Annexes

Annex A: Noise Model Certification

Annex B: Noise Model Settings

Annex C: Traffic Day/Night Profile Calculations

Annex D: Noise Model Results - Summary

Annex E: Noise Model Results – Complete

Annex F: Noise Assessment Results

Annex G: WebTAG Noise Matrix Results

Annex H: Noise Nuisance Calculations

1 Operational Noise & Vibration

1.1 Introduction

1.1.1 The operational noise and vibration assessment formed Appendix 13.4 of the March 2016 ES. The assessment has been updated in order to consider design modifications arising since publication of the ES and to correct minor errors in the model. This report therefore replaces Appendix 13.4 of the March 2016 ES.

1.2 Limitations and Assumptions

1.2.1 Detailed noise modelling has been undertaken using SoundPLAN version 7.4, which is certified to calculate road traffic noise levels in accordance with CRTN. A certificate to this effect is provided in Annex A. The noise model has been rerun to accommodate the design modifications and to correct the minor errors.

1.2.2 A summary of the modelling assumptions is provided in Table 1 and the noise model settings are summarised in Annex B.

Table 1: Noise Modelling Assumptions

Assumption	Do-Minimum	Do-Something
Topography	Topography for the study area has been obtained from OS Terrain 5. Height data for the existing alignment, cuttings and embankments have been obtained from topographic surveys.	Topography for the study area has been obtained from OS Terrain 5. Height data for the existing alignment, cuttings and embankments have been obtained from AutoCAD plans of the Scheme based on topographic surveys.
Roads	All roads have been modelled as having a bituminous road surface with a 2.0mm texture depth.	Unmodified roads as do-minimum situation; new motorway carriageways modelled with a low noise 'thin surfacing system' providing -3.5 dB attenuation compared to hot-rolled asphalt surface (HRA). Committed development roads and other new or modified roads modelled as HRA.
Buildings	All buildings within approximately 1.5 km of the alignment have been included. All buildings have been set to two storeys high, e.g. 7.5 m high to the roof ridge.	As for do-minimum, all buildings within approximately 1.5 km of the alignment have been included. All buildings have been set to two storeys high e.g. 7.5 m high to the roof ridge. Buildings to be demolished have been identified.
Receptors	Receptors have been included on all noise sensitive buildings within required distances of the new or existing highways as detailed below. Ordnance Survey Address Base Plus data from 20/05/2015 has been used to identify property locations and usage. Due to the numbers of receptors (calculation points) within the assessment, the most affected	

Assumption	Do-Minimum	Do-Something
	façade has been identified on each building using professional judgement based upon closest to/greatest angle of view of the road and the receptor placed on that façade. The receptors are set as 'façade' (with reflections as required by CRTN / DMRB), with repeats at ground and first floor. Receptors within 600 m of the existing-modified, or within 1 km of the proposed new section of motorway, have been identified and grouped into distance bands of <300 m; 300-600 m; and 600 – 1000 m. Receptors have been included at various outdoor areas (e.g. one receptor per area, set to 'free-field', with repeats at ground floor only). Note that Nash Baptist Chapel, Pye Corner is now assessed as being in residential use.	
Traffic Data	Traffic data have been supplied by the Transport Consultant, Arup, issue 18/12/2015 rev 1.09. Although minor changes to the traffic model are understood to have been made, these are considered insignificant in terms of the resulting overall noise levels.	
Model Parameters	SoundPLAN kernel 26/07/2016 (64bit) was used for all calculations. Parameters have been set to: Reflection order: 1 Maximal reflection distance to receiver: 200 m Maximal reflection distance to source: 50 m Search radius: 5000 m Weighting: dB(A) Tolerance: 0.100 dB Create ground effect areas from road surfaces: No Roads: CoRTN: 1988 Driving on left side Emission according to: CoRTN Reflection order limited to: 1 Road gradient smoothed with smooth length of: 15 m Disable low flow correction: No Method for L_{10} to L_{eq} conversion: $L_{eq} = L_{10} – 2.5$ dB Calculation with side screening: No Attenuation Foliage / Built up area / Industrial Site: No attenuation Three lane carriageway in each direction, each lane 3.65 m wide	
Noise Contours	Grid Spacing = 25 m grid Grid Height = 4 m high	

Traffic Data

1.2.3 This assessment of operational noise effects is based on the traffic model for the Scheme. Calculations of the AAWT (annual average weekday traffic) have been provided, calculated from AM peak, PM peak and inter-peak flows.

1.2.4 No detailed data have been provided for the night period. A profile of hourly change, however, indicates that, in general, the nightly $L_{Aeq,8hr}$ would be -7 dB lower than the daytime $L_{Aeq,18hr}$. During the quietest night-time hour (02:00 – 03:00), the $L_{Aeq,1hr}$ would be up to -10 dB lower than the daytime $L_{Aeq,18hr}$; during the most-trafficked night-time hour (06:00 – 07:00), the $L_{Aeq,1hr}$ would be -2 dB

lower than the daytime $L_{Aeq,18hr}$. The traffic profile provided makes no distinction between existing and future years; nor between do-minimum and do-something scenarios.

1.2.5 The data also confirm that the noise levels predicted from the 8-hr AADT traffic will be approximately -8 dB lower than noise levels predicted from the 18-hr AAWT.

1.2.6 During the night, average speeds would be marginally higher than during the day. The differences calculated, however, only account for a fraction of a dB (<0.3 dB). Calculations of this are provided in Annex C.

Noise Modelling

1.2.7 An indication of residential or otherwise noise-sensitive properties have been obtained from the OS Address Base Plus dataset, retrieved 20/05/2015. The assessment assumes that the OS Address Base Plus data do not necessarily include all residential or otherwise noise-sensitive properties but are representative of the area. Where specific noise sensitive receptors (NSRs) are identified from sources other than the Address Base Plus data, these are also included within the model.

1.2.8 One property, Nash Baptist Chapel, Meadow Road, Pye Corner was identified within the OS Address Base dataset as a 'Place of Worship'. This has now been modelled as in residential use.

1.2.9 Residential receptors are considered to be of medium sensitivity. Consequently, a major magnitude of impact equates to a moderate or large significance of effect; a moderate magnitude of impact equates to a moderate significance of effect; a minor magnitude of impact equates to a slight significance of effect; a negligible magnitude of impact equates to a neutral or slight significance of effect; and no change equates to neutral significance.

1.2.10 There are a total of 20,786 receptors derived from the Address Base Plus data. Approximately 7,867 noise sensitive properties lie within 300 m of the centreline of the existing M4 and the proposed new section of motorway. A further 9,800 properties lie between 300 m and 600 m of the centreline. Beyond this, 3,119 properties lie within 600 m to 1 km of the centreline. Receptors are shown on Figure 1. In addition 44 ecological or heritage receptors have been identified.

1.2.11 Noise emissions from road links immediately beyond the study area are included in the prediction of noise levels within the study area where traffic data are available.

1.2.12 Twelve residential properties have been identified as being demolished. These are identified in Chapter 2 of the March 2016 ES. Noise predictions are provided for these properties for the base and do-minimum scenarios but not for the do-something options. Consequently, the number of reported receptors will total slightly below the 20,786 stated above. The majority of these NSRs are residential properties (20,720 receptors DM / 20,708 receptors DS). A total of 68 non-residential noise sensitive receptors. It should be noted that two of the twelve properties to be demolished are not included in the base / do-minimum scenarios. Calculations therefore, report 20,718 residential properties rather than the 20,720 given above.

1.2.13 Receptors are placed at the façade of the property considered most exposed to noise arising from either the existing modified or new motorway carriageway. They have been positioned at 1.5 m above local ground height (ground floor) and at 4 m above local ground height (first floor). The assessment is primarily reported on ground-floor noise levels, however tabular data and summary tables are provided for both ground and first floor level receptors in Annex D (noise model results -summary); and Annex E (noise model results - complete data).

1.2.14 Noise contours of predicted daytime noise levels for the Base Year and for the Do-Minimum and Do-Something scenarios for Opening and Future years are provided in Figures 2 to 10, as fully defined below. These also include the committed (embedded) and additional mitigation scenarios.

1.2.15 The different scenarios are referred to by abbreviation, as follows.

- **2014 Base** – Baseline Year 2014 (without Scheme).
- **2022OYDM** – Opening Year 2022 Do Minimum (without Scheme).
- **2037FYDM** – Future Year 2037 Do Minimum (without Scheme).
- **2022OYDS** – Opening Year 2022 Do Something (with Scheme).
- **2037FYDS** – Future Year 2037 Do Something (with Scheme).
- **2022OYDSCM** – Opening Year 2022 Do Something (with Scheme and committed measures forming part of Scheme design).
- **2037FYDSCM** – Future Year 2037 Do Something (with Scheme and committed measures forming part of Scheme design).
- **2022OYDSB2** – Opening Year 2022 Do Something (with Scheme with additional mitigation).
- **2037FYDSB2** – Future Year 2037 Do Something (with Scheme with additional mitigation).

1.2.16 Noise difference contours are provided in Figures 11 to 13 and Figures 15 to 19, between 2022OYDM and the opening and future years for the above scenarios.

1.2.17 For external, non-residential noise-sensitive locations, such as parks, playing fields and ecologically sensitive areas, predicted noise levels can be found within the noise contour plots.

1.2.18 Traffic noise reporting tables and traffic noise change reporting tables are provided in Annex F, which also provides an identification and classification of all non-residential NSRs for which a non-negligible noise change is predicted to occur. A cross-tabulated noise level table is provided in Annex G for a range of scenarios.

1.2.19 The tables illustrate the overall effect of the Scheme. For the properties that are affected by the new section of motorway and Complementary Measures, the majority would experience a slight noise benefit (albeit not sufficient to qualify as a significant effect, particularly in the long term). For a minority of dwellings, however, the adverse effect would be much greater than experienced by those dwellings that would benefit. It is therefore necessary to evaluate the overall effects on annoyance or monetary cost.

1.2.20 It should be noted that the use of the terms 'nuisance' and 'annoyance' relate to the percentage of people bothered very much or quite a lot by traffic noise, as described in the DMRB, and do not directly related to 'Statutory Nuisance' as used in the Environmental Protection Act 1990.

1.3 No Mitigation Assessment

Noise Change Assessment

1.3.1 The assessment has been based upon five sets of traffic data: the base year 2014; the opening year 2022 'do minimum' (2022OYDM); the future year 2037 'do minimum' (2037OYDM); the opening year 2022 'do something' (2022OYDS); and the future year 2037 'do something' (2037FYDS).

1.3.2 In addition to these, assessments are includes for the following scenarios: a Scheme with no mitigation; a Scheme with the standard measures that form part of the Scheme design (such as low-noise road surface and solid 0.9 m concrete safety barrier within the central reservation); and a Scheme with mitigation which includes acoustic barriers in specific locations as identified as being appropriately effective.

Do-Minimum scenario in the opening year against Do-Minimum scenario in the future assessment year (long term) (2037FYDM <- 2022OYDM)

1.3.3 Noise difference contours are provided in Figure 11. Tables of noise change at each receptor are provided in Annex D and summarised in Annex E. Changes in noise levels reflect the changes in predicted traffic flow and composition around the scheme, including changes due to other committed developments.

1.3.4 Comparison of the do minimum scenario for the opening and future years indicates that, out of the 20,718 residential receptors included in the noise model, during the daytime period, a noise increase of at least 3 dB (of greater than negligible magnitude) is likely to occur at 38 receptors, with a maximum noise increase of up to 5 dB. A noise decrease of at least 3 dB is not likely to occur at any receptors, with a maximum noise decrease of up to -2 dB. There is therefore no significant change likely to occur at 20,680 receptors; this is summarised in Table 2.

Table 2: Residential Property Count – Without Scheme

Long term without scheme	Maximum change	Major	Moderate	Minor	Negligible	No Change	SubTotal
2037FYDM <- 2022OYDM	/ dB	10+ dB	5-9.9 dB	3-4.9 dB	0.1-2.9 dB	+-0.1 dB	
Benefit	-2	0	0	0	901		901
Disbenefit	5	0	0	38	9816		9854
Neutral	-	-	-	-		9963	9963
						Total:	20718

1.3.5 Out of the 68 non-residential sensitive receptors (buildings - e.g. religious buildings, educational facilities, medical facilities, community facilities, etc.) identified and included in the noise model, a noise increase of at least 3 dB is not

likely to occur at any receptors, with a maximum noise increase of up to 2 dB. A noise decrease is not likely to occur at any receptors, with a maximum noise decrease of up to 0 dB. No significant change is likely to occur at 68 receptors.

1.3.6 Based on the predicted noise change, the magnitude of impact for residential and non-residential receptors is considered to range between negligible beneficial and minor adverse, with the majority of receptors experiencing a negligible noise increase, due to general traffic growth in the area.

1.3.7 With regards to the assessment of significance, this is considered to result in an effect ranging from neutral or slight beneficial to slight adverse.

Do-Minimum scenario in the opening year against Do-Something scenario in the opening year (short-term) (2022OYDS <- 2022OYDM)

1.3.8 Noise difference contours are provided in Figure 12. Tables of noise change at each receptor are provided in Annex D and summarised in Annex E. Changes in noise levels reflect the changes in predicted traffic flow and composition around the scheme arising from the proposed scheme on the year of opening.

1.3.9 Out of the 20,708 residential receptors included in the noise model, during the daytime period, a noise increase of at least 1 dB (of greater than negligible magnitude) is likely to occur at 3,841 receptors, with a maximum noise increase of up to 21 dB. A noise decrease of at least 1 dB is likely to occur at 11,584 receptors, with a maximum noise decrease of up to -8 dB. There is therefore no significant change likely to occur at 5,283 receptors. This is summarised in Table 3.

Table 3: Residential Property Count - No Committed or Additional Mitigation

Short-term with scheme	Maximum change	Major	Moderate	Minor	Negligible	No Change	SubTotal
2022OYDS <- 2022OYDM	/ dB	5+ dB	3-4.9 dB	1-2.9 dB	0.1-0.9 dB	+-0.1 dB	
Benefit	-8	1040	1646	8898	2891	-	14475
Disbenefit	21	1197	591	2053	1722	-	5563
Neutral	-	-	-	-	-	670	670
						Total:	20708

1.3.10 Out of the 68 non-residential sensitive receptors (buildings - e.g. religious buildings, educational facilities, medical facilities, community facilities, etc.) identified and included in the noise model, a noise increase of at least 1 dB is likely to occur at 9 receptors, with a maximum noise increase of up to 6 dB. A noise decrease of at least 1 dB is likely to occur at 45 receptors, with a maximum noise decrease of up to -7 dB. No significant change is likely to occur at 14 receptors.

1.3.11 Based on the predicted noise change, the magnitude of impact for residential and non-residential receptors is considered to range between major beneficial and major adverse in the short-term, although more receptors are likely to experience a noise decrease rather than a noise increase.

1.3.12 With regard to the assessment of significance, this is considered to result in an effect ranging from moderate or large benefit to moderate or large adverse.

Do-Minimum scenario in the opening year against Do-Something scenario in the future assessment year (long term) (2037FYDS <- 2022OYDM)

1.3.13 Noise difference contours are provided in Figure 13. Tables of noise change at each receptor are provided in Annex D and summarised in Annex E. Changes in noise levels reflect the changes in predicted traffic flow and composition around the scheme arising from the proposed scheme on the year of opening, including changes due to other committed developments.

1.3.14 Out of the 20,708 residential receptors included in the noise model, during the daytime period, a noise increase of at least 3 dB (of greater than negligible magnitude) is likely to occur at 2,015 receptors, with a maximum noise increase of up to 21 dB. A noise decrease of at least 3 dB is likely to occur at 1,972 receptors, with a maximum noise decrease of up to -8 dB. There is therefore no significant change likely to occur at 16,721 receptors. This is summarised in Table 4.

Table 4: Residential Property Count - No Committed or Additional Mitigation

Long-term with scheme	Maximum change	Major	Moderate	Minor	Negligible	No Change	SubTotal
2037FYDS <- 2022OYDM	/ dB	10+ dB	5-9.9 dB	3-4.9 dB	0.1-2.9 dB	+-0.1 dB	
Benefit	-8	0	717	1255	11230	-	13202
Disbenefit	21	205	1097	713	4804	-	6819
Neutral	-	-	-	-	-	687	687
						Total:	20708

1.3.15 Out of the 68 non-residential sensitive receptors (buildings - e.g. religious buildings, educational facilities, medical facilities, community facilities, etc.) identified and included in the noise model, a noise increase of at least 3 dB is likely to occur at 3 receptors, with a maximum noise increase of up to 7 dB. A noise decrease of at least 3 dB is likely to occur at 7 receptors, with a maximum noise decrease of up to -6 dB. No significant change is likely to occur at 58 receptors.

1.3.16 Based on the predicted noise change, the magnitude of impact for residential and non-residential receptors is considered to range between moderate beneficial to major adverse in the long term, although more receptors are likely to experience a noise decrease rather than a noise increase. With regard to the assessment of significance this is considered to result in an effect ranging from moderate beneficial to moderate or large adverse.

1.3.17 In summary, with no mitigation and in the short-term, 1,788 receptors have a significant adverse effect; and 2,686 have a significant benefit. In the long term, 1,302 receptors have a significant adverse effect; and 717 have a significant benefit.

Noise Nuisance Assessment

1.3.18 Noise Nuisance Assessments following the procedure given in DMRB are provided here. The percentage of the population experiencing a nuisance and the monetary cost associated with the noise change are given to inform the assessment but do not determine the significance of effect. Only residential properties, excluding those to be demolished, are considered.

Do-Minimum scenario in the opening year against Do-Minimum scenario in the future assessment year (long term) (2037FYDM <- 2022OYDM)

1.3.19 In the 2037FYDM <- 2022OYDM scenario: out of the 20,708 residential receptors included in the noise model, predictions indicate that, during the daytime period, at Ground Floor, a marginal increase in nuisance level of up to 10% is likely to occur at 3,790 receptors, with 0 properties experiencing an increase in nuisance of 10% or more (to a maximum of 8%); a marginal decrease in nuisance level (of up to -10%) is likely to occur at 143 receptors with a decrease of -10% or more at 0 receptors (to a maximum of -3%); and no change is likely to occur at 16,775 receptors.

1.3.20 Following the methodology of DMRB and using a standardised population density of 2.3 people per dwelling, it is estimated that the noise change would result in an increase in people annoyed by 146 persons.

1.3.21 It is possible to associate a change in monetary cost with noise change. Following the methodology of DMRB and using standardised 2014 cost-data, it is estimated that the noise change would result in an increase (adverse) in monetary cost by £24,269 over the whole assessment area.

1.3.22 The noise nuisance assessment is summarised in Annex H and Table 5.

Do-Minimum scenario in the opening year against Do-Something scenario in the opening year (short-term) (2022OYDS <- 2022OYDM)

1.3.23 In the 2022OYDS <- 2022OYDM scenario: out of the 20,708 residential receptors included in the noise model, predictions indicate that, during the daytime period, at Ground Floor, a marginal increase in nuisance level of up to 10% is likely to occur at 4,213 receptors, with 50 properties experiencing an increase in nuisance of 10% or more (to a maximum of 38%); a marginal decrease in nuisance level (of up to -10%) is likely to occur at 12,028 receptors with a decrease of -10% or more at 321 receptors (to a maximum of -25%); and no change is likely to occur at 4,096 receptors.

1.3.24 Following the methodology of DMRB and using a standardised population density of 2.3 people per dwelling, it is estimated that the noise change would result in a decrease in people annoyed by -474 persons.

1.3.25 It is possible to associate a change in monetary cost with noise change. Following the methodology of DMRB and using standardised 2014 cost-data, it is estimated that the noise change would result in a decrease (beneficial) in monetary cost by -£90,083 over the whole assessment area.

1.3.26 The noise nuisance assessment is summarised in Annex H and Table 5.

Do-Minimum scenario in the opening year against Do-Something scenario in the future assessment year (long term) (2037FYDS <- 2022OYDM)

1.3.27 In the 2037FYDS <- 2022OYDM scenario: out of the 20,708 residential receptors included in the noise model, predictions indicate that, during the daytime period, at Ground Floor, a marginal increase in nuisance level of up to 10% is likely to occur at 5,388 receptors, with 63 properties experiencing an increase in nuisance of 10% or more (to a maximum of 38%); a marginal decrease in nuisance level (of up to -10%) is likely to occur at 10,252 receptors with a decrease of -10% or more at 254 receptors (to a maximum of -23%); and no change is likely to occur at 4,751 receptors.

1.3.28 Following the methodology of DMRB and using a standardised population density of 2.3 people per dwelling, it is estimated that the noise change would result in a decrease in people annoyed by -237 persons.

1.3.29 It is possible to associate a change in monetary cost with noise change. Following the methodology of DMRB and using standardised 2014 cost-data, it is estimated that the noise change would result in a decrease (beneficial) in monetary cost by -£50,704 over the whole assessment area.

1.3.30 The noise nuisance assessment is summarised in Annex H and in Table 5.

Table 5: Noise Nuisance Assessment Summary

Change in Nuisance Level		Do-Minimum OYDM>FYDM	Do-Something	
			OYDM>OYDS	OYDM>FYDS
		Number of dwellings	Number of dwellings	Number of dwellings
Increase in nuisance level	< 10%	3790	4213	5388
	> 10%	0	50	63
	Maximum Increase	8%	38%	38%
No change	0%	16775	4096	4751
Decrease in nuisance level	< 10%	143	12028	10252
	> 10%	0	321	254
	Maximum Decrease	-3%	-25%	-23%

1.4 Mitigation Measures

1.4.1 It is commonly accepted that there is a hierarchy of noise mitigation with the most favoured being control at source, then control of the transmission path and finally control at the receiver location.

Control at Source

1.4.2 Measures may include:

- treatment of the road with a low noise surface;
- reducing traffic speeds; and/or
- restricting HGV traffic.

1.4.3 With regards to low noise surfaces, the DMRB (Volume 11, Section 3, Part 7 HD 213/11. Chapter 4, Page 4/1, Paragraph 4.3 iv) states that:

"The principal benefit of low-noise surfaces is the reduction in mid and higher frequencies of noise generated by tyres at speeds in excess of 75 km/hr. They are less effective in reducing noise at low speeds where engine noise particularly from heavy vehicles is more dominant. These surfaces also create a relatively smooth running surface that in some cases can help to eliminate ground borne vibration."

1.4.4 As part of the design, the proposed new section of motorway would include a thin surfacing system or similar (such as stone mastic asphalt (SMA)), having relatively good 'low-noise' properties. The principal benefit of low-noise surfaces is the reduction in mid and higher frequencies of noise generated by tyres at speeds in excess of 75 km/hr (approximately 47 mph).

1.4.5 The acoustic performance of low-noise road surfaces can degrade with time. The DMRB recommends that a maximum of -3.5 dB attenuation to traffic noise (compared to hot rolled asphalt) be assumed when considering 'with scheme' noise levels where speeds are at or in excess of 75 km/hr.

1.4.6 The do-something scenario includes a thin surfacing system, specifically a thin surface course system for all new asphalt, mainline, slip roads and side roads, which provides at least -3.5 dB attenuation at higher speeds, compared to bituminous road surface (the reference case). The quiet surface has been considered as part of the design of the new section of motorway.

1.4.7 Should an alternate quieter road surface become practicably available with longevity of performance, this could provide further benefits in terms of reduced traffic noise. However, the current guidance in the DMRB would not recommend that a higher attenuation be assumed, leaving the assessment unchanged.

1.4.8 With regards to speed and volume restrictions, the DMRB (Volume 11, Section 3, Part 7 HD 213/11. Chapter 4, Page 4/1, Paragraph 4.3 v) states that:

"The effect of the speed of vehicles on noise level is one of the most fundamental in the noise prediction process. Above 40 km/hr, noise level increases with the speed of the vehicle and a reduction in speed will normally cause a reduction in noise level. In a similar way, the volume and composition of traffic has a direct influence on the noise level."

1.4.9 There is no intention to restrict HGV use or to restrict normal motorway speeds on the main carriageways to reduce noise.

Control at the Receiver Location

1.4.10 Mitigation measures may include compensation or remedial works i.e. installing noise insulation as secondary glazing, where NSRs are eligible under the Noise Insulation Regulations (NIR). Some receptors where the greatest noise levels are identified are those which would be taken by Compulsory Purchase (CP) and removed from residential use. It is assumed that the occupants would relocate to a location with acceptable noise levels and hence are no longer considered as adversely affected.

Control of the Transmission Path

1.4.11 Mitigation measures may include the construction of environmental barriers - the term 'barrier' means any object that interrupts the path of noise transmission between source and receiver/receptor. Examples are a close-boarded wooden fence, brick wall, concrete parapet, earth bund, or combination (i.e. earth bund with a fence running along the top or motorway edge safety barriers if solid concrete).

1.4.12 With regards to environmental barriers, the DMRB (Volume 11, Section 3, Part 7 HD 213/11. Chapter 4, Page 4/1, Paragraph 4.3 iii) states that:

"These can be in the form of earth mounding or acoustic fencing of various types, or a combination of the two… The use of reflective and absorptive barriers could also be considered."

1.4.13 Furthermore, the DMRB (Volume 11, Section 3, Part 7 HD 213/11. Chapter 4, Page 4/1, Paragraph 4.4) states that:

"The potential benefits of mitigation measures vary widely according to circumstances. For example, environmental barriers can provide reductions of 10 dB or more for well-screened locations relatively close to the source. But at further distances, and especially where the barrier provides only a small deflection of the transmitted sound waves, actual noise reductions may only be 1 or 2 dB. Beyond 200-300 m, the effects are often zero as ground attenuation becomes the most significant factor."

1.4.14 As a standard safety measure, a solid concrete 'step' barrier of 0.9 m height would be positioned between the two, three lane motorway carriageways. This may provide a small amount of acoustic attenuation and has been included as a part of the design for the new section of motorway. Safety barriers along the outer carriageway edges would be 'steel barriers' and provide no acoustic benefit in terms of the noise model, i.e. they would provide some reflection and scattering but this cannot be considered within the model.

1.4.15 Acoustic barriers have been considered at locations where they might provide benefit to properties predicted to experience a significant noise increase but only where there are significant groups of properties. The barriers would also provide some benefit to other properties in these areas. The height has been assumed to minimise other non-acoustic effects of the barriers, i.e. adverse landscape and visual effects. The locations of these barriers would be subject to further definitive evaluation and confirmation in due course.

1.4.16 Four lengths of 2.0 m height acoustic barrier have been assessed; their approximate locations are shown on Figure 14, in the following indicative locations:

- Duffryn – north side of the new section of motorway – 1,670 m run from the west extending to Lighthouse Road Overbridge – 2 m height protecting some 100 properties.
- Duffryn – north side of the new section of motorway – 520 m run east from Lighthouse Road Overbridge – 2 m height protecting some 80 properties.
- North of Magor – south side of the new section of motorway – 1,100 m run from Newport Road and Vinegar Hill. 2 m height protecting approximately

150 properties. The barrier would only be provided where sufficient attenuation is not already provided by the cutting for the new section of motorway or existing barriers.

- West of Magor – southeast side of the new section of motorway – 750 m run south from Green Moor Lane. 2 m height protecting approximately 100 properties and Caldicot Level.

The exact locations, alignments and heights of these barriers will be developed during the detailed design. However, the barriers would generally be such as to remove direct line-of-sight between the carriageway and some or all windows of the nearer NSRs.

1.5 Assessment with Measures included in Scheme Design

1.5.1 Measures forming part of the design comprise a low-noise road surface providing -3.5 dB attenuation (to vehicles travelling over 75 kph) and a solid 0.9 m concrete safety barrier between the two carriageways.

1.5.2 To allow consideration of the committed and additional mitigation, assessment is made of the scenarios discussed above. For the do-minimum scheme, 2022OYDM > 20237FYDM, the assessment remains unchanged.

Noise Change Assessment

Do-Minimum scenario in the opening year against Do-Something scenario with committed mitigation in the opening year (short-term) (2022OYDSCM <- 2022OYDM)

1.5.3 Noise difference contours are provided in Figure 15. Tables of noise change at each receptor are provided in Annex D and summarised in Annex E. Changes in noise levels reflect the committed mitigation; and changes in predicted traffic flow and composition around the scheme arising from the proposed scheme on the year of opening.

1.5.4 Out of the 20,708 residential receptors included in the noise model, during the daytime period, a noise increase of at least 1 dB (of greater than negligible magnitude) is likely to occur at 2,039 receptors, with a maximum noise increase of up to 17 dB. A noise decrease of at least 1 dB is likely to occur at 12,438 receptors, with a maximum noise decrease of up to -8 dB. There is therefore no significant change likely to occur at 6,231 receptors. This is summarised in Table 6.

Table 6: Residential Property Count – With Committed Mitigation

Short-term with scheme 2022OYDSCM <- 2022OYDM	Maximum change / dB	Major 5+ dB	Moderate 3-4.9 dB	Minor 1-2.9 dB	Negligible 0.1-0.9 dB	No Change +-0.1 dB	SubTotal
Benefit	-8	1069	1777	9592	3677	-	16115
Disbenefit	17	471	611	957	1755	-	3794
Neutral	-	-	-	-	-	799	799
						Total:	20708

1.5.5 Out of the 68 non-residential sensitive receptors (buildings - e.g. religious buildings, educational facilities, medical facilities, community facilities, etc.) identified and included in the noise model, a noise increase of at least 1 dB is likely to occur at 5 receptors, with a maximum noise increase of up to 3 dB; a noise decrease of at least 1 dB is likely to occur at 47 receptors, with a maximum noise decrease of up to -7 dB; and no significant change is likely to occur at 16 receptors.

1.5.6 Based on the predicted noise change, the magnitude of impact for residential and non-residential receptors is considered to range between major beneficial to major adverse in the short-term, although more receptors are likely to experience a noise decrease rather than a noise increase.

1.5.7 With regards to the assessment of significance, this is considered to result in an effect ranging from moderate or large benefit to moderate or large adverse.

Do-Minimum scenario in the opening year against Do-Something scenario with committed mitigation in the future assessment year (long term) (2037FYDSCM <- 2022OYDM)

1.5.8 Noise difference contours are provided in Figure 16. Tables of noise change at each receptor are provided in Annex D and summarised in Annex E. Changes in noise levels reflect the committed mitigation; and changes in predicted traffic flow and composition around the scheme arising from the proposed scheme on the year of opening, including changes due to other committed developments, as described in the Transportation assessment.

1.5.9 Out of the 20,708 residential receptors included in the noise model, during the daytime period, a noise increase of at least 3 dB (of greater than negligible magnitude) is likely to occur at 1,265 receptors, with a maximum noise increase of up to 18 dB. A noise decrease of at least 3 dB is likely to occur at 2,127 receptors, with a maximum noise decrease of up to -8 dB. There is therefore no significant change likely to occur at 17,316 receptors. This is summarised in Table 7.

Table 7: Residential Property Count - With Committed Mitigation

Long-term with scheme	Maximum change	Major	Moderate	Minor	Negligible	No Change	SubTotal
2037FYDSCM <- 2022OYDM	/ dB	10+ dB	5-9.9 dB	3-4.9 dB	0.1-2.9 dB	+-0.1 dB	
Benefit	-8	0	792	1335	12270	-	14397
Disbenefit	18	31	548	686	4102	-	5367
Neutral	-	-	-	-	-	944	944
						Total:	20708

1.5.10 Out of the 68 non-residential sensitive receptors (buildings - e.g. religious buildings, educational facilities, medical facilities, community facilities, etc.) identified and included in the noise model, a noise increase of at least 3 dB is likely to occur at 2 receptors, with a maximum noise increase of up to 4 dB; a noise decrease of at least 3 dB is likely to occur at 7 receptors, with a maximum noise decrease of up to -6 dB; and no significant change is likely to occur at 59 receptors.

1.5.11 Based on the predicted noise change, the magnitude of impact for residential and non-residential receptors is considered to range between moderate beneficial to major adverse in the long term, although more receptors are likely to experience a noise decrease rather than a noise increase. With regards to the assessment of significance, this is considered to result in an effect ranging from moderate benefit to moderate or large adverse.

1.5.12 In summary, with the committed mitigation: in the short-term, 1,203 receptors have a significant adverse effect; and 4,026 have a significant benefit. In the long term, 585 receptors have a significant adverse effect; and 774 have a significant benefit.

Noise Nuisance Assessment

Do-Minimum scenario in the opening year against Do-Something scenario with committed mitigation in the opening year (short-term) (2022OYDSCM <- 2022OYDM)

1.5.13 In the 2022OYDSCM <- 2022OYDM scenario: out of the 20,708 residential receptors included in the noise model, predictions indicate that, during the daytime period, at Ground Floor, a marginal increase in nuisance level of up to 10% is likely to occur at 2,387 receptors, with 20 properties experiencing an increase in nuisance of 10% or more (to a maximum of 27%); a marginal decrease in nuisance level (of up to -10%) is likely to occur at 13,037 receptors with a decrease of -10% or more at 322 receptors (to a maximum of -25%); and no change is likely to occur at 4,942 receptors.

1.5.14 Following the methodology of DMRB and using a standardised population density of 2.3 people per dwelling, it is estimated that the noise change would result in a decrease in people annoyed by -665 persons.

1.5.15 It is possible to associate a change in monetary cost with noise change. Following the methodology of DMRB and using standardised 2014 cost-data, it is

estimated that the noise change would result in a decrease (beneficial) in monetary cost by -£119,821 over the whole assessment area.

Do-Something: Do-Minimum scenario in the opening year against Do-Something scenario with committed mitigation in the future assessment year (long term) (2037FYDSCM <- 2022OYDM)

1.5.16 In the 2037FYDSCM <- 2022OYDM scenario: out of the 20,708 residential receptors included in the noise model, predictions indicate that, during the daytime period, at Ground Floor, a marginal increase in nuisance level of up to 10% is likely to occur at 3,746 receptors, with 24 properties experiencing an increase in nuisance of 10% or more (to a maximum of 30%); a marginal decrease in nuisance level (of up to -10%) is likely to occur at 11,052 receptors with a decrease of -10% or more at 274 receptors (to a maximum of -23%); and no change is likely to occur at 5,612 receptors.

1.5.17 Following the methodology of DMRB and using a standardised population density of 2.3 people per dwelling, it is estimated that the noise change would result in a decrease in people annoyed by -425 persons.

1.5.18 It is possible to associate a change in monetary cost with noise change. Following the methodology of DMRB and using standardised 2014 cost-data, it is estimated that the noise change would result in a decrease (beneficial) in monetary cost by -£80,608 over the whole assessment area.

1.5.19 The noise nuisance assessment is summarised in Annex H and in Table 8.

Table 8: Noise Nuisance Assessment Summary

Change in Nuisance Level		Do-Something Committed Mitigation	
		2022OYDSCM <- 2022OYDM	2037FYDSCM <- 2022OYDM
		Number of dwellings	Number of dwellings
Increase in nuisance level	< 10%	2387	3746
	> 10%	20	24
	Maximum Increase	27%	30%
No change	0%	4942	5612
Decrease in nuisance level	< 10%	13037	11052
	> 10%	322	274
	Maximum Decrease	-25%	-23%

1.6 Assessment with Mitigation

1.6.1 In addition to the measures forming part of the design (comprising a low noise road surface providing 3.5 dB attenuation (to vehicles travelling over 75 kph) and a solid 0.9 m concrete safety barrier between the two, three lane carriageways), four lengths of acoustic barrier have been considered, as identified in Figure 14.

1.6.2 The combination of measures forming part of the Scheme design and the proposed mitigation (barriers) compared to do-minimum scenario is provided

below. For the do-minimum scheme, 2022OYDM > 20237FYDM, the assessment remains unchanged.

Noise Change Assessment

Do-Minimum scenario in the opening year against Do-Something scenario with additional and committed mitigation in the opening year (short-term) (2022OYDSB2 <- 2022OYDM)

1.6.3 Noise difference contours are provided in Figure 17. Tables of noise change at each receptor are provided in Annex D and summarised in Annex E. Changes in noise levels reflect the committed and additional mitigation; and changes in predicted traffic flow and composition around the scheme arising from the proposed scheme on the year of opening, as described in the Transportation assessment.

1.6.4 Out of the 20,708 residential receptors included in the noise model, during the daytime period, a noise increase of at least 1 dB (of greater than negligible magnitude) is likely to occur at 2,004 receptors, with a maximum noise increase of up to 17 dB. A noise decrease of at least 1 dB is likely to occur at 12,504 receptors, with a maximum noise decrease of up to -8 dB. There is therefore no significant change likely to occur at 6,200 receptors. This is summarised in Table 9.

Table 9: Residential Property Count – With Committed and Additional Mitigation

Short-term with scheme	Maximum change	Major	Moderate	Minor	Negligible	No Change	SubTotal
2037FYDSCM <- 2022OYDM	/ dB	5+ dB	3- 4.9 dB	1- 2.9 dB	0.1-0.9 dB	+-0.1 dB	
Benefit	-8	1102	1786	9616	3661	-	16165
Disbenefit	17	420	558	1026	1760	-	3764
Neutral	-	-	-	-	-	779	779
						Total:	20708

1.6.5 Out of the 68 non-residential sensitive receptors (buildings - e.g. religious buildings, educational facilities, medical facilities, community facilities, etc.) identified and included in the noise model, a noise increase of at least 1 dB is likely to occur at 5 receptors, with a maximum noise increase of up to 3 dB; a noise decrease of at least 1 dB is likely to occur at 47 receptors, with a maximum noise decrease of up to -7 dB; and no significant change is likely to occur at 16 receptors.

1.6.6 Based on the predicted noise change, the magnitude of impact for residential and non-residential receptors is considered to range between major beneficial to major adverse in the short term, although more receptors are likely to experience a noise decrease rather than a noise increase.

1.6.7 With regards to the assessment of significance, this is considered to result in an effect ranging from moderate or large benefit to moderate or large adverse.

Do-Minimum scenario in the opening year against Do-Something scenario with additional and committed mitigation in the future assessment year (long term) (2037FYDSB2 <- 2022OYDM)

1.6.8 Noise difference contours are provided in Figure 18. Tables of noise change at each receptor are provided in Annex D and summarised in Annex E. Changes in noise levels reflect the committed and additional mitigation; and changes in predicted traffic flow and composition around the scheme arising from the proposed scheme on the year of opening, including changes due to other committed developments, as described in the Transportation assessment.

1.6.9 Out of the 20,708 residential receptors included in the noise model, during the daytime period, a noise increase of at least 3 dB (of greater than negligible magnitude) is likely to occur at 1,178 receptors, with a maximum noise increase of up to 18 dB. A noise decrease of at least 3 dB is likely to occur at 2,165 receptors, with a maximum noise decrease of up to -8 dB. There is therefore no significant change likely to occur at 17,365 receptors. This is summarised in Table 10.

Table 10: Residential Property Count - With Committed and Additional Mitigation

Long-term with scheme	Maximum change	Major	Moderate	Minor	Negligible	No Change	SubTotal
2037FYDSB2 <- 2022OYDM	/ dB	10+ dB	5-9.9 dB	3-4.9 dB	0.1-2.9 dB	+-0.1 dB	
Benefit	-8	0	820	1345	12300	-	14465
Disbenefit	18	28	492	658	4131	-	5309
Neutral	-	-	-	-	-	934	934
						Total:	20708

1.6.10 Out of the 68 non-residential sensitive receptors (buildings - e.g. religious buildings, educational facilities, medical facilities, community facilities, etc.) identified and included in the noise model, a noise increase of at least 3 dB is likely to occur at 2 receptors, with a maximum noise increase of up to 4 dB; a noise decrease of at least 3 dB is likely to occur at 7 receptors, with a maximum noise decrease of up to -6 dB; and no significant change is likely to occur at 59 receptors.

1.6.11 Based on the predicted noise change, the magnitude of impact for residential and non-residential receptors is considered to range between moderate beneficial to major adverse in the long term, although more receptors are likely to experience a noise decrease rather than a noise increase.

1.6.12 With regards to the assessment of significance, this is considered to result in an effect ranging from moderate benefit to moderate or large adverse.

1.6.13 In summary, with the committed and additional mitigation and in the short-term, 978 receptors are subject to a significant adverse effect; and 2,888 are subject to a significant beneficial effect. In the long term, 520 receptors have a significant adverse effect; and 820 have a significant benefit.

1.6.14 When considered as a whole, the Scheme has a net benefit, with an average noise level difference of -1.3 dB per property across the 20,708 properties

assessed for the opening year, when comparing the Do-Minimum scenario against the Do-Something scenario. This equates to approximately a 63,000 'dB·people' improvement due to the Scheme.

1.6.15 Calculations indicate that in the long term, the noise barriers would provide a significant benefit for 87 properties, decreasing noise sufficiently to change the impact category for these properties either: from major adverse to moderate adverse; from moderate adverse to minor adverse; or from minor adverse to negligible. There would be 58 fewer properties within the long term adverse category with the barriers in place.

Noise Nuisance Assessment

Do-Minimum scenario in the opening year against Do-Something scenario with additional and committed mitigation in the opening year (short-term) (2022OYDSB2 <- 2022OYDM)

1.6.16 In the 2022OYDSB2 <- 2022OYDM scenario: out of the 20,708 residential receptors included in the noise model, predictions indicate that, during the daytime period, at Ground Floor, a marginal increase in nuisance level of up to 10% is likely to occur at 2,339 receptors, with 20 properties experiencing an increase in nuisance of 10% or more (to a maximum of 27%); a marginal decrease in nuisance level (of up to -10%) is likely to occur at 13,068 receptors with a decrease of -10% or more at 341 receptors (to a maximum of -25%); and no change is likely to occur at 4,940 receptors.

1.6.17 Following the methodology of DMRB and using a standardised population density of 2.3 people per dwelling, it is estimated that the noise change would result in a decrease in people annoyed by -679 persons.

1.6.18 It is possible to associate a change in monetary cost with noise change. Following the methodology of DMRB and using standardised 2014 cost-data, it is estimated that the noise change would result in a decrease (beneficial) in monetary cost by -£122,264 over the whole assessment area.

Do-Something: Do-Minimum scenario in the opening year against Do-Something additional and scenario with committed mitigation in the future assessment year (long term) (2037FYDSB2 <- 2022OYDM)

1.6.19 In the 2037FYDSB2 <- 2022OYDM scenario: out of the 20,708 residential receptors included in the noise model, predictions indicate that, during the daytime period, at Ground Floor, a marginal increase in nuisance level of up to 10% is likely to occur at 3,694 receptors, with 24 properties experiencing an increase in nuisance of 10% or more (to a maximum of 30%); a marginal decrease in nuisance level (of up to -10%) is likely to occur at 11,101 receptors with a decrease of -10% or more at 292 receptors (to a maximum of -23%); and no change is likely to occur at 5,597 receptors.

1.6.20 Following the methodology of DMRB and using a standardised population density of 2.3 people per dwelling, it is estimated that the noise change would result in a decrease in people annoyed by -439 persons.

1.6.21 It is possible to associate a change in monetary cost with noise change. Following the methodology of DMRB and using standardised 2014 cost-data, it is

estimated that the noise change would result in a decrease (beneficial) in monetary cost by -£83,479 over the whole study area.

1.6.22 The noise nuisance assessment is summarised in Annex H and in Table 11.

Table 11: Noise Nuisance Assessment Summary

Change in Nuisance Level		Do-Something Committed Mitigation	
		2022OYDSB2 <- 2022OYDM	2037FYDSB2 <- 2022OYDM
		Number of dwellings	Number of dwellings
Increase in nuisance level	< 10%	2339	3694
	> 10%	20	24
	Maximum Increase	27%	30%
No change	0%	4940	5597
Decrease in nuisance level	< 10%	13068	11101
	> 10%	341	292
	Maximum Decrease	-25%	-23%

Efficacy of Additional Mitigation Measures

1.6.23 As discussed above, three sections of noise barrier have been considered, as shown in Figure 14.

1.6.24 Figure 19 gives a noise-difference contour for the 2022OYDS with committed mitigation against 2022OYDS with committed mitigation and additional noise barriers. This shows the reduction in noise levels afforded by each barrier section, with the noise nuisance assessment summarised Table 12.

Table 12: Noise Nuisance Assessment Summary

Change in Nuisance Level		Do-Something Additional Mitigation & Committed Mitigation vs Committed Mitigation
		2022OYDSB2 <- 2022OYDSCM
		Number of dwellings
Increase in nuisance level	< 10%	11
	> 10%	0
	Maximum Increase	2%
No change	0%	20263
Decrease in nuisance level	< 10%	434
	> 10%	0
	Maximum Decrease	-6%

1.6.25 The eleven dwellings experiencing a disbenefit as a result of the barriers would be subject to reflections of traffic noise back to their property. This is no more than a 2% increase in annoyance and could be avoided by the use of acoustically absorbent barriers.

1.6.26 An estimated 434 dwellings would experience a decrease in noise nuisance as a result of the acoustic barriers. None of these experiences a benefit of 10% or more.

1.6.27 Using the standardised population density, an estimated 13 fewer people would be annoyed were the barriers to be installed. This equates to a cost reduction (benefit) of £2,443 over the whole study area following the DMRB methodology.

1.7 Results Summary

1.7.1 The planning system promotes sustainable economic growth whilst ensuring that quality of life is not unreasonably affected. It is considered that the Scheme appropriately reflects these aims with regard to the noise and vibration effects associated with the future use of the Scheme.

1.7.2 In operation, both beneficial and adverse noise effects are predicted as a result of the Scheme. The new section of motorway would reduce congestion on the existing M4. Noise mitigation has been incorporated into the Scheme by the provision of a thin road surface system, which is relatively low noise, and screening within the landscape provisions, including bunding and retaining walls, has been considered throughout.

1.7.3 Based on the predicted noise change, the level of significance is considered to range between major benefit and major adverse effect in the short-term. In the long term, the range decreases to levels of significance from moderate benefit to major adverse.

1.7.4 The results of the assessment with regard to operational noise are provided in Table 13.

Table 13: Operational Noise Impacts with Committed Mitigation

Description of impact	Short / medium / long term	Magnitude of impact (with mitigation)	Magnitude of impact	Significance of effect	Significant / Not significant
Adverse Noise Change	Short / medium / long term	471 receptors Short / medium term; 31 receptors Long term	Major adverse	Moderate or Large	Significant
		611 receptors Short / medium term; 548 receptors Long term	Moderate adverse	Moderate	Significant
		957 receptors Short / medium term; 686 receptors Long term	Minor adverse	Slight	Not Significant
		1755 receptors Short / medium term; 4102 receptors Long term	Negligible adverse	Neutral or slight	Not Significant
Beneficial Noise Change	Short / medium / long term	1069 receptors Short / medium term; 0 receptors Long term	Major beneficial	Moderate or Large	Significant
		1777 receptors Short / medium term; 792 receptors Long term	Moderate beneficial	Moderate	Significant
		9592 receptors Short / medium term;	Minor beneficial	Slight	Not Significant

Description of impact	Short / medium / long term	Magnitude of impact (with mitigation)	Magnitude of impact	Significance of effect	Significant / Not significant
		1335 receptors Long term			
		3677 receptors Short / medium term; 12270 receptors Long term	Negligible beneficial	Neutral or slight	Not Significant
Neutral	Short / medium / long term	799 receptors Short / medium term; 944 receptors Long term	No Change	Neutral	Not Significant

1.7.5 Noise barriers of 2 m height have been modelled for four locations along the main carriageway. Calculations indicate that in the long term the noise barriers would provide a significant benefit for 87 properties, decreasing noise sufficiently to change the impact category for these properties either: from major adverse to moderate adverse; from moderate adverse to minor adverse; or from minor adverse to negligible. There would be 58 fewer properties within the long term significant adverse category with the barriers in place. The results of the assessment with regard to operational noise are provided in Table 14.

Table 14: Operational Noise Impacts with Committed and Additional Mitigation

Description of impact	Short / medium / long term	Magnitude of impact (with mitigation)	Magnitude of impact	Significance of effect	Significant / Not significant
Adverse Noise Change	Short / medium / long term	420 receptors Short / medium term; 28receptors Long term	Major adverse	Moderate or Large	Significant
		558 receptors Short / medium term; 492 receptors Long term	Moderate adverse	Moderate	Significant
		1026 receptors Short / medium term; 658 receptors Long term	Minor adverse	Slight	Not Significant
		1760 receptors Short / medium term; 4131 receptors Long term	Negligible adverse	Neutral or slight	Not Significant
Beneficial Noise Change	Short / medium / long term	1102 receptors Short / medium term; 0 receptors Long term	Major beneficial	Moderate or Large	Significant
		1786 receptors Short / medium term; 820 receptors Long term	Moderate beneficial	Moderate	Significant
		9616 receptors Short / medium term; 1345 receptors Long term	Minor beneficial	Slight	Not Significant
		3661 receptors Short / medium term; 12300 receptors Long term	Negligible beneficial	Neutral or slight	Not Significant
Neutral	Short / medium / long term	779 receptors Short / medium term; 934 receptors Long term	No Change	Neutral	Not Significant

1.7.6 The barrier locations are in terms of exact run length and location and are subject to optimisation.

Annex A: Noise Model Certification

SoundPLAN International LLC

Software Designers and Consulting Engineers for
Noise Control • Air Pollution • Environmental Protection

designing a sound environment

13th of March 2015

To Whom It May Concern,

SoundPLAN is a standards based software that requires the Windows operating system to function. SoundPLAN GmbH (former name Braunstein + Berndt GmbH), the SoundPLAN software development office in Germany, checks every new release of SoundPLAN with an extensive testing procedure to ensure the continuous quality of the computed results. When available, they use the author's or overseeing agency's test questions for the standards for testing. However, not all authors or organizations provide test cases to benchmark results. When no test questions are available, SoundPLAN GmbH or a SoundPLAN trading partner generates questions to ensure the correct implementation of the calculation standards.

Please note that all noise prediction models are statistical approximations of the real world. Deviations in measurement can occur. Every standard has a number of uncertainties such as metrological conditions, the source input data and geometry. SoundPLAN only processes the input data with the algorithm provided in the standards themselves. SoundPLAN is not inventing or developing new propagation methodologies, nor improving on the equations inherent in the standards. SoundPLAN GmbH and SoundPLAN International LLC (SoundPLAN international sales office in the US) only guaranty the accuracy of the standard implementation in the SoundPLAN software.

Quality Assurance (QA) is of vital importance to SoundPLAN GmbH and SoundPLAN International LLC. Every new SoundPLAN release is compared with the test cases from the previous version to ensure results are the same. Our QA testing is an ongoing process so results remain accurate to the requirements of the standards and routines are compatible in all versions.

Furthermore, SoundPLAN GmbH has been awarded the ISO 9001: 2000 certificate. The certification body of TUV SUD Management Service GmbH certifies that "SoundPLAN GmbH has established and applies a quality management system for development and distribution of software as well as consultant work for environmental noise control, structural sound insulation and air pollution control."

SoundPLAN GmbH implements new standards as they are published. All changes are incorporated in SoundPLAN updates available at www.soundplan.eu for customers with warranty or update and maintenance contracts.

The following page lists the standards implemented and tested in SoundPLAN.

Sincerely,

Elizabeth Berndt

Annex B: Noise Model Settings

Project description

Project title:	M4 CaN Rev1
Project No.:	8201e
Engineer:	PB
Customer:	

Description:

Run description

Calculation:	Single Point Sound		
Title:	1) 2014Base		
Group:	Main		
Run file:	RunFile.runx		
Result number:		31	
Distributed Calculation			
Calculation start:		02/08/2016 22:05	
Calculation end:		02/08/2016 22:59	
Calculation time:	53:34:522 [m:s:ms]		
No. of points:		21277	
No. of calculated poi		21277	
Kernel version:	26/07/2016 (64 bit)		

Run parameters

Reflection order	1
Maximal reflection distance to receiver	200 m
Maximal reflection distance to source	50 m
Search radius	5000 m
Weighting:	dB(A)
Tolerance:	0.100 dB
Create ground effect areas from road surfaces:	No

Standards:

Roads:		CoRTN: 1988
Driving on left side		
Emission according to:	CoRTN	
Reflection order limited to:	1	
Road gradient smoothed with smooth length of:	15 m	
Disable low flow correction: No		
Method for L10 to Leq conversion: Leq = L10 - 3 dB		
Calculation with side screening: No		
Attenuation		
Foliage:		No attenuation
Built up area:		No attenuation
Industrial site:		No attenuation
Assessment:		CoRTN
Reflection of "own" facade is suppressed
