.
- **4.1.3** A summary of the Site's history is presented in Table 1 below.

Table 1: Site History

Date	Use	Source of Information
1843-1893	The Site is shown to be occupied by an old quarry with old limekiln shown in the northern part of the Site.	1:10,560 Historical Mapping
1882-1921	No significant changes.	OS maps
1891-1912	No significant changes.	1:10,560 Historical Mapping
1904-1939	No significant changes.	1:10,560 Historical Mapping
1964-1965	No significant changes.	1:10,560 Historical Mapping
1969-1971	The limekiln is no longer shown.	1:10,560 Historical Mapping
1969	Part of a field; Site area overgrown with trees (as at present).	Aerial Photography
1981	Bare ground or a structure identifiable in the area previously identified as a limekiln.	Aerial Photography (infra red)
1985	Bare ground identified in the fields surrounding the Site, beyond the Site boundary. Considered to be due to agricultural activity.	Aerial Photography
1985-1996	The quarry is no longer shown.	1:10,000 Historical Mapping
1991	Bare ground no longer identified.	Aerial Photography
2006	The Site is occupied by woodland.	Aerial Photography
2009-2010	No significant changes.	Aerial Photography
2013-2014	No significant changes.	Aerial Photography

Notes: Potential sources of contamination are <u>underlined</u>. Those within the temporary and permanent land take are shown in **bold**.

- **4.1.4** The sources of information presented above supplement those used in the 2014 PSSR. Relevant extracts of the photographs are presented in Appendix 3.
- 4.1.5 The review of historical plans indicates the Site to be an old quarry and a limekiln. A Site walkover survey undertaken in 2014 indicated the Site to have been partially backfilled.
- **4.1.6** Historically the Site is located in proximity to areas which may have been bombed during World War II which is discussed in the Explosive Ordnance Threat

Assessment Report (Bactec, 2014). This categorises the site as low risk with respect to unexploded ordnance.

5 Environmental Setting

5.1 Geology

- 5.1.1 The British Geological Survey (BGS) records indicate the Site to be directly underlain by solid geology of the Mercia Mudstone Group (sandstone).
- **5.1.2** The Black Rock Limestones of the Dolostone subgroup lies uncomfortably at depth and is shown to outcrop further north of the Site.
- 5.1.3 No superficial deposits are indicated to be present. This is consistent with the observations of the residual rock face remaining following quarrying.

5.2 Hydrology

5.2.1 No surface water features are located within the Site boundary. A drain associated with the existing M4 drainage is located approximately 50 m south. The nearest watercourse is St Brides Brook located approximately 1,100 m to the west of the Site. St Brides Brook connects with Mill Reen further south.

5.3 Hydrogeology

- 5.3.1 Natural Resources Wales (NRW) records indicate the Mercia Mudstone to be a Secondary A Aquifer whilst the Black Rock Limestone has been classed as a Principal Aquifer.
- 5.3.2 The Site does not lie within a groundwater source protection zone. However it lies within a groundwater vulnerability zone classified as a major aquifer with intermediate leaching potential.

5.4 Environmental Information

- **5.4.1** NRW records do not identify any pollution incidents, sewage discharge or abstraction licences, or any waste management facilities in the vicinity of the Site.
- **5.4.2** No further environmental information relevant to this Site has been identified.

6 Scope of Investigations

6.1 General

6.1.1 No previous ground investigation information has been identified for this Site. However a number of exploratory holes were advanced within 100 m of the Site. These have been considered in order to support an understanding of ground conditions beneath the Site and inform the groundwater quality and gas regime.

6.2 Scope of Works

6.2.1 The various off site intrusive ground investigations undertaken in the near vicinity of the Site are summarised in Table 2.

Table 2: Site Investigation Summary (Off Site)

Date	Contractor	Boreholes	Trial Pits	Location from Site	Sampling
1997	Norwest Holst	BHP5	-	Approximately 50 m north	None
2015	Geotechnical Engineering	BH560	TP532	Approximately 35 m south-west and 75 m south-east, respectively	None

6.2.2 The well construction details of the above off site boreholes are summarised in Table 3.

Table 3: Summary of Off Site Borehole Construction Details

Borehole ID	Diameter (mm)	Total Drilled Depth (m)	Top of Slotted Well Casing / Gravel Pack (mbGL)	Base of Slotted Well Casing / Gravel Pack (mbGL)	Targeted Geology
BHP5	Unknown	8.05	4.5	7.5	Black Rock Limestone
BH560	50 mm	7	1	7	Marginal Facies of the Mercia Mudstone Group

6.3 Surface Water Quality Sampling

6.3.1 Surface water quality monitoring was not undertaken during the previous ground investigations of the Site.

6.4 Field Testing

6.4.1 No field testing has been undertaken on Site.

6.5 Groundwater and Land Gas Monitoring

6.5.1 A summary of the groundwater sampling, groundwater and ground gas monitoring undertaken at the selected off site boreholes are shown in Table 4.

Table 4: Summary of Monitoring Rounds (Off Site)

Location Ref.	Number of rounds (Date of Sampling)	Monitoring Details	Notes
BHP5	6 no.	Groundwater – levels	-
BH560 (50 mm)	3 no. 29 th April 2015, 7 th May 2015, 13 th May 2015	Groundwater – level ground gas	-

6.6 Laboratory Chemical Testing

6.6.1 No laboratory analysis is available for soil, groundwater, leachate or surface water samples within the Site from the previous ground investigations. No groundwater analytical data is available for the selected off site exploratory holes.

6.7 Gap Analysis of Available Data

6.7.1 There is no investigation data available for the Site from the previous ground investigations and therefore no quantitative risk assessment has been undertaken.

7 Ground Conditions

7.1 Geology

7.1.1 The geological logs for all available exploratory holes excavated in the vicinity of the Site are provided in Appendix 1. Borehole BH560 is located approximately 35 m to the south west of the Site, TP532 approximately 75 m south-east and BHP5 approximately 50 m to the north. The observed geological sequence is consistent with that described in the 2014 PSSR report and summarised in the following sections. Information from the Supplementary Ground Investigation (Geotechnical Engineering, 2015) has also been used.

Superficial Deposits

7.1.2 Unconsolidated superficial deposits were encountered within both boreholes to depths of between 0.6 and 2 mbGL. It comprises a reddish brown slightly sandy gravelly clay with frequent plant fragments. This material represents local Head Deposits. However, given Site observations, Head Deposits on the Site are likely to be thin.

Solid Geology

- **7.1.3** Within BH560 the bedrock encountered was sandstone, representing the Marginal Facies of the Mercia Mudstone Group to 7 mbGL (19 mAOD).
- 7.1.4 Within borehole BHP5, the Mercia Mudstone was also encountered, although comprising predominantly conglomerate to 4.8 mbGL (22.07 mAOD) overlying dolomite to 5.9 mbGL (21 mAOD). Beneath the dolomite, grey limestone was encountered to the base of the borehole at 18.85 mAOD. Whilst the borehole records indicate the formation as of the Mercia Mudstone Group, it is considered this may represent the Black Rock Limestone.

Geological Sequence Summary

7.1.5 The anticipated general geological sequence beneath the Site, based on the nearby off site ground investigation records, is summarised in Table 5 below.

Table 5: Summary of Geological Sequence (Based On Off Site Investigation)

Unit	Description	Thickness Range (m)	Basal Depth (mbGL)
Infill Made Ground (within the quarry pit)	Unknown	unproven	unproven
Head Deposits (outside the quarry pit)	Slightly sandy gravelly clay	0.6* - 2*	0.6* - 2*
Marginal Facies of the Mercia Mudstone Group	Sandstone bedrock	> 5*	> 7*
Black Rock Limestone	Limestone bedrock	unproven	unproven

Note: * inferred from off site exploratory holes.

7.1.6 The conceptual site model included within the 2014 PSSR report has been revised in light of the 2015 information and is presented within Figure 2.

7.2 Visual and Olfactory Evidence of Contamination

7.2.1 No visual or olfactory evidence of contamination was identified within the site. No intrusive records are available.

7.3 Gas Monitoring

7.3.1 The gas monitoring data available from previous monitoring is summarised on the field data sheets provided in Appendix 2. The maximum gas concentrations (minimum for oxygen) are presented in Table 6.

Table 6: Summary of Gas Monitoring Data (Off Site)

Location ID	Flow (l/hr)	VOCs (ppm)	CH₄ (%/vol)	Peak LEL (%)	CO ₂ (%/vol)	O ₂ (%/vol)	CO (ppm)	H ₂ S (ppm)
	Max.	Max.	Max.	Max.	Max.	Min.	Max.	Max.
BH560 50 mm	0	2.9	0.1	1	8.1	9.6	2	0

7.4 Groundwater

Groundwater Encountered During Investigation

7.4.1 No records are available from the previous ground investigations.

Groundwater Levels During Monitoring Rounds

7.4.2 Groundwater levels recorded from the selected off site boreholes are provided in Table 7.

Table 7: Summary of Groundwater Level During Monitoring Rounds (Off Site)

Location	Installation	Depths of Response Zone (mbGL) and Geological Formation	No. Measurements	Min Depth (mbGL)	Max Depth (mbGL)	Comments
BHP5	No data	4.5 - 7.5 (Black Rock Limestone)	6	Dry	6.22	-
BH560	50 mm	1 - 7 (MFMMG)	3	Dry	Dry	BH560 was dry on all monitoring occasions

Groundwater Summary

7.4.3 Groundwater is indicated from the off site BHP5 to be within the solid strata at a resting level at about 6 mbGL.

8 Contamination Assessment

- **8.1.1** The following sections provide details of the assessment of land contamination at the Site.
- 8.1.2 The conceptual site model presented within the 2014 PSSR has been reviewed based on data from the Supplementary Ground Investigation (Geotechnical Engineering, 2015) and the Scheme. The main alteration to the 2014 PSSR model are summarised as follows:
 - Revision of the anticipated geological sequence beneath the Site.
 - Removal of St Brides Brook as a potential receptor.
 - Inclusion of a ditch to the south between the Site and the motorway as a receptor.
 - Inclusion of motorway end users as a receptor.
 - Inclusion of a ground gas source within the quarry infill.
 - Update of the source-pathway-receptor linkages taking into account of the above and more detailed assessments.

Potential Sources

- 8.1.3 The material used for the backfilling of the pit is a potential source of contamination and ground gas. Observations made during the 2014 walkover survey indicated infill materials exposed at the surface to comprise quarry spoil with a resultant low potential for contamination and ground gas generation.
- 8.1.4 Some infill is anticipated to be removed as part of the proposed cutting of the new slip road. Beneath the proposed embankment, the Made Ground may be left in place.
- **8.1.5** Perched water within the backfill material may be present at the base of the quarry.

Potential Receptors

8.1.6 Receptors during the construction and operational stages of the Scheme have been considered:

Construction

- Construction workers during Site development works.
- General Public (existing M4 user) / Site neighbours (users of the agricultural buildings located some 50 m to the north-east) adjacent to construction works.
- Groundwater (Secondary Aquifer/Principal Aquifer) during earthworks operation and soils improvement/treatment works.

Operational

- Maintenance workers.
- General public end users.

Groundwater (Secondary Aquifer/Principal Aquifer).

Potential Pathways

- **8.1.7** Pathways during the construction and operational stages of the Scheme have been considered:
 - Dermal contact, ingestion, inhalation pathways possible during construction works.
 - Inhalation pathways possible during operation works.
 - Leaching of contaminants from the fill materials to the Principal Aquifer during excavation or soil treatment.

8.2 Risk Evaluation

- 8.2.1 Source-pathway-receptor linkages were considered in the 2014 PSSR using the historical data available up to 2008. With review of the other data described herein, the following risk evaluation has been reconsidered and included the following:
 - The quarry backfill is indicated to potentially comprise quarry soil materials although this is based on visual evidence at the surface and remained unconfirmed.
 - Full depth of infill unknown.
 - The Site topography is indicated to be at approximately 25 mAOD and groundwater within the bedrock around 20 mAOD therefore there is potential for the infill materials to extend below the underlying aguifer.
 - The Scheme is likely to require part removal of infill materials, part capping (from the embankment construction).
 - Hardstanding cover is likely to limit infiltration thus reducing leaching.
 - Raised ground gas (carbon dioxide) with depleted oxygen levels has been identified in the off site borehole (BH560) some 35 m south-west. Source of off site abnormal gas has not been established.
 - The nearest surface water is the St Brides Brook which is discounted as a viable receptor given its distance to the Site (1.1 km).
 - Motorway users will be within an open environment with no proposed structures or other confined spaces.

8.3 Human Health Risk Assessment

8.3.1 No chemical soils data is available for the Site from the previous ground investigations.

8.4 Controlled Waters Screening Assessment

8.4.1 No groundwater quality or soil leachate data is available on site or in the near vicinity from the previous ground investigations.

8.5 Ground Gas Risk Assessment

- 8.5.1 No monitoring wells were installed on site during the previous investigations and therefore no gas monitoring data is available. Off site gas monitoring is available for borehole BH560 some 35 m south-west of the Site. The monitoring well is installed within the Black Rock Limestone which is found below the Mercia Mudstone at the Site. The following initial comments may be made:
 - No monitoring was undertaken during low barometric pressure (less than 1000 mb), with the lowest conditions being 1011 mb. As such worst case atmospheric conditions for potential ground gas generation may have not been monitored.
 - Gas flow was recorded absent during all rounds.
 - Methane has been recorded of up to 0.1 % on the first round and absent for the subsequent two rounds. The concentrations are at or below the initial screening criteria of 1 %. The Lower Explosion Limit of up to 1 % is noted for the first round reducing and nil for the following two. Given the lack of correlation between methane concentration per volume and per LEL, it is considered these marginal readings to be caused by equipment inaccuracy rather than representative of the presence of actual methane gas.
 - Carbon dioxide is identified to be generally between 4 and 8.1 % across the monitoring data. The concentrations are generally at or above the screening criteria of 5 %.
 - Trace of Volatile Organic Compounds of up to 2.9 ppm has been recorded.
 - Hydrogen sulphide was not detected throughout the monitoring.
 - Carbon monoxide was identified with a maximum concentration of 2 ppm which is lower than the Work Place Exposure Limit of 30 ppm.
 - Oxygen has been recorded to be at ambient or depleted concentrations of between 9.6 and 20.6 %.
- **8.5.2** The available data identifies raised carbon dioxide and depleted oxygen conditions and these may be related to the presence of limestone bedrock rather than gas migration from any materials used to backfill the quarry at the Site.
- **8.5.3** Further assessment of the gas regime at the Site will be required to confirm associated risks.

9 Refined Conceptual Site Model

- 9.1.1 The incorporation of data from the 2015 supplementary Ground Investigation has enabled the CSM presented in the 2014 PSSR to be updated. All relevant contaminant (source-pathway-receptor) linkages have been considered within the refined CSM. The assessment is based on the proposed Scheme during construction and operational phases.
- 9.1.2 A CSM representing general ground conditions, overall Scheme layout and relevant source-pathway-receptors (each of which having a specific alphanumerical symbol attached) is presented in Figure 2 and is described in Table 8.

Table 8: Conceptual Site Model

Contamination Source	Potential Receptor	Possible Pathway	Likelihood	Severity	Risk	Comment	
	Construction						
Potentially contaminated Made Ground	Construction workers (Bc)	Direct dermal (1)	Likely	Moderate	Moderate	Construction workers will possibly be exposed to Made Ground materials during Site construction works; however exposure duration will be short term only. Prior to construction, a specific risk assessment will be required in line with CDM and health and safety guidance. This will enable safe methodology and appropriate levels of PPE to be put in place. As such all risks will be duly considered and suitably mitigated to protect construction workers. No data available for the Site. Current contamination status is not foreseen to represent abnormal constraints to construction workers health and safety over and above those	
		Ingestion (3)	Likely	Moderate	Moderate	typical of a brownfield site. Absence of ground gas data from Made Ground formation. Additional monitoring data may be considered. Dust suppression measures are	
		Inhalation of soil dust (2)		Moderate	Moderate	recommended during construction works. Made Ground subject to ground improvement to improve its bearing capacity. This may increase vertical pathways from any potential ground gas	

Contamination Source	Potential Receptor	Possible Pathway	Likelihood	Severity	Risk	Comment
		Inhalation of ground gas or vapours (2)	Likely	Moderate	Moderate	and mobilise potential contamination to groundwater or surface waters. No chemical analysis has been undertaken at the Site however exposed materials at surface indicate possible backfill with quarry spoil. Construction to be within open space. Any earthworks within confined space would require specified risk assessment, control measures and PPE. Off site abnormal gas regime identified some 35 m south-west. Additional investigation required to confirm the potential presence of any Made Ground and associated risks.
		Dermal contact with soil dust (1)	Low	Low	Low	During construction there is the possibility of short term exposure only. Dust suppression measures are recommended during construction works. Off-site receptors are at least 50 m from
	Off site users during construction	Ingestion of soil dust (3)	Low	Low	Low	proposed earthworks. Off site abnormal gas regime identified some 35m south west. Significant flux of gas not anticipated. Additional investigation and soil testing required to confirm the characteristic of
	works (C)	Inhalation of soil dust (2)	Low	Low	Low	the Made Ground and associated risks.
		Inhalation of ground gas or vapour (3)	Low	Low	Low	

Contamination Source	Potential Receptor	Possible Pathway	Likelihood	Severity	Risk	Comment
	Groundwater aquifer (Da)	Mobilisation of contaminants due to excavation and/or ground improvement works (4)	Likely	Moderate	Moderate	It is considered that the base of the quarry may extend below the water table. Excavation works or ground improvement may cause mobilisation of contaminants within the backfill materials and migration into the underlying aquifer. No data available. A foundations works risk assessment is required to confirm the absence of risk to controlled waters. Additional investigation required to confirm the presence of Made Ground and associated risks.
	Operation					
Potentially contaminated Made Ground	Maintenance workers (Bm)	Inhalation of ground gas (2)	Unlikely	Moderate	Low	Made Ground to be fully encapsulated (subject to passing reuse criteria) or removed therefore the exposure to contamination will be limited to ground gas inhalation. Exposure duration will be short term only. Site specific risk assessment will be required in line with health and safety guidance. This will enable safe methodology and appropriate levels of PPE to be put in place. As such all risks will be duly considered and suitably mitigated. Infill not anticipated to pose gassing potential. However abnormal gas regime identified on an adjacent off site borehole. Additional investigation required to confirm the presence of Made Ground and associated risks.

Contamination Source	Potential Receptor	Possible Pathway	Likelihood	Severity	Risk	Comment
	Future motorway users (A) and off-site users (C)	Inhalation of ground gas (2)	Unlikely	Moderate	Low	Made Ground to be removed or encapsulated entirely by the proposed cutting and embankment (subject to passing reuse criteria) removing direct pathways. New pathways for ground gas to be created with possible ground improvement works. Presence of pavement provides a barrier to migration gases. Receptors within open space. Off site receptors are some 50 m from proposed earthworks. Infill not anticipated to pose gassing potential. However abnormal gas regime identified on an adjacent off site borehole. Additional investigation required to confirm the presence of Made Ground and associated risks.
Potentially contaminated Made Ground	Groundwater aquifer (Da)	Leaching of potential contaminants and downward migration (4)	Likely	Moderate	Moderate	Ground improvement may provide pathways for migration of potential contaminant from the infill, if remaining post construction. Hardstanding will reduce infiltration and thus reduce leaching potential. No data available. A foundations works risk assessment is required to confirm the absence of risk to controlled waters. Additional investigation required to confirm the presence of Made Ground and associated risks.

10 Conclusions and Recommendations

10.1 Conclusions

- 10.1.1 No ground investigations have been undertaken at the Site during the previous ground investigations, however, based on the desk study information gross contamination is not anticipated. The preliminary risk assessment has identified that low risks to human health and low to moderate risks to controlled waters could exist.
- **10.1.2** Normal construction control measures will be required to facilitate the construction and ongoing operation of the scheme.
- 10.1.3 During the construction phase, specific mitigation measures will be required to prevent inhalation pathways of dust to the general public off site and construction workers. A suitable water management strategy will also be required to prevent impact to surface waters from run-offs.
- **10.1.4** Materials from excavations are considered likely to be suitable for reuse subject to compliance with reuse criteria under a Materials Management Plan.
- 10.1.5 Abnormal ground gas regime has been identified in an adjacent off site borehole, although this may simply be associated limestone bands within the bedrock rather than associated with any historical activities undertaken at the Site.

10.2 Recommendations

- 10.2.1 In order to confirm the low to moderate risks associated with the Site in relation to both construction and operational phases, it is recommended that intrusive investigation including testing of soils, soil leachate and possible gas and groundwater is undertaken.
- Upon review and assessment of the recommended ground investigation information, any contamination identified that could cause an unacceptable risk to the identified receptors will require appropriate remedial mitigation measures. These measures would be identified within a remediation strategy for the Scheme. A remediation strategy for the Scheme should be developed that for the Site includes the following:
 - Addressing potential human health and controlled waters risk identified by the proposed additional ground investigation.
 - Risk assessment of possible ground improvement creating pathways enabling contaminants migration.
 - Dealing with unexpected contamination.
 - Verification sampling to confirm suitability of soils for reuse.
 - Control measures (over and above good practice construction management) to prevent risks to construction workers and the general public during construction.
 - Verification of material used as topsoil.

- **10.2.3** The remediation strategy should include a remediation options appraisal, remediation implementation plan and remediation verification plan.
- 10.2.4 The remediation strategy should be supported by a Scheme wide Materials Management Plan prepared in accordance with CL:AIRE Code of Practice (CL:AIRE, 2011).

1 Introduction

1.1 Background

- **1.1.1** This report relates to the potentially contaminated land area CL-41 known as the 'Severn Junction Tunnel Yard' herein referred to as the 'Site'.
- **1.1.2** The Site is located between chainage 23,800 and 24,000 (see Figure 1), upon an area of former railway land.

1.2 Reporting Context

- 1.2.1 The Site has been assessed as part of ground investigations and monitoring associated with the wider works for the M4 Corridor around Newport (M4CaN) (hereafter referred to as the 'Scheme') and informs the baseline for the environmental impact assessment (EIA) for the Scheme. The EIA is reported in the M4CaN Environmental Statement (ES) of which this document is an appendix to the chapter on Geology and Soils.
- 1.2.2 In 2014, a Preliminary Sources Study Report (2014 PSSR) was prepared as an initial land contamination appraisal (Ove Arup and Partners, 2014) as part of Design Manual for Roads and Bridges (DMRB) Stage 2 Assessments for a number of potential route options. This identified a number of individual areas that may have been affected by contamination as a result of historical activities. In addition, this report draws upon the 2015 Supplementary Ground Investigation report (Geotechnical Engineering, 2015) on behalf of the Welsh Government.
- 1.2.3 The overarching rationale and approach for the assessment of areas of land along the new section of motorway with potential contamination is detailed in the Land Contamination Assessment Report (Appendix 11.1 of the ES).

1.3 Objectives

- **1.3.1** The key objectives of this report are set out below:
 - Undertake a risk assessment of the Site and determine whether potential risks to human health or controlled waters could exist based upon the Scheme.
 - Identify the need for further assessment and investigation in order to refine potential land contamination risks and inform the need for remediation/mitigation.
 - To provide information to support the Ground Investigation Report (GIR) and Geotechnical Design Report (GDR) required under DMRB HD22/08 (Highways Agency, 2008).

1.4 Report Structure

1.4.1 The remainder of this report is structured as follows:

- Section 2: Site Location and Description.
- Section 3: The Scheme This section details the M4CaN alignment and associated features at the Site.
- Section 4: Site History This section summarises the history of the Site based on historical maps and historical land photographs.
- Section 5: Environmental Setting This section summarises the Site description, published geology, hydrology and hydrogeology and relevant environmental information presented in the 2014 PSSR.
- Section 6: Scope of Ground Investigations Work This section describes previous and supplementary ground investigation data available at the Site.
- Section 7: Ground Conditions This section describes the main findings of the intrusive site investigations including the ground conditions encountered and significant visual or olfactory evidence of contamination identified.
- Section 8: Contamination Assessment This section describes the findings of the Tier 1 and Tier 2 contamination risk assessment based upon potential contamination sources, potential receptors and potential contaminant linkages and presents the human health and controlled waters assessments.
- Section 9: Refined Conceptual Site Model This section presents the Conceptual Site Model (CSM) for the Site and identifies potential contaminant linkages based upon the findings of the data presented within Sections 2 to 7.
- Section 10: Conclusions and Recommendations This section provides conclusions concerning the likelihood of land contamination associated with the Site affecting the Scheme and requirements for remediation/mitigation.

2 Site Location and Description

- 2.1.1 The Site is located at the eastern end of the Scheme, in the area of the Magor Interchange, centred at National Grid Reference (NGR) ST 451 876. It comprises an area of former railway land, the Severn Junction Tunnel Yard. The location and Site layout is provided on Figure 1.
- 2.1.2 The existing M4 transects the Site into eastern and western parts. The western part is bounded by a railway line to the south. The eastern part extends further to the south across the mainline railway lines. Agricultural land bounds the Severn Junction Tunnel Yard to the north. A row of residential properties is located to the north-eastern part.
- 2.1.3 The Scheme only crosses the central part of the Site in the area where the existing M4 embankment and railway bridge are located.
- 2.1.4 The Site is longitudinal in shape and covers an area of some 26.6 hectares (ha), out of which 7.5 ha falls within the Scheme.
- 2.1.5 A walkover survey undertaken in January 2014 indicated that the Site formed derelict land. Whilst access to the very central area of the Site was not possible, access was made to the western area and the eastern areas via publically accessible routes.
- 2.1.6 Evidence of former industrial activity was noted during the walkover of the western area with slag evident at the surface, fragments of railway trucks and building foundations, derelict buildings and an embankment running along the central part of the Site. During the visit remains of bonfires and littering was noted across the visible areas of the Site.

3 The Scheme

- 3.1.1 The Site is situated at approximate chainage 23,800 to 24,000 and Figure 1 shows the Site location in relation to the Scheme. Only the central part of the Site falls within the study area for the purpose of this report.
- 3.1.2 The Scheme within the Site area comprises widening of the embankment of the existing motorway that will form part of the permanent works.
- **3.1.3** Currently there are no proposals to alter the railway bridge.

4 Site History

- **4.1.1** The 2014 PSSR historical searches have been based on Ordnance Survey plans, literature reviews, information provided by British Steel, Natural Resources Wales (NRW) (formerly Environment Agency Wales), Newport City Council and aerial photographic interpretation.
- **4.1.2** This is supplemented by a review of historical maps obtained in 2015 from Welsh Government. Relevant extracts are presented in Appendix 5.
- **4.1.3** A summary of the Site's history is presented in Table 1 below.

Table 1: Site History

Date	Use	Source of Information
1843-1893	A railway line bounds the western part of the Severn Junction Tunnel Yard with fields and occasional woodland further north. Fields and a network of reens/drains surround the railway line which cuts through the eastern part of the yard.	1:10,560 Historical Mapping
1891-1912	Additional <u>railway lines/sidings</u> are shown in the eastern part of the yard.	1:10,560 Historical Mapping
1904-1939	Additional railway lines/sidings are shown in the eastern part of the yard. A tank is shown on the northern boundary of the eastern half.	1:10,560 Historical Mapping
1921 - 1938	Severn Tunnel Junction marshalling yard raised area.	Ordnance Survey (OS) map
1964-1965	Additional railway lines/sidings are shown in the eastern part of the yard.	1:10,560 Historical Mapping
1969	Railway sidings cover the entire yard including the central area.	Aerial Photography
1969-1971	No significant change.	1:10,560 Historical Mapping
1981	No significant change. Storage of railway carriages observed within the yard. Five buildings are observed within the northern boundary of the eastern area and a further building within the central eastern area. A track runs along the northern boundary of the western area.	Aerial Photography
1981-83	Railway sidings are no longer shown.	OS 1:250 Historical Mapping
1985	Railway sidings still visible.	Aerial Photography
1991	Railway sidings no longer identified within the yard. Western area appears to be roughly vegetated. Track remains along the northern boundary.	Aerial Photography (image only available for the western area)
1996	M4 Severn Crossing constructed within the Site.	Internet Research
1998	Majority of the Site area appears to be scrub vegetation. With several tracks, including a hardstanding track in the central eastern area. The footprint of the railway sidings is still visible. M4 now seen to cross the railway in the current position in the central area of the Site. Three buildings remain along the northern boundary of the eastern area of the Site (two demolished).	Aerial Photography

Date	Use	Source of Information
2006	The western area of the Site is vegetated with wooded areas. Tracks have been developed across the western area and there is evidence of possible fly-tipping.	Aerial Photography (image only available for the western area)
2009-2010	No significant changes.	Aerial Photography (image only available for the western area)
2013-2014	No significant change in the western area. Railway sidings, a storage shed and a track are identified alongside the railway line in the eastern area. Tracks and disturbed ground identified in the central area leading to an approximately 50 m x 15 m area of what appears to be plastic sheeting, approximately 20 m to the east of the proposed land take area. Storage of materials identified on the hardstanding track adjacent. Small scale earthworks identified 25 m beyond the northern boundary of the Site, approximately 450 m east of the proposed land take area.	Aerial Photography
2014	No significant change in the western area. Plastic sheeting no longer identified. Area of bare ground in the central area of the Site (200 m east of proposed land take area) has increased in size.	High Resolution Aerial Photography

^{*}Notes: Potential sources of contamination are underlined.

- 4.1.4 The sources of information presented above supplement those used in the 2014 PSSR. In particular, the 2013/2014 aerial photograph has identified new potentially contaminative activities in the vicinity of the proposed land take area. Relevant extracts of the photographs are presented in Appendix 4.
- 4.1.5 The review of historical plans and published information on the history of the Severn Tunnel Junction Yard indicates that it has been a railway depot and sidings since the late 1880s until 1987, when it was closed.
- **4.1.6** In mid-1990, the Severn Crossing was constructed with the motorway crossing the Site.
- 4.1.7 Historically the Site was in the vicinity of areas that may have been bombed during World War II which is described in detail within the Explosive Ordnance Threat Assessment Report (Bactec, 2014). There is thus a risk from unexploded ordnance at the Site which is categorised as a low risk site (Bactec, 2014).

5 Environmental Setting

5.1 Geology

- 5.1.1 British Geological Survey (BGS) records indicate much of the Site is underlain by Tidal Flat Deposits. The deposits extend further and cover the eastern part of the Severn Junction Tunnel Yard. The northern end of the Site and eastern part of the yard are indicated to have no superficial deposits with pockets of River Terrace Deposits present in the vicinity.
- 5.1.2 Beneath the Site and the majority of the Severn Junction Tunnel Yard, the bedrock comprises the Mercia Mudstone Group together with Black Rock Limestone.

5.2 Hydrology

- 5.2.1 No surface water features are located within the Site boundary. Two land drainage ditches are located to the north of the central part of the Site stretching between the Site and Red Barn Farm.
- 5.2.2 A lake forms part of the Manor House farm land. It is located to the north of the eastern part of the Site (outside the study area).
- 5.2.3 A number of ponds and ditches are located directly to the south of the eastern Site area (to the north of the existing Toll facilities). From the OS plan it is unclear if these ditches connect to the wider network of reens of the Caldicot Levels Site of Special Scientific Interest (SSSI) located further to the south.
- 5.2.4 Vurlong Reen appears to commence south of the western Site area, across the railway line and connects to the reens of the Caldicot Levels.

5.3 Hydrogeology

- 5.3.1 NRW classifies the bedrock at the Site as a Secondary B Aquifer in the Mercia Mudstone (mudstone) in the central region, Secondary B Aquifer in the Mercia Mudstone (sandstone) in the east, and the Mercia Mudstone Marginal Facies (conglomerate) in the west and Black Rock Limestone at the western tip of Site as Principal Aquifers.
- 5.3.2 The River Terrace Deposits are classified as a Secondary A Aquifer and the Tidal Flat Deposits as Unproductive Strata.
- **5.3.3** The Site does not lie within a groundwater source protection zone, however parts of the Site lie within groundwater vulnerability zones. To the west an area of the

Site is classified as a minor aquifer with intermediate leaching potential and the western tip is classified as a major aquifer with intermediate leaching potential.

5.4 Environmental Information

- **5.4.1** NRW records do not identify any pollution incidents, sewage discharge or abstraction licences, or any waste management facilities on or in close proximity of the Site.
- **5.4.2** The Gwent Levels Magor and Undy SSSI is located approximately 200 m to the south.

6 Scope of Investigations

6.1 General

6.1.1 Two ground investigations include works that have been undertaken within the Site. The information provided covers the existing M4 motorway and has been summarised below.

6.2 Scope of Works

6.2.1 The intrusive investigations that have been undertaken within the Site area are summarised in Table 2.

Table 2: Site Investigation Summary - On Site

Date	Contractor	Site Location	Boreholes	Window Sampler	Trial Pits	Sampling
2008	Norwest Holst	Central	SBHQ06RC	-	STPQ06	Soil
2015	Geotechnical Engineering	Central	BH567	-	-	Soil

6.2.2 To improve the understanding of ground conditions, the off site borehole, summarised in Table 3 has also been considered.

Table 3: Site Investigation Summary – Off Site

Date	Contractor	Off Site Location	Boreholes	Window Sampler	Trial Pits	Sampling
2015	Geotechnical Engineering	26 m south	BH568	-	-	Soil

6.2.3 The construction details of all boreholes installed on the Site are summarised in Table 4.

Table 4: Summary of Borehole Construction Details

Borehole ID	Diameter (mm)	Total Drilled Depth (m)	Top of Slotted Well Casing / Gravel Pack (mbGL)	Base of Slotted Well Casing / Gravel Pack (mbGL)	Targeted Geology
SBHQ06RC	19	8	7.1	8	Mercia Mudstone

6.3 Surface Water Quality Monitoring

6.3.1 Surface water quality monitoring was undertaken on two occasions at location R20 during spring and summer 2008 and on one occasion at location 20.1 during spring 2015. The locations are described in Table 5.

Table 5: Surface Water Monitoring Locations

Surface Water Location ID	Location Description	Comments
R20/IDB 24a	Located at Pratt Reen, approximately 100 m south of the Site.	Dry on four occasions.
20.1	Located at Pratt Reen, approximately 70 m south of the Site.	Low flow, large amounts of vegetation within the reen.

6.3.2 The historical surface water chemical results are presented in the Baseline Surface Water Quality Monitoring Report by Titan Environmental Surveys Limited (2008). This is supplemented by the 2015 monitoring programme undertaken as part of the Baseline Water Environment Report (Appendix 16.2 of the ES).

6.4 Field Testing

6.4.1 Monitoring of Volatile Organic Compounds (VOCs) was undertaken on two shallow soil samples from trial pit STPQ06 at 0.3 and 1.0 mbGL.

6.5 Groundwater Monitoring

6.5.1 A summary of the groundwater sampling, groundwater/monitoring and ground gas monitoring is shown in Table 6.

Table 6: Summary of Monitoring Rounds

Location Ref.	Number of Rounds (Date of Monitoring/Sampling)	Monitoring Details	Notes
SBHQ06RC	6no . (31 January 2008, 26 February 2008, 7 March 2008, 20 March 2008, 8 April 2008 and 18 April 2008)	Groundwater levels	-

6.6 Laboratory Chemical Testing

6.6.1 A summary of the contamination results from the previous Site investigations is shown in Table 7 and Table 8.

Table 7: Summary of Previous Investigation Sampling – Intrusive Exploratory Locations

Site Investigation Date	No. of Soil Samples	No. of Leachate Samples	No. of Water Samples	Suites of Testing

2015	0	0	0	-

Site No. of No. of No. of Soil Investigation Leachate Water Suites of Testing **Samples** Samples Samples **Date** Nitrate, nitrite, phosphate, hardness, heavy metals, TPH, DO¹, BOD², 2008 0 0 4 ammoniacal nitrogen, suspended solids, chloride, TON, sulphate, calcium, magnesium Inorganics, PAH, TPH, BTEX 2015 0 1

Table 8: Summary of Previous Investigation Sampling - Surface Water

Notes: ¹ Dissolved Oxygen. ² Biochemical Oxygen Demand

Soil Analysis

- 6.6.2 The following sections summarise the laboratory analytical results for soil samples collected during the 2008 intrusive investigation phases. The available data has been tabulated and is presented in Appendix 2 and supporting laboratory certificates are available in the relevant original ground investigation reports (see Table 2).
- 6.6.3 The available soil data comprises one sample from the Made Ground from STPQ06.
- 6.6.4 The analytical soil data for the off site borehole BH568 have not been considered within the current report, given it lies outside the Site boundary. The analytical data has been considered within the overarching Land Contamination Assessment Report instead.

Soil Leaching Analysis

6.6.5 No soil leachate analysis was undertaken during the previous ground investigations.

Groundwater Analysis

6.6.6 No groundwater data is available for the borehole installed on site during the previous ground investigations.

Surface Water Analysis

6.6.7 The following sections summarise the laboratory analytical results for surface water samples collected during the various monitoring undertaken. The available data has been tabulated and is presented in Appendix 3 with supporting laboratory certificates available in the relevant original reports.

Table 9: Summary of Analytical Surface Water Data

Surface	Number of Water Analysis per Analytical Suite (Number of Locations) – 2015 data / All Gl data									
Water System	Metals & Inorganics	Water Quality Parameters	Polycyclic Aromatic Hydrocarbons	Total Petroleum Hydrocarbon	ВТЕХ					
Pratt Reen North	1 (2) / 5 (2)	1 (2) / 5 (2)	1 (1) / 1 (1)	1 (2) / 5 (2)	1 (1) / 1 (1)					

6.7 Gap Analysis of Available Data

6.7.1 The investigation data available for the Site is limited. In particular, the available information relates to two 2008 intrusive locations with only one sample of the Made Ground analysed.

7 Ground Conditions

7.1 Geology

- 7.1.1 The exploratory borehole logs for available locations excavated on or in close proximity to the Site are provided in Appendix 1. The observed geological sequence is consistent with that discussed in the 2014 PSSR report and is summarised below.
- 7.1.2 The conceptual site model within the 2014 PSSR report has been updated in light of the 2015 information and is included within Figure 2.

Made Ground

- **7.1.3** Made Ground was encountered in all exploratory locations with thicknesses ranging between 0.4 and 0.9 m as summarised in Table 10.
- **7.1.4** Made Ground is commonly present as a coarse material comprising gravel of concrete, brick, ash and clinker.
- **7.1.5** Borehole BH567, was located over the existing M4 embankment refused within tarmacadam at 0.4 bGL.
- 7.1.6 A nearby off site borehole (BH568, 2015) also sunk at the level of the existing highway, some 5 m south of the Site proved the embankment to include Made Ground, some 13.3 m (basal depth at 5.45 mAOD) in thickness overlying bedrock of the Mercia Mudstone. The Made Ground was identified to include predominantly limestone gravel and boulders with layers of clay. No extraneous material was recorded.

Superficial Deposits

- 7.1.7 Beneath the Made Ground generally soft brown becoming firm red brown sandy clay was encountered with thicknesses ranging from 3.6 m to 5.3 m (3.27 to >4.6 mAOD).
- **7.1.8** Below this in SBHQ06RC, very dense sands were encountered (with no recovery) to 8 mbGL (1.27 mAOD).
- 7.1.9 These are identified as Head Deposits within the borehole records. Considering the published geological data, soil description, recorded strength and correlation with the off site 2015 borehole information; it is considered that the upper soft clay material (2.4 to 3 mbGL) represents the Tidal Flat Deposits. Beneath, both SBQ06RC and STPQ06 weathered Mercia Mudstone was encountered.

Solid Geology

- **7.1.10** As detailed above Mercia Mudstone is considered to have been encountered below 5.97 mAOD.
- **7.1.11** The nearby off site borehole BH568 identified the Mercia Mudstone below 5.45 mAOD and comprised a sequence of mudstone, limestone and sand.
- **7.1.12** Both on site and off site data on the depth of the rockhead correlate well.

Geological Sequence Summary

- **7.1.13** The general geological sequence identified during the Site investigation is summarised in Table 10.
- **7.1.14** On the basis of BH568 findings, it is noted that the existing embankment has been constructed directly over the rockhead with the Tidal Flat Deposits and weathered Mercia Mudstone removed.

Table 10: Summary of Geological Sequence

Unit	Description	Thickness Range (m)	Basal Depth (mAOD)
Made Ground	Gravel including ash, clinker, brick and concrete	>0.4 to 0.9	8.21 to 8.57
Superficial Deposits (Tidal Flat Deposit)	Soft - brown sandy clay	1.5 to 2.6	5.97 to 6.71
Mercia Mudstone Group - weathered	Firm to stiff reddish brown clay with sand bands	>2.1 to 4.7	3.3 to 5.45*
Mercia Mudstone Group - bedrock	Sequence of mudstone, limestone and sand (based on nearby off site borehole)	12.9*	- 7.45*
Mercia Mudstone Marginal Facies	Breccia (based on nearby off site borehole)	>0.3*	> - 7.75*

Note: *Based on off site borehole information

7.1.15 The conceptual site model included within the 2014 PSSR report has been revised in light of the 2015 information and is presented within Figure 2.

7.2 Visual and Olfactory Evidence of Contamination

7.2.1 A summary of visual and olfactory evidence of contamination encountered during the intrusive investigations is presented in Table 11.

Table 11: Visual and Olfactory Evidence of Contamination Summary

Location ID	Depth (mbGL)	Strata	Evidence of Potential Contamination			
All locations	GL to >0.4-0.9	Made Ground	Ash, clinker, tarmacadam, concrete and brick			
STPQ06	0.9 to 1.1	Tidal Flat Deposit	Grey staining			

Note: * geological terminology altered to the one referred to in the borehole record.

- **7.2.2** No visual or olfactory evidence of hydrocarbon contamination was identified during the limited trial pitting and drilling undertaken on site. The PID meter recorded zero levels, indicating that no volatiles were present.
- **7.2.3** Full details and observations noted during the drilling and trial pitting are presented on the exploratory hole logs attached in Appendix 1.

7.3 Gas Monitoring

7.3.1 No gas monitoring data is available for the Site from the previous ground investigations.

7.4 Groundwater

Groundwater Encountered During Investigation

7.4.1 Groundwater strikes were encountered during the advancement of borehole SBHQ06RC as detailed on the geological log provided in Appendix 1. This is summarised in Table 12.

Table 12: Summary of Groundwater and Leachate Water Level Data

Location	Strike Depth (mbGL)	Geological Formation	Level after 20 minutes (mbGL)	Comments
	4.4	Mercia Mudstone*	3.41	-
SBHQ06RC	-	-	-	Water level recorded at 5 m bGL when borehole taken into the top of the sand layer of the Mercia Mudstone (7 m bGL)
	-	-	-	Water level recorded at 2.65 m bGL when borehole finished at a depth of 8 m bGL within Mercia Mudstone

Note: * geological terminology altered to the one referred to in the borehole record.

7.4.2 Groundwater was not recorded in the other boreholes or trial pits referenced.

Groundwater Level Data Set

7.4.3 The groundwater level data available for the Site is summarised in Table 13.

Table 13: Summary of Groundwater Level Data

Location	Installation ^{#1}	Depth of Response Zone (mbGL) and Geological Formation	No. Measurements	Minimum Depth (mbGL)	Maximum Depth (mbGL)	Comments
SBHQ06RC	19 mm	7.1 – 8 m (Mercia Mudstone)	6	3.89	6.63	-

Notes: #1 S denotes a shallow installation and D denotes deep installation. *Geological terminology altered to the one referred to in the borehole record.

Groundwater Summary

7.4.4 The groundwater monitoring of the borehole on site has reported a groundwater body within the Mercia Mudstones at a level of between 3.9 and 6.6 mbGL. The relatively high variability is considered to be representative of seasonal variation, although some marginal tidal influence cannot be discounted.

8 Contamination Assessment

8.1 Introduction

- **8.1.1** The following sections provide details of the assessment of land contamination at the Site.
- 8.1.2 The outline Conceptual Site Model (CSM) presented within the 2014 PSSR has been reviewed and updated based on data from the Supplementary Ground Investigation (Geotechnical Engineering, 2015) and the Scheme. The main amendments to the 2014 PSSR model are summarised as follows:
 - Alteration to the ground and groundwater model.
 - New ditch considered as a new pathway.
 - Update of the source-pathway-receptor linkages taking account of above and more detailed assessments.

8.2 Preliminary Risk Assessments

Potential Sources

- **8.2.1** The Site was used as railway sidings between 1920 and the late 1980s and therefore subsurface contamination with contaminants typical to railway land can be expected. In particular these can include fuel oils, lubricating oils, and PAHs.
- **8.2.2** A limited thickness of Made Ground containing ash and clinker was encountered in all investigated locations.
- 8.2.3 A low embankment was noted to run along the western Site area. The nature of the fill materials is unknown.
- **8.2.4** The existing M4 embankment is an approximate 10 m high feature and comprises imported gravel, boulders and clays, apparently of reworked natural material. This is not considered a significant potential contamination source.

Potential Receptors

8.2.5 Receptors during the construction and the operational stages of the Scheme have been considered:

Construction

- Construction workers during Site development works.
- Adjacent general public/workers (users of the Severn Junction Tunnel Yard).
- Groundwater within the Mercia Mudstone.

 Nearby surface waters including the reens and existing surface water ditches within the Site and bordering the surrounding fields. This land drainage may be connected with the Gwent Levels SSSI wider network of reens and ditches, located south of the new section of motorway.

Operational

- General public end users and adjacent general public/workers (users of the Severn Junction Tunnel Yard).
- Maintenance workers.
- Groundwater within the Mercia Mudstone.
- Surface water, particularly nearby Vurlong Reen. If a new drainage ditch is created through the existing Made Ground a new pathway to surface waters could exist.

Potential Pathways

- **8.2.6** Pathways during the construction and the operational stages of the Scheme have been considered:
 - Dermal contact, ingestion, inhalation pathways of potentially contaminated soils possible during construction and maintenance works.
 - Dermal contact, ingestion, inhalation pathways, all dust related, possible to for general public end users and adjacent general public/workers.
 - Leaching of contaminants from the Made Ground to groundwater.
 - Surface water run-off into existing/new drainage system.

8.3 Risk Evaluation

- 8.3.1 Source-pathway-receptor linkages were considered in the 2014 PSSR using the historical data available up to 2008. With review of the new data described herein, the risk evaluation has been reconsidered and includes the following:
 - The Site has been subject to a range of potential contaminating uses associated with use as a railway sidings/yard.
 - Made Ground shown to be of limited thickness.
 - Proposed embankment widening and overlying hardstanding (carriageway) is
 to be constructed at the Site which is to cover most of the motorway corridor
 reducing pathways from any contamination in shallow soils left in situ to
 motorway users and maintenance workers.
 - Made Ground to be removed within the footprint of the embankment widening. Made Ground may be left in place outside the embankment and is likely to extend beyond the land take to facilitate the Scheme.
 - Cohesive superficial deposits with low permeability overly a Secondary Aquifer associated with the River Terrace Deposits and Mercia Mudstone Group in the centre of the Site.

- Perched groundwater within the Tidal Flat Deposits, if present, is not considered a resource.
- Risk of ground gas emissions from the Made Ground is considered negligible given its small thickness and composition. Risk associated with ground gas is not considered further in the Conceptual Site Model.
- Motorway users will be within an open environment with no proposed structure or other confined spaces.

8.4 Human Health Risk Assessment

- 8.4.1 The rationale and approach for the screening assessment is detailed in the Land Contamination Assessment Report (Appendix 11.1 of the ES) and the soil chemical analysis results are presented in Appendix 2.
- **8.4.2** No exceedances of the relevant criteria were identified.
- **8.4.3** Presence of TPH is recorded however speciated data does not exceed the screening criteria.

8.5 Controlled Waters Screening Assessment

- 8.5.1 The rationale and approach for the screening assessment is detailed in the Land Contamination Assessment Report (Appendix 11.1 of the ES). No groundwater or leachate analyses are available in relation to the Site. All exceedances to the relevant generic criteria for surface waters are summarised in Table 14.
- Where EQS is dependent on water hardness, i.e. some heavy metals, the hardness of the surface water receptor should normally be used. The Baseline Water Environment Report (Appendix 16.2 of the ES) indicates surface water to be generally moderately hard with hardness concentrations within a range of 100 to 150 mg/l as calcium carbonate. Therefore EQSs within this water hardness range have been used for screening purposes.

Groundwater

8.5.3 No groundwater analytical data is available for the Site from the previous ground investigations.

Leachate

8.5.4 No leachate analytical data is available for the Site from the previous ground investigations.

Surface Water

8.5.5 Six surface water samples have been taken and analysed from the Pratt Reen

located south of the Site. A summary of the exceedances to selected screening criteria are shown in Table 14 below.

Table 14: Summary Surface Water Exceedances

Parameter	Unit	No. Analyses	No. Analyses Above LOD	Min. Conc.	Max. Conc.	Location & Round with Max. Conc.	EQS	No. Analyses Exceeding EQS	DWS	No. Analyses Exceeding DWS	CCW Trigger Level	No. Analyses Exceeding CCW Trigger Level
Lead	μg/l	5	2	0.147	6	E3 / R20	1.2	1	10	0	250	0
Cadmium	μg/l	4	3	0.6	0.9	E3 / R20	0.15	3	5	0	5	0
BOD	mg/l	5	2	2	7	E3 / R20	5	1	-	-	18	0
Nitrate as N	mg/l	4	2	0.5	1.5	E2 / R20	-	-	50	0	1	1
Nitrate as NO ₃	mg/l	5	3	1.3	6.64	E2 / R20	-	-	50	0	1	3
Orthophosp hate	mg/l	4	2	0.1	1.2	E3 / R20	-	-	-	-	1	1
Dissolved Oxygen	%	4	4	40.4	80	E2 / R20	60	3	-	-	-	-

- 8.5.6 Water quality within Pratt Reen North is generally observed to be good with only a small number of exceedances for some parameters above their respective EQS. Multiple exceedances were recorded for cadmium (total) and a single exceedance for lead was recorded at location R20.
- **8.5.7** Exceedances were recorded for nitrate (NO₃) above the CCW Trigger Levels and also of phosphorus.
- 8.5.8 Whilst BTEX and TPH concentrations were recorded below laboratory limit of detection for the 2015 data, concentrations of long chain organics have been identified on one of the four historical rounds for Pratt Reen North. Given the presence of similar heavy range TPH within the Made Ground, a possible linkage may be present between the soil and water quality within the reen. It is noted however, that the sampling point and indeed the Pratt Reen are located 800 m from the land take within the Site. Whilst there is no clear and direct hydraulic continuity between the Scheme land take within the Site and the receptor, some possible mobility of organic contamination is identified which may also impact nearer surface water receptors. Additional surface water quality data and near surface soil data would be required to confirm contaminant linkages.
- 8.5.9 The results are presented in the Baseline Water Environment Report (Appendix 16.2 of the ES).

8.6 Summary

- **8.6.1** The Made Ground at the Site has detected levels of PAH and TPH but remain below the relevant screening criteria.
- **8.6.2** The leachability of contaminants within the Made Ground has not been identified.
- 8.6.3 No groundwater monitoring on site or within the wider Severn Junction Tunnel Yard land use has been undertaken and therefore it is not known whether the Made Ground at the Site has affected the underlying groundwater.
- **8.6.4** Whilst the surface water quality of Pratt Reen is seen to be in keeping with the baseline seen in the area of Newport, a possible impact from the high TPH contaminants seen within the Made Ground is identified.

9 Refined Conceptual Site Model

- **9.1.1** The incorporation of data from the 2015 Supplementary Ground Investigation has enabled the original CSM presented in the 2014 PSSR to be updated. The assessment is based on the Scheme during its construction and operational phases.
- 9.1.2 A CSM representing general ground conditions, overall layout of the new section of motorway and relevant source-pathway-receptors (each of which having a specific alpha-numerical symbol attached) are presented in Figure 2 and is described in Table 15.

Table 15: Conceptual Site Model

Potential Source	Potential Receptor	Possible Pathway	Likelihood	Severity	Risk	Comment
Made Ground	Construction					
containing ash, clinker and/or slag incl. the embankment running across the western Site area. Contamination associated with railway land.	Construction	Dermal contact (1)	Likely	Low	Low	Construction workers will possibly be
	workers (B)	Ingestion (2)	Likely	Low	Low	exposed to Made Ground materials during
		Inhalation of dust (3)	Likely	Low	Low	Site construction works; however exposure duration will be short term only. Prior to construction, a specific risk assessment will be required in line with CDM and health and safety guidance. This will enable safe methods of work and appropriate levels of Personal Protective Equipment (PPE) to be put in place. As such all risks will be duly considered and suitably mitigated. Current data set does not identify exceedances to the screening criteria although elevated organic contamination is present. Data is limited to one soil sample of the 2008 investigation. Dust suppression measures are recommended during construction works. Data is based on limited information. Further investigations are required to delineate any potential contamination and confirm the risks and soil reuse potential.
	Off site users – Severn Tunnel	Dermal contact - dust(1)	Likely	Low	Low	The current data set does not identify exceedances to the screening criteria but is
	Junction Yard (C)	Ingestion - dust (2)	Likely	Low	Low	considered to be limited (one soil sample).
		Inhalation of dust (3)	Likely	Low	Low	Data based on limited information. Further investigations are required to delineate any potential contamination and confirm the risks and soil reuse potential. Dust suppression measures are recommended during construction works.

Potential Source	Potential Receptor	Possible Pathway	Likelihood	Severity	Risk	Comment
Source	within granular superficial deposits (Da)					during the widening earthworks. In the areas left in place, thickness is anticipated to be limited. Existing 3 m Tidal Flat Deposit to be removed as part of the construction. No recorded perched water within the Made Ground or Tidal Flat Deposits. Absence of leachate data. The provision and implementation of a suitable verification sampling inspection strategy during construction to confirm risks is recommended.
	Surface water (land drainage) (E)	Leaching/migration (4)	Low	Moderate	Moderate to low	The quality of perched groundwater may become affected by contamination during the construction works, particularly in the area excavation (new drains and new embankment). Leachate data not available. Available surface water data identify possible soil—water linkage for TPH contaminant. Data based on limited information. Further investigations are required to delineate any potential contamination and confirm the risks and soil reuse potential.
		Surface water run-off (5)	Low	Low	Very low	Surface water run-off may further deteriorate the quality of surface water. Construction process to adopt surface water control and management.
	Operational					
	Maintenance	Dermal contact (1)	Low	Low	Very low	Maintenance workers may be exposed to
	workers (B)	Ingestion (2)	Low	Low	Very low	Made Ground materials outside the footprint
		Inhalation of dust (3)	Low	Low	Very low	of the embankment (outside the Scheme area); however exposure duration will be short term only. Areas outside the motorway hardstanding are likely to receive topsoil cover and

Potential Source	Potential Receptor	Possible Pathway	Likelihood	Severity	Risk	Comment
Gource						vegetation establishment, reducing potential of exposure. Data based on limited information. Further investigations are required to delineate any potential contamination and confirm the risks and soil reuse potential.
	Future motorway users (A) and	Dermal contact - dust(1)	Low	Low	Very low	Motorway users may be exposed to Made Ground materials outside the footprint of the
	adjacent off site	Ingestion - dust (2)	Low	Low	Very low	embankment (outside the Scheme area);
	users (C)	Inhalation of dust (3)	Low	Low	Very low	however exposure duration will be short term only. Areas outside the motorway hardstanding are likely to receive topsoil cover and vegetation establishment, reducing potential of exposure. Current dataset does not identify exceedances to the screening criteria but is considered to be limited (one soil sample). Data based on limited information. Further investigations are required to delineate any potential contamination and confirm the risks and soil reuse potential.
	Groundwater within the Mercia Mudstone (Da)	Leaching of contaminants as a result of groundwater infiltration (4)	Low	Moderate	Moderate to low	Made Ground containing ash/clinker/slag and contaminants related to railway land may be leaching contaminants as a result of groundwater infiltration; however the rate of contaminants downward migration is likely to be limited due to low permeability of the head deposits. Soil and soil leachate quality testing is recommended to confirm the risk. Made Ground is to be removed beneath the footprint of the embankment.
	Surface water (land drainage) (E)	Saturated flow within perched groundwater (4)	Low	Low	Low	Perched (shallow) groundwater may be intercepted by the land drainage. Hardstanding will reduce infiltration and thus reduce leaching potential.

10 Conclusions and Recommendations

10.1 Conclusions

- 10.1.1 Ground investigations have been undertaken that enable the Site to be assessed for the risks of contamination on the Scheme including human health and controlled waters.
- 10.1.2 The generic risk assessment has identified that low risks to human health and low to moderate risks to controlled waters could exist. Elevated TPH concentrations seen in the Made Ground and in the Pratt Reen may indicate a possible contaminant linkage.
- **10.1.3** Normal construction control measures will be required to facilitate the construction and ongoing operation of the Scheme.
- 10.1.4 During the construction phase, specific mitigation measures will be required to prevent inhalation pathways of dust to the general public off site and construction workers. A suitable water management strategy will also be required to prevent impact to surface waters from run-offs.
- **10.1.5** Materials are considered likely to be suitable for reuse subject to provision of reuse criteria under a Materials Management Plan.

10.2 Recommendations

- 10.2.1 Given the identified gap in the data (limited Site coverage and existing data related to the 2008 investigation) supplementary ground investigation works is required to verify the risk level identified in this report. The investigation will target the potential risks to controlled water from leaching contaminants. Upon completion of the ground investigation this report shall be reviewed and updated accordingly once the findings of the additional investigation are made available.
- 10.2.2 Upon review and assessment of the additional ground investigation information, any contamination identified that could cause an unacceptable risk to the identified receptors will require appropriate remedial mitigation measures to be implemented. These measures would be identified within a remediation strategy for the Scheme. A remediation strategy should be developed for this Site that includes the following:
 - Addressing potential human health and controlled waters risk identified by the proposed additional ground investigation.
 - Dealing with unexpected contamination.
 - Verification sampling to confirm suitability of soils for reuse.

- Control measures (over and above good practise construction management) to prevent risks to construction workers and the general public during construction.
- Verification of material used as topsoil.
- **10.2.3** The remediation strategy should include a remediation options appraisal, remediation implementation plan and remediation verification plan.
- 10.2.4 The remediation strategy should be supported by a Scheme wide Materials Management Plan prepared in accordance with CL:AIRE Code of Practice (CL:AIRE, 2011).

Groundwater Readings For Installations

Fig no.

01

NOTES: SPIE=Piezometer, SP=Standpipe

For multiple installations, use different Installation IDs.

For piezometers installation depth = tip depth. For standpipes = base of pipe

COMMENTS SBHM01 RC installation extends 0.50m above ground level. - symbol indicates water level is above GL

All groundwater levels are recorded from ground level

	All gro	undwat	er lev	els are recor	ded from	n ground	level

Groundwater Readings
For Installations

Fig no.

NOTES: SPIE=Piezometer, SP=Standpipe

For multiple installations, use different Installation IDs.

For piezometers installation depth = tip depth. For standpipes = base of pipe

COMMENTS SBHM01 RC installation extends 0.50m above ground level. - symbol indicates water level is above GL

All groundwater levels are recorded from ground level
