Purpose	**A465 Section 5 and 6 - Environmental Liaison Group Meeting (ELG) 1**		
Prepared by	Amy Davies		
Location	Cardiff Office	**Date/Time**	1 December 2015 10:00
Participants	See Appendix A	**Apologies**	None Received

1 **Welcome and Introduction**

WB welcomed and thanked everyone for attending first Environmental Liaison Group (ELG) for the A465 Sections 5 and 6. The aim of the meeting was for everyone to gain a better understanding of the scheme. Everyone around the table introduced themselves. Wendy Bateman is the Environmental Coordinator for the scheme, Gareth Protheroe is the Project Manager and Sarah Simons is the Principal Ecologist.

2 **Health and Safety Moment**

Two health and safety issues were highlighted:

(i) When preparing the meeting it was noticed that the staples used to staple the handouts together were a potential hand injury risk by as they were too big for the paper. It was subsequently ensured the handouts were re stapled to reduce the risk.

(ii) A weather related incident was described whereby a colleague was waiting for a train and saw a person rushing for their train who slipped almost into the train path. The lesson learned is not to rush especially in bad weather and to be careful as the saying goes it is better late than never.

3.0 **Presentation by the Project Team**

3.1 A copy of the slides used for the presentation is included in Appendix B

It was explained that the scheme is a not for profit distribution (NPD) design build finance and operate (DBFO). It was clarified that with an ECI scheme, which has been the procurement model adopted to deliver previous sections of the A465 Heads of the Valleys Dualling, it is the designer and contractor that would commit to the scheme construction and delivering what is outlined in the Environmental Statement (ES). In the case of the NPD PPP model, the ES mitigation and environmental commitments will be included in the contract set up with the 'special purpose vehicle' company appointed to construct, operate and maintain the new road.

3.2 The Key Stage 3 programme was discussed and key milestone dates highlighted.

This is would be the third major Welsh Highway scheme in 10 years delivered by the Jacobs Cardiff team. The scheme will be taken to the Design Commission for Wales in early 2016 and the draft Environmental Statement is due to be published for consultee comment in May 2016.

3.3 The forthcoming December 2015 Public Information Exhibitions were mentioned. These would be held as per below:

Venue	Date	Time	Address
St Leurwg's Church Hall	Monday 7 December 2015	Open 12.00-21.00	St Lleurwg's Church Hall, Hirwaun, Station Road, Aberdare, CF44 9TA
Cefn coed Community Centre	Tuesday 8 December 2015	Open 12.00-21.00	Cefn coed Community Centre, New Church St, Cefn-coed-y-cymmer, Merthyr Tydfil CF48 2NA
Dowlais Community Centre	Friday 11 December 2015	Open 12.00-21.00	Dowlais Community Centre, Station Rd, Merthyr Tydfil, Mid Glamorgan CF48 2NB
Cefn coed Community Centre	Saturday 12 December 2015	Open 09.00-13.00	Cefn coed Community Centre, New Church St, Cefn-coed-y-cymmer, Merthyr Tydfil CF48 2NA

3.4 *Post Meeting Note:*

ELG attendees that receive general enquiries from members of the public should direct them to the following contacts:

Information about the project is available on the Welsh Government website:
http://gov.wales/a465section5and6
You can let us know your views or questions by contacting the project team by:
Email *A465PLO@Jacobs.com*
Phone *07497 894081*
Post *: A465 Public Liaison Officer, Chris Meredith, Jacobs UK Limited, Churchill House, Churchill Way,*
Cardiff, CF10 2HH

3.5

3.6 JA advised that Jacobs may need to factor in extra meetings for Design Commission for Wales.

Minutes of this meeting will be included in the ES. Any concerns about the scheme are to be raised as early as possible. Where necessary, issues will be taken forward to be discussed in more detail at technical working groups (TWGs). The current proposed list of TWGs is as follows. All will be held at the Jacobs Office in Cardiff and Outlook Calendar invitations will be issued in due course.

3.7

Proposed TWGs and Invitees

1. *Landscape*

Invitees – Merthyr LA, RCT LA, BBNP, Olwen Maidment (NRW), Jacobs - Highways, Wendy Bateman, Cath Walker, Kathy Ronald, Lucy Emery, Sarah Simons, Lindis Danson, Rupert Lovell,
Timing – January 2016

2. *Flood risk, structures and highways design*

Invitees – Jacobs Highways, Jackie Walters (NRW) TBC (NRW), Jacobs - Dan Watson, Wendy Bateman, Cath Walker, Jon Barnes,
Timing – January 2016

3. *Land Quality/GI*

Invitees – Merthyr LA, RCT LA, Kay Roberts (NRW), Jacobs - Hugh Masters-Williams, Alan Dishington, Wendy Bateman, Cath Walker, Highways, Tony Kernon,
Timing – TBC

4. *Marsh Fritillary Butterfly*

Invitees – Richard Wistow (RCT), Rolf Brown (Merthyr), Scott Hand (NRW), Khalid Aazem (NRW) Jacobs - Wendy Bateman, Cath Walker, Sarah Simons, Lucy Emery , Laura Gore, Highways

3.8 Further TWGs will be arranged throughout KS3 as required.

3.9 The Highways Act (1980) process was summarised, highlighting that enhancement is not an easy thing to justify

3.10 The public liaison officer will deal with complaints

4.0 JA stated that monthly meetings with stakeholders are beneficial. The Orders Exhibition will be in late 2016 and will take place in similar locations to the public information exhibitions. LC stated the ES is a legal document. By the Public Inquiry (PI), ideally all issues raised by statutory consultees will have already been addressed through the ELGS and TWGs in KS3, and captured in the ES and Register of Environmental Commitments.

4.1 **Presentation of Draft Environmental Mitigation Measures 1**

4.2 WB presented the draft Environmental Masterplan (EMP) based on the 1997 proposed scheme design.

4.3 Air quality: WB stated that Jacobs are building a traffic model of the proposed scheme.

Landscape and visual: the scheme weaves along the edge of the Brecon Beacons National Park. Lighting will be mainly restricted to junctions and wherever possible, where safety in design standards permit, the intention is that the main sections of

4.4	the scheme will be unlit.	
4.5	Nature conservation: sites potentially affected include Blaen Cynon SAC, SSSIs and SINCs. Protected species may also be impacted. No bat tree roosts have been identified to date, however building roosts have been confirmed.	Jacobs
4.6	RB stated that if the Swansea road junction was stopped up it would be an issue for local road users. MD stated the junction strategy is under review. Best access to Prince Charles Hospital is to be considered. There are issues at Dowlais Top with PROW conflicts, and many recent road accidents involved pedestrians crossing the existing A465 in that area.	
4.7	The overall preferred route corridor of the proposed scheme is fixed but there will be minor alterations as the scheme design is not compliant with current standards.	
4.8	CE queried how the visual and landscape impacts will be presented. WB said that the structures will be in the form of artists impression. Jacobs will produce a 3D model during KS3. GP will determine how far we can take the viewpoint on model.	Jacobs
4.9	CL stated that good practice could be taken from the A465 Sections 2 and 3. JA stated that this will be relevant to the Merthyr Junction as this is the gateway to the Brecon Beacons National Park (BBNP). RB raised point that golf courses and Morlais Castle provide good views. A landscape TWG will be arranged for January 2016. The proposed scheme has to be buildable within existing constraints. CL queried the use of soil nailing. JA stated that there is a lesson learned in relation to Section 2 and ideally would not like soil nailing to be used.	
4.10	LC had attended a lessons learned meeting for Section 3. One of the outcomes was consideration of including a risk element into land take parameters in order to ensure sufficient land to deliver environmental requirements in the event there is incompetent rock or other unexpected issues encountered at construction stage.	
5.0		
5.1	**Marsh Fritillary Butterfly draft mitigation strategy presentation –SS**	
5.2	See slide presentation in Appendix B.	
	The Blaen Cynon SAC is to be taken forward to Stage 2 Appropriate Assessment. Other European sites have been screened out at Stage 1 of the Assessment of Implications on European Sites (AIES) process due distance from the proposed scheme. RW stated that habitat is important to butterfly conservation. There are options to obtain land for essential mitigation. WB stated that in the AIES process it	

5.3	is essential to show how we do this. GP stated that Welsh Government could take land so environmental mitigation is functional. WB stated that the habitat has to be up to standard but not proven to be in use. RW stated that need to consider the existing work with marsh fritillary mitigation in the area and integrate with this. LC raised the possibility of combining the proposed mitigation area with the RCT area. Jacobs is proposing a corridor north of the proposed scheme road and RCT are delivering a corridor south of the road. RW explained that south of the road, there are a number of developments at differing stages of completion.
5.4	Marsh Fritillary Butterfly Mitigation TWG to be arranged for January 2016.
5.5	GP queried how long it takes to make an area of land suitable for marsh fritillary. SS stated that it depends on what the land is like to start with. RW stated the structure of the vegetation needs to be correct with loci of devils bit scabious. It may take 1 to 2 years for overgrazed areas to become suitable. LC queried whether we are looking to improve dispersal ability of meta populations. SS confirmed that we are.
5.6	There will be loss of SSSI and SINC habitats with the proposed scheme therefore proposed essential mitigation areas will serve a dual purpose. RW queried possibility as of growing devil's bit scabious from local nurseries. Further details will be discussed at the TWG in January 2016.
6.0	CL stated that there is an area of species rich grassland of interest at Hirwaun west of the roundabout and whether there was the capacity to translocate. CL also asked whether it would be possible to relocate or translocate dry stone walls within the proposed scheme. SS confirmed that we will consider this and that these types of grasslands are being looked at.
6.1	**Presentation of Draft Environmental Mitigation Measures 2**
6.2	JM queried the status of great crested newts (GCN) and what the impacts may be. The proposed scheme will not involve the loss of any GCN breeding ponds. eDNA surveys were undertaken in 2015 within the study area of the proposed scheme which confirmed absence of GCN in all ponds surveyed. The proposed scheme will result in a small amount of direct GCN terrestrial habitat loss.
6.3	JM queried why the Usk bat SAC sites was screened out based on distance alone as he does not think this would be robust. WB stated that WG are currently reviewing the AIES Stage 1 Screening report and Jacobs are awaiting comments. There will be an opportunity for NRW to review and comment on the AIES Stage 1 screening document once this process has been completed.
	Community and private assets - LC stated it is important to get public liaison officer involved as soon as possible. CL said that on the eastbound approach to Baverstocks there is a memorial tree where there have been fatalities in 2008. This may be mentioned at public inquiry and the public may want more lighting in this area. CL asked whether the tree could be transplanted. Tree is not mature and therefore could be transplanted. SUSTRANS sent a letter of congratulation to section 3 for improving cycle strategy. RB stated that the Merthyr Tydfil cycle path

6.4	has scope for improvement.
6.5	Road drainage and water environment: mitigation is based on construction phase controls. LC asked how the WFD requirements will be included in the process. WB confirmed that the WFD will be included in compliance report as appendix to the Road Drainage and Water Environment chapter of the ES.
7.0	CEEQUAL. MD stated that there may be new guidelines in 2017.

Next Meeting

ELG 2 will take place at the Jacobs office on 29th March 2016.

Meeting Minutes

A465 Section 5 and 6 - Environmental

Liaison Group Meeting (ELG) 1

1 December 2015 10:00

Appendix A – Attendee List

Wendy Bateman (WB) – chair,

Khalid Aazem - Natural Resources Wales (KA)

Julian Atkins - Brecon Beacons National Park Authority (JA)

Rolf Brown - Merthyr Tydfil County Borough Council (RB)

Luci Collinwood - Welsh Government (LA)

Amy Davies – Jacobs (AD)

Petra Davies - South Wales Trunk Road Agent (PD)

Mark Dixon - Welsh Government (MD)

Chris Engel – Blaenau Gwent County Borough Council (CE)

Laura Gore – Jacobs (LG)

Scott Hand - Natural Resources Wales (SH)

Cameron Lewis - South Wales Trunk Road Agent (CL)

Fran Lynn - Jacobs (FL)

Olwen Maidment - Natural Resources Wales (OM)

John Messenger - Natural Resources Wales (JM)

Chris Nutt - Natural Resources Wales (CN)

Gareth Protheroe – Jacobs (GP)

Huw Roberts - Merthyr Tydfil County Borough Council (HR)

Kay Roberts - Natural Resources Wales (KR)

Sarah Simons - Jacobs (SS)

Tim Stephens - Caerphilly County Borough Council (TS)

Cath Walker – Jacobs (CW)

Jackie Walters - Natural Resources Wales (JW)

Richard Wistow - Rhondda Cynon Taff County Borough Council (RW)

Purpose	**A465 Section 5 and 6 - Environmental Liaison Group Meeting (ELG) 2**		
Prepared by	Sarah Denne		
Location	Jacobs, Cardiff Office	**Date/Time**	29 March 2016 10:00
Participants	See Appendix A	**Apologies**	Richard Wistow, Petra Davies, Tim Stephens

1.0 Welcome and Introduction

WB welcomed and thanked everyone for attending the second Environmental Liaison Group (ELG) for the A465 Sections 5 and 6. Everybody around the table introduced themselves (see appendix A for participants list). The aim of the meeting was for everyone to gain a good understanding of the scheme and the design developments that have taken place since ELG 1.

2.0 Health and Safety Moment

One health and safety issue was discussed:

i. It was highlighted that care should be taken whilst undertaking any DIY, especially if using power tools. It is easy to become complacent when working at home where more risks may be taken and necessary PPE is not worn.

3.0 Presentation by the Project Team

3.1 WB provided an update. It was explained that the Key Stage 3 phase of the scheme is currently at week 25 of the 51 week programme with the draft orders, Statement to Inform the Appropriate Assessment (SIAA) and Environmental Statement (ES) due to be published in September 2016. The scheme was summarised as online widening, to dual 2 – lane, of the westernmost 16km of the 40km section of the A465 Heads of the Valleys road between Abergavenny and Hirwaun (Sections 5 and 6). The other 34km, between Abergavenny and Dowlais Top, has either already been dualled or is in the process of being dualled (construction work ongoing in Section 2 – Gilwern to Brynmawr).

3.2 The proposed delivery programme was shown. It was highlighted that the scheme falls under the Highways Act 1980 statutory process, (not under Town and Country Planning). It was explained that draft orders will be published in September 2016, which indicate the end of Key Stage 3. Key stage 4 then follows, which includes a Public Inquiry (PI) likely to take place in spring 2017. This would be followed by the Minister's Decision to proceed in summer/autumn 2017. Further explanation was given about Key Stage 5 (lasting 12 months) ending with the appointment of a special purpose vehicle (SPV) that will design, build, finance and operate (DBFO) the scheme. It was confirmed that the Key Stage 6 construction phase would take approximately 3 years with the operation and maintenance tbc but probably spanning a circa 30 year period.

3.3 GP then highlighted the updates to the scheme design (since ELG 1 in December 2015) with regard to the following junctions:

Hirwaun: proposed to be a grade separated junction.

Trewaun – an overbridge connecting Hirwaun to the Cynon Valley as this had least environmental impact

Croesbychan: new junction included to be linked with the east of Hirwaun and Cynon Valley Gateway It will tie in with RCT aspirations for Aberdare bypass (now named Cynon Valley Gateway).

Baverstocks: grade separated junction which has increased in footprint as it contains a link to and from Swansea Road access.

A470/ A465: shown on 3D polystyrene model. A number of options have been looked at. GP stated that Highways design team had made every effort to reduce the number of structures across this valley. Having spent weeks looking at alternatives, however, they were discarded due to cost and greater environmental impact. The 1996 design has been reverted back to, which makes use of the existing A465.

Gurnos junction removal: The previous scheme had half junctions at Gurnos which have now been removed.

Galon Uchaf: a full movement junction which ties in with existing access roads. It continues east and ties in at DowlaisTop.GP stated that there were numerous structures which time did not allow him to detail.

3.4 CL queried if Pant Viaduct would be retained. GP confirmed it would not be as the existing structure is not up to current standards. It will be demolished and replaced with a shorter span bridge. There are ongoing discussions with neighbouring businesses at the present regarding the impact of the structure.

3.5 CL queried if access has been worked out yet for the balancing ponds. WB explained that the drainage design has not yet been finalised nor has the easements/maintenance access been looked at yet. GP confirmed that the drainage design would be finished as soon as possible with some online attenuation, with attenuation ponds located as near to the highway as possible.

3.6 **Programme**

WB reminded people that this ELG was an opportunity to raise any issues instead of waiting for the draft ES, due to be issued for consultee comment in June 2016. WB explained that the programme was challenging, with Welsh Government having committed to starting construction in late 2018. Timely feedback would be appreciated to understand constraints avoiding surprises in the consultee responses to the draft ES.

3.7 A summary of the Highways Act (1980) statutory process was given. It was

explained that land take can only be argued for essential mitigation. WB will have to justify land take at the PI in front of the minister. If no sound reason for acquiring land under CPO then will not be able to have it.

3.8 **Summary of issues and proposed environmental mitigation strategies**

It was explained that there were no developments since ELG 1 for air quality and noise due to the traffic model having not been completed yet. Each technical topic was summarised.

3.9 LC queried if the communities and private assets chapter was missed in the presentation. WB confirmed it had been combined with non-motorised users (NMUs) and that the Agricultural land quality specialist was in process of completing farm questionnaires.

3.10 **Format of ES**

It was explained that the format of the ES was based on the guidance within the Design Volume for Roads and Bridges (DMRB) Volumes 10 and 11 and associated Interim Advice notes (IANs). Some IANs are out of date so more recent guidelines have been referred to. It was added that assessment methodologies had been taken from Volume 11 (DMRB).

3.11 It was pointed out that only significant effects will be included in the text of Volume 1. Any other issues will be addressed in individual reports that will be appended.

3.12 **Design Commission for Wales (DCfW)**

It was confirmed that Jacobs is in dialogue with DCfW. The first session was held in February 2016 and included a 3D polystyrene model of the A470 junction showing an alternative option, which was met with positive feedback. A similar model of the Baverstocks junction was requested by DCfW and will be provided by the team for the next session. It was explained that the second session with DCfW was planned for the 19th of May 2016.

4.0 **Draft Environmental Masterplan (EMP) presentation**

LE stated that Section 6 had been kept open with good views, Section 5 is much less open within MTCBC as there are residential areas, schools, industrial estates, businesses and other built up areas immediately abutting the scheme. There is a general principle to keep section 6 as open as possible to maximise driver views of surrounding countryside.

4.1 LE explained that existing woodland was shown to fit in with new planting, maximising views where possible.

4.2 LE explained that culverts were shown as lines on the EMP with specific dialogue for each culvert as they all have different issues.

4.3 LE explained that the noise barriers were only indicative at present, due to the lack of traffic data. GP mentioned the scheme shown in room had not been trimmed and therefore correct earthworks spill not shown.

4.4 It was explained that the ecological mitigation is still fluid due to continual junction design changes e.g. Croesbychan junction.

4.5 JW asked when the EMP will be finalised. WB confirmed it would be at the time of ES publication. LE explained that the EMP was an iterative process. There may be some conflict with bat mitigation and desire to maximise the views in section 6.

4.6 LE added that the attenuation ponds would alter and drainage ditches need to be added also.

4.7 LE also said the NMU and Public Rights of Way (PRoW) had been finalised and were shown on a separate drawing with the purple indicating new routes. There has been consultation with local authorities and a pedestrian over bridge will be provided where the PRoW surveys have indicated the most need for.

4.8 GP confirmed a contractor is working with Jacobs regarding buildability. He explained the key buildability challenges as follows:

i. Building Trewaun junction whilst keeping the A465 open.

ii. Nant Hir reservoir structure – discussions with Welsh Water have confirmed that temporary piling in reservoir is possible in reservoir in winter as it a reserve used to cover summer supplies. Widening sections in steel are required on either side of the existing structure.

iii. High Street overbridge at Cefn Coed – very constrained and close to domestic properties

iv. Taf Fechan structure, highly environmentally sensitive and spatially constrained

v. Nursing home (sensitive receptor) near large cutting at Baverstocks.

4.9 WB confirmed that no further ELG meetings are proposed, but suggested that individual meetings could take place with consultees in July after they have reviewed the draft ES. WB asked if 4 to 5 weeks would be enough time for comments from consultees.

5.0 **Discussion**

5.1 OM queried the reasoning behind the Croesbychan junction arrangement. WB confirmed that Croesbychan was needed to prevent significant congestion issues within Hirwaun and also ties up with RCT's LDP with regards to the Cynon Valley Gateway.

5.2 SJ asked about new housing estates at Hirwaun that have been developed since the original 1990s scheme. GP explained that with the original scheme the traffic figures did not warrant a full movement junction at the Croesbychan location. Since then there have been a lot of new housing developments. Feedback from the public information event (PIE) in December 2015 confirmed that the 1990s proposals would result in traffic redirecting through Hirwaun village, exacerbating the existing congestion issues there.GP also stated that there is potentially suppressed demand for the junction as the current junction design on A465 is considered dangerous by road users. It was clarified that the Cynon Valley gateway is not being promoted as part of this scheme, however the provision of the Croesbychan junction, and its design, would facilitate the link should there be future development of the Cynon Valley scheme by RCT.

5.3 SH stated that RCT had advanced the Cynon Valley Gateway through initial stages but had put the project on hold due to financial constraints.

LC queried the project objectives including the environmental design objectives in

5.4	relation to the Futures Generation Act (FGA) and new Historic Environment (Wales) Act 2016. WB stated that DCfW went through the environmental design objectives and provided positive feedback to this project. LC suggested a clear statement could be produced showing how goals of Futures Generation Act (FGA) are being achieved. CW queried where the FGA was in process of completing consultation to confirm what indicators were to be used. LC confirmed achievement of all 7 goals does not need to be shown, only need to show how achieving 3 to 4 goals.	
5.5.	LC stated the Historic Environment Act came in last week. More emphasis is placed on SAM setting now. WB stated that effects on settings have been considered. GP asked that everyone keeps Jacobs Cultural Heritage team in the loop regarding any design changes.	
5.6	**Scheduled Ancient Monuments (SAMs)** JB stated that cranes and SAMs should be discussed as a separate meeting re Taf Fechan structure and Gurnos Trackway and Leat SAM.	
5.7	GP and WB are to discuss buildability with Nick Henry (Jacobs Buildability lead) and JB. SH asked if NRW attendance at this was necessary due to the SSSI as well as the contracting team and Nick Henry. GP stated a list of options of how to build structure can be developed. RB stated that he had got some experience in construction in that area due to work done that he was involved with when repairs were made to the SAM. GP explained that as the design is developed it has become an issue and needs looking at soon, within 2 weeks. *Post meeting note: Buildability meeting regarding Taf Fechan structure held on 19th April 2016.*	Jacobs to arrange a TWG re Taf Fechan Buildability and constraints
5.8	**Lighting** LC enquired about the tranquillity and lighting with regard to bats. WB confirmed the objective was to light junctions only to decrease light spillage. LE talked about the planting at junctions also being used as visual screening to decrease spillage. GP stated that there is no longer a need for the road to light all the way between Gurnos and the A470 junction.	
5.9	**Rock slopes** LC stated that on recent projects there had been a shift from rock slopes to soil nailing. GP explained that on A465 Section 2 there were issues with this. Boreholes were undertaken at 20m intervals but due to the complex geology the contractor was having issues with lack of consistent rock. A 60^{o} slope is currently proposed at Baverstocks. The Jacobs Geotechnical design team are looking at this now. The project risk register includes the rock at Baverstocks and Cefn Coed (High Street). The east side of High Street the rock is exposed and the west side the rock is 20m below ground level. There is a construction risk as it is very close to local properties. CL asked if the compulsory purchase order (CPO) line in Cefn could be extended for this. GP explained that it was not the intention to extend the CPO as any further land take would impact on residential gardens and this would be a last resort.	
5.10	CL queried if there had been an audit of the scheme for operational maintenance design. GP answered that Jacobs have the duty to design with a view to maintenance. Once the design is fixed there will be an internal technical working	

	group regarding operational maintenance which will include to CPO land required.	
5.11	LC stated that with Active Travel Measures Act she anticipated that more improvements and enhancements would be made, especially for cyclists. GP explained that the NMU context report was completed recently and the majority of the measures suggested in the report were incorporated.	
5.12	RB stated that Sustrans were going to comment on the entire scheme. RB enquired about the lack of connection of the N46 cycle trail between RCT and MT. GP explained that Jacobs have met MTCBC, RCTCBC and Sustrans and comments had been taken into account. LE stated that straighter cycle routes had been asked for.	
5.13	LC directed a query to SJ regarding the PPG being removed in December 2015 and asking what replaces these. SJ confirmed they are currently directing people to the EA guidance.	
5.14	LC asked for this to be confirmed in writing by NRW regarding the policy for the replacement of PPGs. JW agreed that NRW will produce confirmation of protocol in writing regarding the PPGs.	
5.15	CL queried if, at Hirwaun West, the dry stone walls and grassland features could be incorporated. LE stated these features will be incorporated into proposed scheme.	
5.16	JB highlighted that the Historic Environment (Wales) Act had recently come into force (March 2016). There is a 2 year implementation period for provisions in Act but Jacobs's project team are to be aware of it. New legislation and policy revised chapter 6. TAN 24 replaces existing Welsh government circulars and will be published soon. There will be a suite of new guidance for example: impact of setting of SAM.	
5.17	It was highlighted that on the M4 CAN, in a late development, that WG recognised the need for an independent Archaeological Curator to look at archaeological reports. This was part of good practice for archaeologists in KS3 An informed archaeological curator such as from Glamorgan Gwent Archaeological Trust (GGAT). JB therefore recommended that GGAT was engaged with.	
5.18	GP raised this issue with MD regarding the requirement for an independent Archaeological Curator. MD to advise.	MD
5.19	JB confirmed that GGAT are an educational charity with Trusted Partner Status that provides planning advice to Local Authorities. GP asked who employs GGAT. JB stated he assumed they are appointed by WG when impartial advice is needed.	
5.20	GP queried whether the archaeological impacts on the M4 CAN project had been large. JB stated that the role of the independent impartial individual was to look at and sign off the Archaeological reports to provide comfort during the PI. GP explained that the A465 risk with regards to archaeological remains was relatively low risk. JB highlighted impacts on non-designated historic environment assets, stating that GGAT could give the most up to date data regarding these.	
5.21	JA asked if there was anything to explain how the risk of soil nailing will be handled in the ES. GP explained that rock cutting is only proposed at Baverstocks	

	and the A470 junction with most rock slopes at 60^{o}. JA stated that soil nailing should be kept to a minimum and mentioned that at ELG 1 there was talk of looking at a dumbbell alternative for the A470 junction. GP agreed that this had been looked at, has had various other junction configuration options. GP confirmed that a lot of time and effort had gone into proving the 1996 design is the best solution.	
5.22	JA queried progress on the proposal for the A470 being a gateway for the Brecon Beacons National Park. GP explained using the structures as the gateway feature had been looked but had to be discarded. Now looking at a piece of public art. WB added that the design and CPO land take were being developed and that do not want to be prescriptive at this stage so to give scope for the SPV to come in with options. Need to ensure sufficient land take to be able to set the art work suitably. JA stated he is happy to work with Jacobs through design development.	
5.23	GP stated that there will be minor junction improvements to the A470/High street junction (north of the scheme) which will be within the existing Highway boundary. WB added that it was unlikely that additional land will need to be CPO`d at this location.	
5.24	JA asked about the Taf Trail in relation to improvements north to south. JA also stated that the Forest Fawr Geopark is now UNESCO site and needs to be incorporated in ES.	
5.25	GP replied that the Taf trail link would be maintained with a straighter bridge. There is an underpass under the existing road, but is substandard.	
5.26	LC asked when the traffic model was due to be completed to allow the air quality assessment to proceed. GP explained that the traffic model was 80% convergent now, mobile phone data needed to supplement with road side interviews. GP confirmed a TWG was due to be held with the WG Traffic team week commencing 4th April. LC stated that air quality is very important issue at present. *Post Meeting Note: The noise and air quality chapters will not be included in the draft ES that is circulated for Statutory Environmental Body and WG comment in June 2016; they will follow in July/Aug 2016.*	Jacobs to review
5.27	GP stated that, once the design is fixed, a 3D fly through model will be created where viewer can examine the proposed scheme from a variety of viewpoints.	

Appendix A – Attendee List

Wendy Bateman (WB) – chair

Khalid Aazem - Natural Resources Wales (KA)

Julian Atkins - Brecon Beacons National Park Authority (JA)

Jon Berry – CADW (JB)

Rolf Brown - Merthyr Tydfil County Borough Council (RB)

Subject	**A465 Section 5 and 6 - Environmental Liaison Group Meeting (ELG) 3**		
Project	A465 Heads of the Valleys Dualling Scheme - Section 5 and 6 - Hirwaun to Dowlais Top		
Project No.	B2191100		
Prepared by	Sarah Denne	**Date/Time**	28 February 2017 11:00 am
Location	Jacobs, Cardiff Office	**Apologies**	See Appendix A
Participants	See Appendix A		

Notes		Action
1.0	**Welcome and Introduction** WB welcomed and thanked everyone for attending the third Environmental Liaison Group (ELG) for the A465 Section 5 and 6. Everybody around the table introduced themselves (see Appendix A for participants list). The aim of the meeting was to provide an update on scheme progression since ELG 2 in March 2016. .	
2.0	**Health and Safety Moment** Two health and safety moments were raised by WB. 1) It was highlighted that care should be taken when going out for any exercise activities. A colleague slipped on their stairs, whilst running down in their socks, before going out for a run. 2) Everyone was reminded to take care in the changeable weather conditions we are experiencing, making sure we are prepared with winter car travel kits, sunglasses and rations in our vehicles.	
3.0	**Programme** WB highlighted that the scheme falls under the Highways Act 1980 statutory process, (not under Town and Country Planning). It was explained that the draft orders will be published at the same time as the Environmental Statement (ES) and Statement to Inform Appropriate Assessment (SIAA) in Key Stage 3. Under this process land can only be acquired by Compulsory Purchase Order (CPO) for “essential mitigation”. Key Stage 4 follows with a Public Local Inquiry (PLI) held by an Inspector appointed by the Planning Inspectorate. The Inspectors prepares a report for the Minister who makes the final Decision on whether to proceed with the scheme. If the Minister’s Decision is in support the orders are then made and, once the challenge period has expired, the land can be entered. WB then summarised the remaining Key Stage 3 programme, which is currently at week 73 of 86 weeks. The draft ES and SIAA will be published for	

Notes		Action
	comment to Welsh Government and Statutory Environmental bodies at week 76 (24 March 2017). The ES, SIAA and draft orders are then due to be published week 86 (6 June 2017). Key Stage 4 then immediately follows with the PLI (if needed) likely to take place in Autumn 2017.This would be followed by the Minister's Decision to proceed in Spring 2018. Key Stage 5 would then run until October 2019, which would end with the appointment of a special purpose vehicle (SPV) company that would design, build, finance and operate (DBFO) the scheme. It was confirmed that the Key Stage 6 construction phase would take approximately 3 years (2019 to 2022) with the operation and maintenance period spanning 30 years (2023 to 2053).	
4.0	**Highways Scheme Design Update** JT then highlighted the updates to the scheme design (since ELG 2 in March 2016) as follows (west to east): • *Hirwaun junction:* still grade separated with the mainline over the existing road. Slight reconfiguration due to the high position of a high pressure gas main. • *Pentwyn footbridge:* added in for Non-motorised user (NMU) provision • *Court Lodge:* overbridge now an underbridge • *Croesbychan junction:* mainline was proposed to go under junction creating large embankments, but now reconfigured and pushed down so mainline goes over junction; junction now has a decreased footprint overall. • *Nant Moel:* overbridge now an underbridge • *Nant Hir reservoir:* now a split structure to remove blended liabilities. New structure to be built to the north. • *Baverstock junction:* reconfigured slightly to remove B4276 Merthyr road connection. This is now connected via the proposed Swansea Road reconfiguration. • *A470 and High St. junction:* reconfiguring of the junction within the highway boundary to provide safer access to and from A470. • *Taff Trail footbridge:* straightened perpendicular to the proposed A465. • *Gurnos Farm:* now served by an underpass • *Prince Charles Hospital junction* (formerly Galon Uchaf): reconfigured significantly as a one full movement junction to accommodate connectivity between residential, retail, industrial estate, school, hospital and NMU needs. Mainline is underneath junction. • *Bryniau Road:* new overbridge to maintain localised vehicular and NMU connectivity.	
4.1	JT highlighted the provision for NMUs at all junctions would be improved through the scheme. Further NMU routes would be incorporated into access tracks for attenuation ponds.	
4.2	JT confirmed that vertical concrete barriers would be used in the central reserve and steel barriers provided as verge side road restraints. A total of eighteen culverts would be improved as part of the scheme (some widened and some with mammal ledges to be added). The scheme currently includes five	

Notes		Action
	variable message boards. Lay-bys have been included in the current scheme design although these are tightly constrained.	
4.3	JA queried if there was assurance the Brecon Beacon Gateway feature would be delivered. WB confirmed that the feature would be included on the Environmental Masterplan (EMP) and the Register of Environmental Actions and Commitments (REAC) ensuring the SPV is under contract to deliver the feature and consult with Brecon Beacons National Park Authority regarding the final design.	Jacobs to include in REAC
4.4	JA queried whether the underpass carrying footpath 111/43 (east of A470 junction) was being kept open to keep connectivity of a rough trail north to south. JT confirmed that this underpass was being closed up with a diversion north of the proposed scheme.	
4.5	RW queried whether the Croesbychan junction had been designed to later accommodate an Aberdare Cynon Gateway bypass. JT explained that there were no firm plans for any bypass and there would unlikely be any before construction of Section 5 and 6.	
4.6	LC queried whether the ES adequately assesses site compounds and other temporary work areas associated with the proposed scheme. WB explained that some of these areas are recorded in the constructability report and they will be covered in the ES. WB also explained that as the road is currently three lanes for most of the widening, only one lane would be closed and used as a haul route during construction. The other two lanes would remain open. The majority of the main works would, therefore, be at junctions. WB also stated the works would start at various locations across the scheme, not from one particular end therefore reducing the distance material being moved.	
5.0	**Structures strategy** WB highlighted the three tier approach that had been taken with developing the structure designs: special (bespoke) solutions; enhanced (modular) solutions; or essential developments requiring minimal work such as culverts or retaining walls. Six junctions / crossings have been designed as special structures: Hirwaun junction, Croesbychan junction, A470 junction, Cefn Coed High Street overbridge, Prince Charles Hospital junction and Dowlais junction.	
5.1	LC queried what material the noise barriers were proposed to be made out of as plastic is often used, which can lack visual aesthetics and doesn't soften over time. WB explained this had not been confirmed yet, but there was potential for using a plastic / composite mix or a wooden and clear mixture. Ultimately the Environmental Masterplan will include a commitment to ensure the design achieves a certain aesthetic requirement.	Jacobs to include in EMP
5.2	**ES topics** WB provided an update of each of the topic chapters.	

Notes		Action
5.3	*Cultural Heritage* WB explained that the significant effects still remained with the Cefn Coed Cemetery and Jewish Burial Ground, which would be mitigated through screen planning and a Landscape survey. There would be no significant impact on the Gurnos Leat during construction of the widened Taf Fechan structure as it is proposed to be built by a temporary cable stay method where no work on the bed of the valley is required. LC stated the works done at Bryn Glas tunnels site to protect the SAC were very successful and should be considered for Taf Fechan also. The Farmhouse and Lofted Cow Shed on Coed Meurig Farm would be lost as part of the proposed scheme with mitigation including Level 4 historic building and photographic surveys of the asset	
5.4	*Landscape and Visual Impact* WB explained the key strategy was to minimise the loss of existing screening vegetation and then add in plant screening where needed. In the central section of the scheme minimal planting is required to keep open views of the surrounding landscape. RW confirmed this would be beneficial for marsh fritillary butterflies as well. WB explained that lighting would be kept to a minimum, mainly located only on the junction slips. At Baverstock junction there is the possibility of exposing existing geology creating drama and providing retaining edges and slope finishes. All design of structures, walls and fences is to reflect local landscape character and pattern.	
5.5	*Nature Conservation* WB explained that a focus was to minimise land take with environmental mitigation achieved by scheme design, standard construction practices and further mitigation to prevent offences under protected species legislation. LC queried whether landscape design would link with ecology in facilitating movement of species towards culverts / tunnels. WB confirmed this was the case with funnelling achieved using planting as much as possible.	
5.6	<u>Marsh Fritillaries</u> WB explained that suitable habitat loss for marsh fritillary was now approximately 7.96 ha, which was 4.81 ha less than was presented at ELG 2 in March 2016. LG replied to a query from SH regarding where this reduction came from. LG confirmed this was due to scheme design development (such as the reduced footprint of Croesbychan junction. Also a more detailed botanical survey has been undertaken which superseded the original Phase 1 habitat survey upon which the ELG 2 habitat loss calculation was based. Approximately 14.4 ha of land will be acquired for mitigation. RW queried the size of the suitable habitat areas to be lost suggesting if small areas remain, but cannot be managed due to accessibility restrictions, they would also be lost. *Post Meeting note: Small, unmanageable, parcels of land would not be created due to the proposed scheme.* RW suggested management of the soft estate could produce stepping stones for marsh fritillary butterflies. WB confirmed that nectar plants would be planted in some sections of the soft estate, but this would not be counted as mitigation.	Jacobs to organise meeting

Notes		Action
	RW queried whether there would be enough access for maintenance to these sections. WB confirmed that this would be considered within the CPO land plans. *Post Meeting note: Figure 8 in the SIAA shows the Marsh Fritillary habitat loss*	
5.7	Ancient Woodland WB explained that the scheme footprint affecting ancient woodland had been reduced as much as possible. Creation and management of approximately 5 ha of new woodland with ancient woodland topsoil salvage would be undertaken to ensure no net loss of woodland. *Post Meeting note: Tree seed collection and propagation will be carried out for the ancient woodland mitigation.* RW stated the importance of natural regeneration with the addition of screening where needed. RB reiterated that long term management was important. LC explained that during the operation and aftercare period (30 years following construction) it would be made sure that the landscape and environmental objectives were met. After this time the objectives would be passed down to the Trunk Road Agents. The environmental design was future proof and had taken into account the inevitable ongoing fluctuations in the amounts of money available for management. RW explained that there were existing partnership and grazing schemes in place (PONT), which should be looked at as an approach to long term management. FP asked for RW to provide information on this and then in due course have a meeting to see if it could potentially feed into the contract. LM asked that GGAT are represented at that meeting.	RW provide information. Jacobs to organise meeting
5.8	Bats Proposed mitigation includes timing of construction work and pipe roosts being fitted in structures. The 18 culverts being enhanced would provide suitable passage for bats beneath the scheme.	
5.9	Lapwing WB explained there have been 12 nesting pairs found next to the proposed scheme. A lapwing mitigation area has been proposed with planting discouraging them from remaining in their current location.	
5.10	Enhancements WB explained that the SuDS based drainage design for the road would result in minimal pollution risks to watercourses compared to the existing baseline. Water would drain from the road into attenuation ponds which would pass into watercourses at a greenfield rate. The attenuation ponds and the associated proposed planting around them would make them suitable for wildlife.	

Notes		Action
	WB mentioned exposing rock slopes at Baverstocks and A470 junctions would provide rock face habitats, in line with TREBAP objectives. RW raised that where topsoil retention is used, management can be more important rather than seeding with wildflower mixes. Natural regeneration of the natural seed bank in soil can be very successful. LC confirmed that using topsoil sometimes has not achieved the desired result, whereas seeded subsoil has. SH explained that burying topsoil and using subsoils can be effective. RB suggested there was no need to specify expensive seeding.	
5.11	*Geology and Soils, Materials* WB explained the importance of striking an earthworks balance, particularly at Baverstock junction. Further ground investigation work is due to take place in Key Stage 5. A draft Materials management plan will be issued with the ES and then refined by the Contractor following his appointment.	
5.12	*Noise and Vibration* WB explained the main locations for potential noise issues are where piling works, bridge works at Cefn Coed and rock / concrete breaking would occur (low noise breaking techniques are being considered). However, there was significant potential for disruption to local residents during the construction phase at these locations.	
5.13	*Effects on All Travellers* WB discussed the provision for new and safer NMU facilities and crossings that would be provided. The Construction Environmental Management Plan (CEMP) will include ways in which dust and noise will be managed during construction. Also, where possible, views of surrounding landscape will be opened up,	
5.14	*Communities and Private Assets* WB highlighted that access and signage for businesses, farms and community facilities would be maintained during construction. A total of seven residential properties, some already in Welsh Government ownership, would need to be demolished. Two properties may not need to be demolished, but would be acquired.	
5.15	*Road Drainage and the Water Environment* WB highlighted that SuDS principles had been applied to the proposed drainage design, clear spanning bridges had been incorporated where possible and culvert expansions were being maximised to reduce flood risk impacts where applicable.	
5.16	*Taf Fechan* LM queried whether any tree clearance work could be done surrounding the	

Notes		Action
	Leat at Taf Fechan as mitigation. WB explained that as there was no significant effect at this location (due to proposed bridge construction via temporary cable stays) and, hence, there would be no mitigation here. It was suggested that LM should discuss with RB about getting this work done given the land is owned by MTCBC.	
6.0	**Format of ES**	
	WB confirmed the layout of the ES would be Volume 1, Main text and significant effects, Volume 2 the Appendices, Volume 3 the Figures and Volume 4 the Environmental Masterplan (EMP).	
	OM queried the level of detail that would be given in this draft of the ES. WB confirmed significant detail would be contained with sketches of proposed landscape features included in the EMP.	
7.0	**Any Other Business**	
	SH queried whether there was still an attenuation pond proposed to be on Tir Mawr a Dderi Hir, Llwydcoed SSSI. WB confirmed it was still incorporated due to local topography in this area.	
	The meeting closed at approximately 1.15pm.

Wendy Bateman (WB) – chair

Julian Atkins - Brecon Beacons National Park Authority (JA)

Gemma Beynon – Natural Resources Wales (GB)

Rolf Brown - Merthyr Tydfil County Borough Council (RB)

Luci Collinwood - Welsh Government (LC)

Sarah Denne – Jacobs (SD)

Lucy Emery – Jacobs (LE)

Laura Gore – Jacobs (LG)

Scott Hand - Natural Resources Wales (SH)

Olwen Maidment - Natural Resources Wales (OM)

Louise Mees – Cadw (LM)

John Messenger - Natural Resources Wales (JM)

Filipe Pamment – Welsh Government (WG)

Jonathan Thirkettle – Jacobs (JT)

Cath Walker – Jacobs (CW)

Richard Wistow – Rhondda Cynon Taf County Borough Council (RW)

Apologies List

Jonathan Berry - Cadw

Petra Davies - South Wales Trunk Road Agency

Cameron Lewis – South Wales Trunk Road Agency

Mark Dixon – Welsh Government

Claudine Gerrard – Glamorgan Gwent Archaeological Trust

Tim Stephens - Caerphilly County Borough Council

Appendix 6B – Environmental Technical Working Group Actions

The following TWG Actions are displayed in chronological order:

- 13 January 2016 - Land Quality and Ground Investigation
- 19 January 2016 - Landscape
- 27 January 2016 - Flood and drainage
- 3 February 2016 - Nature conservation – Marsh fritillary
- 9 March 2016 - Nature conservation – Marsh fritillary
- 29 March 2016 - Nature conservation – Marsh fritillary and lesser horseshoe bat
- 19 April 2016 - Taf Fechan Buildability
- 23 November 2016 – Nature conservation
- 29 November 2016 – Flooding

See the following pages.

Meeting Minutes

Churchill House

Purpose	**A465 Section 5 & 6 TA role – Land Quality and GI TWG**		
Project	A465 S5 & 6		
Prepared by	Amy Davies		
Location	Conference Room 4 8th Floor, Cardiff Office, Churchill House, Churchill Way	**Date/Time**	13th January 2016, 10:00
Participants	Wendy Bateman, Amy Davies, Mark Dixon (WG), Lucy Emery, Anthony John, Tony Kernon, Huw Masters-Williams, Gareth Protheroe, Kay Roberts (NRW), Sarah Simons, Hannah Thomas, Cath Walker, Jackie Walters (NRW), Adam Ward (NRW).	**Apologies**	Allan Dishington, Simon Gale (RCTCBC)

Action		**Owner**
1	Send proposed GI work taking place over the next few weeks including borehole locations to JW, KR and AW (NRW). Arrange meeting for w/c 25th Jan – NRW, HMW and AJ.	HMW/CW
2	*Post Meeting Note:Scope and location sent 20th January. NRW have issued comments 25th January on scope of GI works. If comments dealt with by Jacobs then meeting will not be needed*	
3	Arrange for the flood risk and drainage team to produce an input statement to show Jacobs' approach and to inform the discussion at the flood TWG. *PM: issued 26th January*	WB/CW
4	Arrange meeting with AW and other relevant NRW staff to discuss MMP.	HMW
	Inform TK if any offline areas cross any major gas/water pipes.	GP

Purpose	**A465 Section 5 & 6 TA role – Landscape Technical Working Group**		
Project	A465 S5 & 6 TA role		
Prepared by	Sarah Denne		
Location	Cardiff Office, Churchill House	**Date/Time**	19th January 2016
Participants	Cath Walker (CW), Rupert Lovell (RL), Kathy Ronald (KR), Lindis Danson (LD) Ruth Coulthad (RC), Jackie Walters (JW), Olwen Maidment (OM), Raymond Edwards (RE), Mark Dixon (MD), Wendy Bateman (WB), Fran Lynn (FL), Lucy Emery (LE), Gareth Protheroe (GP), Jonathan Thirkettle (JT).	**Apologies**	Tom Bramley (TB)

	Action	**Owner**
	3-Review of Baseline	
1	Jacobs landscape team to circulate landscape policy overview, so attendees can double check no essential policy missed.	Jacobs landscape team
2	OM to forward LANDMAP cultural landscape guidance note which the team have not been able to obtain and LANDMAP Geology guidance note.	OM
3	RE to forward/ loan team a copy of RCT LANDMAP study.	RE
4	RE and BBNP attendees to follow up and forward a copy of the boundary of the Brecon Beacons National Park report to the team. *PMN: BBNP origins report received 20th January*	RE and LC
5	Determine if following webpage shows descriptions from the report that was referred to in action 4: http://www.beacons-npa.gov.uk/environment/planning-access-and-row/boundary/.	Jacobs landscape team
	4 – Key Viewpoints	

6	• Key viewpoints recommended at the meeting:
	  ○ View from Mynydd-y-glog
	  ○ View from Moel Penderyn
	  ○ View from Hirwaun Common (important cairn)
	• Key views received by e-mail from Tom Bramley (MT CBC):
	  ○ View from A4060 to approaches to Dowlais.
	  ○ Views (from the A465?) looking to the Pant Industrial Estate, looking north.
	Views towards Gurnos looking east (the Graig is visible here) – *Unclear if this is describing the view from the A465 or generally views towards Gurnos looking east? Assume reference to the Graig refers to the woodland 'Y Graig'*
		Jacobs landscape team

7	RC to provide dark sky quality data. *PMN: RC provided link to data 20th January 2016*	RC
8	Jacobs to provide material to help visualise alternative A470/A465 junction option, in particular in relation to visualising extent of impact within the BBNP.	GP
9	RE to meet TB Friday 22nd January re key viewpoints. Feedback to Jacobs following this meeting.	RE
	5 – Brecon Beacons gateway – A470 and A4059	
10	RC to circulate ideas relating to A470 gateway.	RC
11	Jacobs and Welsh Government to further discuss possible engagement with public artist in relation to A470 gateway.	Jacobs/WG
12	Jacobs to explore inclusion of low key/ low maintenance A4059 gateway feature, similar to the existing stone wall at the roundabout.	Jacobs landscape team
	5A – A465 / Brecon Road / Hirwaun Road junction optioneering	
13	Over option with road on embankment negative response NRW, WB and RE re visual impact, air quality, noise and increased sense of severance. GP request memo from KR re wide street scape bridge to promote connectivity between Hirwaun and Penywaun.	KR
14	Confirm status of optioneering for this junction.	GP
	6 – Enhancements to Taff Trail cycle route	
15	Adam Priestly (AP) to follow up with Sustrans to confirm the official route of the Taff Trail and check the status of the route through the underpass with Merthyr Tydfil CBC.	AP
16	Jacobs engineers to look at this location in relation to development of A470 junction option.	JT
17	Jacobs to follow up re positioning of the link, in case this may help with access.	JT
	7 – Tree Survey	
18	Scope: localised surveys including ancient woodland, TPOs affected by scheme and important mature vegetation will be undertaken.	WB/CW
19	In relation to discussion regarding replacement planting, RE stated that RCT CBC's management objective is to emphasise existing grassland and avoid planting of trees. Jacobs landscape team to take account of this in development of the environmental masterplan, whilst balancing the need for essential visual screening and bat mitigation	Jacobs landscape team,/WB/LE

20	**8 – Potential mitigation** Jacobs landscape team to note comments from RE in relation to: • preference for natural regeneration of grassland (no wildflower seeding) or turf relocation – respreading existing topsoil/creation of more impoverished topsoil helpful in relation to this • preference for stone wall details incorporating round stones (typical local detail, as per existing A4059 roundabout) • allowing sufficient space for mowers on roundabouts, as well as somewhere to store the cutting on the roundabout • timber noise fences must comply with BS	
21	Jacobs landscape team to explore visual screening of Pant Industrial Estate from the A465, further to TBs e-mailed comments.	Jacobs landscape team
22	Internal meeting landscape and noise specialists re siting and specification of noise barriers.	CW
23	**9 - DCfW Statutory Environmental Body attendance**The 1st DCfW session will be held at the DCfW at Cardiff Bay on the 18th Feb at 15:30. Clarify protocol of SEB attendance *Post Meeting Note: The DCfW have stated that they will contact the Local Authorities with an invitation to attend and a request for background information and the planning context.*	WB
	10 – AOB	
24	Include amenity stopping points in design	GP
25	GP to confirm who is responsible for maintaining the drainage system of the road	GP
26	Jacobs to include discussion of SUDS for landscape and ecological benefits into TWG related to drainage to be held next week.	Jacobs

JACOBS

Subject	**Flood and Drainage Technical Working Group**		
Project	A465 S5 & S6 Technical Advisor Role	**Project No.**	B2191100
Prepared by	Sarah Denne	**Phone No.**	02920355538
Location	Cardiff Office, Churchill Way	**Date/Time**	27 January 2016
Participants	See Appendix A	**Apologies**	N/A

Notes		Action
1	**Review Constraints**	
	GP: We need to clearly demonstrate why we do not think there will be a significant effect on designated areas.	DW
	DW: NRW to provide model of Afon Cynon to Jacobs to allow flood models to be run showing effects of different structure options.	DW/JW
	JW: Any Jacobs' model changes to be agreed by NRW.	DW/JW
	JW: NRW would need to review flood extents if structure is altered.	DW/JW
	JW: Jacobs need to clearly show why other options were not chosen if exacerbating upstream or downstream flood risk e.g. providing a new clear span bridge.	DW
2	**Construction phase drainage**	
	KD: Target should be greenfield run off along whole length if possible.	GP
3	**Drainage design – highways**	
	KD/JW: There should be no transfer of water between catchments.	GP/DW
	KD/AP: Need to assess Morlais culvert strength. Drawings with KD. Arrange for Jacobs to have a look next week.	KD
	GP/WB: Will include in the ES that contractors will	

Notes		Action
	require relevant NRW consents for silt control. SPV project company will be applying for permits.	DW/WB
4	**Drainage design – environmental**	
	AS: Drainage designs need to follow design standards.	JP
	JW: Will find out if NRW can set hydrocarbon limits.	JW
	DW: Need to alter HAWRAT model. DW to e-mail JW with what we are proposing.	DW
	GP: Discharge water quality limit that is standard for all consents in Heads of the Valley area needed from NRW.	SJ
	DW: Need to find out from welsh water where water is being discharged for Nant Hir reservoir.	DW
5	**Structures – bridge/culverts**	
	GP: Could have a meeting Jacobs with RCT/MT to talk through any current known constraints?	GP
6	**Flood assessment**	
	AP/KD: meeting with Welsh Water next week regarding sewer. AP to send agenda point regarding flood assessment to JT for next week.	AP
7	**Climate change**	
	No Actions other than apply good design in accordance with CIRIA guidance etc	GP
8	**AOB:**	
	Jacobs to talk to the RCT planning team and NRW regarding Tower Regeneration development (re ES cumulative impacts chapter).	WB/GP

APPENDIX A: List of Attendees

Gareth Protheroe (GP) Jacobs, Project Manager
Kevin Davies (KD) MTCBC
Gerald Coughlan (GC), MTCBC
Scott Hand (SH), NRW, Invertebrate Specialist
Jackie Walters (JW), NRW, Planning Co-ordination officer
Fraser Pullin (FP), Jacobs Engineer
Wendy Bateman (WB), Jacobs Environmental Coordinator
Mark Dixon (MD), WG, Project Director
Sarah Jones (SJ), NRW, Water Quality/Consents
John Thirkettle (JT), Jacobs, Engineer
Laura Gore (LG), Jacobs, Principal Ecologist
Chris Nutt (CN), NRW, Flood Defence Officer
Daniel Watson (DW), Jacobs, Road drainage ES lead
Andrew Stone (AS), RCTCBC
Frank Klaptocz (FK), Jacobs, Structures
Alex Perryman (AP), Jacobs, Flood Modelling
Jonathan Price (JP, conference call) Jacobs, Drainage Design Lead
Sarah Denne (minutes) Jacobs

Purpose	**A465 Section 5 & 6 TA role – Marsh Fritillary Butterfly TWG**		
Project	A465 S5 & 6	**Project No.**	B2191100
Prepared by	Cath Walker	**Phone No**	02920 353200
Location	Conference Room 4 8th Floor, Cardiff Office, Churchill House, Churchill Way	**Date/Time**	3rd February 2016, 10:00
Participants	Wendy Bateman, Mark Dixon (WG), Lucy Emery, Laura Gore, Gareth Protheroe, Sarah Simons, Cath Walker, Jackie Walters (NRW), Scott Hand (NRW), Khalid Aazem (NRW), Richard Wistow (RCT CBC), Rolf Brown (MT CBC),	**Apologies**	N/A

Action		**Owner**
1	Blaen Cynon SAC conservation objectives under review. Confirmation of completion date.	SH
2	How does NRW monitor conservation objectives? Especially within wider SAC area.	SH
3	Consensus that a ratio of approximately 1:2 habitat mitigation would be appropriate mitigation for the direct loss of habitats within the 2 km SAC core metapopulation area and the wider functional landscape.	N/A
4	Blaen Cynon SAC MF meta-population is one of the most successful populations in UK (RW). Therefore extra onus on maintaining this success.	All
5	Improve junction strategy to reduce queuing traffic by Tir Mawr a Dderi Hir SSSI to improve air quality.	GP
6	Examine evidence / best practice of other schemes creating MF habitat.	LG/LE
7	Further survey of suitable habitat within 2km of Blaen Cynon SAC needed to determine if 50ha of suitable habitat present or not. Requested by SH.	SS
8	Draft SIAA will need to have two mitigation options stated.	LG
9	Summary memo to be sent to NRW for comment.	LG

Meeting Minutes

A465 Section 5 & 6 TA role – Marsh

Fritillary Butterfly TWG

3rd February 2016, 10:00

	PMN: Memo issued to NRW 5th February 2016	
10	List of suitable organisations to grow on DBS plants to be sent to Jacobs to collate.	SH/RB/RW
11	Contact National Botanic re DBS propagation.	LE
12	Density of plants and number of plants required to be calculated. Discussed using good condition assessment criteria or DAFOR scale %.	LE
13	NRW to supply Jacobs with all existing MFB habitat survey work they have undertaken to date.	SH
14	Letter to be sent to JW (NRW) who will pass on to relevant species officer in regards to requirement for licensing (to translocate marsh fritillary).	LG
	PMN: letter issued 5th February to NRW	
15	2 no. Jacobs/NRW meetings to set up during period of determination of SIAA screening and stage 2 report	SS/JW
16	General principle of land CPOd for mitigation purposes – bigger blocks not small scattered sites.	Jacobs
17	Taf Fechan overbridge. If access/works carried out from gorge (SSSI and SAM) then site visit needed with NRW/CADW/Jacobs. Highways to confirm.	GP/WB/JW

Purpose	**A465 Section 5 & 6 TA role – Marsh Fritillary Butterfly mitigation meeting with Butterfly Conservation**		
Project	A465 S5 & 6	**Project No.**	B2191100
Prepared by	Cath Walker	**Phone No**	02920 353200
Location	Conference Room 4 8th Floor, Cardiff Office, Churchill House, Churchill Way	**Date/Time**	9th March 2016, 12:00
Participants	Wendy Bateman, Lucy Emery, Laura Gore, Gareth Protheroe, Cath Walker, Len Wyatt (WG), Russell Hobson (BC)	**Apologies**	Mark Dixon, Luci Collinwood, Sarah Simons

Action		**Owner**
1	LW requested a meeting pre the week 28 1: 2500 presentation to discuss the scheme and environmental masterplan *Post Meeting Note: meeting arranged for 11th April 2016 (week 27). 10:00, Jacobs office*	WB/CW LW/RH
	Relevant references and past mitigation programmes to be forwarded Jacobs *Post Meeting Note: Response from RH received on 11th March 2016 as follows:* • *M40 scheme - Bickmore, C.J. 1992. M40 Waterstock – Wendlebury: planning, protection and provision for wildlife. Proceedings - Institution of Civil Engineers Municipal Engineer.* ***93****: 75-83* • *Twyford DBS planting - Snazell, R.G. 1998. Ecology & Twyford Down. I.T.E. Wareham* • *Munguira, M.L. & Thomas, J.A. 1992. Use of road verges by butterfly and burnet populations, and the effect of roads on adult dispersal. Journal of Applied Ecology.* ***29****:316-329* • *A30 – Spalding. 2005. The butterfly Handbook. English Nature* • *'roads' in Dennis, R.L.H. 2010. A resources-based habitat view for conservation: Butterflies in the British Landscape. Wiley-Blackwell* • *Least cost modelling at Cross Hands –contact Lindsey Rendle at Carmarthenshire Council LRendle@carmarthenshire.gov.uk* • *English Ball Clays turf translocation report (it covered 14 years) and the Sweden road and butterfly paper to follow*	
	Low cost flight modelling published work to be reviewed to determine if proposed scheme will affect MFB flight options to cross road	LE/LG
	RH advised: • move larval webs as short a distance as possible from original site; • it is not practical to monitor translocated larval webs. Remove from success criteria.	LE/LG

	RH advised that mitigation effort should be concentrated on translocating turves rather than planting of devils bit scabious (DBS) plants	LG/LE
	Agreed that Jacobs should investigate outcome of DBS propagation at National Botanical Garden of Wales where mixed seeds from different areas have been propagated to increase genetic diversity of plants	LE/LG
	RH advised that after site clearance phase, areas previously identified as positive for larval webs to be kept strimmed to ensure they are not recolonised by marsh fritillary butterfly (MFB).	WB/CW
	RH advised there should be no compaction of retained and translocated top soil as this encourages rush (*Juncus* spp.) regrowth. Contract should specify to manage by avoiding use of heavy plant/machinery. Allow natural regrowth of vegetation.	WB/CW
	Long term maintenance of mitigation sites – agreed there should be an outcome led specification allowing flexibility for how performance achieved and to allow any adjustment in the maintenance regime with time to respond to changes in best practice as they arise. Guidance for management to be included in specification plus details of financial penalties for failures in reporting or achieving management outcomes.	LG/LE/WB/CW
	RH confirmed that BC has received Section 106 mitigation monies to start mitigation project in 2019 which will require a grazing regime for habitat management. A copy of the relevant Section 106 agreement was provided by RH for information.	n/a

Purpose	**Taf Fechan Buildability meeting minutes**
Prepared by	Leanne Smith
Location	Cardiff Office **Date/Time** :11am
Participants	Wendy Bateman (WB), Cath Walker (CW), Gareth Protheroe (GP), Dexter Mansell (DM), Scott Hand (SH), Rolf Brown (RB), Filipe Pamment (FP), Andy Findlater (AF), Sam Kenward (SK), John Thirkettle (JT), Mark Dixon (MD), Adam Brossler (AB), Jon Berry (JB), Russel Cryer (RC) & Leyton Davies (LD).

Notes		Action
1	**Health and safety moment:** Provided by Wendy Bateman – She raised an issue from a previous experienced. A taxi driver dropped her off outside the Angel hotel on double yellow lines and on a busy junction; the taxi driver stopping at this unsafe point also caused a traffic jam. The action from this event would be, if you find yourself in a similar situation please ask your taxi driver to drop you off in a safe area before your journey, and if you are not happy where they have dropped you off, please don't hesitate and ask them to move to a safer area.	
2	**Key Actions from meeting** • To develop all options – Surveys need to be completed to determine our best option and collect the required resources to evidence each option. - Topography survey - Geological survey of the valley's bank to determine its stability - Lower plant and bryophytes survey - Bat activity and endoscope survey - Peregrine survey - Otter survey - Environmental Impact assessment - Structural assessment - Arrange access to carry out these surveys • Contact other organisations that may have issues with the	All

Notes	Action
construction. They may have areas that they class as important, and may be able to discuss other options and solutions i.e. Wales archaeology society. • Need to assess the impact on the tram way and leat – How the vibration of construction will impact these structures. • Contact CADW and request access to their report ?????? • Contact Archaeology society to request access to their GIS information on the location of the sleeper cells. • GP to ask Chris to go to site to take photos before the leaves come out. • Contact Roadbridge re alteration of SAM on Red Roses scheme.	GP CW
3. **Environmental constraints discussed in meeting** • Scheduled Ancient Monument (SAM) JB and meeting attendees discusses that the Tramway and its association with cultural heritage. JB explains appealing to CADW has three possible outcomes either Yes, Yes with constraints or No. He discussed that CADW have a target to get 90% of all requests processed within 30 days of application. Additionally, he discussed that for an application to be successful, CADW would need all information such as the environmental statement, details of any requested modification of the structure, if all options have been considered, if other organisation have been consulted on the planned construction. As part of the application process, CADW may have consultation with these organisation to discuss Jacobs application, and a method statement how you would preserve the structure after work has been completed would be required. - JB available for pre-application advice • SSSi - LW- Placed anabats outside the known caves and we found there was Lesser Horseshoe bat activity and small amount of activity from Great Horseshoe bats. - We need to complete a lower plant and bryophytes survey but access to the bottom of the valley will be extremely difficult.	

Notes	Action
- RB – We could make a reasonable judgement on whether the specific plants identified in the SSSi would be present in the valley, we could look at the ideal conditions and substrate of the plants. - We need to have a risk assessment on the implications of construction on the bats i.e. excessive light and noise. - Currently we can't access the bridge to check if bats use the crevices as roosts. 4. **Structure Buildability options and constraints** • Structure buildability option 1 - Destruction of bridge and erect a new bridge in its place. • Structure buildability option 2 - (see appendix 1 for diagram) • Structure buildability option 3 – Symmetrical extension of bridge (See appendix 2 for diagram) • Structure buildability option 4 – Asymmetrical extension of bridge 5. **Building Constraints** - AB raises the discussion of constraints of the tramway. First is a protected schedule one structure, it is really narrow which limits access. It connects directly with the leat, SSSi and river there for space is even more limited in the valley below the structure. - RB raises his concerns about the width of the structure. It is small. It also causes issues getting equipment down to the valley floor. The valley sides are fragile and may causes collapses if heavy equipment is placed on top. - - RB - it's a functioning structure and this needs to be taken into account during the planning stage. - JB states exposing the sleeper stones may cause the structure to become fragile. - AF raises the question of the equipment needed to do the job is limited due to the limited space of the valley, weather conditions will also limit what equipment they can use. - Traffic issue during construction- May causes serious disruptions in Merthyr if the road has to be closed during construction, but a road closure would allow more freedom on the work that can be done to the structure. Additionally, we	

Notes	Action
could limit traffic to one lane but this has safety issues with construction equipment and the public, safety zones would be an issue, and the space available for construction equipment would be limited. - WB raises the issue that the construction window is limited and this needs to be taken into account during planning. Construction will take longer than one summer which causes issues with the Lesser Horseshoes located in the nearby caves. - WB- We still don't know the entire cave structure, we do not know how it is interconnected which may causes additional implications. - SSSi noted species and habitats need to be taken into account during planning and construction. - WB – Raises the issue that if we have to continuously re-visit the structure for maintenance for example that will cause other issues. 6. **Conclusions of meeting** - More surveys are needed to research the area further. - Without a construction plan it is difficult to discuss the impact construction will have on protected species, the SAM, and the surrounding SSSi. - A future meeting needs to be planned.

Purpose	**A465 S5 & 6 - Ecology TWG**		
Project	A465 Section 5 & 6	**Project No.**	B2191100
Prepared by	Cath Walker	**Phone No**	02920 353200
Location	Conference Room 3 and 4 8th Floor, Cardiff Office, Churchill House, Churchill Way	**Date/Time**	23 November 2016, 10:00 to 16:00
Participants	Jacobs - Wendy Bateman (WB), Cath Walker (CW), Laura Gore (LG), Dave Sallis (DS) Welsh Government - Mark Dixon (MD), Luci Collinwood (LC), Len Wyatt (LW) Rhondda Cynon Taff Council - Richard Wistow (RW) Merthyr Tydfil County Borough Council - Rolf Brown (RB) Natural Resources Wales – Gemma Beynon (GB), John Messenger (JM) Butterfly Conservation George Tordoff (GT) South and West Wales Wildlife Trust - Carys Solman (CM) Mott MacDonald – Ellen Campbell (EC), Joanne Bates (JB)	**Apologies**	Lucy Emery, Russell Hobson, Tom Eyles, Veronika Brannovic, Gareth Protheroe, John Byrne

	Action	**Owner**
	Taf Fechan SSSI	
1	WB stated that as the A465 Section 5 and 6 is DBFO procurement, not ECI there is no contractor currently on board to develop a detailed Kaarst protocol. Jacobs will produce a Performance Specification using similar principles as A465 section 2.	n/a
2	WB confirmed 8 month construction period for the widening of the existing structure with no works that may disturb hibernating bats during the 3.5 winter months (1 December to 15 March inclusive). JM agreed this timescale.	WB
3	CS noted existing key access to Taf Fechan SSSI used by SWW WT will be affected by proposed scheme. Jacobs to review land ownership and access provision around proposed attenuation ponds (north side, chainage approx. 12260).	WB
	Lapwing Mitigation at Dowlais	
4	Confirm ownership of proposed mitigation site to South of Dowlais Top junction further to RB comments that it is potentially included in the emerging MTCBC strategic plan as an employment site.	RB/WB

5	Jacobs to undertake further work, and consultation with Tom Eyles, Gwent WT, to confirm details of barriers to ground based predators, disturbance etc. for proposed mitigation site. Landscaping design to ensure no trees in vicinity to attract corvids.	LG
6	KS6 Construction works in Dowlais Top area to be timed so as to not disturb nesting lapwing.	WB/DS
	Lesser Horseshoe Bats	
7	No lighting proposed at Taf Fechan mainline structure and strip/spot LED lighting on Taf Fechan NMU structure only to ensure no light spill into gorge.	CW
8	JM confirmed that Jacobs survey effort to date with regard to Lesser Horseshoe bats is sufficient and is happy with conclusion of no significant effects on Usk Bat Sites in SIAA.	LG
9	JM recommended the optimisation of proposed pipe roost locations in structures so that they are located independently of the road and avoid areas of low probability of use or where there would be complex maintenance or H&S access issues.	LG
	Great Crested Newt	
10	GCN surveys will be updated in KS5 to inform licencing process.	LG
11	JM comments regarding a conservation strategy for the GCN metapopulation across the scheme to be considered by Jacobs for inclusion in ES.	LG
12	Proposed culvert at chainage 9300 (nearest to confirmed GCN breeding ponds at Winch Fawr SINC) to be upgraded to be suitable as multi mammal crossing point + vegetation as guide.	LG
	Marsh Fritillary Butterfly	
13	Consensus between those present (RW/GT/RB) that ‘do nothing’ option i.e. provision of 0 ha of mitigation land is not acceptable.	n/a
14	NRW to provide statement detailing why existing land designated within SAC cannot be used for mitigation under current legislation.	GB
15	Consensus between those present (that preferred site of land for mitigation is to SW of Baverstocks junction as this land improves connectivity between SSSIs and within the wider functional landscape area. This location is also situated near to existing plots managed for marsh fritillary in the area by RCT/BC. This proposed mitigation land is approximately 17 ha in total.	All
16	Consensus between those present that the eventual quality of the mitigation land provided should exceed that which it is mitigating for. i.e. 2.2 ha of “good quality” habitat would be lost to the scheme. Therefore at least 2.2 ha of good quality habitat should be provided.	LG
17	RW to confirm (provide plans etc.) which areas RCT are already managing in conjunction with BC for conservation of MFB e.g. Tower Colliery and Enviroparks. This will be with a view to ensure the scheme proposals align with the long term strategy for managed grazing across the landscape.	RW

18	LW commented that in SIAA need to demonstrate beyond scientific doubt that integrity of Blaen Cynon SAC will not be affected	WB/LG

Meeting Minutes

Purpose	**A465 Flood Technical Working Group Meeting**		
Project	A465 Section 5 & 6	**Project No.**	B2191100
Prepared by	Sarah Denne	**Phone No**	02920 353200
Location	Conference Room 3 and 4 8th Floor, Cardiff Office, Churchill House, Churchill Way	**Date/Time**	29th November 2016, 10:00-12:00
Participants	Welsh Government: Mark Dixon (MD) MTCBC: Kevin Davies (KD), Gerald Coughlan (GC) RCTCBC: Ian Woodland (IW), Owen Griffiths (OW) Natural Resources Wales: Gemma Beynon (GB), Carl Llewellyn (CL) Jacobs: Dave Sallis (DS), Kim Longman (KL) Phil Raynor (PR), Cath Walker (CW), Sarah Denne (SD)	**Apologies**	Wendy Bateman, Gareth Protheroe, Christopher Nutt (NRW), Sarah Jones (NRW), Andrew Stone (RCT CBC), Fil Pamment (WG)

	Action	**Owner**
1	<u>Flood Modelling</u> *Afon Cynon* PR - Model based on existing NRW 2012 ESTRY model, but has been run in Flood Modeller Pro which accommodates potential changes to the watercourse as a result of structure amendments. Current proposal is to increase the efficiency of the current structure allowing all flow to pass. This would increase flood risk for up to 130m downstream (14cm water level rise), but decrease flood risk up to 200m upstream (14cm water level fall). **CL – NRW require more detail of what this will mean before giving advice on whether compensation is required. This detail to be provided in the FCA.** *Nant y Bwlch* PR – New model produced using FEH statistical method. An increase in capacity to allow passage of all flow is proposed (expansion of culvert). This would reduce flood risk over the wide area, but increase flood risk in a small number of gardens. *Nant Melyn* PR - New model produced using FEH statistical method. Due to the steep nature of the channel, the water flow remains in the channel with no scheme impacts on the flood risk.	PR

	GB/CL – Requested that NRW will need to receive flood modelling report before Christmas to allow time for review before end of required KS3 deadline (end of February 2017)	PR
2	Other watercourses PR - Assessment on simple culverts/watercourses was based on spread-sheet tool which uses the CIRIA C689 method. More complex culvert arrangements required modelling (HEC-RAS 5.0.1). The proposed scheme requires need for some existing pipes/culverts to be extended, some existing pipes/culverts to be replaced by larger, or new culverts to be added in some locations. One culvert (4424) may require the watercourse bed to be lowered to allow for more headroom between the culvert and the road surface. **KD – Requested that LA' will need to receive culvert assessing spreadsheet before Christmas to review before end of required KS3 deadline (end of February 2017).**	PR/KL
3	Water Framework Directive (WFD) PR – Eleven watercourses have been determined as medium (9) or high (2) vulnerability. PR – The WFD is not expected to change significantly from the draft that was issued to WG in June 2016 but was not issued to NRW and LPAs for comment at the time. **Jacobs to issue draft WFD to NRW and LPAs, highlighted with expected changes.**	CW/PR
4	Flood compensation storage area (option for Afon Cynon) **PR to include as a possibility with detail of consequences being tabulated in the Flood Compensation Assessment.** **Jacobs to remodel Afon Cynon with the storage area included.**	PR PR
5	AOB **KD – Requested that Jacobs should investigate any impacts of the Trunk sewer near to Afon Cynon.** **IW - Requested copy of presentation slides showing difference in flooding levels in Hirwaun from present situation vs larger culvert at Nant – y - Bwlch**	DS CW

Appendix 8A – Construction Phase Assessment

8A.1 Introduction

This technical appendix supports Chapter 8: Air Quality of the Environmental Statement (ES) and outlines criteria developed by the Institute of Air Quality Management (IAQM, 2014) for the assessment of air quality impacts arising from construction activities. The assessment procedure is comprised of five steps. The following sections outline the methodology and the construction dust assessment.

8A.2 Assessment Methodology

8A.2.1 Step 1: Identify the need for a detailed assessment

An assessment would normally be required where there is:

- a human receptor within 350 m of the proposed scheme and / or within 50 m of the access route(s) used by construction vehicles on the public highway, up to 500 m from the study area site entrance(s); and / or
- an ecological receptor within 50 m of the proposed scheme and / or within 50 m of the access route(s) used by construction vehicles on the public highway, up to 500 m from the site entrance(s).

A human receptor refers to any location where a person or property may experience the adverse effects of airborne dust or dust-soiling, or exposure to particulate matter (PM10) over a period relevant to the air quality objectives.

An ecological receptor refers to any sensitive habitat affected by dust soiling. For locations with a statutory designation, such as a Site of Specific Scientific Interest (SSSI), Special Area of Conservation (SACs) and Special Protection Areas (SPAs), consideration should be given as to whether the particular site is sensitive to dust. Some non-statutory sites may also be considered if appropriate, such as a Site of Importance for Nature Conservation (SINC).

Where the need for a more detailed assessment is screened out, it can be concluded that the level of risk is 'negligible' and any effects would be 'not significant'.

8A.2.2 Step 2: Assess the risk of dust impacts

A site is allocated to a risk category on the basis of the scale and nature of the works (Step 2A) and the sensitivity of the area to dust impacts (Step 2B). These two factors are combined in Step 2C to determine the risk of dust impacts before the implementation of mitigation measures. Risks are described in terms of there being a low, medium or high risk of dust impacts for each of the four separate potential activities (demolition, construction, earthworks and trackout). Site-specific mitigation would be required, proportionate to the level of risk.

8A.2.2.1 Step 2A: Define the potential dust emission magnitude

The potential dust emission magnitude is based on the scale of the anticipated works and should be classified as small, medium or large. Table 8A.1 presents the dust emission criteria outlined for each construction activity.

Table 8A.1 : Potential dust emission magnitude criteria

Construction activity	Large	Medium	Small
Demolition	Total building volume >50,000 m^3, potentially dusty construction material (such as concrete), on-site crushing and screening, demolition activities >20 m above ground level.	Total building volume 20,000 m^3 – 50,000 m^3, potentially dusty construction material, demolition activities 10-20 m above ground level.	Total building volume <20,000 m^3, construction material with low potential for dust release (such as metal cladding or timber), demolition activities <10 m above ground, demolition

			during wetter months.
Earthworks	Total site area >10,000 m^2, potentially dusty soil type (such as clay, which will be prone to suspension when dry due to small particle size), >10 heavy earth moving vehicles active at any one time, formation of bunds >8 m in height, total material moved >100,000 tonnes.	Total site area 2,500 m^2 – 10,000 m^2 , moderately dusty soil type (such as silt), 5-10 heavy earth moving vehicles active at any one time, formation of bunds 4 m – 8 m in height, total material moved 20,000 tonnes – 100,000 tonnes.	Total site area <2,500 m^2, soil type with large grain size (such as sand), <5 heavy earth moving vehicles active at any one time, formation of bunds <4 m in height, total material moved <20,000 tonnes, earthworks during wetter month.
Construction	Total building volume >100,000 m^3, on site concrete batching, sandblasting.	Total building volume 25,000 m^3 – 100,000 m^3, potentially dusty construction material (such as concrete), on site concrete batching.	Total building volume <25,000 m^3, construction material with low potential for dust release (such as metal cladding or timber).
Trackout	>50 HDV (>3.5 t) outward movements[1] in any one day[2], potentially dusty surface material (such as high clay content), unpaved road length >100 m.	10-50 HDV (>3.5 t) outward movements[1] in any one day[2], moderately dusty surface material (such as high clay content), unpaved road length 50 m – 100 m.	<10 HDV (3.5 t) outward movements[1] in any one day[2], surface material with low potential for dust release, unpaved road length <50 m.

1 A vehicle movement is a one way journey. i.e. from A to B, and excludes the return journey.
2 HDV movements during a construction project vary over its lifetime, and the number of movements is the maximum not the average.

8A.2.2.2 Step 2B Define the sensitivity of the area

The sensitivity of the area is described as low, medium and high takes into account of a number of factors:

- the specific sensitivities of receptors in the area;
- the proximity and number of those receptors;
- the local background PM_{10} concentrations; and
- site-specific factors, such as whether there are natural shelters, such as trees, to reduce the risk of wind-blown dust.

Table 8A.2 presents indicative examples of classification groups for the varying sensitivities of people to dust soiling effects to the health effects of PM_{10}; and the sensitivities of receptors to ecological effects. A judgement is made at the site-specific level where sensitivities may be higher or lower, for example a soft fruit business may be more sensitive to soiling than an alternative industry in the same location. Box 6, Box 7 and Box 8 within IAQM (IAQM, 2014) outlines more detailed guidance for defining sensitivity.

Table 8A.2 : Indicative examples of the sensitivity of different types of receptors

Sensitivity of receptor	Sensitivities of people and ecological receptors		
	Dust soiling effects [1]	Health effects of PM_{10} [2]	Ecological effects [3]
High	Dwellings, museums and other culturally important collections, medium and long-term car parks and car showrooms.	Residential properties, hospitals, schools and residential care homes.	Locations with an international or national designation and the designated features may be affected by dust soiling (such as SAC/SPA/Ramsar). Locations where there is a community of a particularly dust sensitive species such as vascular

			species included in the Red Data list for Great Britain.
Medium	Parks, places of work.	Office and shop workers not occupationally exposed to PM_{10}.	Locations where there is a particularly important plant species, where dust sensitivity is uncertain or unknown. Locations with a national designation where the features may be affected by dust deposition (such as SSSIs).
Low	Playing fields, farmland, footpaths, short-term car parks and roads.	Public footpaths, playing fields, parks and shopping streets.	Locations with a local designation where the features may be affected by dust deposition (such as local nature reserves).

1 People's expectations would vary depending on the existing dust deposition in the area.
2 This follows the Department for Environment, Food and Rural Affairs (Defra, 2016) guidance as set out in Local Air Quality Management Technical Guidance (LAQM.TG (16)). Notwithstanding the fact that the air quality objectives and limit values do not apply to people in the workplace, such people can be affected to exposure of PM_{10}. However, they are considered to be less sensitive than the general public as a whole because those most sensitive to the effects of air pollution, such as young children are not normally workers. For this reason workers have been included in the medium sensitivity category.
3 Only if there are habitats that might be sensitive to dust. A Habitat Regulation Assessment of the site may be required as part of the planning process if the site lies close to an internationally designated site i.e. Special Conservation Areas (SACs), Special Protection Areas (SPAs) designated under the Habitats Directive (92/43/EEC) and RAMSAR sites.

The IAQM guidance advises consideration of the risk associated with the nearest receptors to each phase of work. The A465 construction will be split into the following phases:

- Phase 1 Stage 1 – Hirwaun and Trewaun and Wind Farm Access;
- Phase 1 Stage 2 – Hirwaun Junction, Trewaun Roundabout and structures to River Cynon Bridge;
- Phase 1 Stage 3 – Nant Melyn Viaduct and Croesbychan Junction;
- Phase 1 Stage 4 – Vale of Neath Railway and Court Farm Underpass;
- Phase 2 Stage 1 – Opening Main Cut at Baverstock Junction and new Swansea Road;
- Phase 2 Stage 2 – Taf Fawr Viaducts, Junctions and Approaches;
- Phase 2 Stage 3 – Online Widening to Nant Ffrwd and associated Crossing;
- Phase 2 Stage 4 – Baverstock Junction and Approaches;
- Phase 2 Stage 5 – Nant Hir Crossing and Nant Moel Reservoir;
- Phase 3 Stage 1 – Dowlais Junction;
- Phase 3 Stage 2 – Cefn-Coed High Street Bridge to Taf Fechan;
- Phase 3 Stage 3 – Pant Road Viaduct and Pen-Y-Werrn Bridge;
- Phase 3 Stage 4 – Taf Fawr Viaducts, Junctions and Approaches; and
- Phase 3 Stage 5 – Prince Charles Hospital Junction.

Where there are multiple receptors in a single location, a worst case representative receptor location is considered and the highest risk applicable is allocated.

The receptor sensitivity and distance are then used to determine the potential dust risk for each dust effect for each construction activity as shown in Table 8A.3, Table 8A.4 and Table 8A.5. It is noted that distances are to the dust source and so a different area may be affected by trackout than by on-site works.

For trackout, the distances should be measured from the side of the roads used by construction traffic. Without site specific mitigation, trackout may occur from roads up to 500 m from large sites, 200 m from medium sites and 50 m from small sites, as measured from the site exit. The impact declines with distance from the site, and it is only necessary to consider trackout impacts up to 50 m from the edge of the road.

Table 8A.3 : Sensitivity of the area to dust soiling effects on people and property[1]

Receptor sensitivity	Number of receptors	Distance from the source (m)			
		<20	<50	<100	<350
High	>100	High	High	Medium	Low
	10-100	High	Medium	Low	Low
	1-10	Medium	Low	Low	Low
Medium	>1	Medium	Low	Low	Low
Low	>1	Low	Low	Low	Low

1 Estimate the total number of receptors within the stated distance. Only the highest level of area sensitivity from the table needs to be considered. For example, if there are 7 high sensitivity receptors <20 m of the source and 95 high sensitivity receptors between 20 and 50 m, then the total of number of receptors <50 m is 102. The sensitivity of the area in this case would be high.

Table 8A.4 : Sensitivity of the area to human health impacts[123]

Receptor sensitivity	Annual mean PM_{10} concentration	Number of receptors	Distance from the source (m)				
			<20	<50	<100	<200	<350
High	>32 µg/m^3	>100	High	High	High	Medium	Low
		10-100	High	High	Medium	Low	Low
		1-10	High	Medium	Low	Low	Low
	28-32 µg/m^3	>100	High	High	Medium	Low	Low
		10-100	High	Medium	Low	Low	Low
		1-10	High	Medium	Low	Low	Low
	24-28 µg/m^3	>100	High	Medium	Low	Low	Low
		10-100	High	Medium	Low	Low	Low
		1-10	Medium	Low	Low	Low	Low
	<24 µg/m^3	>100	Medium	Low	Low	Low	Low
		10-100	Low	Low	Low	Low	Low
		1-10	Low	Low	Low	Low	Low
Medium	>32 µg/m^3	>10	High	Medium	Low	Low	Low
		1-10	Medium	Low	Low	Low	Low
	28-32 µg/m^3	>10	Medium	Low	Low	Low	Low
		1-10	Low	Low	Low	Low	Low
	24-28 µg/m^3	>10	Low	Low	Low	Low	Low
		1-10	Low	Low	Low	Low	Low
	<24 µg/m^3	>10	Low	Low	Low	Low	Low
		1-10	Low	Low	Low	Low	Low
Low	-	≥1	Low	Low	Low	Low	Low

1 Estimate the total within the stated distance (such as the total within 350 m and not the number between 200 and 350 m), noting that only the highest level of area sensitivity from the table needs to be considered. For example, if there are 7 high sensitivity receptors <20 m of the source and 95 high sensitivity receptors between 20 and 50 m, then the total of number of receptors <50 m is 102. If the annual mean PM_{10} concentration is 29 µg/m^3, the sensitivity of the area would be high.

2 Most straightforwardly taken from the national background maps, but should also take account of local sources. The values are based on 32 µg/m^3 being the annual mean concentration at which an exceedance of the 24-hour objective is likely in Wales.

3 In the case of high sensitivity receptors with high occupancy (such as schools or hospitals) approximate the number of people likely to be present. In the case of residential dwellings, just include the number of properties.

Table 8A.5 : Sensitivity of the area to ecological impacts[1]

Receptor sensitivity	Distance from the source (m) [1]	
	<20	<50
High	High	Medium
Medium	Medium	Low
Low	Low	Low

1 Only the highest level of area sensitivity from the table needs to be considered

8A.2.2.3 Step 2C Define the risk of impacts

The dust emission magnitude is then combined with the sensitivity of the area to determine the overall risk of impacts with no mitigation measures applied. The matrices in Table 8A.6 provide a method of assigning the level of risk for each activity. These can then be used to determine the level of mitigation that is required.

Table 8A.6 : Risks of dust impacts

Receptor sensitivity	Dust emission magnitude		
	Large	Medium	Small
Demolition			
High	High risk	Medium risk	Medium risk
Medium	High risk	Medium risk	Low risk
Low	Medium risk	Low risk	Negligible risk
Earthworks			
High	High risk	Medium risk	Low risk
Medium	Medium risk	Medium risk	Low risk
Low	Low risk	Low risk	Negligible risk
Construction			
High	High risk	Medium risk	Low risk
Medium	Medium risk	Medium risk	Low risk
Low	Low risk	Low risk	Negligible risk
Trackout			
High	High risk	Medium risk	Low risk
Medium	Medium risk	Low risk	Negligible risk
Low	Low risk	Low risk	Negligible risk

8A.2.2.4 Step 3 Site specific mitigation

Step three of the IAQM guidance identifies appropriate site-specific mitigation. These measures are related to whether the site is a low, medium or high risk site. The highest risk category of a site (of all activities being undertaken) is recommended when considering appropriate mitigation measures for the site. Where risk is assigned as ‘negligible’, no mitigation measures beyond those required by legislation are required. However, additional mitigation measures may be applied as good practice.

A selection of these measures have been specified for Low risk to High risk sites in the IAQM guidance (IAQM, 2014) as measures suitable to mitigate dust emissions from activities.

8A.2.2.5 Step 4 Determine significant effects

Following Step 2 (definition of the proposed scheme and the surroundings and identification of the risk of dust effects occurring for each activity), and Step 3 (identification of appropriate site-specific mitigation), the significance of the potential dust effects can be determined. The recommended mitigation measures should normally be sufficient to reduce construction dust impacts to a not significant effect.

The approach in Step 4 of IAQM dust assessment guidance has been adopted to determine the significance of effects with regard to dust emissions. The guidance states the following:

"For almost all construction activity, the aim should be to prevent significant effects on receptors through the use of effective mitigation. Experience shows that this is normally possible. Hence the residual effect will normally be 'not significant."

IAQM guidance also states that:

"Even with a rigorous DMP [Dust Management Plan] in place, it is not possible to guarantee that the dust mitigation measures will be effective all the time, and if, for example, dust emissions occur under adverse weather conditions, or there is an interruption to the water supply used for dust suppression, the local community may experience occasional, short-term dust annoyance. The likely scale of this would not normally be considered sufficient to change the conclusion that with mitigation the effects will be 'not significant'."

Step 4 of IAQM guidance recognises that the key to the above approach is that it assumes that the regulators ensure that the proposed mitigation measures are implemented. The management plan would include the necessary systems and procedures to facilitate on-going checking by the regulators to ensure that mitigation is being delivered, and that it is effective in reducing any residual effect to 'not significant' in line with the guidance.

8A.3 Construction Dust Assessment

8A.3.1 Step 1 Identify the need for a detailed assessment

An assessment of potential demolition and construction impacts was undertaken in accordance with the IAQM methodology described earlier and as set out in section 3. The first step is Step 1, where the need for a detailed assessment is determined based on the location of receptors within the vicinity of the study area.

8A.3.1.1 Human receptors

Human receptors include locations where people spend time and where property may be impacted by dust. They may have a high, medium or low sensitivity to dust soiling and human health effects in accordance with IAQM guidance. There are human receptors within 350 m of the study area; therefore, further assessment is required. A count of the 'High' sensitive relevant human receptors within the specified assessment bands for each phase of the proposed scheme was carried out as recommended in IAQM guidance (IAQM, 2014), the results of which are set out in Table 8A.7. The receptors have been identified for each of the different phases in line with Step 2B. Medium and low sensitivity receptors were also identified e.g. The Beacons Park natural burial ground at upper High Street, Merthyr Tydfil.

IAQM guidance (IAQM, 2014) recommends a Trackout count (i.e. those receptors within 50 m of the route(s) used by construction vehicles on the public highway, up to 500 m from the site entrance(s)) be undertaken. Site access / egress points and haul routes are to be finalised. However, based on available drawings at the time of writing, sensitive receptors (i.e. residential properties or commercial premises, etc.) have been identified. These receptors are set out in Table 8A.7.

Table 8A.7 : Dust soiling and human health receptor count

Construction activity and distance		Receptor count		
		Phase 1	Phase 2	Phase 3
Demolition, earthworks and construction				
Distance to construction boundary	< 20 m	54	13	107
	< 50 m	159	56	446
	< 100 m	372	203	1,111
	< 350 m	2,300	1,110	5,406
Trackout		**Phase 1**	**Phase 2**	**Phase 3**
Distance from roads up to 500 m from the site entrance	< 20 m	115	2	149
	20 m – 50 m	57	1	57

8A.3.1.2 Ecological receptors

The effect of construction dust on ecological sites has also been considered. There are 41 ecological receptors within 50 m of the proposed scheme site boundary. There are no ecological receptors within 50 m of the local road network up to 500 m from the site entrance, which would likely be utilised during the works associated with the construction of the proposed scheme.

The ecological receptors considered in this assessment are displayed in Table 8A.8. The vegetation type present at each site was obtained from the UK Air Pollution Information System (APIS) website which is published by the Centre for Ecology and Hydrology. Where this information was not available, advice was sought from Jacobs ecologists. The ecological receptors were then categorised into a dust deposition sensitivity class of Low, Medium or High taking into account the likely effect and the value of the sites ecological assets as recommended in the IAQM construction dust guidance (IAQM, 2014) and the likely sensitivity to dust soiling and smothering of the vegetation within each site.

Table 8A.8 : Ecological receptor identification and sensitivity

Ecological receptor	Sensitivity to dust deposition	Reason for sensitive classification
Ancient Semi Natural Woodland (12372)	Low	Primary vegetation type is broadleaved, mixed and yew
Ancient Semi Natural Woodland (13684)	Low	Primary vegetation type is broadleaved, mixed and yew
Ancient Semi Natural Woodland (13688)	Low	Primary vegetation type is broadleaved, mixed and yew
Ancient Semi Natural Woodland (13689)	Low	Primary vegetation type is broadleaved, mixed and yew
Ancient Semi Natural Woodland (18501)	Low	Primary vegetation type is broadleaved, mixed and yew
Ancient Semi Natural Woodland (18509)	Low	Primary vegetation type is broadleaved, mixed and yew
Ancient Semi Natural Woodland (18514)	Low	Primary vegetation type is broadleaved, mixed and yew
Ancient Semi Natural Woodland (7347)	Low	Primary vegetation type is broadleaved, mixed and yew

Ecological receptor	Sensitivity to dust deposition	Reason for sensitive classification
Ancient Semi Natural Woodland (7392)	Low	Primary vegetation type is broadleaved, mixed and yew
Ancient Semi Natural Woodland (8800)	Low	Primary vegetation type is broadleaved, mixed and yew
Ancient Semi Natural Woodland (8801)	Low	Primary vegetation type is broadleaved, mixed and yew
Ancient Semi Natural Woodland (8804)	Low	Primary vegetation type is broadleaved, mixed and yew
Cwm Taf Fechan Woodlands SSSI	Medium	Primary vegetation is broadleaved, mixed and yew. Medium sensitivity assigned as per IAQM guidance (IAQM, 2014)
Cwm Taf Fechan Woodlands LNR	Low	Primary vegetation type is broadleaved, mixed and yew
Habitats supporting the Marsh Fritillary butterfly	High	Blaen Cynon SAC to the north of the proposed scheme (areas within designated SAC boundary not considered in this assessment) is designated for this mobile species and as such, those areas of marshy grassland or rhos pastures and purple moor grass likely to support Marsh Fritillary have been assigned the same sensitivity as an SAC (i.e. High) as per IAQM guidance (IAQM, 2014).
Plantation on Ancient Woodland Site (39415)	Low	Primary vegetation type is broadleaved, mixed and yew
Plantation on Ancient Woodland Site (39606)	Low	Primary vegetation type is broadleaved, mixed and yew
Restored Ancient Woodland Site (11374)	Low	Primary vegetation type is broadleaved, mixed and yew
Restored Ancient Woodland Site (11376)	Low	Primary vegetation type is broadleaved, mixed and yew
Restored Ancient Woodland Site (21421)	Low	Primary vegetation type is broadleaved, mixed and yew
Restored Ancient Woodland Site (21422)	Low	Primary vegetation type is broadleaved, mixed and yew
Restored Ancient Woodland Site (21423)	Low	Primary vegetation type is broadleaved, mixed and yew
Pan March and Traed y Milwyr, Llechryd (SINC 001)	Low	Primary vegetation type is acid grassland
Y Graig (SINC 64)	Low	Primary vegetation type is acid grassland
Winchfawr West (SINC 72)	Low	Primary vegetation type is fen, marsh and swamp
Coed Meirig Pastures (SINC 74)	Low	Primary vegetation type is acid grassland
Cwm Taf Fawr (SINC 79)	Low	Primary vegetation type is broadleaved, mixed and yew
Bryniau (SINC 89)	Low	Primary vegetation type is acid grassland
Cwm Ffrwd (SINC 151)	Low	Primary vegetation type is broadleaved, mixed and yew

Ecological receptor	Sensitivity to dust deposition	Reason for sensitive classification
Proposal - Hirwaun Industrial Estate (SINC 214)	Low	Primary vegetation type is fen, marsh and swamp
Proposal - Hirwaun Ponds (SINC 216)	Low	Primary vegetation type is fen, marsh and swamp
Proposal - Hirwaun Common (SINC 217)	Low	Primary vegetation type is acid grassland
Proposal - Hirwaun Ponds North (SINC 219)	Low	Primary vegetation type is fen, marsh and swamp
Proposal - Hirwaun Iron works (SINC 220)	Low	Primary vegetation type is neutral grassland also broadleaved, mixed and yew woodland
Proposal - Upper Cynon Floodplain (SINC 222)	Low	Primary vegetation type is fen, marsh and swamp also broadleaved, mixed and yew woodland
Proposal - Nant Hir Valley & Reservoir (SINC 223)	Low	Primary vegetation type is broadleaved, mixed and yew woodland
Proposal - Llwydcoed slopes (SINC 225)	Low	Primary vegetation type is fen, marsh and swamp
Proposal - Bryn-defaid Heath (SINC 226)	Low	Primary vegetation type is dwarf shrub heath
Proposal - Aberdare mountain (SINC 236)	Low	Primary vegetation type is acid grassland
Cwm Taf Fechan (SINC 241)	Low	Primary vegetation type is broadleaved, mixed and yew
Tir Mawr A Dderi Hir, Llwydcoed SSSI	Medium	Primary vegetation type is Acid Grassland. Medium sensitivity assigned for a SSSI as per IAQM guidance (IAQM, 2014)

8A.3.2 Step 2 Assess the risk of dust impacts

8A.3.2.1 Step 2A Define the potential dust emission magnitude

The activities associated with the construction of the proposed scheme will be split into three stages, which could potentially involve different periods of demolition, earthworks, construction and trackout, and activity levels of which will not necessarily peak simultaneously.

8A.3.2.2 Dust emission magnitude summary

The dust emission magnitudes of each activity for each phase is summarised in Table 8A.9.

Table 8A.9 : Dust emission magnitude

Construction programme	Demolition	Earthworks			Construction		Trackout	
	Dust emission magnitude	Vehicles active at any one time	Total earthworks (m^3)	Dust emission magnitude	Construction volume (m^3)	Dust emission magnitude	Max vehicle movements in any one day	Dust emission magnitude
Phase 1 between Hirwaun Ponds and Nant Melyn.								
Phase 1 Stage 1	Large	14	600,216	Large	52,452	Medium	146	Large
Phase 1 Stage 2	Large	11	63,699	Large	15,736	Small	68	Large
Phase 1 Stage 3	Large	12	593,608	Large	37,591	Medium	124	Large
Phase 1 Stage 4	Large	7	0	Large	0	N/A[1]	45	Medium
Phase 2 between Nant Melyn Mainline Viaduct and the A470 junction.								
Phase 2 Stage 1	Large	4	0	Large	30,597	Medium	36	Medium
Phase 2 Stage 2	Medium	11	238,608	Large	11,365	Small	79	Large
Phase 2 Stage 3	Medium	7	244,625	Large	19,232	Small	57	Large
Phase 2 Stage 4	Large	10	373,456	Large	0	N/A[1]	80	Large
Phase 2 Stage 5	Large	15	318,106	Large	27,974	Medium	169	Large
Phase 3 between the A470 junction and Dowlais junction.								
Phase 3 Stage 1	Medium	7	225,721	Large	45,633	Medium	114	Large
Phase 3 Stage 2	Large	6	3,235	Medium	4,371	Small	28	Medium
Phase 3 Stage 3	Large	7	106,293	Large	14,687	Small	55	Large
Phase 3 Stage 4	Large	14	114,699	Large	36716	Medium	100	Large
Phase 3 Stage 5	Large	9	143,693	Large	13,113	Small	55	Large

1 Construction activities not anticipated.

8A.3.3 Step 2B Define the sensitivity of the area

The proposed scheme bypasses the communities of Hirwaun, Cefn Coed, Gurnos, Penbryn, Dowlais and Pant which includes a number of residential / commercial properties and a number of schools including Hirwaun Primary School, Ysgol-y-Graig Primary School and Pen-Y-Dre High School.

The Beacons Park natural burial ground at upper High Street, Merthyr Tydfil is adjacent to the proposed scheme (Phase 3) and would be considered a medium sensitivity receptor in accordance with IAQM guidance. This site was included in the sensitivity assessment.

Table 8A.10 displays the sensitivities of the surrounding area to demolition, earthworks, construction and trackout based on the criteria set out in Table 8A.3 and Table 8A.4. For trackout activities, the overall sensitivity determined for each Phase has been assigned to each stage within the relevant phase. The ecological receptors presented in Table 8A.10 represent the most sensitive ecological receptor considered within each stage.

Table 8A.10 : Sensitivity of the proposed scheme area

Potential impact	Sensitivity of the surrounding area			
	Demolition	Earthworks	Construction	Trackout
Phase 1 between Hirwaun Ponds and Nant Melyn.				
Phase 1 Stage 1 Hirwaun and Trewaun and Wind Farm Access.				
Dust Soiling	Medium	Medium	Medium	High
Human Health	Low	Low	Low	Low
Ecological (Marsh Fritillary habitat[2])	High	High	High	High
Phase 1 Stage 2 Hirwaun Junction, Trewaun Roundabout and structures to River Cynon Bridge.				
Dust Soiling	High	High	High	High
Human Health	Low	Low	Low	Low
Ecological (Marsh Fritillary habitat[2])	High	High	High	High
Phase 1 Stage 3 Nant Melyn Viaduct and Croesbychan Junction.				
Dust Soiling	High	High	High	High
Human Health	Low	Low	Low	Low
Ecological (Marsh Fritillary habitat[2])	High	High	High	High
Phase 1 Stage 4 Vale of Neath Railway and Court Farm Underpass.				
Dust Soiling	Medium	Medium	N/A[1]	High
Human Health	Low	Low		Low
Ecological (Marsh Fritillary habitat[2])	High	High	High	High
Phase 2 between Nant Melyn Mainline Viaduct and the A470 junction.				
Phase 2 Stage 1 Opening Main Cut at Baverstock Junction and new Swansea Road.				
Dust Soiling	Low	Low	Low	Medium
Human Health	Low	Low	Low	Low

Potential impact	Sensitivity of the surrounding area			
	Demolition	Earthworks	Construction	Trackout
Ecological (Marsh Fritillary habitat[2])	High	High	High	High
Phase 2 Stage 2 Taf Fawr Viaducts, Junctions and Approaches.				
Dust Soiling	High	High	High	Medium
Human Health	Low	Low	Low	Low
Ecological (SINC 79. Cwm Taf Fawr)	Low	Low	Low	Low
Phase 2 Stage 3 Online Widening to Nant Ffrwd and associated Crossing.				
Dust Soiling	Medium	Medium	Medium	Medium
Human Health	Low	Low	Low	Low
Ecological (Marsh Fritillary[2])	High	High	High	High
Phase 2 Stage 4 Baverstock Junction and Approaches.				
Dust Soiling	Low	Low	N/A[1]	Medium
Human Health	Low	Low		Low
Ecological (SINC 72. Winchfawr West)	Low	Low	Low	Low
Phase 2 Stage 5 Nant Hir Crossing and Nant Moel Reservoir.				
Dust Soiling	Medium	Medium	Medium	Medium
Human Health	Low	Low	Low	Low
Ecological (Marsh Fritillary habitat[2])	High	High	High	High
Phase 3 between the A470 junction and Dowlais junction.				
Phase 3 Stage 1 Dowlais Junction.				
Dust Soiling	High	High	High	High
Human Health	Low	Low	Low	Low
Ecological (SINC 001. Pan March and Traed y Milwyr, Llechryd)	Low	Low	Low	Low
Phase 3 Stage 2 Cefn-Coed High Street Bridge to Taf Fechan.				
Dust Soiling	High	High	High	High
Human Health	Low	Low	Low	Low
Ecological (SINC 241. Cwm Taf Fechan)	Low	Low	Low	Low
Phase 3 Stage 3 Pant Road Viaduct and Pen-Y-Werrn Bridge.				
Dust Soiling	High	High	High	High
Human Health	Low	Low	Low	Low

Potential impact	Sensitivity of the surrounding area			
	Demolition	Earthworks	Construction	Trackout
Ecological	N/A			
Phase 3 Stage 4 Taf Fawr Viaducts, Junctions and Approaches.				
Dust Soiling	High	High	High	High
Human Health	Low	Low	Low	Low
Ecological (Cwm Taf Fechan Woodlands SSSI)	Medium	Medium	Medium	Medium
Phase 3 Stage 5 Prince Charles Hospital Junction.				
Dust Soiling	High	High	High	High
Human Health	Low	Low	Low	Low
Ecological (SINC 89. Bryniau)	Low	Low	Low	Low

1 Construction activities not anticipated.
2 As discussed previously, Blaen Cynon SAC to the north of the proposed scheme (not considered in this assessment) is designated for the Marsh Fritillary butterfly. As a mobile species, those areas of marshy grassland or rhos pastures and purple moor grass likely to support Marsh Fritillary have been assigned the same sensitivity as an SAC (i.e. High) as per IAQM guidance (IAQM, 2014).

8A.3.4 Step 2C Define the risk of impacts

8A.3.4.1 Human receptors

Using the dust emission magnitudes for the various activities in Table 8A.9 and the sensitivity of the area provided in Table 8A.10, the definition of the risks for each activity are provided in Table 8A.11 for dust soiling, human health impacts and impacts on ecological sites.

Table 8A.11 : Dust risk at human ecological receptors

Potential impact	Risk			
	Demolition	Earthworks	Construction	Trackout
Phase 1 between Hirwaun Ponds and Nant Melyn.				
Phase 1 Stage 1 Hirwaun and Trewaun and Wind Farm Access.

1 Denotes highest risk.
2 Construction activities not anticipated.
3 No ecological receptors considered

For the construction phase associated with Phase 1, Phase 2 and Phase 3 the results in Table 8A.11 indicate that the highest level of dust risk is High risk for demolition, earthworks and trackout and Medium risk for construction activities. However, for some of the stages within each phase the dust risks are lower.

8A.3.5 Step 3 Site-specific mitigation

8A.3.5.1 Recommended mitigation measures

The results in Table 8A.11 indicate that activities associated with the proposed scheme ranges from Low risk to High risk at some stages of the proposed scheme. Mitigation measures would be needed to reduce the potential for significant effects of dust emissions in the vicinity of the proposed scheme. The suggested mitigation measures, based on the risk level identified for each phase, which should be adopted for the proposed scheme, are set out below.

The mitigation measures are those specified in the IAQM guidance (IAQM, 2014) and are suitable to mitigate dust emissions generated by the proposed scheme. Measures such as those specified in the guidance would normally be sufficient to reduce construction dust nuisance, risk to human health or effects on ecological sites to

a ‘not significant’ effect. These measures are listed in Table 8A.12 to Table 8A.17 with a recommendation as to whether or not they should be applied based on the highest risk level identified in the dust assessment for each phase and stage. Some specific comments or observations have been added where appropriate. Some of the mitigation measures listed within the IAQM guidance for trackout (mitigation numbers 44 to 48) were considered to represent general on-site activities and operation of haul roads and were moved to the ‘Operations’ section of the general mitigation measures required for all sites. The general mitigation measures were specified based on the highest risk category for each individual stage of each phase as recommended by the IAQM guidance (IAQM, 2014).

As discussed previously, the measures to control dust emissions and monitor the effectiveness of the mitigation would be agreed formally with the respective local authority and potentially key stakeholders as part of a dust and air quality management plan (DMP) which would form part of the construction environmental management plan (CEMP). It is anticipated that this would be achieved through the setting of an appropriate condition or requirement through the environmental impact assessment (EIA) process.

Key: H – Highly recommended D – Desirable N – Not required

Table 8A.12 : Mitigation for all sites: communications

Mitigation measure	Phase 1				Phase 2					Phase 3				
	S1	S2	S3	S4	S1	S2	S3	S4	S5	S1	S2	S3	S4	S5
1. Develop and implement a stakeholder communications plan that includes community engagement before work commences on site.	H	H	H	H	H	H	H	H	H	H	H	H	H	H
2. Display the name and contact details of person(s) accountable for air quality (including dust and odour) issues on the site boundary. This may be the environment manager / engineer or the site manager.	H	H	H	H	H	H	H	H	H	H	H	H	H	H
3. Display the head or regional office contact information.	H	H	H	H	H	H	H	H	H	H	H	H	H	H

H – Highly recommended D – Desirable N – Not required

Table 8A.13 : Mitigation for all sites: dust management

Mitigation measure	Phase 1				Phase 2					Phase 3				
	S1	S2	S3	S4	S1	S2	S3	S4	S5	S1	S2	S3	S4	S5
4. Develop and implement a DMP, which may include measures to control other emissions, approved by the relevant local authority. The level of detail will depend on the risk, and should include as a minimum the highly recommended measures in this assessment. The desirable measures should be included as appropriate for the site in question.	H	H	H	H	H	H	H	H	H	H	H	H	H	H
Site Management														

Mitigation measure	Phase 1				Phase 2					Phase 3				
	S1	S2	S3	S4	S1	S2	S3	S4	S5	S1	S2	S3	S4	S5
5. Record all dust and air quality complaints, identify cause(s), take appropriate measures to reduce emissions in a timely manner and record the measures taken.	H	H	H	H	H	H	H	H	H	H	H	H	H	H
6. Make the complaints log available to the local authority when asked.	H	H	H	H	H	H	H	H	H	H	H	H	H	H
7. Record any exceptional incidents that cause dust and/or air emissions, either on-site or off-site, and the action taken to resolve the situation in the log book.	H	H	H	H	H	H	H	H	H	H	H	H	H	H
8. Hold regular liaison meetings with other high-risk construction sites within 500 m of the proposed scheme, to ensure plans are coordinated and dust and particulate matter emissions are minimised. It is important to understand the interactions of the off-site transport/deliveries which might be using the same strategic road network routes.	H	H	H	H	H	H	H	N	H	H	H	H	H	H
Monitoring														
9. Undertake daily on-site and off-site inspection, where receptors (including roads) are nearby, to monitor dust and record inspection results, and make the log available to the local authority when asked. This should include regular dust soiling checks of surfaces such as street furniture, cars and window sills within 100 m of the proposed scheme, with cleaning to be provided if necessary.	H	H	H	H	H	H	H	D	H	H	H	H	H	H

Mitigation measure	Phase 1				Phase 2					Phase 3				
	S1	S2	S3	S4	S1	S2	S3	S4	S5	S1	S2	S3	S4	S5
10. Carry out regular site inspections to monitor compliance with the DMP, record inspection results and make an inspection log available to the local authority when asked.	H	H	H	H	H	H	H	H	H	H	H	H	H	H
11. Increase the frequency of site inspections by the person accountable for air quality and dust issues on site when activities with a high potential to produce dust are being carried out and during prolonged dry or windy conditions.	H	H	H	H	H	H	H	H	H	H	H	H	H	H
12. Agree dust deposition, dust flux or real-time PM_{10} continuous monitoring locations with the local authority. Where possible, commence baseline monitoring at least three months before work commences on site or, if at a large site, before work on a phase commences. Further guidance is provided by IAQM (IAQM, 2012) on monitoring during demolition, earthworks and construction.	H	H	H	H	H	H	H	H	H	H	H	H	H	H
Preparing and maintaining the site														
13. Plan site layout so that machinery and dust causing activities are located away from receptors, as far as is possible.	H	H	H	H	H	H	H	H	H	H	H	H	H	H
14. Erect solid screens or barriers around dusty activities, or the proposed scheme site boundary, which are at least as high as any stockpiles on site.	H	H	H	H	H	H	H	H	H	H	H	H	H	H

Mitigation measure	Phase 1				Phase 2					Phase 3				
	S1	S2	S3	S4	S1	S2	S3	S4	S5	S1	S2	S3	S4	S5
15. Fully enclose site or specific operations where there is a high potential for dust production and the proposed scheme site is active for an extensive period.	H	H	H	H	H	H	H	H	H	H	H	H	H	H
16. Avoid site runoff of water or mud.	H	H	H	H	H	H	H	H	H	H	H	H	H	H
17. Keep site fencing, barriers and scaffolding clean using wet methods.	H	H	H	H	H	H	H	H	H	H	H	H	H	H
18. Remove materials that have a potential to produce dust from the proposed scheme site as soon as possible, unless being re-used on site. If they are being re-used on-site, cover as described below.	H	H	H	H	H	H	H	H	H	H	H	H	H	H
19. Cover seed or fence stockpiles to prevent wind whipping.	H	H	H	H	H	H	H	H	H	H	H	H	H	H
Operating vehicle/machinery and sustainable travel														
21. Ensure all vehicles switch off engines when stationary - no idling vehicles.	H	H	H	H	H	H	H	H	H	H	H	H	H	H
22. Avoid the use of diesel or petrol powered generators and use mains electricity or battery powered equipment where practicable.	H	H	H	H	H	H	H	H	H	H	H	H	H	H
23. Impose and signpost a maximum speed limit of 15 mph on surfaced, and 10 mph on unsurfaced, haul roads and work areas (if long haul routes are required these speeds may be increased with suitable additional control measures provided, subject to the approval of the nominated undertaker and with the agreement of the local authority, where appropriate).	H	H	H	H	H	H	H	D	H	H	H	H	H	H

Mitigation measure	Phase 1				Phase 2					Phase 3				
	S1	S2	S3	S4	S1	S2	S3	S4	S5	S1	S2	S3	S4	S5
24. Produce a Construction Logistics Plan to manage the sustainable delivery of goods and materials.	H	H	H	H	H	H	H	H	H	H	H	H	H	H
25. Implement a Travel Plan that supports and encourages sustainable travel (public transport, cycling, walking and car sharing).	H	H	H	H	H	H	H	D	H	H	H	H	H	H
Operations														
26. Only use cutting, grinding or sawing equipment fitted, or in conjunction, with suitable dust suppression techniques such as water sprays or local extraction, such as suitable local exhaust ventilation systems.	H	H	H	H	H	H	H	H	H	H	H	H	H	H
27. Ensure an adequate water supply on the proposed scheme site for effective dust/particulate matter suppression / mitigation, using non-potable water where possible and appropriate.	H	H	H	H	H	H	H	H	H	H	H	H	H	H
28. Use enclosed chutes and conveyors and covered skips.	H	H	H	H	H	H	H	H	H	H	H	H	H	H
29. Minimise drop heights from conveyors, loading shovels, hoppers and other loading or handling equipment and use fine water sprays on such equipment wherever appropriate.	H	H	H	H	H	H	H	H	H	H	H	H	H	H
30. Ensure equipment is readily available on-site to clean any dry spillages, and clean up spillages as soon as reasonably practicable after the event using wet cleaning methods.	H	H	H	H	H	H	H	H	H	H	H	H	H	H
44. Avoid dry sweeping of large areas.	H	H	H	H	H	H	H	H	H	H	H	H	H	H

Mitigation measure	Phase 1				Phase 2					Phase 3				
	S1	S2	S3	S4	S1	S2	S3	S4	S5	S1	S2	S3	S4	S5
45. Ensure vehicles entering and leaving sites are covered to prevent escape of materials during transport.	H	H	H	H	H	H	H	H	H	H	H	H	H	H
46. Inspect on-site haul routes for integrity and instigate any necessary repairs to the surface as soon as reasonably practicable.	H	H	H	H	H	H	H	H	H	H	H	H	H	H
47. Record all inspections of haul routes and any subsequent action in a site log book.	H	H	H	H	H	H	H	H	H	H	H	H	H	H
48. Install hard surfaced haul routes, which are regularly damped down with fixed or mobile sprinkler systems, or mobile water bowsers, and regularly cleaned.	H	H	H	H	H	H	H	H	H	H	H	H	H	H
Waste management														
31. Avoid bonfires and burning of waste materials.	H	H	H	H	H	H	H	H	H	H	H	H	H	H

H – Highly recommended D – Desirable N – Not required

Table 8A.14 : Mitigation measures specific to demolition

Appendix 8B – Baseline Monitoring

8B.1 Introduction

In order to characterise the environmental baseline within the study area NO_2 diffusion tube monitoring was undertaken by Jacobs over a six month period between July 2015 and February 2016. This included co-location with the automatic NO_2 analyser at Broadway, Pontypridd. Results of the Jacobs monitoring survey were adjusted to estimate annual mean concentration using the approach set out in Box 7.9 of DEFRA guidance LAQM.TG16 (DEFRA, 2016).

8B.2 Monitoring Site Locations

NO_2 diffusion tube monitoring was undertaken at 24 sites (with three tubes co-located at site 24) within the study area. The Location of these sites is provided in Section 8.4.3 of the ES Chapter (Air Quality) and shown in Figure 8.2.

8B.3 Annualisation of Monitoring Results

The AQOs are all based upon concentrations measured over a calendar year and, ideally, periods of monitoring data should be consistent with this. However, it is possible to use data from a shorter period of monitoring to provide an indication of whether exceedances of the annual mean objective are likely.

Monitoring data from the six month survey were annualised following the approach set out in Box 7.9 of DEFRA guidance LAQM.TG16 (DEFRA, 2016) and bias adjusted using a local bias adjustment factor of 1.03. A summary of adjusted results is presented in Table 8B.1.

Appendix 8C – Air Dispersion Model Process

8C.1 Introduction

The ADMS-Roads model has been developed by Cambridge Environmental Research Consultants Ltd (CERC) and is a version of an atmospheric modelling system that focuses on road traffic as a source of pollutant emissions. Version 4.0 has been used for this study.

The modelling system takes into account the emissions produced by light duty and heavy duty vehicles travelling at a certain speed along a section of road over an average hour and predicts the dispersion of these emissions using appropriate historical meteorological data. The effect of meteorological conditions on dispersion is given a complex treatment within the model. The most significant factors are wind speed and direction and the boundary layer height which is the calculated mixing depth of the lower atmosphere.

8C.2 Assessment Scenarios

In order to quantify the air quality impact of the proposed development, the pollutant concentrations resulting from the emissions from existing road traffic on local roads have been compared to those resulting from predicted traffic emissions with the proposed scheme in place.

This study assesses the proposed dualling of the A465. Committed developments for the opening year (2022) were considered and are included in the traffic predictions for the proposed scheme.

The traffic flow data for the model was prepared by Jacobs. The following scenarios were modelled:

- baseline 2014;
- Do Minimum (DM) 2022; and
- Do Something (DS) 2022.

In addition to these, Design Year scenarios 15 years after opening (2037) were considered for regional emissions. The assessment covers different pollutants, as follows:

- local air quality, focusing only on the pollutants NO_2 and PM_{10}; and
- regional air quality, focusing on NOx, PM_{10} and CO_2 emissions.

8C.3 Background concentrations

The background concentrations across the study area have been defined using the national pollution maps published by DEFRA[1]. These cover the whole country on a 1x1 km grid and are published for each year from 2013 until 2030. The mapped background concentrations were compared with the measured background values from the automatic monitoring stations and network of passive diffusion tubes within the administrative boroughs of Merthyr Tydfil County Borough Council (MTCBC) and Rhondda Cynon Taf County Borough Council (RCTCBC). To provide a more robust assessment, a further NO_2 monitoring survey was undertaken by Jacobs across the study area between July 2015 and February 2016.

The total NOx was calculated using the Defra 'NOx to NO_2 calculator v5.1'. This process identified that the Defra maps were under reporting NOx, and an uplift factor of 1.164 was applied as shown in Table 8C.1.

[1] Department for Environment Food and Rural Affairs, https://laqm.defra.gov.uk/review-and-assessment/tools/background-maps.html. [Accessed 13 March 2017]

Table 8C.1 Total NOx Adjustment factor

Source	Site	X	Y	Site Type	Comments	Measured NOx ($\mu g/m^3$)	Measured NO_2 ($\mu g/m^3$)	NO_2 Data Capture (months)	NO_2 Data Capture (%)	Mapped NOx ($\mu g/m^3$)	Mapped NO_2 ($\mu g/m^3$)	Ratio (Measured/Mapped) NOx	Ratio (Measured/Mapped) NO_2
Merthry Tydfil CBC	Civic Centre (WAQF2)	304743	206261	Urban background	Close urban centre (not representative of background) – EXCLUDED	31	19.4	11	92 %	16.4	12.1	-	-
Merthry Tydfil CBC	Twynyrodyn Infants School (WAQF3)	305832	205941	Suburban	N/A	18	12.4	11	92%	15.5	11.4	1.162	1.088
Merthry Tydfil CBC	Victoria Street (WAQF15)	304866	206137	Urban Centre	Next to a bus station and low data capture - EXCLUDED	41	24.3	8	67 %	16.4	12.1	-	-
Merthry Tydfil CBC	Six Bells Estate (WAQF16)	303525	206388	Suburban	N/A	16	11.4	12	100 %	13.7	10.2	1.165	1.117
Merthry Tydfil CBC	4 Erw Las (WAQF31)	303360	206822	Suburban	N/A	16	11.5	12	100 %	13.7	10.2	1.165	1.127
Jacobs DT Survey	Site 16	295089	205532	Background	Poor data capture - EXCLUDED	30	18.9	5	83 %	12.1	9.1	-	-
									Average adjustment factor			**1.164**	**1.110**

The DEFRA background NO_2 maps were then recalculated from the adjusted NOx concentrations, using the 'NO_2 Adjustment for NOx Sector Removal Tool v5.1'. The adjusted NO_2 concentrations showed good agreement with the measured NO_2 concentrations and no further adjustment was necessary'.

A summary of the monitoring results are detailed in Table 8.10 of the ES Chapter 8: Air Quality.

8C.4 Model parameters

Road Links

ADMS Roads requires lengths of road of equal width (and height if specified as a canyon) to be input into the model. Roads can be split into several 'links' to allow for bends and curves in the road layout. Road alignment and width were determined using the Ordnance Survey Mastermap 1:1,250 scale data.

Traffic Emissions

The traffic flow data for the model was prepared by Jacobs. Traffic data for the modelling scenarios has been provided from the Saturn traffic models produced by Jacobs on behalf of the Welsh Government. The base year air quality modelling uses traffic data, pollution measurements and meteorological measurements from 2014.

Traffic data which represents the average conditions occurring in specific time periods was provided for the periods specified in Table 8C.2.

Table 8C.2 Traffic data parameters used in the modelling

Traffic Period	Time Period
Annual Average Daily Traffic (AADT)	00:00 – 23:00
Annual Average Weekday Traffic (AAWT)	00:00 – 23:00
AAWT AM Peak (AM)	07:00 – 10:00
AAWT Inter-Peak (IP)	10:00 – 16:00
AAWT PM Peak (PM)	16:00 – 19:00
AAWT Off Peak (OP)	19:00 – 07:00

For each time period, the following traffic data parameters were provided:

- total traffic flow, defined as average vehicles / hour;
- percentage heavy duty vehicles (HDV); and
- vehicle speed, in kilometres per hour (kph).

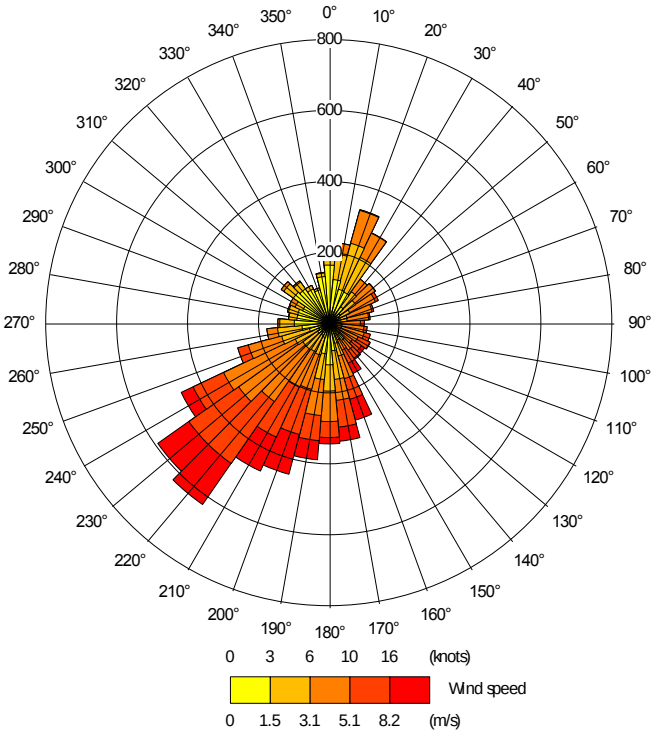
Emission rates representing links in the traffic model were calculated based on the traffic flow, HDV composition, average link speed, and the road type. The emissions were calculated for the AM Peak (AM), Inter-Peak (IP), PM Peak (PM) and Off Peak (OP) periods, and these were then controlled within ADMS using a time varying emission (.fac file) which allows the emission rates to be turned on and off at the times they represent e.g. AM average hour emission rate is emitted between observations made in the meteorological data between 7 am and 10 am.

Meteorological Data

In order to assess the impact of the proposed scheme upon local air quality using a dispersion model, it is important to use representative meteorological data. In simple terms, meteorology is the next most significant factor in determining ambient pollutant levels, after emissions.

Meteorological data for the dispersion modelling assessment was taken from Sennybridge, Powys which is located approximately 13 miles north northwest of the proposed scheme and is considered to be the most representative source for the study area. The windrose for 2014 is presented in Figure 8C.1

Figure 8C.1 Sennybridge, Powys windrose 2014



Surface Roughness

The surface roughness represents the aerodynamic effects of surface friction. This value is an important parameter used to interpret the vertical profile of wind speed and estimate friction velocities which are, in turn, used to define heat and momentum fluxes and turbulence levels. The surface roughness is related to the height of surface elements; typically, the surface roughness is approximately 10% of the height of the main surface features in the preceding kilometre. The greater the surface roughness value used the more mixing of pollutants will occur. For example, the ADMS model suggests a surface roughness of one for cities or wooded areas and 0.5 for open suburbia.

Surface roughness varies across the study area. A surface roughness length of 1.0 m was used in this assessment to represent the meteorological data site and the air quality study area.

Monin Obukhov Length

ADMS models use the Monin Obukhov length as a parameter to describe the turbulent length scale which is dependent on meteorological conditions. Given the nature of the majority of the study area tends to be relatively open and its surrounding districts, a minimum Monin Obukhov length of 10 m was set. A minimum length can be used to account for the urban heat island effect, whereby retained heat in cities causes convective turbulence, which prevents the formation of a very shallow boundary layer at night.

Terrain

The terrain has an effect on the flow field in the air above it. It is recommended that the effect of terrain is incorporated into ADMS-Roads where gradients of greater than 10 % exist within the modelled area, or a short way outside of it. The effect of terrain was not included in the assessment.

Street Canyon

'Street canyons' in air pollution science are roads with continuous high buildings on either side. This arrangement tends to impede the dispersion of pollutants from the road, particularly when the wind is at right angles to it, since a vortex is created in the 'street canyon', retaining the pollution.

No road links were identified as being 'street canyons' within the study area. This feature was therefore not included within the modelling assessment.

Receptors

A total of 107 human receptors and 25 nature conservation sites were included in the assessment. The building usage was identified using an Ordnance Survey Address Base Plus data within ArcGIS 10.4. The grid reference was adjusted to represent the worst-case façade of the property. The resulting list was inserted into the model as an asp file. All representative human health receptor points were given a height of 1.5 m. All representative ecosystem receptor points were modelled at ground height or 0 m.

8C.5 Model verification and adjustment

The comparison of modelled concentrations with local monitored concentrations is a process termed 'verification'. Model verification investigates the discrepancies between modelled and measured concentrations, which can arise due to the presence of inaccuracies and / or uncertainties in model input data, modelling and monitoring data assumptions. The following are examples of potential causes of such discrepancy:

- estimates of background pollutant concentrations;
- meteorological data uncertainties;
- traffic data uncertainties;
- model input parameters, such as 'roughness length'; and
- overall limitations of the dispersion model.

Model Precision

Residual uncertainty may remain after systematic error or 'model accuracy' has been accounted for in the final predictions. Residual uncertainty may be considered synonymous with the 'precision' of the model predictions, i.e. how wide the scatter or residual variability of the predicted values compare with the monitored true value, once systematic error has been allowed for. The quantification of model precision provides an estimate of how the final predictions may deviate from true (monitored) values at the same location over the same period.

Model Performance

An evaluation of model performance has been undertaken to establish confidence in model results. LAQM.TG (16)[2] identifies a number of statistical procedures that are appropriate to evaluate model performance and assess uncertainty. The statistical parameters used in this assessment are:

- root mean square error (RMSE);
- fractional bias (FB); and
- correlation coefficient (CC).

A brief for explanation of each statistic is provided in Table 8.3 and further details can be found in LAQM.TG (16) Box 7.17.

Table 8C.3 Model performance statistics

Statistical parameter	Comments	Ideal value
RMSE	RMSE is used to define the average error or uncertainty of the model. The units of RMSE are the same as the quantities compared. If the RMSE values are higher than 25% of the objective being assessed, it is recommended that the model inputs and verification should be revisited in order to make improvements. For example, if the model predictions are for the annual mean NO_2 objective of 40 µg/m^3, if an RMSE of 10 µg/m^3 or above is determined for a model it is advised to revisit the model parameters and model verification. Ideally an RMSE within 10 % of the air quality objective would be derived, which equates to 4 µg/m3 for the annual mean NO_2 objective.	0.01
FB	FB is used to identify if the model shows a systematic tendency to over or under predict. FB values vary between +2 and -2 and has an ideal value of zero. Negative values suggest a model over-prediction and positive values suggest a model under-prediction.	0.00
CC	CC is used to measure the linear relationship between predicted and observed data. A value of zero means no relationship and a value of 1 means absolute relationship. This statistic can be particularly useful when comparing a large number of model and observed data points.	1.00

These parameters estimate how the model results agree or diverge from the observations. These calculations have been carried out prior to, and after adjustment and provide information on the improvement of the model predictions as a result of the application of the verification adjustment factors.

The verification process involves a review of the modelled pollutant concentrations against corresponding monitoring data to determine how well the air quality model has performed. Depending on the outcome it may be considered that the model has performed adequately and that there is no need to adjust any of the modelled results.

[2] Department for Environment Food & Rural Affairs, Local Air Quality Management Technical Guidance (TG16), April 2016

Alternatively the model may perform poorly against the monitoring data, in which case there is a need to check all the input data to ensure that it is reasonable and accurately represented by the air quality modelling process. Where all input data, such as traffic data, emissions rates and background concentrations have been checked and considered reasonable, then the modelled results may require adjustment to improve alignment with the monitoring data. This adjustment may be either using by a single verification adjustment factor to be applied to the modelled concentrations across the study area or a range of different adjustment factors to account for different situations in the study area.

Air Quality Monitoring Data for Verification

As discussed previously, air quality monitoring data was collected from MTCBC, RCTCBC and the project specific survey. This data was reviewed to determine the suitability of each of the monitoring locations for inclusion in the model verification process. The criteria used to determine the suitability of the monitoring data for inclusion into the verification process are outlined below:

- monitoring location required to be within 200 m of roads forming the study area;
- monitoring data in 2014 required to be >=75% complete data capture;
- monitoring data influenced by major road emissions sources which were missing from the traffic model, and hence could not be included in the dispersion model were excluded; and
- monitoring data from sites where the exact location could not be accurately identified or validated were excluded.

Verification Methodology – NOx / NO_2

The verification method followed the process detailed in LAQM.TG (16)[2]. An initial comparison of the modelled versus monitored results indicated that the model tended to under and over predict against the monitored concentrations. Additionally, there was a high degree of uncertainty or scatter in the model predictions. Model verification adjustment therefore focussed on reducing the uncertainty associated with the modelled results. This is typical in study areas covering large or diverse locations.

The first stage of verification was undertaken by comparing the modelled versus monitored Road NOx. Road NOx measured at the diffusion tubes were calculated using the latest Defra NOx to NO_2 calculator[3], because diffusion tubes only measure NO_2 and do not directly measure NOx.

Once the modelled Road NOx component had been adjusted, this value was used in the Defra NOx to NO_2 calculator[3], and the calculated Road NO_2 component was adjusted following comparison with the monitored Road NO_2.

Verification Summary – NOx / NO_2

A review was undertaken of the modelled versus monitored performance across the whole study area. It was identified that groups of monitoring sites tended to display similar Road NOx model performance. As a result a number of verification zones were defined with the intention of improving the model verification process. The description of the verification zones are presented below:

- Zone 1 – A465 Hirwaun East;
- Zone 2 – A465 West Merthyr Tydfil;
- Zone 3 – A465 Central Merthyr Tydfil;
- Zone 4 – A465 East Merthyr Tydfil; and

[3] Department for Environment Food & Rural Affairs, NOx to NO_2 calculator, Version 5.1, June 2016.

- Zone 5 – A465 Hirwaun West

In total 15 sites were used in the model verification process. The summary results and model performance statistics defined in LAQM.TG (16)[2] are provided in Table 8C.4.

Table 8C.4 Verification zone model performance – NO_2

Parameter	No Adjustment (all zones)	With Adjustment				
		Zone 1	Zone 2	Zone 3	Zone 4	Zone 5
No of monitoring sites	15	2	3	2	3	5
NOx road adjustment factor	N/A	2.095	1.345	1.980	4.140	0.761
NO_2 road adjustment factor	N/A	1.244	1.271	1.404	1.187	1.250
RMSE	9.4	1.4	2.2	0.4	3.9	4.0
FB	0.32	-0.02	0.03	0.00	0.00	0.06
CC	0.17	1.00	1.00	1.00	0.98	0.69
No of sites within +- 25 %	5	2	3	2	3	4

The statistics support the methodology adopted. The statistics show that the RMSE and FB improve when a zonal factor is used for adjustment, when compared to the RMSE and FB for unadjusted results across the whole study area.

Verification Methodology – PM_{10}

There were no PM_{10} analysers within the study area. Therefore, the NOx Road adjustment factor has been applied to the modelled PM_{10} road contributions, following guidance in LAQM TG (16)[2].

Appendix 8D – Air Quality Human Receptor Results

This section contains the results for all modelled receptors in the study area. Receptors can be identified by postal address or grid reference. The receptors within Table 8D.1 are only relevant to human health exposure.

The receptors with a prefix of R represent existing human health receptors and contain the postal address. In some instances where there are different addresses within close proximity of each other the address may not be accurate such as terraced or semi-detached properties.

Table 8D.1 : Model results presented for receptors close to the A465 (2022) affected roads

Appendix 8E – Designated Site Assessment

8E.1 Introduction

Some air pollutants can have an adverse effect on vegetation. Concentrations of pollutants in air and deposition of particles can damage vegetation directly or affect plant health and productivity. Deposition of pollutants to the ground and vegetation can alter the characteristics of the soil, the pH and nitrogen availability that can then impact on plant health and species composition. Some plant species rely on the soil being nutrient-poor, so an increase in nutrient level through nitrogen deposition can cause these species to be lost through competition by species which thrive at higher nutrient levels. The pollutant of most concern for sensitive vegetation near roads is NOx. Increases in concentrations of NOx directly increase nitrogen deposition.

The 1979 Convention on Long-Range Transboundary Air Pollution was established within the framework of the United Nations Economic Commission for Europe (UNECE). The Convention was the first international legally binding instrument to deal with problems of air pollution on a broad regional basis. It is extended by eight related protocols. The overall intention is to reduce pollutant emissions internationally; the reduction has been taking place for many pollutants, including oxides of nitrogen (NOx). The Gothenburg Protocol considers the linked impacts of NOx, ammonia, sulphur dioxide and volatile organic compounds (VOCs) in relation to the issues of acidification, eutrophication and photochemical oxidants.

The institutional framework set up by the UNECE is the source of information used to evaluate impacts on habitats at a local rather than a regional level.

In order to protect certain habitats and species, legislation is in place to reduce the impacts of development on sensitive ecosystems. The sites of these are given legal designations. These include Special Areas of Conservation (SAC), Special Protection Areas (SPA) (for bird conservation), Ramsar Sites (wetland sites for bird conservation), and Sites of Special Scientific Interest (SSSI).

The current policy of the UK agencies associated with environmental protection (which in Wales includes Natural Resources Wales) is that developments should be assessed for their impact on critical levels at Designated Sites in all locations of the country.

8E.2 Protection of habitats and ecosystems

The modelled concentrations at ecological receptors were compared to the relevant critical levels for the protection of vegetation and ecosystems, as set out in Table 8E.1. A 'critical level' is an air quality standard or guideline for ambient concentrations of a pollutant that applies at ecological receptors. Similar to the assessment criteria set out for the protection of human health, there are AQOs and EALs that exist for the protection of vegetation and sensitive ecological sites.

Table 8E.1 : Critical Level for Oxides of Nitrogen (NOx) from the Air Quality Strategy

Pollutant	Concentration	Measured As	Date to be achieved by
Nitrogen oxides (NOx) – for the protection of vegetation and ecosystems	30 µg/m^3	Annual mean	31 December 2000

The modelled nitrogen and acid deposition at ecological sites was compared to the relevant critical loads. The critical loads for designated habitat sites in the UK have been published by the Centre for Ecology and Hydrology and are available from the UK Air Pollution Information System (APIS) website[1]. Critical loads are defined on the APIS website as, "…a quantitative estimate of exposure to one or more pollutants below which significant harmful effects on specified sensitive elements of the environment do not occur according to present knowledge."

[1] Centre for Ecology and Hydrology, Air Pollution Information System, http://www.apis.ac.uk/ [Accessed 1 March 2017]

The critical loads for the designated ecological sites considered in this assessment are set out in Table 8E.2. The selection of the acid deposition critical load for each ecological site, and the nutrient nitrogen deposition critical loads for CWS and ancient woodlands were based on identifying the vegetation or habitat types present at each site using the 'Site Relevant Critical Loads' tool on the APIS website. This tool provides a list of the broad habitat features that are present at each designated ecological receptor. It then lists all the specific priority habitats within that broad habitat category, regardless of whether they are present at the designated site or not. Where relevant, the qualifying features identified in the citations were selected. Otherwise, the specific priority habitat within each broad habitat category present at the site which had the lowest critical load from those present on the ecological site (i.e. the most stringent) was used for the assessment.

For ancient woodlands and the marsh fritillary supporting sites, the 'Search by Location' tool was used to determine the critical loads for these ecological sites, and the specific habitat features present at each site were selected on the APIS website[1].

Deposition rates of nitrogen and acid vary based on whether they are depositing on short or tall vegetation. Where an ecological receptor contained habitat types representing both tall and short vegetation, existing deposition rates and critical load values were obtained for each of these separately.

For nitrogen deposition, the critical loads are provided as a range, and it is accepted standard good practice to apply the lower end of the range in the determination of significance of the predicted increase, as agreed with NRW (NRW, 2016b). For acid deposition, it is more complex as the critical load is made up of a number of values that represent a critical load function, based on the nitrogen and sulphur-derived acid deposition. There are rules on how this critical load function should be applied, (as specified on the APIS website[1]), which were followed for the assessment.

Determining Significance

Where appropriate, the significance of the predicted long-term (annual mean) concentrations or deposition at ecological receptors (specifically SAC and SSSIs) were determined in line with guidance provided by the Environment Agency [2] (Environment Agency, 2016). This is summarised below.

i. Where the process contribution (PC) is less than 1% of the relevant critical level or critical load, the emission is not likely to have a significant effect alone or in combination irrespective of the existing concentrations or deposition rates.

ii. Where the contribution is above 1%, further consideration of existing background concentration or deposition rate is required, and where the total concentration or deposition is less than 70% of the critical level or critical load, calculated in combination with other committed projects or developments included within the traffic data, the emission is considered to be unlikely to have a significant effect.

iii. Where the contribution is above 1%, and the total concentration or deposition rate is greater than 70% of the critical level or critical load, either alone or in combination with other committed projects or developments, then this may indicate a significant effect and further consideration is likely to be required. This would occur on a site-by-site basis through determination of the applicability of the critical levels, directly applicable critical loads at each site, and further assessment by qualified ecologists as part of the assessment set out in Chapter 8: Air Quality.

The above approach is used to give a clear definition of what effects can be disregarded as insignificant, and which need to be considered in more detail in relation to the predicted annual mean concentrations or deposition. For short-term mean concentrations (i.e. the 24-hour mean critical level for NOx), it is considered that a potentially significant effect would be identified where the predicted contribution from the modelled sources would lead to an exceedance of the critical level. In this case, further consideration would be required within the relevant terrestrial and freshwater ecology assessment (see chapter B8).

A predicted exceedance of the 24-hour mean NOx critical level does not necessarily indicate that there will be adverse effects at ecological sites. Use of the critical level value of 75µg/m^3 is conservative and is based on a non-statutory air quality guideline set out in the Environment Agency guidance (Environment Agency, 2016).

[2] Environment Agency, Air emissions risk assessment for your environmental permit, August 2016.

The critical level has been adopted from the World Health Organisation Air Quality Guidelines for Europe (World Health Organisation, 2000). The derivation of, and justification for, this critical level is based on the presence of SO_2 and ozone at elevated concentrations which could cause an additive effect with NOx. This would not always be the case in the vicinity of the proposed scheme. If the predicted NOx concentrations exceed the 24-hour mean critical level then the potential for this additive effect would be considered at the relevant ecological receptor.

For other sites such as the assessed ancient woodland sites, guidance set out in the Environment Agency risk assessment guidance (Environment Agency, 2016) states that:

"If your emissions meet both of the following criteria they're insignificant – you don't need to assess them any further:

- the short-term PC is less than 100% of the short-term environmental standard; and
- the long-term PC is less than 100% of the long-term environmental standard".

This guidance was adopted for use in this assessment for the identification of potentially significant effects at the ancient woodland sites.

Based on the specific guidance for the determination of significance described above, it is not possible to assign a magnitude of change descriptor to the predicted changes in ambient concentrations of pollutants or deposition rates at sensitive ecological sites due to the varying methods specified for determination of the significance of effects. As with the consideration of effects at human receptors, the value of the receptor is built into the criteria for the determination of significance.

Methodology

Traffic is screened for the 'affected roads' which will experience significant changes in traffic flow with the scheme in place. Designated Sites within 200 m of the affected roads are identified, along with the habitat type with the most stringent Critical Load (CL), as reported by APIS[1]. The quoted lower nutrient nitrogen deposition critical load thresholds are advised to be used at the screening stage of an assessment; these are shown in Table 8E.3.

Scheme Impacts

The full results of the dispersion modelling impact (PC) against nutrient nitrogen and acid deposition Critical Loads as well as the NOx critical levels significance criteria are presented in the following pages in Table 8E.2, Table 8E.3 and Table 8E.4. Note that those receptors that only exist in the without scheme scenario (i.e. they are under the scheme) are not shown in Table 8E.4. The term 'exceedence' in Table 8E.3 is used to identify sites which are predicted to exceed the AQO in the DM and D/S and the change in concentration with the scheme in place is greater than 0.4.

A number of transect points show zero values for the PC. This is where the proposed scheme has been built over the transect point, with the scheme in place, or the scheme contribution is nominal at the location.

Appendix 9A – Legislative and Policy Background

Table 9A.1: Legislation

Legislation	Relevant points	How it is addressed through Environmental Statement
Ancient Monuments and Archaeological Areas Act 1979	Scheduled Monuments are protected by law and are, by definition, of national importance. The Act creates criminal offences in respect of unauthorised works to, or the destruction or damage of, Scheduled Monuments.	Scheduled Monuments with the potential to be impacted by the proposed scheme have been identified and the design changed to avoid impact. The proposed scheme is not predicted to have a significant impact on these assets.
Planning (Listed Buildings and Conservation Areas) Act 1990	Planning authorities are required to have special regard to the desirability of preserving a Listed Building, its setting or any features of special architectural or historic interest which it may possess. Designation as a Listed Building provides planning authorities with additional controls over the demolition and alteration of historic buildings through the process of gaining Listed Building Consent.	Listed Buildings with the potential to be impacted by the proposed scheme have been identified during assessment and the design changed to avoid impact. The proposed scheme is not predicted to have a significant impact on these assets.
Historic Environment (Wales) Act, 2016	An Act of the National Assembly of Wales to make provision amending certain aspects of the law relating to ancient monuments and listed buildings; to establish a register of historic parks and gardens; to require local planning authorities to establish historic environment records relating to their areas; to establish an Advisory Panel for the Welsh Historic Environment; and for connected purposes.	The key change affecting cultural heritage assets identified during assessment is the designation of Registered Parks and Gardens as a statutory designation. This results in changes to the potential impacts on such assets and puts a greater importance on the mitigation of impact in regard to the planning process.

Table 9A.2 : National Planning Policy

Policy Document	Relevant points	How it is addressed through Environmental Statement
Wales Spatial Plan (Welsh Assembly Government, 2008b)	The Wales Spatial Plan (WSP) sets out to ensure that planning proposals throughout Wales are integrated, sustainable and made in compliance with the shared vision described in the WSP for managing change in the historic environment.	Assets comprising the 'historic environment' and identified as being within the study area for the proposed scheme have been assessed in regard to their value, the impact of the proposed scheme, mitigation measures and residual effects, thus meeting requirements of the WSP for an integrated an sustainable plan for managing change to the historic environment.

Policy Document	Relevant points	How it is addressed through Environmental Statement
Planning Policy Wales Edition 9 (PPW) (Welsh Assembly Government, 2016a) – Chapter 6 (Historic Environment)	PPW sets out the importance of cultural heritage assets and confirms that it is necessary to consider protection of the historic environment in decision-making.	Environmental Statement identifies heritage assets likely to be affected as a result of construction and operation of the proposed scheme. Proposed mitigation measures are designed to minimise impact on these heritage assets.
Technical Advice Note (Wales) 12: Design (Welsh Government, 2014b)	The setting and views of historic buildings, parks and gardens and archaeological sites should be considered during the planning process and the design of a development of a proposed scheme and, if necessary, how setting and views should be protected.	Cultural Heritage input into the Environmental Statement identifies those heritage assets where setting is likely to be affected as a result of construction and operation of the proposed scheme. Proposed mitigation measures are designed to minimise impact on the setting of heritage assets.
Technical Advice Note 24 – The Historic Environment (2017)	This guidance reflects the changes to cultural heritage protection resulting from the Historic Environment (Wales) Act 2016. It notes the importance of archaeological remains, schedule monuments, listed buildings, conservation areas, historic parks and gardens and historic landscapes.	Environmental Statement identifies heritage assets likely to be affected as a result of construction and operation of the proposed scheme. Proposed mitigation measures are designed to minimise impact on these heritage assets.
Hedgerow Regulations 1997 (amended 2003)	This affords protection to hedgerows which are deemed important for their ecological and archaeological / historic significance across England and Wales. The Regulations set out criteria to be used to establish whether a particular hedgerow is important and provides guidance regarding the replacement of such hedgerows and measures required to ensure good practice is adhered to.	No hedgerows assessed as being important under the Hedgerow Regulations have been identified within the study area. A number of drystone wall and turfstone walls have been identified in the Cultural Heritage ES chapter, however the Hedgerow Regulations does not include drystone or turfstone walls, unless there is a hedge located on the summit of the wall.

Table 9A.3: Local Planning Policy

Policy Document	Relevant points	How it is addressed through Environmental Statement
Rhondda Cynon Taf County Borough Council Local Development Plan up to 2021 (LDP) (Adopted March 2011) (RCTCBC, 2011a)	Policy CS 1: Development in the North In the Northern Strategy Area the emphasis will be on building strong, sustainable communities. This would be achieved by: 1. Promoting residential and commercial development in locations which would support and reinforce the roles of Principal Towns and Key Settlements; 2. Providing high quality, affordable accommodation that promotes	Cultural Heritage input into the Environmental Statement identifies aspects of the built and historic environment that may be affected by the proposed scheme and proposes mitigation measures designed to minimise impact, thereby contributing to the preservation of the local setting and cultural and historical qualities of the area.

Policy Document	Relevant points	How it is addressed through Environmental Statement
	diversity in the residential market; 3. Ensuring the removal and remediation of dereliction by promoting the re-use of under used and previously developed land and buildings; 4. Promoting large scale regeneration schemes in the Principal Town of Aberdare and in the Key Settlements of Mountain Ash, Ferndale and Treorchy; 5. Promoting accessibility by securing investment in new roads, public transport improvements, walking and cycling; 6. Encouraging a strong, diverse economy which supports traditional employment and promotes new forms of employment in the leisure and tourism sectors; 7. Protecting the cultural identity of the Strategy Area by protecting historic built heritage and the natural environment; 8. Promoting and enhancing transport infrastructure services to support growth and investment; and 9. Reducing daily out commuting by private car and promoting sustainable forms of travel. Policy EB101: The Historic Built Environment (SPG) 2010. This Supplementary Planning Guidance (SPG) gives detailed guidance to owners and occupiers of land and buildings within the historic built environment, and anyone wishing to develop within it or make alterations to it, and is a material consideration in the determination of relevant planning applications.	
Merthyr Tydfil County Borough Council Local Development Plan 2006-2021 (LDP) (Adopted May 2011) (MTCBC, 2011)	Strategic Objective 11 To ensure the continued protection and enhancement of the natural, cultural, built and historic environment. Policy BW6: Townscape and Built Heritage The Council will protect and support the enhancement of the unique built heritage of the County Borough.	Cultural Heritage input into the Environmental Statement identifies aspects of the built and historic environment that may be affected by the proposed scheme and proposes mitigation measures designed to minimise impact, thereby contributing to the preservation of the local setting and cultural and historical qualities of the area.

Policy Document	Relevant points	How it is addressed through Environmental Statement
	Development proposals would only be permitted where it can be demonstrated they would preserve or enhance the architectural quality, character and setting of any of the following: • listed Buildings; • scheduled Ancient Monuments; • conservation Areas; • registered Historic Parks and Gardens of Special Historic Interest; • townscape character and the local distinctiveness of settlements; and • other historic, archaeological and cultural features of acknowledged importance. *Policy AS4: Historic Landscape* There would be a presumption in favour of the protection, conservation and enhancement of: • Gelligaer Common; and • the main settlement of Merthyr Tydfil in accord with their status as landscapes of Historic Interest in Wales. The extent of these areas is shown on the LDP Proposals Map and proposals for development would only be permitted where they would maintain or enhance the character and integrity of the landscape.	
Merthyr Tydfil County Borough Council Built Heritage Strategy and Action Plan (2008)	The principal objectives of the Brief for this Built Heritage Strategy are: • to provide the Council with a costed and detailed Action Plan to protect and enhance its heritage assets, including listed and locally listed buildings, ancient monuments, and conservation areas; • to assess the Council's management of these heritage assets, and suggest areas for improvement; and • to promote Merthyr Tydfil in terms of its tourism and cultural value.	Cultural Heritage input into the Environmental Statement identifies aspects of the built and historic environment that may be affected by the proposed scheme and proposes mitigation measures designed to minimise impact, thereby contributing to the preservation of the local setting and cultural and historical qualities of the area.
Brecon Beacons National Park Local	Overarching Policies: SP1 – National Park Policy. Sets out	Cultural Heritage input into the Environmental Statement identifies aspects

Policy Document	Relevant points	How it is addressed through Environmental Statement
Development Plan (adopted December 2013)	that development should be permitted where it conserves and enhanced the cultural heritage of the Park. Policy 1 – Appropriate Development in the National Park. Sets out that the potential effects on cultural heritage should be considered and design for development should be appropriate taking into this into account. SP2 – Major Development in the National Park – Strategic Policy. Sets out that major development should only be consented in the National Park in exceptional circumstances and where they are proven in the public interest. SP3 – Environmental Protection – Strategic Policy. Sets out that the potential effects on cultural heritage should be considered in determining planning applications. Policy 15 – Listed Buildings Policy 16 – Demolition of Listed Buildings Policy 17 – The Settings of Listed Buildings Policy 19 – Development affecting Conservation Areas Policy 20 – Historic Parks and Gardens Policy 21 – Historic Landscapes Policy 22 – Areas of Archaeological Evaluation CYC LP1 – Enabling Appropriate Development	of the built and historic environment that may be affected by the proposed scheme and proposes mitigation measures designed to minimise impact, thereby contributing to the preservation of the local setting and cultural and historical qualities of the area.
Caerphilly County Borough Council Local Development Plan (adopted November 2010)	There are no policies that are of relevance to the assessment of cultural heritage effects	Cultural Heritage input into the Environmental Statement identifies aspects of the built and historic environment that may be affected by the proposed scheme and proposes mitigation measures designed to minimise impact, thereby contributing to the preservation of the local setting and cultural and historical qualities of the area.

Appendix 9B – Cultural Heritage Gazetteer

Asset Number	1
Asset Name	Vale of Neath Railway
Sub Topic	Archaeological Remains
NGR	SN8913006480
Easting	289130
Northing	206480
Parish	Glynneath
Broad Type	Railway
Specific Type	Transport
Designation	None
Cadw Reference	N/A
HER Reference	02500.0m
Condition	Good
Period	19th Century
Value	Low
Description	The line was initially designed for passenger travel and played an important role in the development of mining in the Vale of Neath; carrying coal, iron and chemicals. The line was closed in 1985 with the section between Neath and Glynneath currently being restored by the Vale of Neath Railway Society as a tourist attraction. The railway line appears twice within the study area for the proposed scheme; once, for a distance of approximately 1200 m, to the north of the existing A465 west of Hirwaun. At its closest point the line is located less than 40 m to the north of the proposed scheme. The line then appears within the study area to the east of Hirwaun, where it runs for approximately 750 m west to east, bisecting both the existing A465 and the footprint of the proposed scheme. The construction of the Vale of Neath Railway was authorised by Act of Parliament in 1846. The first trains ran between Neath and Pontypool in 1863 and in the same year the Vale of Neath Railway amalgamated with the Great Western Railway. The line played an important part in the later development of industry and mining in the Vale of Neath carrying coal, iron and chemicals as well as passengers. In 1967 the section of line from Glynneath to Aberdare was closed. The rest of the line was closed in 1985. [1]

Northing	206736
Parish	Glynneath
Broad Type	Tramway
Specific Type	Transport
Designation	None
Cadw Reference	N/A
HER Reference	03225.1m
Condition	Damaged
Period	19th Century
Value	Low
Description	It took long deliberation before the construction of a tramroad connecting the ironworks at Llwydcoed and Abernant with the Neath Canal was finally begun. The tramroad was eventually built in two sections; the first by the Neath Canal Company commenced in 1802 from the canal head at Glyn Neath to Wyfra bridge, the second by Homfray, Birch and the Tappendens eastwards from the bridge to the ironworks. The whole tramroad was eventually opened in 1805. The western section ran west from Hirwaun to the Neath canal head at Glyn-Neath. This section was more or less abandoned after the opening of the Aberdare canal and extension of the eastern section. Most of the tramroad route now comprises minor roads and tracks. From Hirwaun this route can be followed along Manchester Place and Meadow Lane; from this point the tramroad route has been interrupted by road construction and and redevelopment. Its route can be picked up again along Rhigos Road. It heads south west through private land and then along a footpath as far as Wyfra Ucha. West of Wyfra Uchaf farm to the Vale of Neath Gliding Club, the route can be traced along a gravelled and tarmaced track. From here the route of the footpath depicted on the map has been diverted and the tramroad lost to land reclamation. West of Graig-y-Nos farm the route can be followed along a tarmaced road, down an incline then along Merthyr and Aberdare Roads. Approximately 16% of the tramroad survives in varying condition, surviving features include; bridge, causeway and inclined plane. [1] [2]

HER Reference	03220m
Condition	Damaged
Period	19th Century
Value	Low
Description	The Hirwaun Common Mineral Railway was marked as a tramroad on the tithe map of approximately 1840 and a conventional locomotive-operated railway on the Ordnance Survey map of approximately 1880. The line can be followed to the west of Hirwaun at SO 9495 0618 where it converges with the Vale of Neath Railway. To the east, the line of the railway follows along Longfield Court where it is crossed by the A465. The 1880 Ordnance Survey shows that the line continues further on to the south-east and a branch line diverges to the south, currently a footpath. The main line eventually crosses the Hirwaun Road. [1] [2] Within Stage 3 of the archaeological programme in 1996, two trenches were evaluated and were located across the route of the tramway, one to assess the presence of possible track / sleeper level, the other to record in section the construction methods used for track bedding. The construction method used for the track bedding is similar to the branch-line of the Hirwaun Common Railway. A series of hogging layers suggest that the track bedding was improved during its use. The location of trenches for the railway plus trenches across the branch-line merged into one large trench. In section there was a small gap between the two suggesting that the branching of both lines was a few metres north of the trench location. No artefacts were recovered from either trenches. [3]

Condition	Near destroyed
Period	19th Century
Value	Negligible
Description	The course of the Aberdare & Rhondda Railway running roughly west / east, and crossing the proposed line of the A465 near to the crossing over the Nant-y-Bwlch. It is marked on the Ordnance Survey of 1880 as the Aberdare & Rhondda 'main line'. From a bridge over the stream at SO 9531 0508 the line continues east, running to the south of the tennis courts to another bridge where a tramroad crossed the main line (SO9560 0503). [1] Within Stage 3 of the archaeological programme in 1996, an evaluation was undertaken where the proposed scheme severely impacts the site. The excavation revealed the remains (in section) of a track-bed layer constructed of stone hogging. Also present was slag and coke deposits. [2]

HER Reference	02498.0m
Condition	Not known
Period	Post-Medieval
Value	Negligible
Description	Course of the dismantled Bute Colliery to Hirwaun Tramway intersects with the preferred route south of A465 and has now been replaced by the Tower Road. To the south at SO 9506 0501 the Bute colliery tramway and the Aberdare to Rhondda Railway appear to converge near an area of open cast workings. [1] [2] Within Stage 3 of the archaeological programme in 1996, two evaluation trenches were excavated in the area where the proposed scheme would impact. The excavation revealed little evidence of a tramroad surface. Below the present road surface was an extensive stony layer which may be the foundation material for the tramroad. Below this was a deep, well sorted layer of shale. There was no evidence of an earlier ground surface. [3]

Description	Shown on the Ordnance Survey map of 1880 as an abandoned branch of the Aberdare & Rhondda tramroad, continuing south-south-west, presumably to pits, which had vanished by the time of the Ordnance Survey in 1880. The tramroad is built upon an earth bank over 1.5 m high which has been truncated by the later construction of Tramroad C and crosses a stream above a culvert. [1] [2] Within Stage 3 of the archaeological programme in 1996, an evaluation of the site revealed the remains of the tramroad track-bed (in section). The banking is constructed of a clean clayey soil. At the base of the trench was recorded that original ground surface which at the same height as the ground either side of the tramroad bank. [3]

Description	At the point where the Hirwaun Common Mineral Railway crosses the A465, a branch line diverges to the south and currently survives as a footpath. This branch line is marked on the 1880 O.S. (but not on the tithe map). [1] [2] Two trenches were evaluated with Stage 3 of the archaeological programme. These were located across the route of the tramway, one to assess the presence of possible track/sleeper level, the other to record in section the construction methods used for track bedding. Revealed in section were a series of deposits which are conducive with track ballast construction. Each deposit contained thick varying quantities of slag, coke and coal. The residues of which were present throughout. Below the track ballast was a clay deposit (0.30-0.40 m thick) which overlies a brick culvert. [3]

Description	This tramway survives as a north / south track and is marked on the Ordnance Survey map of 1880. It was a branch line of the Hirwaun Common Railway and would have carried coal from collieries to the south. [1] [2] Two trenches were evaluated with Stage 3 of the archaeological programme in 1996. These were located across the route of the tramway, one to assess the presence of possible track/sleeper level, the other to record in section the construction methods used for track bedding. Revealed in section were a series of deposits which are conducive with track ballast construction. Each deposit contained thick varying quantities of slag, coke and coal. Description	It took long deliberation before the construction of a tramroad connecting the ironworks at Llwydcoed and Abernant with the Neath Canal was finally begun. The tramroad was eventually built in two sections; the first by the Neath Canal Company commenced in 1802 from the canal head at Glyn Neath to Wyfra bridge, the second by Homfray, Birch and the Tappendens eastwards from the bridge to the ironworks (Mear, 1999). The whole tramroad was eventually opened in 1805. The section east of Hirwaun (03225.0m), also known as the Abernant Tramroad, carried limestone brought from Penderyn along a pre-existing tramroad to Aberdare and Abernant furnaces. Following the eventual commencement of the Aberdare Canal in 1809 a new tramroad branch was built from the proposed canal head to Gelli Isaf bridge. Later in 1819 Abernant ironworks constructed a direct line to the canal, making the route westwards (03225.1m) redundant. In 1827 Gadlys ironworks was linked via a small branch to Robertstown bridge (van Laun 2001: 188-196). The growth of Abernant ironworks resulted in increased traffic and acted as a catalyst for the conversion of the eastern section of tramroad to Aberdare canal firstly to a steam-hauled line and then to a railway in 1852. This route represents the most long-lived section of Tappenden's Tramroad east of Hirwaun, which thrived after the construction of the Aberdare Canal. This includes the original route running between Abernant and Llwydcoed to Hirwaun; later branches built to the new canal head from Gelli-Isaf bridge and Abernant ironworks as well as the 1827 branch linking Gadlys ironworks to the whole system. From Hirwaun the route can be followed along a tarmaced track and footpath just south of the River Cynon above Penywaun to Gelli-isaf bridge near Llwydcoed. Through the site of Llwydcoed ironworks the route can be followed along a footpath then minor road to Abernant, where the later route to the canal can be traced as a footpath to the canal. The branch running from a junction at Gelli-isaf bridge (01084m) to the canal can now be traced along a tarmaced footpath to the canal. approximately 29% of the tramroad survives in varying condition, surviving features include; stone blocks, revetment, bridges (Roberts and Jones 2006). Description	Between the Afon Cynon and a brook to the west is a small, demolished, farmstead in the lea of a small hillock, associated with dry-stone wall field boundaries probably of the early 19th century. It was probably a single-storey cottage divided in two bays with a western gable-end chimney. Attached to the northern elevation is a lean-to structure with further separate outbuildings to the east, currently represented by the remains of a flagstone floor. The building is constructed of uncoursed limestone bonded with lime mortar, but with some repairs in cement and red-brick. To the west, is an area of gardens and a masonry revetment along the nearby stream . [1] [2] No evidence of the structure above ground. [3]

Description	Gelli-Tarw, between Hirwaun and Penywaun, stands on a level site, on the north side of the Afon Cynon, west of Cwm Ynysmintan and lying just north of the branch railway line between Hirwaun and Cardiff. The farm is built of local mixed stone and consists of an L-shaped range that includes the farmhouse in the longer North to South range with a barn in the shorter East to West range. The farmhouse is a two storey building with a slate pitched roof, with a centrally located doorway and four sash windows to the south-eastern front. Part of the house on the east may be of approximately 1800 date. The rear part of the house and the remaining buildings are late 19th century. The L-shaped range farmhouse range is flanked by two cowsheds in the longer North to South range with a barn and cart-shed to the east of this, in the shorter East to West range. The barn has a central projecting entry and between it and the cart-shed on the external North facing wall are stairs leading up to a loft. The cowsheds are single storey pitched roof buildings. The barn, along with one cowhouse, may be of approximately1800 date. The remaining outbuildings are late 19th century in origin. Setting: The setting is characterised by the Hirwaun Common Mineral Railway to the south and the open field looking on to the existing embanked section of the A465 to the north. To the east the setting is screened by woodland. Located approximately 260 m south of the main A465 road. [1] [2]

Description	An unusual arrangement of farm buildings constructed adjacent to Nant Hir reservoir and associated with a drystone walled landscape, the intersections of two hollow ways and reservoir perimeter wall. [1] An unusual arrangement of farm buildings constructed adjacent to Nant Hir reservoir and associated with a drystone walled landscape and the intersections of two hollow ways adjacent to the reservoir perimeter wall. To the north the remains of a substantial building (approximately 4 m x 6 m) of coursed masonry, standing to approximately 2 m high which has become derelict. The stonework is uniform with quoin stones and a cross-passage, but no evidence of the roofing material. Attached to the eastern elevation was a later lean-to rubble masonry building. To the south of the mortared building is a drystone walled structure. Probably a stable / field-barn. Setting: The remains of this structure are located approximately 75 m to the south of an embanked section of the A465 road. The embankment is heavily wooded and views to the barn/stable are limited. Description	The Nant Hir Reservoir, of mid-19th century date, was built by the Aberdare Water Works Co. The reservoir which is now bisected by the existing A465 is not found on the tithe map, but is shown on the OS of 1880. It is surrounded by a substantial mortared wall and a dam, sluice and bridge are found in the southern extent of the reservoir. [1] [2] Reservoir already compromised by existing A465. Mortar and walling in fair condition. [3]

Description	A track to the south of the A465 which is visible above ground level. It has a slightly raised platform running north / south. It is possible that this track once continued further to the north of the A465, but forestry planting in this area has now destroyed any possible evidence. [1] [2] Within Stage 3 of the archaeological programme in 1996, an evaluation of the track was undertaken. A trench was located across the track which revealed that it had been constructed recently. At approximately 0.55 m below present ground surface, the original field level was present. Consisting of a black humic soil, this layer linked-up with the present exposed field level. [3]

Description	An extensive hollow way (2-3 m deep) running north / south, either side of the A465. On both sides of the hollow way is a series of mature taxa possibly indicating an early date for the hollow way. To the north, approximately 50 m from the road, the hollow way merge into an extensive corralling area (sheep or cattle) which is delineated by low dry-stone walling. To the south, a second hollow way converges at a small field shelter, west of Nant Hir Reservoir. [1] [2]

Description	Bryn-y-Gwyddel is the name of a house as well as the name of the hill on which it stands. The house was recorded on the 1st Edition of the Ordnance Survey 25 inch map and therefore predates 1868. It was found to be in a derelict condition. A two storey limewashed, stone built farmhouse with a slate roof and two chimneys and later extensions to the rear. The farm has been in continued use since Tithe survey of Merthyr Tydfil in 1850. [1] Setting: The setting consists of an oval plot of land bounded by overgrown hedgerows to the west, modern forestry planting to the east and largely uninterrupted sight lines to the existing A465 approximately 300 m to the north. Description	This site was marked as an 'Old Level' on the 1st Edition of the 25 inch Ordnance Survey map which was surveyed in 1868. It was, therefore one of the earlier mineral-working features in the area. It is recorded on that map as having been used for the mining of ironstone. The site now lies within a forested area but close to the edge and it could be visited. It was found to survive in good condition despite fairly dense tree-planting on it. The visible features consisted of a clear entrance to the level and extensive finger tips on the slope below it. [1] [2] Site no longer visible from the existing road. Condition uncertain. [3]

Description	A heavily modernised dwelling recorded in 1885 by Ordnance Survey mapping on rectangular plot of land, which it still maintains. The building survives as a two storey cottage with rough cast render under a slate roof with a gable end chimney. All windows have been replaced with modern casements. The floorplan is of two bays with a gable end, flat roof extension. No surviving external features of architectural or historic interest. [1] Setting: The setting consists of 1970s forestry surrounding the cottage on all sides, except where bisected by the Merthyr Road. Located approximately 430 m south of the existing A465 road. [2]

Description	The remains of early open-cast workings possibly aided by water extraction located behind the Post-Medieval settlement of Baverstock. The tippings have been purposely dumped in order not to extend beyond field boundaries close to the settlement. They stretch for approximately 110 m and merge into substantial coal tippings running east to the settlement of Cyfarthfa. [1] [2] Mineral mining As suggested above, a division of mineral rights may have occurred at the watershed between the Cynon and Taff valleys which now follows the County Boundaries. This would give the western part to Aberdare and the eastern to Cyfarthfa. The other three Merthyr Tydfil ironworks had mineral rights to the east of the Taff. The Rosser Ironstone outcrops (32.18% metallic iron) from around SO 0045 0700 to SO 0168 0717 and the Lower Four-Foot coal lies about 210 m south, petering out around SO 0086 0693 close to the County Boundary. The succession being the Lower Four-Foot Coal over the Rosser ironstone. There are no Geological Memoirs for the area. However there are for the Rosser Ironstone and 4 Foot Coal at Dowlais. Here the 'Botton Rosser Vein' was 4 inches thick, with the Lower Four-Foot Coal, or Old Coal, 117 feet above (35.66m). This was made up of eight seams totalling 14 foot 6 inches. The Four Foot itself appears to be the Botton Coal. The practice here was to work the outcrop from the north, but the 7 degree dip south of the coalfield created drainage problems. However the land profile made it possible to drive levels up into the ore and coal. In order to work the seams downwards, adits were driven at a lower level still, with drainage taking

place into established valley systems. This would allow approximately 600 m of southerly working before drainage again became a problem.

Ironstone working

In places, a little above the Rosser ironstone outcrop, are three or more 'trials' presumably pre-dating other workings. In 1813 there were mine (iron ore) levels at SO 0120 0710 and SO 0111 0707 worked from a tramroad which ran via SO 0141 0712, SO 0164 0709 to Clwydyfagwyr (SO 0321 0681). Here it was joined by two branches (SO 0210 0683 and 0219 0674) working 'Coal and Mine Works'. The line ran steeply on to SO 0260 0697 and from here to SO 0289 0666, the old road via SO 0327 0668 took it to the furnace bank at around SO 0360 0675. In several places collapses from pillar and stall working are apparent (SO 0101 0720) and would have been within the Rosser.

By 1829 (Ordnance Survey 1832) work had progressed as far as Pen-y-Waun itself (SO 0089 0718) and this part appears from field walking to be worked by 'plank and barrow' (from SO 0108 0719). With this method the overburden would have been removed to expose the rock. The face was then worked down as far as practicable until the next section of overburden was reached. This was barrowed across the newly formed gorge and deposited one step further on. In this way the face advanced in a long strip with the waste moving a step at a time, always being roughly the same distance behind the face. The characteristic of this method left a waste tip roughly where quarrying began, sometimes radiating slightly outwards where gaps have been filled, with a final gorge where working stopped. The advantage was that trams could be loaded directly from the face.

The area worked from SO 0045 0700 to SO 0073 0723 is more characteristic of this method. At SO 0063 0721 is a clear outcrop showing 'balls' and 'pins' . From SO 0045 0700 a gully can be followed along the outcrop. Waste was dumped to the north. At SO 0047 0700 is a cutting through the waste to a dump to the west of the B 4276. This appears to have been by tramroad at the final stage when the disposal of waste became a problem, possibly after the post-1829 enclosure (SO 0063 0728). These post-1829 workings can be attributed to Aberdare Ironworks before 1867-72.

By 1829 the Cyfarthfa tramroad had, apart from the 'plank and barrow' work, sprouted a level at SO 0190 0700 working into the outcrop with two fingers of waste, shown on the 1832 Ordnance Survey map, to the north. The mine levels at SO 0120 0710 and SO 0111 0707 were still in operation where there is now an issue. They were abandoned well before 1867-72 (OS 1899).

In 1866 there were 10 furnaces in blast but no returns for raising Argillaceous Carbonate. But by 1867-72 there were a number of ironstone levels at work but in different areas, all situated east of northing 0140. In the 1850s, judging by the engineering, the tramroad running to the general area appears to have been modified (well graded embankment at SO 0163 0709) to work a level (OS 6 inch map surveyed 1867-72) around SO 0140 0713. This created as much waste as a deep mine, with fingers of spoil running around 250 m and intertwining with each other in a search for dumping space. At the 1867-72 period there were six short parallel lines running from the level but by

	comparison with the 1906 Ordnance Survey 6 inch map the waste tip appears formed by then. By the extent of the waste this must have been a major source for native ores. Coal Workings By 1829 (Ordnance Survey 1832) a tramroad, or track, ran from around 0164 0708 slightly south of the tramroad described, making a loop and rejoining the tramroad near its western limits. This ran fairly close to the Lower 4 foot coal which lay from SO 0086 0693 to SO 0182 0689. No investigation has yet been made but it is suspected that coal working from this was abandoned early. West of the large ironstone level (SO 0130 0715) the tramroad appears as the original line and can be intermittently followed to SO 0098 0718. A number of levels lay just south of it indicated by run-ins. After 1829, but well before 1867-72, the tramroad was realigned north from SO 0132 0714 to serve a level at SO 0090 0724 with extensive waste dumped at SO 0094 0729. This was driven below the ironstone outcrop to meet the Lower Four-Foot beyond. Although some distance from the underground seams, the angle driven upwards would provide a good gradient for drainage and tramroads. This was abandoned along with all the western workings by 1867-72. By the 1870s, and probably well before, levels were being driven westwards into the outcrop but between 100 m to 170 m lower down in the Taff valley giving more direct access to coal and ironstone. Initially it appears puzzling that the coal levels, and accompanying waste, lie below the ironstone workings. However the reasons, were necessitated by the only means of obtaining drainage, and easy haulage. To reach the coal workings it would have been necessary to pass through the iron. However there was an advantage as ironstone could also be won from the same level. Based on the methods of working, a phasing could be reasonably undertaken. This area of approximately 37 hectares rivals Blaenavon as a complete industrial landscape. Although only preliminary fieldwork has been undertaken this compact area appears to contain near complete survivals of workings for iron and coal from well before the 1870s (not including deep mining). Levels, pillar and stall, and plank and barrow working combine with tramroads and surviving waste tips to make this rich mixture worth preserving. Furthermore the area is largely vegetated which would not benefit by land reclamation. [3]

Period	19th Century
Value	Medium
Description	Located south-east of the existing Ja Jireh Nursing Home is a complex series of field systems of substantial turf and drystone walling representing gardens, enclosures and drainage systems. Areas of rubble concentrations seem to indicate house platforms and the associated banks may be the remains of post-medieval tofts. The surface finds of pottery and glass indicate continuing usage and the disposal of domestic refuse throughout the 19th century. On the hillside above the site is a multi-period landscape with a number of features including several Bronze Age ring cairns and an unusual raised turf cross described as a 'pillow mound', known locally as the 'Giant's Grave' (Asset 49). This latter feature, although with no supporting evidence, is indicated by the HER as the possible site of a medieval windmill (GGAT). This, however, seems to be a somewhat unlikely inference as the surrounding landscape supplies ample opportunity for the harnessing of water-power. The Merthyr tithe map of 1850 marks two cottages, now demolished, close to the site of the Dynevor Arms, one of which is likely to be directly impacted by the dualling, whereas the other is on the edge of the 50 m corridor. These may have been built by miners working the outcrops of coal and iron up slope. [1] [2] Field evidence Carefully organised field patterns with stone rubble walls and house platforms suggest a pre-industrial settlement. This is confirmed by the careful dumping of post-1829 ironstone waste (SO 0059 0725 to SO 0073 0726) short of the settlement. The rectangular field patterns with houses situated in the middle is characteristic of the type found following the growth in population in the 1600s. Documentary evidence The 1813 Ordnance Survey draft 2 inches to the mile shows a single field running the length of the area and beyond, to around SO 0129 0716. At SO 0082 0723, there is

	now a small enclosure, named 'Penywaun Newydd'. This implies a new settlement on a previous site. Pre-1813 'old' Pen-y-Waun seems to have been part of a greater enclosure which would have crossed the Heads of the Valleys Road (SO 0063 0735) to multiple fields north of the road grouped around tributaries of the Taf Fawr. Pen-y-Waun was the most southerly enclosed part of this. The area west (SO 0070 0730 to SO 0058 0726) up to the B4276 was open moorland at this time. Possibly this became part of Pen-y-Waun Newydd estate. The 1 inch Ordnance Survey map (1832), surveyed 1829, confirms the location of Pen-y-Waun and that the area west was still not enclosed. Discussion Industrial settlement should not be ruled out. In 1813 Pen-y-Waun itself was within 400 m of a mine level and the western part of the enclosure within a few metres. By 1829 industrial activity had extended right up to Pen-y-Waun. The field pattern of the area enclosed by 1867-72 follows the line of the County Boundary on the west (SO 0056 0729 to SO 0060 0723). This suggests it might be related to mineral holdings east and west along the watershed. On this remote moorland it is likely that squatter settlement may have continued with miners and colliers. There is evidence that quarrying was a seasonal job and the same may have applied with minerals. Furthermore, in this there may be similarities between the Hafod and Hendre dwellings common throughout upland Wales. Within Phase 2 of the archaeological programme in 1996, a photographic record and ground survey was undertaken. A series of evaluation trenches were excavated within Stage 3 and involved the excavation of six trenches. Trenches 1 and 2 were located within a banked enclosure approximately 30 m x 25 m and incorporated the platforms of two buildings. Within trench 1 was the external walls of two small, but substantial dwellings. The side elevations and walls to both buildings were located in trench 2. A structure resembling the base of a cottage chimney was located within the side walling. The foundation walling for both dwellings was that of sandstone, probably locally quarried. The walling of both buildings were on average 0.5 m thick. There were in places along the walling within trench 1 evidence of internal walls. Dispersed throughout both trenches were large amounts of 19th century pottery including Staffordshire dark earthen ware, china and glazed biscuit wares. Trenches 3, 4, 5 and 6 were located in order to cut into the raised turfstone boundaries. The construction methods for each boundary were identical: limited drystone wall covered over by an earthen bank. Over the years of disuse, the earthen banks have been colonised by mosses, sedges and grasses. The excavation of turfstone boundaries within trenches 4, 5 and 6 revealed the original ground surface and the line a stones. [3]

Asset Number	53
Asset Name	Iron Ore Scours and Patch Workings at Winch Fawr
Sub Topic	Archaeological Remains
NGR	SN0180006800
Easting	301800
Northing	206800
Parish	Cyfarthfa
Broad Type	Ironstone workings
Specific Type	Industrial
Designation	Scheduled Monument
Cadw Reference	GM554
HER Reference	04351m
Condition	Not known
Period	19th Century
Value	High
Description	Asset 53, a Scheduled Monument, forms an area of patching and scouring associated with iron ore processing dating to the late 18th century located approximately 200 m to the south of the proposed scheme and associated with the Cyfarthfa Ironworks to the east. As a legible industrial landscape and example of industrial practice, Asset 53 contributes to the overall historic character of the Merthyr Tydfil Landscape of Outstanding Historic Interest (MTLOHI) and has the potential to contribute to Regional Research Framework (RRF) priorities relating to the landscape impact and survival of the iron industry. The site is a well preserved area at Winch Fawr of patching and scouring for iron ore associated with the early history of Cyfarthfa Ironworks. The mineral leases for the supply of iron ore to Cyfarthfa appear to have extended over this area from 1765, and the area is believed to have been worked intensively during the late 18th century and into the early years of the 19th century, when Cyfarthfa was the largest ironworks in the world. The earliest working methods, of patching at the outcrops and scouring with water, are well represented on this site. Minerals were excavated from the outcrop on a contract basis, patch by patch, in which miners sub-leased sections of the seams and often worked them in family groups, including young children. The physical evidence of surface quarrying and clusters of small conical tips downslope is visible in the north and south of the area, following the Seven Foot seam and Lower Coal Measures. Scouring was the process of damming water and releasing it suddenly at localised points to remove overburden or to sort mined ore from shale heaps placed in the stream. Two deep scours can be seen, together with the bank of a large reservoir at their head, and hand-dug watercourses supplying them. The earlier features have been cut through in a few places by 19th century tramroads, levels, and their associated crowsfoot pattern spoil tips. Designated of national importance as a particularly clear and well preserved group of typical remains of patching

	and scouring, associated with Cyfarthfa Ironworks. [1] Physical evidence of surface quarrying, conical tips and hand-dug watercourses is visible in the landscape. [2] Iron Ore Scours and Patch Workings at Winch Fawr, west of Gellideg. The site is extensive, part of which is a Scheduled Ancient Monument (GM554). The scheduled site takes in the Cyfarthfa Levels (NPRNs: 265250 and 265251), the D. Rees Levels (NPRNs: 262518, 262517 and 262339), the Clwyd-y-fagwr Moorland Tramway II (NPRN: 262341) and the Cyfarthfa Main Moorland Tramming Level. [3]

Description	A substantial drystone walled landscape which incorporates a sheep fold, both are at present related to Coed Meurig Farm. The walling on the southern side of the A465 is arranged in order to funnel livestock towards the lofted cow shed at Coed Meurig Farm (north of A465). Remnants of drystone walling located south-east of Coed Meurig Farm which represents part of the associated field-system enclosing the farmstead. To the north-east of Coed Meurig farm is a drystone walled field-system which extends approximately 60 m to the east. Associated with the lofted cow shed [1] [2] [3]

Description	Coed Meurig lofted cowshed of six bays in length with external stone staircase at the eastern end to the hayloft above. Built of uncoursed masonry with brick detailing, wooden lintels. The roof trusses have been entirely replaced.[1] Coed Meurig farmstead and the associated lofted cowshed are bisected by the A465 road. Coed Meurig farm, currently unoccupied, consists of a two-storey cottage with an outshut to the rear. It is constructed of a coursed masonry with front and rear porches, two gable-end chimneys, a Welsh slate roof and a small lean-to. The associated lofted cowshed structure is of six bays in length with external stone staircase at the eastern end to the hayloft above. Built of uncoursed masonry with brick detailing, wooden lintels. The roof trusses have been entirely replaced and covered with a Welsh slate roof. There are the remains of full-length double doors at the rear (northern elevation), mirrored by a similar blocked entrance to the front, which appear to have been used as threshing doors. Ventilation slits either side of these entrances also suggest that fodder was stored in this building. Internally the stalls and hay racks are still present. Externally, there are associated sheep pens, a sheep dip and a cobbled yard which surrounds the cowshed. Coed Meurig farm is shown on the Merthyr tithe map of 1850 and described in the schedule of 1846 as being a farm of 37 acres belonging to Lord Dynevor. Setting: The immediate setting is dominated by the adjacent existing A465 which bisects the main house from the outbuildings. To the south of the house is the modern estate housing of the outskirts of Merthyr Tydfil and to the north of the outbuildings is a line of woodland. [3]

Description	Complex of post-medieval buildings, comprising a 17th-18th century farmhouse based on a long-house design, with its associated outbuildings of mostly 18th- 19th century date. The house has stone rubble walls and a slate gabled roof. Although there have been some modern alterations and additions to the buildings, the earlier elements are still well preserved. [1] The Ffrwd Uchaf Farmhouse and attached outbuilding form a Grade II Listed Building. The farmhouse and cowshed range, are probably 17th century in origin as long-house. It has been much rebuilt in 19th century and 20th century. The main part of the farmhouse is supposed to have been converted from a cowshed after 1896, when all 4 windows were inserted, and the door even later, but this part is of 17th century origins having an external chimneybreast, stair projection at rear and marks of a lower gable. There was a 3-light diamond-mullion window in the stair projection, now gone. The house was said to have had original entry from the byre into the hall, with inner rooms beyond, then it was extended upwards with kitchen scullery and dairy, and presumably at the same date or later the upper floor was raised. It forms part of a traditional farm group with the attached cowshed and the barn range across the yard. The interior has a stone winding stair within and fireplace with oak lintel. A deep fireplace in upper section is said to have been blocked. The farmhouse, rubble stone with close-eaved slate roofs. Three sections, the roofs stepping down to left, and the cowhouse downhill to right. The main part of the house said to have been rebuilt approximately 1900 has 2 4-pane sashes each floor, the upper ones longer, and off-centre door close to right sash. Stone voussoirs to cambered heads, stone sills. Stone chimney to right end. Section to left has continuous walling, door to right and window to left

	with stone voussoirs, and casement pair window under eaves above the window. A chimney on left end has gone. Short lowest section to extreme left has one window with stone voussoirs. All windows and doors renewed in late 20th century. End wall of top section is rendered. Rear of second section has added rear wing. Main house rear has small projection to left, apparently a 17th century or 18th century stair projection with tiny window. Rear wall to right has an arch with stone voussoirs found in wall, apparently a blocked cart entry, one window to right and 2 above. Cowshed to right is of whitewashed rubble stone with 5 doors with timber lintels, the third and fifth doors now windows.[2] Setting: Situated on a hillock on the west side of the A470, approximately 750 m northwest of its existing roundabout junction with the existing A465. Description	The barn with lofted stables, probably early 19th century but possibly of several periods. Walling between loft steps and barn door was damaged by tremors during construction of A470 and has been rebuilt. It forms a farm group with the farmhouse and attached byre. The interior consists of the end left doors into stable with one large oak beam. The centre stable has pine joists, former loose box for cart horse. The barn and lofted stable range, whitewashed rubble stone with long slate roof. Barn to right has full-height opening to right of centre. Lofted part to left has 2 square loft openings, the right one with outside stone steps up, and ground floor has 2 doors with stone voussoirs to left, a window and a door with timber lintels set between the 2 loft windows (to left of loft stairs). Lean-to on right end wall.[1] [2] Setting: Located on the east side of the farmyard at Ffrwd Uchaf. Situated on a hillock on the west side of the A470, approximately 750 m northwest of its roundabout junction with the A465 road. [3]

Period	~~18th Century~~
Value	~~High~~
Description	~~The Tai Mawr Leat comprises a well-preserved artificial water course built in 1766 and is located approximately 150m to the west of the A470 and 500m south of proposed scheme. The leat is a Scheduled Monument and forms a component of the broader Cyfarthfa Ironworks surviving in the form of a blast furnace to the south and a section of tramroad to the west.~~ ~~An unusually complete water course from an important C18th ironworks, exceptional for its ingenious design and the documentary evidence for its construction. The leat was built in 1766 as the original water course serving Cyfarthfa. It was designed initially by William Edwards and revised by Charles Wood. The scheduled area incorporates all surface remains of the leat from the re-emergence of the first tunnel to a former rail crossing, after which the leat is less well preserved. [1]~~ ~~Charles Wood and William Edward's original 1766 weir and leat from the Taff Fawr to the first Cyfarthfa furnace. Ditch runs alongside the river as far as Pontycafnau. (A Guide to the Industrial Archaeology of South East Wales, AIA, 2003). The leat was built in 1766 to carry water from a weir across the Afon Taf to Cyfarthfa Ironworks (nprn 34078), approximately 1km to the southeast. The course includes a rock-cut tunnel with a stone paved floor, originally some 93m long but later extended. [2]~~

Description	Brecon-Merthyr Line, London and Northwestern joint railway. 1868. [1] Cefn railway viaduct is a Grade II* Listed structure. The structure is located partly within the Merthyr Tydfil County Borough and partly within the Vaynor and Penderyn Districts. An impressive rusticated-limestone structure of fifteen arches, set on a curve, Cefn-coed-y-cymmer viaduct was built to carry the Brecon and Merthyr Railway over the Taf Fawr. Constructed by Savin and Ward in 1866 to a design by H. Conybeare and A. Sutherland, it is 235 m (770 ft) long and 36.6 m (120 ft) high. The railway viaduct was built 1866 by Henry Conybeare and Alexander Sutherland for Savin and Ward at a cost of £25,000. Sutherland was a friend of Robert Crawshay of the nearby Cyfarthfa Iron Works. The viaduct carried the former Brecon and Merthyr Railway over the Afon Taf Fawr and was built on a curve to satisfy conditions laid down by the Crawshay Estate. It was planned to be constructed entirely of limestone like the nearby Pontsarn Viaduct but a trade union strike by stonemasons in February 1866 caused the company to buy 800,000 bricks from Hirwaun and Welshpool and use bricklayers to complete the fifteen arches. Most of the masons were sacked shortly after returning to work. The first arch from the Vaynor side was keyed on 12 May 1866 and the last on 27 August 1866. The viaduct was built for double-line working but a single track only was installed, on the north side. The viaduct is noted as one of the most historically interesting and architecturally impressive railway viaducts in Wales and a key structure in Cyfartha Conservation Area– Character Area 3: Taf Fechan Valley (Asset 64).

	The railway viaduct consists of abutments, tall slender piers and parapets of coursed irregular sized rock-faced limestone blocks and fifteen ring-built semi-circular brick arches each of six courses. The piers have a projecting impost band and there are two projecting string courses below the parapets. The viaduct is built on a gentle arc some 235 m long and has a maximum height of approximately 36 m. An inscription on the south side reads "Built by Savin and Ward 1866". [2] Setting: Located on the southwest side of Cefn-coed-y-cymmer crossing the valley of the Afon Taf Fawr and approximately 22 m from the existing A465 at its closest point. The viaduct is located to the south of the existing A465, at the same height and has clear sight lines to and from the existing A465. The viaduct has been refurbished and now forms part of the Taff Trail walking and cycling route. [3]

Description	Two 1960's concrete viaducts are located further west of the Taf Fechan viaduct; all three won Civic Trust Awards in 1968. The road is supported by two single-span elliptical arches with vertical struts. The bridges were designed by road [1] A 1960s concrete award winning viaduct built as part of the original A465 scheme. The furthest west of 1960's concrete viaducts over the Taf Fechan valley, it won a Civic Trust Award in 1968. The road is supported by two single-span elliptical arches with vertical struts. The bridges were designed by road engineers Rendel, Palmer & Tritton with Alex Gordon and Partners as consultant architects. Those central viaduct over the Taf Fawr has three spans cantilevered from two piers. Setting: The bridge forms part of the existing A465 and carries the road directly over the Taf Fawr valley below. Views of the structure from the surrounding landscape contribute to its value. [2]

Condition	Good
Period	Post-Medieval
Value	Medium
Description	Cyfartha Conservation Area is an area of special architectural and historic interest the character and appearance of which it is desirable to preserve or enhance. The Conservation Area is sub-divided into the following character areas: • Character Area 1 - Cyfarthfa Park South and Castle; • Character Area 2 - Cyfarthfa Park North; • Character Area 3 - Taf Fechan Valley; and • Character Area 4 - Cyfarthfa Ironworks and Taf Fawr Valley Two character areas within the study area: Character Area 3 - Taf Fechan Valley; and Character Area 4 - Cyfarthfa Ironworks and Taf Fawr Valley. The Conservation Area is centred on the Cyfarthfa Ironworks, park, castle and the features which relate all three. The Conservation Area is important in relaying Merthyr Tydfil's importance as an ironworking centre of worldwide significance. This is displayed with the grand architectural scale of Cyfarthfa Castle, Cefn Viaduct and the Blast Furnace bank and the associated Cyfartha Park. The buildings and structures in the area are predominantly built of pennant stone with limestone incorporated on buildings of a higher status, many of which have been recognised nationally as buildings, structures, or archaeological remains of special historic interest. It also contains a number of smaller elements of the local built heritage such as the stone walls and cast iron fencing that surround Cyfarthfa Castle and parts of the River Taf. The unscheduled remains of the Cyfarthfa fingertip provide for an interesting manmade feature of the landscape by means of a cinder tip, while the Cyfarthfa museum contains portraits of the Crawshay family,

examples of steel and iron work, and much on Merthyr's industrial and cultural life.

Character Area 3: The Taf Fechan Valley

Character Area 3 is the primary Character Area located within the study area. The Taf Fechan Valley is a narrow and steep sided basin, which converges with the Taf Fawr valley south near Pont-y-cafnau and running below the A465 road which carried on a viaduct above it. The Gurnos Quarry tramway runs along the eastern bank of the Taf Fechan River from the open Gurnos Quarry, constructed in 1792-4, which becomes enclosed within the gorge after passing under the higher, modern Heads of the Valleys bridge. The Taf Fechan leat runs along the tramway and supplies Cyfarthfa Park's lake with water. Nearer to the south the area becomes more open woodland, eventually leading into Cyfarthfa Park.

Setting: The character area is set outside the town centre of Merthyr Tydfil whilst the settlement of Cefn-coed-y-cymmer is wedged in between these two valleys.The setting includes sections of the rivers Taf Fawr and Taf Fechan which runs through steep-sided and wooded valleys and converges to the south of Cefn Coed-y-Cymmer. The settlement of Cefn-coed-y-cymmer runs alongside the western edge of the valley, while some modern housing development is located to the east and the A465 road carried on a viaduct above it. This gorged area is covered in copious woodland set alongside quarried limestone cliffs. The river bed, which is a base to this valley, creates a natural corridor although it is largely hidden from much of its surrounding area.

Character Area 4: Cyfarthfa Ironworks and Taf Fawr Valley

The most prominent structure within the study area is the Cefn Viaduct Grade II* Listed railway viaduct across the Taf Fawr Valley. The bridge is a very large structure which is prominent in views from both sides of the valleys and adjacent to the A465 road. The setting of the viaduct is important to the attractiveness of these views. The viaduct also acts as a landmark entry into the built up areas of Merthyr Tydfil from the A465 road. The viaduct is used to carry the Taf Trail across the valley towards the Brecon Beacons.

Setting: Most of the area retains wasteland with areas of self-seeded scrub, woodland and heathland with a number of residential properties and highways providing for its setting.

The area provides for extensive views across Cefn-coed-y-cymmer, up the valley towards Brecon Beacons and down the valley towards Cyfarthfa Castle and Park The Taf and Taf Fawr flow to the eastern flank of this character area and makes a large contribution in terms of its setting and function.

Overall Setting

Areas of modern and semi-modern housing development exist around the fringes of the Conservation Area including the Gurnos and Gellideg Estates. These have reduced the areas connection with the wider historic landscape. Some areas of modern industrial development appear to be unsympathetic to the historic character of the area.

	Views Key views can be achieved through Cyfarthfa Park from east to west encompassing the tranquil parkland areas. However, views to the north towards the existing and proposed A465 are blocked by the castle woodlands, which also screen views towards the Gurnos Estate High and matured trees block many views and it is noted, that some trees obscure views directly to the south towards Cyfarthfa Retail Park. This, however, is considered to be somewhat of an advantage to the amenity of Cyfarthfa Park. [1] [2]

Description	Tabor chapel was built in approximately 1850, and rebuilt in 1904 in a Neo-classical style, as a 2 storey building with a basement. The first floor has decorative keystones and mouldings to windows on front elevation. The ground floor has decorative long / short work [1] Tabor Independent Chapel is a Grade II Listed Building. The Independent chapel was rebuilt in 1904. The chapel was founded by members seceding from Ebenezer chapel, Cefn Coed in 1842 under the Rev W Moses. The first chapel was built in 1845. By 1851, there were 150 attendees. A meeting of 26 March 1899, elected to rebuild the chapel. The new chapel was begun in 1904. The chapel closed in the early 1970s, and by 1980 was a sport club. The chapel was carefully restored as a place of worship in 1989 and has recently undergone refurbishment. The building is a well-preserved chapel of early 20th century regional character and prominently sited. The interior is largely complete from 1904, and was carefully restored in 1989. Three-sided raked gallery, with canted angles, and slightly deeper rear, supported by 6 painted, fluted, cast iron columns, with florid capitals, carrying bracketed cornice. Gallery front has long, horizontal panels, similar shorter panels to canted angles. Pews with two aisles and panelled to match gallery. Pulpit with curved stair to each side, with turned balusters. Canted pulpit front with pair of arched-headed panels with small columns to centre, horizontal panels to canted sides. Base, also canted, has horizontal panels. Large, arched recess behind pulpit, with panelled pilasters, moulded arch and keystone. Ceiling has deep moulded cornice, then timber border with pierced ventilation panels at corners and diagonal slatting elsewhere, and plaster centre. This is divided in 4 by moulded beams terminated at outer ring of centre rose. Rose has 2 moulded rings with 15 floral bosses in band between. Centre has large pendant, probably for a gasolier, with banded

	detail, surrounded by a pierced ornamental iron grille. Independent Chapel of 1904, basement and two storeys in painted stucco with imitation slates to roof, bargeboards and terracotta finial to front gable. Gabled façade of 3 bays with recessed roundel to gable inscribed: 'Tabor Built 1845. Rebuilt 1904. Arched windows with raised shouldered surrounds to upper storey. Triplet to centre, of large central light, with flanking, narrower, similar lights. Single, shorter window to each side. Keystones to triplet. Stucco pilasters to angles. Raised cornice between storeys. Ground floor has cambered-headed windows flanking large projecting central entrance lobby with triplet. Rusticated quoins and window dressings. Projecting lobby has entablature with painted frieze and cornice moulding corresponding to upper floor cornice. Three memorial stones and pair of blank arches below window. Arched entry is in right side-wall with panelled double doors and simple fanlight. Horned sash windows with marginal glazing bars throughout. Painted stucco sides of 3 storeys, 3 bays. Arched windows to top floor, the rest cambered-headed. Basement windows altered, door to right has porch with stone end wall and imitation slate roof. [1] [2] Setting: Located in a prominent position, just to the north of the existing A465 in north Merthyr Tydfil. The chapel is located on a natural platform situated adjacent to the modern High Street road bridge over the existing A465 cutting below. The chapel looks out on to the existing A465 below approximately 30 m away although sight lines to the existing A465 road are partly screened by an existing bridge over the A465. Rebuilt in 1904. In good condition and recently repainted. [3]

Description	The Station Hotel public house is currently unoccupied. It consists of a two storey, purpose built building, rendered and finished in yellow paint with red stone dressings around the doors and windows. It has two gable end chimneys and a slate roof. The building retains the external signage. Dating from the late 19th century. [1] Setting: Located on Station Road, a side street off the main High Street to the north of Merthyr Tydfil. The public house is located on a natural platform above the A465 cutting below. The public house is overshadowed by large modern blocks of flats and terraces of workers housing to the east. The site and has no clear sight lines towards the existing A465 road and is located approximately 120 m to the south of it. [2]

Description	A two bay, two storey, semi-detached cottage. It is built of squared, but roughly coursed, un-rendered limestone, with a modern concrete tile roof and white painted ashlar stone dressings with keystones around the windows and doors. Workers housing dating from the mid to late 19th century. Possibly pre-1842 workers housing comprised of one dwelling based on evidence from the Merthyr Tithe survey of 1850. [1] Setting: Located along the main High Street to the north of Merthyr Tydfil and surrounded by similar terraces of workers housing. The site is located on a natural platform above the existing A465 cutting below, has no clear sight lines towards the existing A465 road and is located approximately 100 m to the south of it. [2]

Description	Church of St John the Baptist is a Grade II Listed Anglican parish church of 1870 by G E Robinson of Cardiff, David Jenkins builder, built on land given by A G Holford. Known as the Swiss church for its slated spire. Vestry and organ chamber added after 1922. Included as a mid-Victorian church with unusual brick-lined interior (reminiscent of John Norton's churches in South Wales) and landmark spire. Interior Walls of pale brick with thin decorative bands of red brick and encaustic tile, one at level of capitals the other at level of corbels of the colonnettes that carry the roof trusses, and alternating buff and white bricks to pointed window reveals and chancel arch. Plastered dado. Open roofs of thin arch-braced collar trusses, the braces carried down low onto short colonnettes with moulded square caps at level of upper decorative band, marble shafts and corbels at level of lower band. Broad 4 bay nave roof. Tall pointed chancel arch in 3 orders of moulded brick, the inner 2 round-moulded, the outer one hollow-moulded with hoodmould, and the inner arch on corbelled colonnettes as in nave. Pointed door at east end of nave to left of chancel arch. One step into chancel, considerably narrower than nave with similar 3-bay roof on corbelled paired colonnetes. Timber lintel to north organ chamber, gabled organ chamber, vestry to east, with plaque recording addition of both in memory of K Jones died 1922. Sanctuary has plain 3-colour tiles to floor, east window has ashlar frame with column shafts and hoodmould. Ashlar cusped piscina on south wall with moulded gabled hood mould and broad segmental-pointed tall entry into base of tower. Fittings: Ashlar octagonal font on octagonal shaft. Ornate brass eagle lectern post 1895, Gothic panelled pulpit post 1922. Gothic stalls of 1904 with colonnettes to bench ends, tall backs with pierced band of cusped triangles, similar cusped heads to arcaded fronts. Fine brass rails also of 1904, 2 round rails on 4 standards with pointed arch on twisted shafts with Gothic leaf scroll each side. Oak Gothic reredos of 1918 with eight blind traceried panels between tall side pieces with crocketted gables and finials.

	Oak altar with traceried panels, early 20th century. Stained glass: Nave south first window, Suffer the children, post 1938, by Wippell & Co of Exeter, signed G. Cooper-Abbs; second window post 1884, Angel at the tomb, possibly by Mayer of Munich; third post 1904, 2 saints to 2 brothers; large E window Sermon on the Mount, early C20 by Heaton, Butler & Bayne of London, to Kate Jones, died 1901; N third, Ann Griffiths and St David, 1984 by Celtic Studios; North fourth Dorcas and Joanna, post 1932. Memorials: marble scroll to west. Gould died 1902, brass plaque to Mrs Williams, caretaker, died 1905. In porch is an early Christian inscribed stone. The exterior of the parish church consists of distinctive stonework in crazed rubble with bands of thin stones at sill and impost levels, rock-faced sandstone quoins, and ashlar windows, steep slate roofs. Nave, chancel, South porch, south-east tower with slated spire and north gabled organ-chamber with vestry. W end has 4 bands of thin stones, diagonal buttresses and two-step buttresses framing lower half of large W window with chamfered surround of sandstone, with hoodmould. Odd tracery of three lancets with transoms at mid height and across tops and tracery in head, apparently partly or wholly renewed in concrete in the 20th century. Coped shouldered gable with stone finial. Big south porch has steep gable and ashlar pointed door, hollow-moulded with hoodmould. Double doors with diagonal boarding. Within porch S door has roll-moulded pointed arch with double cambered-headed doors with diagonally boarded panels. Nave has buttresses of rock-faced sandstone between pointed windows with ashlar heads and hoodmoulds, chamfered rockfaced sandstone jambs, and ashlar 2-light tracery with quatrefoils in heads, 3 windows south, 4 to north. Lower chancel has attached south tower of 3 stages with high battered base, clasping buttresses at angles with similar high bases and long set offs, reaching up to base of top stage. Top stage has paired long bell openings with segmental-pointed ashlar chamfered heads, and big ashlar corbels under eaves of slated spire. Spire is broached with 4 small timber lucarnes set low with metal 3-sided roofs, and 4 similar but smaller vents in diagonal faces. Tower S side has cross in stonework above second stage and lancet in lowest stage, and E side has door with segmental-pointed arch. Chancel south has no windows, east end has coped gable, 3-light pointed window with ashlar tracery and hoodmould Chancel north has approximately 1925 gabled organ chamber with small flat-roofed vestry to east. Organ chamber has reset 2-light north window, matching those of nave. [1] [2] Setting: Location In a prominent position on the NE side of New Church Road in Cefn-coed-y-cymmer. Views from the north of the churchyard towards the existing A465 approximately 60 m to the north. [3]

Description	A bridge once carrying the Brecon & Merthyr Railway across the line of the Merthyr / Abergavenny Railway (now the A465). It appears to have been fitted after construction of the A465 in 1964 and therefore may not be the original bridge. [1] A bridge across the A465. It once carried the Brecon & Merthyr Railway across the line of the Merthyr and Abergavenny Railway which later became the A465 road. The bridge is constructed iron riveted plates supported by iron girders and linked the northern and southern parts of Cefn-coed-y-cymmer. It appears to have been fitted after construction of the A465 in 1964 and therefore may not be the original railway bridge prior to the construction of the road. Setting: The bridge is located directly over the existing A465 and its setting is dominated by it. [2]

Description	A Tramroad and Leat constructed in 1792 and associated with the Gurnos limestone quarries that served Cyfarthfa Ironworks. The Tramroad and Leat run southeast to northwest along the line of Brecon Road in Merthyr Tydfil and are bisected by the current A465. The leat was constructed in 1825 to provide water for the Cyfarthfa Ironworks. Features of the leat include a weir on the Taf Fechan with entrance sluice, a culverted section beneath the quarry floor and an impressive overflow near the southern end. The monument demonstrates the complex water and transport management required for an important ironworks in the industrial revolution. [1] A leat, some 1.6 km long, was constructed in 1825 to provide water for the ornamental lake at Cyfarthfa Castle (nprn 18504) and, via Pont-y-cafnau (nprn 34860), for Cyfarthfa Ironworks (nprn 34078). The northern end of the watercourse is at a sluice on the Afon Taf opposite Gurnos Quarry; it runs parallel to the earlier Gurnos Tramroad (nprn 303701) and still supplies the lake at Cyfarthfa Castle. Description	A large 'model' farm which was occupied, but not owned, by the ironmaster William Crawshay. A tithe award was prepared in 1846 relating to 209 acres. The farmstead is in a poor condition and is covered by striated render imitating ashlar masonry, painted windows and door detailing, with a front porch and decorative barge boards. The main body is of three bays in length with a hipped roof. To the side is an extension with a pitched roof of Welsh slate. Either side of house are single-storey stable blocks (the western wing forming a 'c' shaped layout) built of uncoursed stone with brick detailing. At the centre of the courtyard is a lofted barn built of coursed stone. The farm is unusual in being a planned courtyard farm, and the layout dates from before 1885 Ordnance Survey mapping. It may have been erected by William Crawshay II as part of his development of the Cyfartha estate, which included a large amount of ornamental planting between Gurnos and his seat at Cyfartha Castle. Associated with the model farm are three farm worker's cottages of two bays, and two storeys high with painted brick window & door detailing and coursed, rusticated masonry. Architecturally very similar to Gurnos Farm the buildings probably acted as tied cottages for agricultural labourers. [1] Setting: The farm is located approximately 40 m to the north of the existing A465 although it is partly screened by trees planted along the verge of the road. To the north side of the road the setting is largely rural whilst on the south side the setting is suburban being dominated by the modern, Gurnos housing estate. [2]

Value	Low
Description	Asset 83 is located to the east of Gurnos Farm (Asset 82) adjacent to the boundary of the existing A465 and within the footprint of the proposed scheme. Approximately 110 m to the east of Gurnos Farm is a semi-circular drystone walled enclosure which appears to have been truncated to the south by the construction of the A465. Inside the semi-circular feature there is evidence of stone clearance, whilst externally the surrounding fields are littered with limestone outcrops and possible quarrying. Following the external circumference of the walling is a stream linked to other watercourses to the north. [1] [2] This site was included in the Stage 3 evaluation programme and was excavated in October 1996. A small section of walling was excavated. The lower section of the wall extended approximately 0.30 m below the present ground surface, close to the interface between recent shallow dark humic soils and light orange clays. No wall foundations were present. [3]

Description	West of the Castle Morlais Tramroad is a large coppice area which incorporates three lime kilns. It is possible that the coppice supplied fuel for the kilns as well for the farm. Surrounding the coppice on the north, east and western edges is a fragmented drystone wall. To the west the walling encloses open unimproved pasture land. [1] [2] [3]

Condition	Poor
Period	19th Century
Value	Negligible
Description	The Dowlais Iron Company opened a new limestone quarry at Morlais (east) after leaving Twynau Gwynion quarries in 1825. Despite this a tramroad connecting the quarries to the Dowlais and Ivor Ironworks was not opened until the 1830s. The gauge was 4 ft 2 in, the same as the Penydarren tramroad allowing traffic to transfer between the two. By 1832 it is possible that combined wheel locomotives could have worked the line to Morlais East as they were able to run on 4 ft 2 in as well as standard gauge railways.Track was converted to standard gauge after 1838. The northern section of the tramroad through the quarries is now a designated trail known as Morlais Heritage Trail; set up by Pen-y-Dre high school in conjunction with Merthyr Groundwork Trust. The trail starts opposite the lower car park of the Brecon Mountain Railway alongside Morlais Golf Course. From here the tramroad ran a winding course southwards through Pant to the Ivor Works, its route can be partly followed along Pant Road. The tramroad continued southeast to the eastern extent of Dowlais Ironworks where it joined the Penydarren Tramroad. Approximately 39% of its route survives in varying condition. surviving features include stone blocks, wooden sleepers and revetment. [1]

Asset Name	Limekilns, Castle Morlais Tramroad
Sub Topic	Archaeological Remains
NGR	SN0471008720
Easting	304710
Northing	208720
Parish	Vaynor
Broad Type	Lime kiln
Specific Type	Industrial
Designation	None
Cadw Reference	N/A
HER Reference	03134m
Condition	Damaged
Period	Post-Medieval
Value	Low
Description	The remains of at least three circular, corbelled limekilns constructed of unmortared, uncoursed rubble stonework (standing to a height of approximately 1.5 m) are located on the eastern edge of a large coppiced woodland, next to the Morlais Tramroad (Asset 87, Asset 93). This tramroad would have supplied the raw materials used to charge the kilns, the resultant lime was probably being used for agricultural improvement of the land surrounding Gurnos Farm. [1] [2] [3]

Specific Type	Infrastructure
Designation	None
Cadw Reference	N/A
HER Reference	RR621-02b
Condition	Poor
Period	Roman
Value	Negligible
Description	Within the vicinity of the drystone walling at Gurnos are the possible remains of a Roman road which ran from Brecon to Cardiff. The road is marked on the 1891 Ordnance Survey map, approximately 200 m west of Gurnos Farm. [1] [2] Recent test pitting in an area 150 m east of Gurnos Farm was recovered a Roman pottery shard. [3] A Roman road is assumed to lead north from the Roman settlement at Cardiff, linking the military settlements at Caerphilly, Gelligaer and Pen-y-Darren, eventually heading for Brecon Gaer. Field evidence is limited to an uncertain stretch north from Gelligaer. [4]

Description	The Dowlais Iron Company opened a new limestone quarry at Morlais (east) after leaving Twynau Gwynion quarries in 1825. Despite this a tramroad connecting the quarries to the Dowlais and Ivor Ironworks was not opened until the 1830s. The gauge was 4 ft 2 in, the same as the Penydarren tramroad allowing traffic to transfer between the two. By 1832 it is possible that combined wheel locomotives could have worked the line to Morlais East as they were able to run on 4 ft 2 in as well as standard gauge railways. Track was converted to standard gauge after 1838. The northern section of the tramroad through the quarries is now a designated trail known as Morlais Heritage Trail; set up by Pen-y-Dre high school in conjunction with Merthyr Groundwork Trust. The trail starts opposite the lower car park of the Brecon Mountain Railway alongside Morlais Golf Course. From here the tramroad ran a winding course southwards through Pant to the Ivor Works, its route can be partly followed along Pant Road. The tramroad continued southeast to the eastern extent of Dowlais Ironworks where it joined the Penydarren Tramroad. Approximately 39 % of its route survives in varying condition. surviving features include stone blocks, wooden sleepers and revetment. [1] The course of the tramroad which was built in 1803 crosses the existing A465 at this point. It brought lime and limestone from Castle Morlais quarries down to the Dowlais Ironworks. The line was constructed of a plateway with mixed 2 ft. 9 in. and 4 ft. 2 in. gauge track and the route is marked on the tithe map and Ordnance Survey of 1880. The section of tramroad running under the existing A465 has been damaged and may have been re-aligned during the construction of the original A465 scheme in the 1960s. [2] [3]

Period	19th Century
Value	Negligible
Description	To either side of, and below, the existing A465 are the remains of a substantial north/south cutting originally part of the branch line of the Brecon & Merthyr Railway. Opened in 1869, the branch line ran from Dowlais Central (south of A465) to Pant in the north. At Pant, the branch line joins the main earlier Brecon & Merthyr Railway (to Brecon via Pontsticill) opened in 1863. [1] [2] Within Stage 3 of the archaeological programme in 1996, two trenches were evaluated and were located across the route of the railway, one to assess the presence of possible track/sleeper level, the other to record in section the construction methods used for track bedding. The construction method used for the track bedding is similar to exposed areas of the railway nearby. A series of stone hogging layers suggest that the track bedding was improved during its use. The trench section went to a depth of 1.2 m and revealed at least three sets of track. [3]

Description	In 1873 the Brecon and Merthyr Railway allowed the London North Western Railway (LNWR) to construct a line running westward through Dowlais Top to Ivor Junction, in return for running rights. In achieving this the London North Western gained access to the strategically placed Lloyd Street station and the Dowlais Iron Company's traffic. The completion of this line and a number of others allowed the LNWR to run trains into Merthyr Tydfil from Monday 9 June 1879, ending the aspirations of the Midland Railway to run trains into the Merthyr area. Description	Upper Row consists of post 1827 workers housing comprised of thirty-six dwellings. A row of two storey, two-bay, terraced housing retaining Welsh slate roofs. The buildings are unrendered and built in finely cut and well-coursed rusticated limestone ashlar with painted brick detailing around the doors and windows. The original sash windows have generally been replaced unsympathetically with casements. Lower Row consists of post 1827 workers housing comprised of twenty-four dwellings. A row of two storey, two-bay, terraced housing retaining Welsh slate roofs, chimneys largely demolished. The buildings are rendered in rough cast some exposing finely finished painted stone detailing around the doors and windows. The original sash windows have generally been replaced unsympathetically. [1] Setting: The rows are located within a suburban setting of 19th century industrial workers housing, located approximately 70 m south of the A465 road at the closest point. The front elevations of the rows face away from the A465. [2]

Description	No. 1 Lower Row is a Grade II Listed Building. Mid C19 corner house of industrial workers terraced housing. Originally many terraces in the Dowlais and Penydarren areas ended in a curved corner house, this is the least altered survivor. The building is a corner house, unpainted roughcast with slate curved close-eaved roof. Two-storeys with one-window range and door to Lower Row, one-window range on corner. The upper windows are boarded over, the lower ones have C20 12-pane glazing. Windows and C20 half-glazed door have plain raised surrounds. Thick stone sills to ground floor windows, thinner above. It is listed for it special interest as the best surviving example of the curved corner-houses of the industrial workers' terraces in Dowlais. [1] [2] Setting: The building is located on the east end of Lower Row at its junction with the road leading to Upper Row. The building is within a suburban setting of 19th century industrial workers housing, located approximately 150 m south of the existing A465 road. The building faces southward away from the existing A465. [3]

Description	Two 19th century aqueducts constructed of unmortared sandstone masonry are located approximately 15 m north of the existing A465, close to the perimeter fence of the Asda superstore (Dowlais Top). [1] The Grade II Listed aqueduct was built 1860 / 1865 on Dowlais Free Drainage System to carry watercourse to nearby reservoir over access way to common. The aqueduct is built of grey stone, with a segmental arch approximately 2.4 m high and 1.4 m span with stone voussoirs. Angled wing-walls and buttresses in stone with soffit in red brick. The parapets have been repaired with cement. The associated watercourse is 1 m wide lined with brick. The tunnel is approximately 4 m long, the north side being part buried in overburden in 1979. The building was listed for its special interest as part of the historically important Dowlais Free Drainage System. [2] [3] Setting: The industrial setting of the structure is dominated by the reservoir, the existing A465 approximately 20 m to the south and overshadowed by a large supermarket on an embankment above it to the north. [4]

Cadw Reference	N/A
HER Reference	286344, 286343, 286066
Condition	Good
Period	Post-Medieval
Value	Low
Description	Post 1829 workers housing comprised of two dwellings. Terraces of two storey, two-bay, workers housing with a mixture of retained Welsh slate roofs and replacement modern concrete tiles, chimneys largely demolished. The buildings are finished in smooth render or rough cast with painted brick detailing around the doors and windows. The original sash windows have generally been replaced unsympathetically with modern casements. [1] Setting: The rows are within a suburban setting of 19th century industrial workers housing approximately 80 m south of the Dowlais roundabout on the existing A465. [2]

Description	Course of the Brecon and Merthyr Railway, main line The first of these is the main line Merthyr and Brecon Railway. This has now been demolished, but its line is still partly visible above Dowlais Top, north of the existing A465, before heading south through Gelli Gaer Common. West of this is a branch line of the Merthyr and Brecon Railway that ran into the development corridor north of Pen-y-Wern, and ended at Dowlais. [1] [2] [3]

Value	Low
Description	A purpose built public house of three-bay, two and half storeys building with dormer windows to the attic it incorporates an adjacent two-bay, two-storey terrace house. The chimneys have been removed and the roof replaced in concrete tiles. The exterior is smooth rendered and there is a decorative door surround consisting of doric-style pilasters with an over-hanging coach light. The four front windows, one blocked, are large arch-headed 12 pane lower louvers with three pane upper louvers. The external signage survives with a large 'Tredegar Arms' sign applied in stucco to the front. [1] Setting: Structure is located at the end of a terraced row on High Street, Dowlais with oblique views towards the existing A465 to the northeast. [2]

Condition	Good
Period	Post-Medieval
Value	Negligible
Description	Former Dowlais Top railway station, now converted to residential use. Adjacent to the former line of the Brecon and Merthyr Railway, opened to Dowlais Top in 1863, and close to a junction with the former London and North Western Railway Dowlais Extension of 1873 is the former Dowlais Top Station. The two-storey station house is constructed of rusticated coursed masonry typical of 19th century railway architecture. The platform area to the west of the station house has now been landscaped and new housing built to the north. [1] Setting: The setting of the former railway station house is now dominated by the existing A465 road approximately 20 m to the south of it and has been eroded by a new supermarket to the west and new housing to the north. [2]

Specific Type	Pig pen
Designation	None
Cadw Reference	N/A
HER Reference	03210m
Condition	Damaged
Period	19th century
Value	Low
Description	The uncoursed stone masonry pig-pens appear to have originally belonged to a former farmstead between the river Nant-y-Bwlch and Tower road. The remnants of the farmstead survive as the lower courses of a masonry building on the bank of the Nant-y-Bwlch which pre-dates the modern two storey house. The pig pens and associated farmstead are not shown on the Ordnance Survey map of 1867 and therefore probably date from the late-19th century. [1] [2] [3] [4]

Condition	Near intact
Period	Post-Medieval
Value	Negligible
Description	A 1960's concrete viaduct across the Nant Hir reservoir. The viaduct carries the existing A465 road supported by two single-span elliptical arches with vertical struts similar to Asset 77. The bridge was designed by road engineers Rendel, Palmer & Tritton with Alex Gordon and Partners as consultant architects as part of the original A465 scheme in the 1960s. The bridge to cross Nant Hir Reservoir, required a self-supporting concept which could have no bridge supports in the water at any point, including during construction. The contractor had to devised a completely new method of construction: the arch was formed step-by-step outward from its two abutments. Temporary towers, like on a suspension bridge, supported a mobile shutter for pouring concrete. As each section set into place, the shutter was moved along and the next section poured, with the emerging structure supporting its own weight [1]. Setting: The bridge forms part of the existing A465 and carries the road of the located directly over the Nant Hir reservoir below which contributes to the significance of the bridge.

Historic Development	The historic landscape area of the A465 Heads of the Valleys Road comprises the existing east-west road link constructed in 1964. Important features include the three contemporary road bridges carrying the existing A465 Road over rivers and streams, one of which has been subsequently altered. Built by Rendel, Palmer and Tritton (Consultant architects Alex Gordon & Partners), of contrasting design in reinforced concrete, two with twin parabolic arched ribs and one of three spans cantilevered from two piers, these won civic awards in 1968. Historic Development	Hirwaun has an industrial background centering on the Hirwaun Ironworks. After the ironworks closed, coal mining continued, and was a major employer until the second half of the 20th century. Several areas of the modern settlement retain 19th century industrial workers houses, with some further housing and light industrial development into the 20th century. [1]

Historic Development	The coal and ironstone workings of the area mainly owe their existence to the resurgence in the iron industry seen during the latter half of the 18th century, a direct result of the technical innovation that enabled coke to be used in iron smelting. The area is directly associated with the ironworks at Cyfarthfa, built 1765 by Anthony Bacon and expanded under Richard Crawshay, who leased Cyfarthfa in 1786. The early extraction industry largely depended on surface workings using a mixture of patching (a process which scours the land of its topsoil), small pits, and levels driven into the hillsides, the latter make up the majority extractive features of the area with particular concentrations to the west of Winch Fawr, the Upper Black Pins Levels and north of Blaen-canaid. The real boom years in the industry, however, occurred during the 1820s and 1830s and it was during this period that the deep pits, such as Cwm-du Pit, Cornel Waun Pit and Winch Fawr Pit were sunk in the area. The main means of haulage within the shafts was the water balance system, which depended on a plentiful and constant supply of water (Thomas 1981, 306-308); several of the reservoirs in the study area are likely to be relict features associated with this system. The extraction of ironstone and coal in particular continued throughout the 19th century, fluctuating with economic demand. By the end of 19th century the area's levels were largely disused, the mines of the area appear to have continued until the 1920s with been a brief period of renewed mining activity during the Second World War. [1]

Historic Development	The historic landscape area of Coed Meurig comprises an area of agricultural enclosure and ancient and environmentally sensitive deciduous woodland in the area to north of the existing A465 and Gellideg. The area contains post-medieval farms with farm buildings, including Coed Meurig, Tai Mawr, Tai Mawr-uchaf, Pen-Rhiw, Cwmffrwd, Ty'n Coedcae and Cwm-Waun-newydd, the latter two lying just west of the historic landscape boundary. These are associated with a landscape of by drystone walled enclosures and sheep pens. The area was part of the Dynevor Estate during the 19th century, leased to various tenant farmers. Progressive encroachment on waste during the early post-medieval period is suggested by nature of enclosure (intakes of rough grazing), and supported by place-name evidence, ie Ty'n Coedcae and Cwm Waun-newydd; the latter are later additions, which having been enclosed were later settled separately from the original holding, possibly through permanent occupation of earlier temporary structures. The earlier holdings were Coed Meyric (Coed Meurig), Tai Mawr, Tai Mawr-uchaf, Pen-rhiw and Cwmffrwd; all of which were well-established permanent settlements by the 18th century and appear on Yates' map of 1799. All the holdings of the area were extant by 1814, detailed by later maps (1826-1850; and all three editions of the 6-inch Ordnance Survey maps (1875-1915). Though there has been some minor industrial incursion, this typically was in the form of tips extending from workings to the south of the Swansea Road A4102 (HLCA 063). These tips were being created during the first quarter of the 19th century and are first detailed on a map of 1826. The 1st edition 1875 OS 6-inch map of the area depicts the full extent of the industrial encroachment in the area. [1]
Historic Development References	[1] Ggat.org.uk. (2017). Merthyr Tydfil Main. [online] Available at: http://www.ggat.org.uk/cadw/historic_landscape/Merthyr%20Tydfil/English/Merthyr_Main.htm [Accessed 11 Jan. 2017].

Historic Development	The historic landscape area of Clwyd-y-Fagwyr, Gellideg and Pen-Llwyn-Deri comprises as a settlement dominated by 20th century council estates, but which initially developed as small and discrete clusters of cottages and small rows centred at Clwyd-y-Fagwyr and Pen-llwyn-deri, with further isolated properties extending to Gellideg. The settlement, built on land of the Dynevor Estate, was probably initially agricultural, but later became associated with coal and iron ore mining. The original agricultural settlement dated to the 18th century and maps of 1814, 1826, and, in particular, the first edition 6-inch Ordnance Survey map of 1875 chart its later expansion. The settlement comprises isolated industrial rows, now dominated by large regular planned estates of council and suburban housing (mid-late 20th century), including bungalows, and further recent extension carried out during the late 20th/early 21st century with executive housing developments (such as Castle Park). Early industrial housing survives at Gellideg (15-21 Grade II Listed) also 23-28 and bake house, and at Clwyd-y-Fagwyr, which included a former brew house, the Harp Inn, while the area also contains characteristic non-conformist chapels (Clwyd-y-Fagwyr Methodist and Nant-gau Independent). Interspersed around the original isolated rows were workings and tips associated with the Cyfarthfa Mines; an industrial landscape, principally of levels, such as William Morgan's Level, R Morgan's Level, Baynon's Level, and spoil tips including finger tips, together with associated industrial water management features (ie water balance ponds and reservoirs). The area also functioned as a tramroad corridor with a complex and extensive network of tramroads connecting the area's levels and pits to the ironworks at Cyfarthfa (eg the Mynydd Aberdare - Cyfarthfa Tramroad, and the Cyfarthfa - Clwyd-y-Fagwyr Tramway). The extensive network of tramroads was begun during the late 18th century, the development of which is charted by maps of 1814, 1826, and in particular the 1st edition 6-inch Ordnance Survey map of 1875. [1]

Historic Development	The historic landscape area of Cyfarthfa Iron Works and associated features is the site of the ironworks founded in 1765 by Anthony Bacon, a native of Cumberland, and his partner William Brownrigg. The works initially operated a single furnace and concentrated on the production of pig iron. Following Bacon's retirement in 1783, Richard Crawshay gained control of the Cyfarthfa Works. Thereafter the works remained in the Crawshay family, passing from Richard Crawshay, who died in 1810 to William Crawshay I, who directed operation from his London office, while the day to day management, including the great expansion of the works fell to William Crawshay II, and was responsible for the building of Cyfarthfa Castle in 1825 (see HLCA 013). The works at Cyfarthfa was the first in the area to change to the production of bar iron, which ultimately lead to Cyfarthfa becoming the largest Ironworks in the world by 1806. Instrumental in adopting Cort's puddling process soon after it was patented in 1784 were William Crawshay in partnership with George Watkin, foundry manager, perhaps most notable for his involvement in the design of several of the area's early cast-iron bridges, including the surviving Pont-y-Cafnau. Cyfarthfa was forced to buy in supplies of pig iron from both Dowlais and Plymouth for refining to maintain its production of bar iron. The layout of the works at the time is detailed in a view drawn in approximately 1800 by William Pamplin; this shows four furnaces and associated charging houses and casting sheds used in the production of pig iron, and the 48 ft diameter waterwheel which powered the bellow's. Immediately to the north is a large building with numerous chimneys housed the puddling furnaces and rolling mills. The early 19th century layout of the works and its associated features appears on Ordnance Survey maps and surveyors drawings of the period. Also detailed are tramroads leading to the Glamorganshire Canal. The works benefited from the upsurge in railway construction during the 1830s and 1840s, and in 1833 a new mill was built as a result, however shrinking export markets, among other difficulties were to effect the second half of the 19th century. Robert Thompson Crawshay could see no future in the iron industry by 1864 and only with great reluctance renegotiated the

Cyfarthfa lease. Though production reached a peak in 1871, the period was marked by boom-bust and labour relations problems. One strike in particular begun in April 1874 over wage reductions lasted over a year, while the furnaces remained out of blast until 1879 and death of Robert Thompson Crawshay.

The ironworks was shown in detail on the Ordnance Survey maps of 1875 and 1878 located either side of the Afon Taf connected by two tramroad bridges, in addition to Pont-y-Cafnau. Notable features extant at the time, apart from the blast furnaces, were casting sheds, a smithy, and a coke yard (similar to that illustrated by Pamplin in 1800) with extensive coke ovens to the rear of the charging bank and the Tai-mawr leat to the northwest of the works.

The conversion to steel began shortly afterwards with the construction of four new iron clad furnaces, and steel production started in 1884 under Robert Thompson Crawshay's three sons, trading under the name of Crawshay Brothers (Cyfarthfa) Ltd. Cylindrical iron clad furnaces were erected before the former ironworks blast furnaces. An important feature of the period was the linear slag tip leading northwest along the west bank of the Taf Fawr dating to approximately 1884. Other changes included a new range of coke ovens with alterations to the configuration of the coke yard. In 1902, an ailing Cyfarthfa works was acquired by GKN. In spite of additional investment, the works proved unprofitable and production ceased in 1910, with a brief reprieve during the First World War.

The associated Cinder Tips Area to the south was part of the Dynevor Estate leased to the Crawshays. It was depicted in its early stages during the first quarter of the 19th century, linked to the ironworks by tramroad, part of a more extensive transport network also characteristic of adjacent areas, HLCAs 066, 069 and 070). Over the intervening period the area was extensively tipped over: the cinder tip eventually extending as far as Georgetown, and in the process of being extended south to Cwm Pant Bach. A separate area of cinder tips was also located to the south of Cwm Pant Bach, just north of Ynysfach Ironworks. Small allotments characterised the fringes of the area, while an engine house was located just north of the Cinder Tips Area. By 1905 though the Cinder Tips remained largely unchanged; the engine house was now disused, while the tip area to the north of the Ynysfach ironworks appeared to be largely covered by small, regular allotments.

An old ironstone level (Ynysfach Pit) was located in the same general area. By 1919, the allotments to the west side of Llwyn Celyn Lane have been tipped over.

The area to the northeast of the ironworks and Pont-y-Cafnau contains the Gurnos Limestone Quarry, associated scheduled Tramroad and limekiln, near Pont-y-Cefn, and the scheduled Cyfarthfa Feeder Canal. The need for both water and limestone at the Cyfarthfa Ironworks necessitated the construction of a combined packhorse or plateway bridge and aqueduct, Pont-y-Cafnau, during the 1770s this would have been of wood; sketches by JMW Turner in 1797 depict the elevated wooden aqueduct, which formerly fed a great water wheel known to have been in use from 1796. A lease of 1771 secured the right to quarry limestone from the Gurnos Quarry

	and the Gurnos Tramroad had been built by 1792-3. The present Pont-y-Cafnau Iron Bridge, depicted in a painting of approximately 1819 / 20 by Penry Williams, is thought to date from this period, or shortly after, approximately 1793. The layout of the features of the area is detailed by 1875 Ordnance Survey map which also depicted the Cyfarthfa Feeder Canal and the leat approaching from a weir (possibly that built in 1766-77) on the Taf Fechan to the north via Pont-y-Cafnau. [1]

Historic Development	A major effect on the character of the area was the introduction into the northern part area for burial following the establishment of the Cefn Cemetery in 1858; proposals of 1857 authorised the laying out of the ground, and erection of chapels, lodge and boundary wall. The main cemetery between Brecon Road and the Taf was depicted in 1890 with a chapel and lodge. By 1919, the cemetery had expanded to take in an area to the westside of the Taf, linked by bridge. In 1860, the Jewish Community purchased land for a Jewish Burial Ground, to the east side of Brecon Road: the first burial was in 1870; burials had previously taken place in Swansea. The Jewish Burial Ground with its small mortuary chapel doubled in size between 1890 and 1918, an indication of the size of the Jewish Community at the time. The area formed the corridor of the construction railway for Llwyn-Onn Reservoir, built between 1914 and 1927. [1]

Historic Development	The historic landscape area of Cefncoed-y-cymmer has retained its distinct identity despite the spread of 20th century building around it. Compared to many of the settlements in Merthyr Tydfil, Cefn-coed-y-cymmer has survived with much of its 19th century character intact; this is primarily due to it being until recently outside the borough. Early 19th century documentary evidence indicates that Cefn-coed-y-cymmer originated as a squatter settlement. Theopholus Jones noted in 1809: "The village, raised in consequence of the neighbouring iron works at Merthyr is built upon the waste and houses are seen starting up without the slightest attention to regularity or arrangement, the convenience of each other or the preservation of health" (cited in Bowen 1992, 15). Thus it reflects a stage where the ironmasters had yet to assume control of all aspects of their workforce's lives. The irregular street pattern reflects this unplanned growth, although many of the buildings are of mid-late 19th century date. The expansion of population led to the construction of a chapel-of-ease in 1833, replacing a ruined medieval chapel (Bowen 1992, 243). The area contains the remains of the British Midland and London and North Western Railway Joint Line, which is carried over the Taf Fechan by the impressive Cefn-coed-y-cymmer Viaduct by Savin and Ward 1866 (Grade II Listed). By 1894, Clarke noted that Cefn-coed-y-cymmer was "situated two miles from Merthyr, and contains about 2,500 inhabitants" (1894, 35). By this time, the settlement had extended to the north along Upper High Street (north of the A465). There was a public tramway along the High Street in the early 20th century. Intermixed with the housing the settlement retained transport links to the ironworks, mines and quarries, the most notable survival of which is the railway viaduct. [1]

Historic Development	Cefn Coed cemetery is the oldest and largest general public cemetery in Merthyr Tydfil. Apart from the loss of the chapel of rest it survives in its entirety, with its original layout. Some of the graves are of great historic interest, reflecting a wide range of occupations & wealth. Historical events, such as pit disasters, are also commemorated. A few memorials are of value for their sculptural and monumental qualities and include the work of the well-known Victorian sculptor Joseph Edwards. [1] [2] Merthyr Tydfil occupies a natural basin at the head of the Taf valley. High hills and ridges reach 450m above OD on all sides, with development constrained to the basin floor and smaller tributary valleys of the Taf, which itself provides the only natural route out of the basin to the south east. However, it is not topography alone that has shaped the town, but the mineral resources contained within its hinterland. It was probably the largest iron-making town in the world in the early to mid-1900s, with an output calculated to be a quarter of that of the entire United States of America. The town, and its associated landscape, was rapidly transformed from a modest village in the 1750s to the largest town in Wales by 1801. Despite extensive recent land reclamation and the sanitisation of the surrounding waste tips, overall Merthyr still retains its industrial landscape character as the most significant Welsh town of the Industrial Revolution. The town and its environs remain a potent example of an internationally renowned industrial landscape of the 18th and 19th centuries and a permanent reminder of man's exploitation of the landscape. The primarily late 18th to 19th centuries landscape comprises numerous relict elements and foci set within the present landscape. These individual elements consist of the remains of large ironworks, remnants of the associated coal mining industry, water power eats, an early iron bridge, communication systems, including early tramroads, tips, terraced industrial housing, and the ironmasters house, Cyfarthfa Castle. Merthyr Tydfil, however, retains not only its economic significance, but also its importance as a religious, literary and political centre. The area identified here contains many and diverse elements, which include Merthyr's Dowlais Ironworks, established in 1759, and probably the first such works to use coke in South Wales. It was followed by the foundation of other ironworks such as Plymouth in 1763, Cyfarthfa in 1765

	and Penydarren in 1784. Other subsidiary works were created in the early 19th century at Ynysfach by Cyfarthfa, Ivor by Dowlais, Dyffryn by Plymouth, with further forges at Pentrebach, a part of Plymouth. Surviving remains include the renowned furnace bank at the Cyfarthfa Ironworks, where six out of its seven late 18th century blast-furnaces, and its ranges of calcining kilns, survive substantially intact. At the Dowlais Ironworks the remains include the great stables and the blast-engine house, which have been restored. The remains of the Ynysfach Ironworks consist of one blast engine house and four early 19th century furnaces. The engine house is also restored and acts as a museum of the iron industry. Locally, early communication systems survive, though to varying degrees. Adjoining the Cyfarthfa Ironworks lies the Pontycafnau bridge built in 1793, and the first ever iron railway bridge to be built. The bridge has added significance in that it had a combined use as an aqueduct. The Gurnos tramroad which used the Pontycafnau bridge carried limestone from the Gurnos quarries and exists today as a scenic footpath retaining its stone sleeper blocks. The remains of limekilns and fulling mills survive on either side of the route. Elsewhere, the line of the Penydarren tramroad, built in 1802 to carry iron by horse-drawn tram, survives and is also historically significant as the route of the first steam-hauled railway journey by Richard Trevithick's 1804 locomotive. The tramroad also includes a tunnel constructed under the Plymouth Ironworks. Short sections of the famous Glamorganshire Canal, built in the 1790s, also survive as important landscape features, including a restored section in front of Chapel Row. This is crossed by the relocated Rhydycar bridge which is an early iron girder bridge dating from the 1790s. Chapel Row itself was built by the Cyfarthfa Iron Company as workers' houses, one of which is restored, both as an example of a period ironworker's cottage and also as the birthplace of the renowned composer Dr Joseph Parry. In a sharp distinction which reflects the other social extreme of the Merthyr ironmasters' activities, Cyfarthfa Castle, overlooking the Cyfarthfa Ironworks, was the largest and grandest ironmaster's house in Merthyr Tydfil, and amongst the most notable surviving industrialist's house in Wales. The house is situated in 64 ha of grounds, which were landscaped by the Crawshay family to include woodlands and a lake. This grand house and its parkland setting also provide an interesting and important contrast to the other relict landscape features of Merthyr.[3]

Historic Development	The historic landscape area of Gurnos Farm and Bunker's Hill comprises the surviving post-medieval agricultural landscape north of the Heads of the Valleys Road. The area was largely associated with William Crawshay; it included the eastern part of the Cyfarthfa Estate (Glanmol-goch tithe map of 1850, Llwyn-moelgoch OS 6-inch 1875 (later Dan-y-Castell Farm), and the holding of Gurnos, centred on its 'model' farm' owned by David Edwards leased to William Crawshay in 1850. The southeastern corner of the area comprises the surviving portion of Gain, formerly part of the Estate of Robert Henry Clive, the Earl of Plymouth, leased to the Penydarren Iron Company. The industrial agricultural landscape of large regular enclosures and stands of trees associated with the 'model' farm of the area was in place by 1826; cartographic evidence indicates that the area's field and track layout underwent drastic remodelling between 1814 and 1826. This included the removal of the former settlement of Pantton; the element 'Pen ton' retained in the field names of the area is a reference to it, while relict drystone enclosures in the area are surviving elements associated with the earlier agricultural landscape. The Morlais Castle Quarries Tramroad of 1803 crosses the area on its route to the Penydarren and Plymouth ironworks. [1]

Historic Development	The historic landscape area of Gurnos and Galon Uchaf comprises housing estates of local authority housing created during the early 1960s. The area displays an attempt to integrate commercial facilities at the core of the settlement. The estates at Gurnos are laid out in a variety of differing patterns centred on the Prince Charles Hospital. A unifying feature are the street names, which follow a common theme of plants and trees, such as Acacia Avenue, Sycamore Road, Chestnut Way and Honeysuckle Close. Additional distinctive features of the area are large schools, which with playing fields and allotments preserve to an extent the former open nature of the area, this is particularly evident at the south of the area. The area included the former holding of Gwaunferran Farm (the Dairy on the 1850 tithe map). The Penydarren Iron Company owned, or leased most of the area for agricultural purposes. Apart from agricultural land, the area contained leats and reservoirs such as those which formerly connected Goitre Pond (now infilled) to Penydarren, and which formed a part of a water management system supplying the needs of the Penydarren Ironworks. These features were extant by 1826, shown on the tithe map of 1850 and elaborated by 1875, the lower reservoir at Gwaelod-y-garth in use as a swimming pool by 1915. In 1858, the Penybryn filterbeds and storage tanks were constructed by the Merthyr Tydfil Corporation to supply domestic water to Merthyr and Penydarren piped from the Taf Fechan at a point near Dolygaer; this was in operation by 1861. Supply to Dowlais and Pant was via a service reservoir at Dowlais Top to which water was pumped by steam engine until 1884. The small road/tramroad junction settlement of Gwaelod-y-garth, the early development of which is charted by maps of 1814, 1826, and 1850, lies at the southwest corner of the area . Though the settlement has been almost submerged by the expansion of Penydarren Park, isolated rows of industrial housing (extant in 1875), still survive. Prince Charles Hospital (built in 1965-75 by Sir Percy Thomas and Partners, with additions of 1989-91) comprises a formal modem structure of two parallel five-storey ranges with service towers linked by a series of cross ranges.

	Prior to the construction of the housing estates the area was characterised by a mixed regular and irregular field pattern of generally large improved enclosures of late 18th / early 19th century date. The area contained the holdings of Galon Uchaf, Penygarn (kennels), Gain, Goitre, parts of Gellifaelog, Bonymaen and Gymos (Gurnos), only the latter farmstead survives just north of the A465. The use as the area as a transport corridor from the Roman period, and especially during the 19th century (eg the limestone tramway to Penydarren Iron Works from Morlais Castle Quarries) has had some influence on the present road system. The current main arterial routes of the area are essentially those established before the end of the 19th century. [2]

Historic Development	The historic landscape area of Bon-y-Maen included a rectangular range of buildings, the post-medieval farmstead, on the southern edge of a very large sub-circular enclosure of unknown date to the north of Cwm Rhyd-y-Bedd. The northwest boundary of the area is formed by the Bryniau Road to Pant, while along the northeast is Heol Rhyd-y-Bedd, which formerly carried the line of the tramroad from Bryniau Quarry to the Dowlais Ivor Ironworks, shown on maps between 1878 / 9 and 1915. The entire area was radically changed during the 1930s when ICI established a works in the area, in operation by 1939. The construction of the Heads of the Valleys Road during the mid-1960s opened up the area to renewed commercial and industrial possibilities and in response the site of the old works area was developed as the Merthyr Tydfil Industrial Estate by the Borough in 1966. The current features of the area comprise mixed industrial and commercial units and a sports ground. [2]

Historic Development	The historic landscape area of Bryniau Quarries comprises an area of poorly drained rough grazing, part of the Castle Farm holding of the Plymouth Estate, leased to the Dowlais Iron Company during the 19th century. The area, depicted as wooded (scrub) on maps between 1766-1875, was being quarried by 1875. At this date a small quarry within the Bryniau enclosure was being worked connected by tramroad to the Dowlais area and the Ivor Iron Works, in particular. The quarry with its associated tram network had expanded considerably by 1915. Other features of the 19th century (and earlier) were tracks leading to Castle Farm. [1]

Historic Development	The historic landscape area of Dowlais comprised the settlement associated with the Dowlais and later Ivor Works. The settlement developed on the holdings Wern-Llwyn Isaf and Uchaf farms during the latter half of the 18th century. Estate maps of the area (Dowlais Iron Company 1784-1806) provide useful background to the area's early development. The initial settlement comprised a loosely dispersed scatter of cottages, mainly along the road to the Dowlais Iron Works furnaces and in the area immediately north of the furnaces, with a core cluster at the junction of the road from Upper Garth with Nantmorlais (the Cae-Harris area). By 1814, the settlement was characterised as a linear ribbon development along the road west of Pontgellifaelog to the junction with the lane from Pant, where there was a small nucleus of settlement adjacent to the furnaces, in the area south of the later Dowlais stables. The characteristic grid system imposed on the settlement was partly in place by the 1820s, with the area to the south of Union Street complete, including a church and the Dowlais stables (1820; site of the first educational facility for workers in Merthyr, established by Josiah John Guest in 1828). Gwern Llwyn Uchaf Farm remained, separated by agricultural land, to the east of the settlement. There was also a scatter of cottages in the area of Morgan Sweet during the period. Between 1832 and 1850 the settlement at Dowlais underwent major expansion; by the latter date Dowlais comprised linear ribbon development to the south of High Street, while the original core had been extended to include Cae Canol Street. Ribbon development now extended east beyond the junction with Pant Road. The southern area of Dowlais, all Dowlais Iron Company land, had already been laid out in grid fashion. By 1850, this area extended north of High Street as far as Upper Elizabeth Street and the southern end of Victoria Street, extending as far as the later station area and the road to Pant. The area included the north side of Ivor Street, where a barracks was located (later replaced by Barrack Row), and Lower and Upper Row. The northwestern area of Dowlais, adjacent to Cwm-Rhyd-y-Bedd belonged to a number of minor landowners and developed slightly different characteristics: notably in its layout. The latter was typified by a

	scatter of short rows and individual cottages and included the area between Pant Road and the Ivor Iron Works (HLCA 029), Llewellyn Street; Winifred Street and a row to the west of the later Balaclava Road in the area of Pen Cae Eira. The OS 6-inch and 25-inch First Edition maps (1875 and 1878) provide further detail such as the Dowlais Ironworks stables, Market House, Dowlais Iron Company schools, the Guest Reading Room, Hebron chapel, Dowlais House Lodge, hospital, and Beulah chapel. The area from Victoria Street and Elizabeth Steet as far north as Francis Street, ie north western Dowlais, had developed in a more tightly-packed fashion with a less regular grid street pattern, perhaps indicating different house provision to the south part of Dowlais where the Influence of the Iron Company on town-planning was clear. Dowlais was largely complete by 1878, though there was some minor additional development during the period up to 1919, such as Alfonso Terrace and Moulson, Rees and Jones Street. [1]

Historic Development	The historic landscape area of Pantcadifor, Rhyd-y-bedd and Caeracca originated as a small roadside quarrymen's settlement. By the 1870s, the settlement had grown to the north and south eventually merging with Dowlais. The original settlement at Pant appears in 1799 as a small settlement at the junction of the Penydarren and Dowlais roads to Brecon, nucleated around the Pant-Cad-Ivor Inn (c 1740), with minor development along the road south to Nant Morlais (Dingle) and Dowlais, including the farms of Cae'r-acca and Cwm Rhyd-y-bedd. By 1814 a small settlement was in place at Pantysgallog, including Pantysgallog House, just to the south of the original settlement at Pantcadifor, while to the west was a row of cottages (Tair Efail on the 1850 Tithe Map). The settlement remained static during the period up to 1850, apart from a major shift in the alignment of Pant Road to the south, and the establishment in 1849 of the prominent cemetery for victims of the second cholera epidemic to hit Merthyr (the first being in 1832). Pant Cemetery with its two mortuary chapels, one nonconformist, one Church of England, was located on land formerly part of Castle Farm. The Dowlais Fever Hospital located slightly to the south of Pantysgallog had been constructed in 1869 for the Merthyr Board of Health, built of wood, this 32 bed hospital was occupied on a temporary basis during epidemics. Just northeast of Pant Road was the Dowlais Branch of the Brecon & Merthyr Railway, built in 1864/65, with a signal box. The settlement developed in ribbon fashion with roadside developments of industrial workers' rows constructed at Pantysgallog and at Pant-Cerddinen to the south of Bryniau Quarry by 1875. Forty years later, the settlement had grown to include King and Queen Streets in the area between Pant Road and the Merthyr Extension of the LNWR (c 1868). Additional terraces had been constructed on the west side of Pant Road (New Houses), while a new area had been established to the east of the Brecon & Merthyr Railway including Caracas Terrace, and the grid layout of Edward and Gwladys Streets. By this date the settlement, served by a halt on the BM Railway and a station on the LNWR, also boasted schools, a post office, and a church, Christ Church, a laundry. [1]

Historic Development	The historic landscape area of the Ivor Iron Works Area comprises the site of the works, which opened in 1839 as an extension of the Dowlais Iron Works, initially with four blast furnaces. A single redbrick built building, post-1915 in date, survives from the pre-British Steel era. During the second half of the 20th century the site of the Ivor Works was given over to a foundry operated by British Steel. The closure of the foundry in 1987 ended Merthyr's association with the iron industry; an association which had lasted more than 200 years. [1]

Historic Development	The historic landscape area of Pengarnddu comprises an area of semi-improved land bordered at the north and east by the Rhymney Limestone Railway of c 1864. The latter served the Twynau-gwynion quarries, connecting the quarries with the Guest's Ironworks at Rhymney and was connected to the ironworks by the Rhymney Mineral (Limestone) Railway in c 1864. The Twynau Gwynion Tramroad of 1805 to Dowlais Ironworks passed through the area; a Tramroad bridge of 1805/15 survived until 1984. The area also contains the remains of the Brecon & Merthyr (Newport Branch) Railway, dating from between 1860 and 1865. Interesting water management features dating from the 19th century, also survive in the area, part of the extensive 'Dowlais Free Drainage System': these remains are primarily Lower (Fish Pond) and Upper Reservoirs (New Pond) with associated leats (with brick and masonry lining) and aqueducts (masonry), and a 19th century red-brick pumping station, below Upper Reservoir. Lower Reservoir was built before 1850, while Upper reservoir dates to between 1850 and 1875. The area largely formed part of the Bute Estate during the l850s and included the farm of Blaen-Morlais. The area contains the small industrial settlement of Pengarnddu, extant in 1814. By 1875, this comprised two isolated rows, one associated with yards, to either side of the existing farmstead, and a school to the south-west. By 1915, the settlement boasted a church, St Michaels south of the school and a public house, among other features. By the 1960s the settlement had been abandoned, the farmstead and one cottage remaining. [1]

Historic Development	The historic landscape area of Dowlais Top comprises former industrial landscapes associated with the Dowlais Ironworks. The area to the north contained extensive workings, extant in 1814 and 1826 and connected to Dowlais and Dowlais Top by haulage or tramroad. These workings, depicted on later maps as quarries with numerous linear and lobed tips, were the remains of early surface or patch workings, and levels probably worked from the adjacent settlement of Penygarnddu and Dowlais Top. The workings, like those to the south would have been largely redundant by the 1860s, confirmed by the apparent lack of associated railed tramroads depicted on the 1875 Ordnance Survey 6-inch maps. Rail and tramroad routes passed through the area: that of the Twynau Gwynion Tramroad ('Tramway' in documentary evidence) of 1805 to Dowlais Ironworks, later the Rhymney Limestone Railway of c 1864, and the B&M (Newport Branch) Railway c 1860-1865, opened 1863. The latter had a station at Dowlais Top, detailed on the 1st, 2nd and 3rd edition 6-inch Ordnance Survey maps (1875-1915). This survives to the present-day. A kiln was depicted in the area adjacent to the Twynau Gwynion Tramway in 1826, apparently still extant in 1875 as a limekiln adjacent to the Rhymney Limestone Railway. Leats associated with the Dowlais Free Drainage system (see neighbouring 5) also once existed in the area. The area to the south comprises an open area of reclaimed industrial land to the south of Dowlais Top primarily a former rail corridor associated with Dowlais Iron Company Railway, which formerly contained lines and sidings in area north east of the charging bank and blast furnaces of Dowlais Ironworks. The lines served both the Dowlais and Ivor Works and connected tips, and the Dowlais coke yard. The present character of the area is that of a recreational landscape with sports facilities, football fields and until recently, a commercial presence, provided by the site of a demolished McDonalds Restaurant, one of the earliest in the area. [1]

Historic Development	The historic landscape area of Dowlais Great Tip, Trecatti, Trehir and Twyn-y-Waun comprises an extensive area of reclaimed industrial land, part of which has been subjected to opencast operations. The area encompasses the sites of Longtown (Trehir), Trecatti and Twyn-y-waun, the latter being the former site of a medieval market mentioned in numerous documentary sources. The area formed part of the extensive coal and ironstone workings associated with Dowlais Ironworks. The workings of the area spanned from the latter half of the 18th century, through the hay days of iron production associated with railway construction during the 1840s, and the conversion of Dowlais to steel production during the 1860s. With conversion to steel production the area's mineral workings declined, being all but abandoned by the early 1870s; a result of coal and iron ore imports from northern Spain, the local ore, rich in phosphorous and sulphur being unsuitable for steel production. By 1879, most if not all the pits and levels within the area, were probably already defunct. [1]

Historic Development	The historic landscape area of Dowlais Iron Works Area encompasses site of the ironworks founded in 1759 by a partnership headed by Isaac Wilkinson, an ironmaster from Bersham, Clwyd. The change over to the production of bar as opposed to pig iron was comparatively late at Dowlais. The lack of success in applying Peter Onions' puddling process dissuaded all but John Guest from investing in the technology during the 1780s and Dowlais continued to supply pig iron to Penydarren and Cyfarthfa. The Dowlais works was the first in Merthyr Tydfil to install Steam blowing engines, replacing waterwheel-powered bellows in 1798. The Works at Dowlais was to become strongly associated with the Guest family; first John Guest, then his son, Thomas Guest (1787) and in turn by his son, Josiah John Guest (1807), a liberal who advocated free trade and Merthyr's first MP, following the 1832 Reform Act. It was a result of the latter's vision and business acumen that Dowlais became the largest ironworks in the world. The rails for the Stockton and Darlington Railway were produced at the Dowlais works in 1821 heralding the rewards to come of the railway boom years of the 1830s and 1840s. Technological advances such as the adoption of the 'hot blast technique', patented in 1828, which substantially reduced the amount of coke required for smelting, enabled Dowlais to maintain its competitive edge. Further mills were constructed to produce rails: the Big Mill in 1830, supplemented by the Little Mill in 1840. William Menelaus was appointed general manager in 1856 and soon after the Dowlais works began experimenting with a new process developed by Henry Bessemer. Menelaus was to oversee the conversion to steel production, which began in a limited fashion in 1865. The local ironstone was unsuitable for the production of steel, due to its high phosphorous content and by the 1870s ironstone mining had ceased altogether in the Merthyr area. Based on imports, chiefly from Spain, steel production would ultimately transfer to coastal sites, such as the new steelworks built by the Dowlais Company at East Moors in Cardiff in 1891. In 1905, under GKN a new blast Furnace complex, which included two American designed 'Yankee' furnaces and a new mill was added. However, after a period of prolonged decline, in 1930 the production of steel at Dowlais finally came to an end.

	The early development of the works can be charted from cartographic sources, including estate maps and early Ordnance Survey maps and surveyor's drawings, the Tithe map of 1850 and unpublished map of 1851, among others. The extent of the ironworks development is well demonstrated by the 1878 6-inch Ordnance Survey map, which in part reflects the conversion of the works to steel production in the years after 1865. Numerous features were recorded within the area including charging bank, furnaces and brick kilns among other industrial features southeast of Dowlais House. Other features shown are engine houses, levels, a brickworks, the reservoir to the south of Dowlais House, Cae-Harris Pond, adjacent cottages on Pond Street (now demolished), the Dowlais Railway and numerous railway sidings and tramroads. GGAT Mill, Coed Cae pond, and an adjacent row of cottages (demolished by 1905) were located to the south the area. Significant changes occurred in 1905 when the plant was remodelled under GKN: additional reservoirs and extensive coke ovens were built in the area to the north of the brickworks, which itself had been extended. The Goat Mill was enlarged and Cae-Harris station had been constructed; this included a goods shed, an engine shed and cattle pens. Further alterations indicated by 1919 were primarily in the area to the southeast of Dowlais House and the blast engine house (now Grade II Listed), and included additions to the furnaces. [1]

Value	High
Historic Development	The historic landscape area of Ffos-y-fran comprises an important industrial extractive landscape; the area is dominated by coal and ironstone workings along the western outcrop of Merthyr Common, associated with the Dowlais and Penydarren Ironworks. It should be emphasised that while most of the surface remains in the area are 19th century coal and ironstone outcrop workings associated with the main period of operation of the Dowlais, and the Penydarren works (the latter closed c 1859), outcrop workings in the area span most of the century. These start in the late 18th century and end with some residual activity in the early 20th . Today's landscape is essentially the product of a succession of 19th century extraction phases (including re-working of earlier areas). The accessibility of the outcrop, particularly the reserves of ironstone make it likely that some mining activity occurred during late 18th to early 19th century. The initial stage of working would have been by quarrying or patch working, in addition to small levels and pits. These activities have produced a scarped face almost 1 km in length, curving around the crest of the north-north-west facing slopes to the north of Ffos-y-fran, possibly on the line of an existing erosion bench (the area has been subject to some reworking in later periods). Further patch working or open ore quarrying. some 9.5 ha in extent, in conjunction with surviving areas of crown pit type workings, continues south to the iron ore miners' settlement. Overburden removal for the patch working may have been cleared by a process known as scouring although surviving evidence in the area is now inconclusive. Scouring on the coalfield, though well documented in the 18th century, seems not to have continued much beyond the early 19th century. The Dowlais Free Drainage System, an ingenious system of reservoirs and leats, fed by gravity, and which formerly provided water to the Dowlais Ironworks and the water balance systems of its associated workings, was also a feature of the area (though the largest concentration of surviving features are now found in the adjacent area. The system, which in part dates to c 1818, was crucial to the expansion of the ironworks at Dowlais and indeed Penydarren. It supplied water to the coal mines and ironworks of Dowlais via an extensive above-ground network of leats and reservoirs and underground U-shaped channels, built to the 'Dowlais pattern' within various levels, such as the Brew House Level, and Buxton's or the Purple

Level. The system acted to drain a variety of coal seams including the Lower Four Feet seams of the Cwmbargoed, Trecatty and Trehir area and the Upper, and Lower Four Feet, Big Coal, Red, Blue and Spotted Vein in the Pantywaun, Rhaslas, and South Tunnel areas. It eventually drained into a water pit at Tyle Dowlais Pit, from where water could either be pumped back to the surface system or allowed to drain to the charging levels of the Penydarren furnaces (Owen 1977, 67-8).

Considerable expansion of level and shaft activity was the main feature of the mid 19th century (1820s to 1880s) outcrop working in the area and entirely replaced the older methods of shallow surface workings, as accessible sections of the outcrop became exhausted. Despite the Dowlais Iron Company having sunk 19 pits between 1837 and 1857, levels continued to provide the main means of coal and ironstone extraction in the area up to 1850, and accounted for 75 per cent of coal out put from the Dowlais workings. After this date, however, extraction of ironstone and coal appears to have concentrated on a number of pits (shafts) set on the lower slopes immediately to the west of this area. These included the Dowlais Pits 1, 2, 4, 6, and 7, the Pen-y-waun Fawr Pits and the Tyle Dowlais Pit, the latter two at the extreme northwest corner of the application area. Further reworking of the area along the crest of the west-facing outcrop with at least two additional levels driven into the worked face during the period was evident as was a series of levels driven along the base of the slope at the western boundary of the area.

The area contains extensive versions of 'finger' or 'fan-tips' frequently associated with shaft, as opposed to level workings, and generally restricted to the lower western outcrop, above the area of the now removed Great Dowlais Tip. Examples of these dominant and highly visual features include those associated with No.1 Pit, No. 2 Pit, No. 4 Pit, and No. 6 Pit, Dowlais. While many of the levels and pits were still named in the 1873 and 1879 Ordnance Surveys, the vast majority appear to have become disused soon after.

By 1879, the current form of tipping was typified by parallel tramlines, in close-set blocks, producing smooth, level surfaces; the contrast between the old and new forms of tipping is clearly shown on the surface of the tip. The first edition Ordnance Survey map shows this method in practice in the area north and south of No.1 Pit and at the pits of Pen-y-waun Fawr and Tyle Dowlais; the tips at the latter two sites have been extensively remodelled during the latter part of the 20th century.

The haulage tramroad, a common feature of the Merthyr outcrop landscape by the early 19th century, was an important element of the workings, allowing increasing volumes of ironstone and coal to be moved to the Dowlais stockyards. A haulage tramroad, the Dowlais Iron Company Railway, skirted the line of the outcrop, connecting the various levels and pits (shafts) with the main routes to the stockyards via a system of inclines. Several large sections of haulage tramroads, including the latter, and inclines provided for the levels of the Dowlais, and the Penydarren workings survive in the area.

Others included the Pant-y-Waun Mineral Railway, extended and incorporated into the Dowlais Iron Company Railway at around the turn of

	the century. The principal line in the study area was the Great Western & Rhymney Railways' Taff Bargoed Joint Line (c 1876). This projected eastwards to sidings at Fochriw Junction and westwards to the Dowlais Zigzag Lines Junction, where it divided, one line proceeding to Ivor Works, via the passenger station at Dowlais (Cae Harris), the other, via two reversing junctions (Furnace Tops and Ffos-y-fran) to the Dowlais Works. The former mineral branch of the LNWR (opened 1881, closed 1937) from Cwmbargoed Junction, between Dowlais Top and Dowlais, to Cwmbargoed and the Cwmbargoed Pits passes through the area. Also located within the area is a section of the Dowlais Iron Company's Railway, together with remains of various associated industrial tramways and inclines, such as the Penydarren and Bargoed inclines at Tyle Dowlais, and the Penydarren Pits tramway / incline. By the end of the 19th century, the outcrop workings of the area were in decline; the main product of these workings had been ironstone for the Dowlais furnaces, now given over to steel production, while coal was being won in far greater quantities elsewhere from the surviving mid-19th century deep shaft mines. By this date, iron ore was being sourced from northern Spain, the local ore, rich in phosphorous and sulphur being no longer suitable for steel production. As a result, local ore production declined rapidly to such an extent that it had ceased altogether by the early 1870s. Most if not all the pits and levels within the area shown on the first edition 2 inch Ordnance Survey map (surveyed 1879) were probably already defunct. Cartographic evidence charted the dereliction of the area's workings and associated transport network. The majority of the coal and iron ore workings in the area, in particular along the north west-facing slopes above Dowlais. Were disused by this date, including Pits 1, 2, 4, 6, and 7, as were the ironstone levels (2nd edition Ordnance Survey, 1905). A possible exception of Pen-y-waun Fawr pits and Tyle Dowlais pit where the continued existence of tramway tracks might indicate some level (if limited) of continued working. Most of the minor haulage tramroads had also been removed, however, the main Dowlais Iron Company Tramroad connecting the works at Dowlais with Cwm Bargoed Pits and the incline to Penydarren Pits were apparently railed. Historic Development	The visually imposing northwards-facing escarpments and adjoining dramatic mountain masses of the Black Mountains, the Brecon Beacons, Fforest Fawr and the Black Mountain together form a vast natural ridge and physical barrier that divides South from Mid-Wales. Fforest Fawr forms the central part of this barrier with the area identified here comprising its eastern side situated between the valleys of the Mellte in the west and the Taf Fawr in the east. This natural block of land extends from Fan Fawr and Mynydd y Garn in the north, to Cadair Fawr, Cefn Sychbant and Mynydd-y-glôg in the south which lay outside the historical extent of the forest. The block comprises dissected upland plateau which dips gradually southwards from 734 m at the distinctive tabletop summit of Fan Fawr, to between 250 m and 300 m in the Hepste and Cwm Cadlan-Pant Sychbant valleys that penetrate the middle and include the only extents of enclosed land in an otherwise noticeably bleak and remote area of moorland. An intensive archaeological and historic landscape field survey undertaken in the Black Mountain and Fforest Fawr in the mid-1980s revealed the widespread survival of archaeological remains representing the recurrent, and at times intense, occupation and exploitation of this area and its natural resources from the prehistoric period to the recent past. These remains include prehistoric funerary and ritual monuments, evidence of early agriculture and land allotment, and a range of settlements from the prehistoric and the medieval periods, the whole superimposed in parts by more recent remains of quarries, lime works and workings, and abandoned land intakes. The earliest occupation of the area probably occurred in the Mesolithic period with an excavated assemblage of flings from Pant Sychbant having produced a tool type considered to be of late Mesolithic date. However, intensive and sustained land use probably did not occur in the area until the Bronze Age, when a proliferation of burial cairns was created on the slopes of Mynydd-y-glôg, Cefn Sychbant, Penmoelallt, Cefn Esgair-caerau, Waun Tincer and in Pant Sychbant. Most of the sites comprise quite simple, round heaps of stone, but some have more regular structures indicating reuse and adaptation, and a different status possibly, although very few sites have been excavated.

The ring cairn which, as the name implies, is essentially a ring of heaped stone, is another type of Bronze Age sepulchral monument represented in the area, although occurring in fewer numbers than round cairns. From excavated evidence elsewhere, ring cairns have a broader range of ritual functions than round cairns which were more likely to be used for the straightforward burial of the dead. The large ring cairn in Cwm Cadan is a particularly fine example of the type.

Undated, but presumed to be of broadly prehistoric date on the basis of similarities with sites dated by excavation elsewhere, are concentrations of remains representing early settlement and agriculture. The evidence includes hut circles or the stone foundations of round houses, artificial platforms or scooped hollows possibly intended for wooden structures, enclosures, field systems and groups of small clearance cairns, and occasionally, mounds of burnt stone which have been interpreted as the debris from cooking food in water heated in a pit or trough by hot stones. There are notable and extensive concentrations of these features in Pant Sychbant, Cwm Cadlan, and in the Hepste valley. It has even been argued that the patterns of limestone sink holes in this area probably relate to prehistoric human activity, monument building and field clearance. These erosion features are a distinctive feature of the local landscape.

Medieval settlement generally favoured similar locations to the prehistoric period but overall there appears to have been greater settlement dispersal, with more isolated sites occurring in the area. Clusters of characteristic medieval rectangular stone building foundations and house platforms occur in Pant Sychbant, Pant y Gadair and in the Hepste valley. The Pant Sychbant sites are in close proximity to earlier, prehistoric structures. There is less evidence for associated cultivation in the medieval period and the sites are conventionally regarded as having been predominantly pastoral, although none within the area has been excavated. Excavation would provide a more accurate indication of date and evidence of whether the sites were permanent, or seasonal hafod settlements in a transhumance regime.

Historically, after the Norman conquest, the northern part of the area now lying within Powys, became part of Fforest Fawr which was set aside for hunting as a Forest of the Lordship of Brecon by Bernard de Neufmarché in the late 11th century. In 1521, however, Fforest Fawr passed into Crown ownership and thereafter it steadily declined in size as landowners bought immunity from the restrictions of forest law, or through assarting and enclosure as, for example, in the Hepste valley. In 1819, Fforest Fawr was sold and the central part, or Crown Allotment, was enclosed by Parliamentary Enclosure, with the part included here remaining open moorland as the Commoners' Allotment. The abandoned land intakes found on the margins between the enclosed land and open moor date to about this time: there is a good example in Cwm Cadlan. Curiously, Hepste-fechan, a holding in the upper Hepste valley had been enclosed out of the open moorland at some stage prior to the sale, and the holding remains a highly visible 'island' of improved pasture within the Commoners' Allotment.

There is evidence of past industrial activity, mainly from the last two

	centuries, on Cadair Fawr and Mynydd-y-glôg, including quarrying and the burning of limestone. Lime working occurred in Fforest Fawr in the medieval period as documentary sources attest to the rights of commoners to quarry, burn and sell lime, but the surviving concentrations of remains in the areas noted here, which lay outside Fforest Fawr, probably belong to the main period of lime production in the 18th and 19th centuries when the demand – for agriculture, and to a lesser extent, for building work – rose. Silica sand used for making refractory fire bricks was recently worked at the Cwm Cadlan quarry, but has now ceased to be extracted. The growing importance of sheep farming during the post-medieval period is attested by the numerous sheepfolds and pens in the area. The richness, variety and remarkable extent of the surviving archaeological resources in this area, which is in many ways typical of upland Wales, demonstrates the vigour with which human populations recurrently, and at times continuously, exploited these zones in the past. The scale and intensity of human activity is remarkable. The results of recent historic landscape survey, using modern mapping, surveying and aerial photographic plotting techniques over very wide and representative areas, successfully brings that intensity of activity to life, in what appears today to be an essentially deserted and desolate area of moorland. Appendix 9C – Regional Research Framework

Regional research priorities relevant to the assessment of value were identified from the Industrial and Modern Research Framework Priorities presented in: A Research Framework for the Archaeology of Wales, Version 2 (February, 2011). Regional Research Framework (RRF) priorities identified as relevant to this assessment are detailed below.

Background

The historic environment within a kilometre of the footprint of the proposed scheme is dominated by the archaeological remains of eighteenth, nineteenth and early twentieth century extractive industries, including levels, mine workings, spoil tips and elements of associated transport infrastructure. Some landscape evidence associated with agriculture (in the form of field systems and farm buildings) is also present. The proposed scheme is bisected in two locations by the line of two separate Roman roads. In general, prehistoric, Roman and medieval archaeological remains are poorly represented in the baseline. The following research priorities, presented in the RRF, are considered relevant to this study and have been taken into consideration during assessment:

Prehistory

The publication of the Prehistoric Funerary and Ritual Monument Survey by Cadw has identified archaeological sites relating to the monumental use of landscape during prehistory, as well as undertaking a number of associated environmental studies. This information has been considered by the RRF, which has identified the importance of obtaining detailed records of individual monuments as a result of targeted excavation. In considering the overall theme 'Ceremonial and Funerary Monuments' the RRF identifies the following questions as research priorities:

- What do prehistoric monuments tell us about the nature of society?
- What can their immediate environs tell us about the development, role and use of such monuments?

Roman

The Roman period in Wales began in AD 48 and continued until around AD 383. Clear research priorities for the Roman period in Wales are not presented in the RRF. However, the following themes are discussed in the text and are considered relevant to this study:

- settlement Patterns; and
- interaction between Roman occupiers and the indigenous population.

Industrial and Modern

The Industrial and Modern period in Wales is the period from 1750 to present. This period witnessed an agricultural and pastoral society changing to a leading industrial export economy. Wales supplied not only iron and copper products, coal, tinplate, lead, granite and slate to world-markets and to the rest of the UK, but also labour and knowledge, as Welsh workers took their skills with them to the United States, Russia and elsewhere. For these reasons, the period offers strong narratives of innovation and renewal, of transformation and social conflict, which inform the contemporary sense of Welsh identity. The RRF identifies the following research priorities considered relevant to this study:

- the significance of technical change in, and the scale, landscape impact and survival (including below-ground archaeology) of, the major industries of coal, iron, copper, tin, lead and slate; their context and significance in terms of similar sites elsewhere in the world; their relationship with the markets they served;
- the extent to which some industrial sites might have origins predating 1750;
- the erosion or survival of local and regional characteristics in domestic building from the later eighteenth century onwards; the varieties of planned and unplanned settlement; evidence for migration and social diversity in housing stock;

- the extent to which the proliferation of social infrastructure and communal institutions, such as chapels and churches, is a distinctive feature of the period and in what ways these structures might be distinctive to Wales;
- the significance, form and archaeological survival of transport corridors – turnpikes, government-sponsored roads, canals, railways – in terms of their engineering, the industries they served and the settlements they sustained; their context and significance in terms of similar sites elsewhere in the world;
- the agricultural sector remained important in Wales and saw many fundamental changes in this period, including enclosure, the development of court-yard farms and even of mechanised 'high farming' in some places. Improved transport links altered much of the character of Welsh agriculture in this period. Study of the many new farm-yards and agricultural buildings of this period must be a high priority; and
- the erosion or survival of local and regional characteristics in domestic building from the later eighteenth century onwards; the varieties of planned and unplanned settlement; evidence for migration and social diversity in housing stock.

Summary

This assessment presents the results of an *Assessment of the Significance of the Impact of Development on the Historic Landscape* (ASIDOHL2) (Cadw *et al*., 2007) with regard to Section 5 and Section 6 of the proposed dualling of the A465 Heads of the Valley road in south Wales ('the proposed scheme').

The proposed scheme is partially located within the Merthyr Tydfil Landscape of Outstanding Historic Interest (MTLOHI), included on the Register of Historic Interest in Wales (Cadw, 1998).

The proposed scheme is predicted to have direct physical impacts on 15 of the 79 Historic Landscape Character Areas (HLCAs) comprising the MTLOHI.

The proposed scheme is predicted to have an indirect non-physical (visual) impact on 16 of the 79 Historic Landscape Character Areas (HLCAs) comprising the MTLOHI.

Direct physical impacts have been assessed to be Moderate on five HLCAs and Slight on 10 HLCAs. Indirect non-physical (visual) impacts have been assessed to be Considerable on two HLCAs, Moderate on eight HLCAs and Slight on six HLCAs. The relative importance of impacted areas of the HLCAs has been assessed to be Low overall.

HLCAs predicted to experience an impact as a result of the proposed scheme demonstrate an agricultural or otherwise non-industrial character (e.g. HLCA 7, HLCA 10, HLCA 12, and HLCA 17), poor legibility (HLCA 15), residential settlement (e.g. HLCA 11, HLCA 21 and HLCA 22), industrial (e.g. HLCA 14 and HLCA 20) or comprise predominantly industrial land (e.g. HLCA 18, HLCA 19, HLCA 25 and HLCA 26). As a result majority of the identified HLCAs do not contribute to the overall, predominantly industrial, character of the MTLOHI.

The overall impact of the development on the historic landscape on the register has been assessed to be Slight. The reduction of value of the historic landscape on the Register has been assessed to be Medium to Very Low.

1. Stage 1: Contextual Information

1.1 Introduction

This assessment, which should be read in conjunction with the Guide to Good Practice on Using the Register of Landscapes of Historic Interest in Wales in the Planning and Development Process (Cadw *et al*., 2007), presents the results of an Assessment of the Significance of the Impact of Development on Historic Landscape (ASIDOHL2) on Section 5 and Section 6 of the proposed A465 Heads of the Valley road in South Wales ('the proposed scheme').

The ASIDOHL2 is a staged process for assessing the significance of the impact of a development on historic landscape areas on the Register of Landscapes of Historic Interest in Wales ('the Register') (Cadw, 1998).

The proposed scheme is partially located within a Registered Landscape of Outstanding Historic Interest (LOHI); the Merthyr Tydfil Landscape of Outstanding Historic Interest (MTLOHI). The proposed scheme in relation to the MTLOHI is show on Figure 1 (Annex 3).

1.2 Summary of Proposed Scheme

The proposed scheme comprises dualling of approximately 17.7 km of the A465 between Dowlais Top and Hirwaun. For a full scheme description refer to Chapter 5: Scheme Description in Volume 1 of the Environmental Statement (ES).

1.3 Context of Assessment

The assessment is being carried out as part of an ES to accompany a planning application being carried forward under the Highways Act 1980 (as amended) for the proposed scheme and forms an Appendix to the Cultural Heritage Chapter of the ES (Appendix 9D). Therefore, the HLCA numbering will remain consistent with that applied in the ES Cultural Heritage Chapter (Chapter 9) supported by this ASIDOHL.

1.3.1 Study area

The proposed scheme runs through the northern part of the MTLOHI, from east to west. As part of a Historic Landscape Characterisation programme undertaken by the Glamorgan Gwent Archaeological Trust (GGAT) the MTLOHI was divided into 79 Historic Landscape Character Areas (HLCA) (Cadw *et al*., 2007, GGAT, 2017).

The study area for assessment was defined as the limits of the MTLOHI (as defined by Cadw *et al* (2007) and GGAT (2017)) a 200 m study area extending in all directions from the footprint of the proposed scheme (defined by the ES). Of the 79 HLCAs within the MTLOHI, 24 fall within the 200 m study area. These are listed in Table 1.1.

Table 1.1 : HLCAs located within the study area

Jacobs HLCA Ref.	Name
HLCA 1	A465 Heads of the Valley Road
HLCA 6	Winch Fawr, Pen-yr-heolgerrig, Cwm Du and Upper Cwn Glo Workings
HLCA 7	Coed Meurig
HLCA 8	Clwyd-y-Fagwyr, Gellideg and Pen-Llwyn-Deri
HLCA 9	Cyfarthfa Iron Works and Associated Features
HLCA 10	Taf Fawr River Valley
HLCA 11	Cefn-coed-y-cymmer
HLCA 12	Cefn Coed Cemetery & Jewish Burial Ground and Essential Setting with Significant Views
HLCA 13	Taf Fechan
HLCA 14	Graig Quarry and Tramroad
HLCA 15	Y Graig, Gurnos
HLCA 16	Lakeside Gardens
HLCA 17	Gurnos Farm and Bunkers Hill
HLCA 18	Gurnos and Galon-Uchaf
HLCA 19	Bon-y-maen
HLCA 20	Bryniau Quarries
HLCA 21	Dowlais
HLCA 22	Pantcadifor, Rhyd-y-bedd and Caeracca
HLCA 23	Ivor Works Area
HLCA 24	Pengarnddu
HLCA 25	Dowlais Top
HLCA 26	Dowlais Great Tip, Trecatti, Trehir and Twyn-y-Waun
HLCA 27	Dowlais Iron Works Area
HLCA 28	Ffos-y-fran

1.3.2 Methodology

Under the assessment methodology provided by Cadw *et al.* (2007), impacts on the historic landscape are identified as 'direct physical impacts'; those impacts resulting in the surface area of the landscape being directly affected, 'indirect, physical impacts'; those impacts resulting in a severance or fragmentation of historic landscape areas and 'indirect (non-physical) visual impacts'; those impacts resulting in an effect on the setting of a historic landscape. This assessment does not take into account mitigation and, therefore, presents a 'worst-case' scenario, in accordance with the Guide to Good Practice on Using the Register of Landscapes of Historic Interest in Wales in the Planning and Development Process (Cadw *et al*., 2007).

No impacts (direct or indirect) were predicted to occur on eight HLCAs as set out in Table 1.2. Thus these HLCAs have not been discussed any further in this report.

Table 1.2 : HLCAs located within the study area

Jacobs HLCA Ref.	Name	Rationale
HLCA 1	A465 Heads of the Valley Road	The proposed scheme is in keeping with the existing mid-20th century transport corridor. Thus no direct or indirect impact is predicted to occur.
HLCA 6	Winch Fawr, Pen-yr-heolgerrig, Cwm Du and Upper Cwn Glo Workings	The proposed scheme does not encroach onto the HLCA, and comprises the improvement and upgrade of an existing highway near the industrial area, thus no direct or indirect impact is predicted to occur.
HLCA 8	Clwyd-y-Fagwyr, Gellideg and Pen-Llwyn-Deri	The proposed scheme does not encroach onto the HLCA, and comprises the improvement and upgrade of an existing highway near the industrial settlement, thus no direct or indirect impact is predicted to occur.
HLCA 9	Cyfarthfa Iron Works	The proposed scheme does not encroach onto the HLCA, and comprises the improvement and upgrade of an existing highway near the iron works, thus no direct or indirect impact is predicted to occur.
HLCA 16	Lakeside Gardens	The proposed scheme does not encroach onto the HLCA, and comprises the improvement and upgrade of an existing highway near the modern housing development, thus no direct or indirect impact is predicted to occur.
HLCA 23	Ivor Works Area	The proposed scheme does not encroach onto the HLCA, and comprises the improvement and upgrade of an existing highway near the industrial area, thus no direct or indirect impact is predicted to occur.
HLCA 27	Dowlais Iron Works Area	Due to the distance between this HLCA and the proposed scheme no direct or indirect impact is predicted to occur.
HLCA 28	Ffos-y-fran	Due to the distance between this HLCA and the proposed scheme no direct or indirect impact is predicted to occur.

1.4 Legislation, Policy and Guidance

Legislation and policy are identified in Sections 1.4.1 to 1.4.3 and are presented in further detail in Appendix 9A: Legislative and Policy Background appended to the Cultural Heritage ES chapter (Chapter 9).

1.4.1 Key legislation

- Highways Act 1980 (as amended); and
- Historic Environment (Wales) Act 2016.

1.4.2 Key policy

Planning policy for archaeology and cultural heritage in Wales and local policy relevant to assessment is provided in the following documents:

- Hedgerow Regulations 1997 (amended 2003);
- Merthyr Tydfil County Borough Council Local Development Plan (MTCBC): Strategic Objective 1; Policy BW6; Policy AS4. (2011);
- Planning Policy Wales: Edition 9 (PPW9) Chapter 6: Conserving the Historic Environment (Welsh Government, December 2016);

- Rhondda Cynon Taf County Borough Council (RCTCBC) Local Development Plan up to 2021: Policy CS1; Policy EB101. (2011);
- Supplementary Planning Guidance: Cyfarthfa Conservation Area Character Appraisal (MTCBC 2009);
- Technical Advice Note (Wales) 12: Design (Welsh Government, 2014);
- Planning Policy Wales Technical Advice Note 24 – The Historic Environment (Welsh Government, 2017); and
- Wales Spatial Plan: People, Places, Futures (WSP) (Welsh Government, 2008).

1.4.3 Key guidance

This assessment has been prepared based on the guidance provided by:

- Guide to Good Practice on Using the Register of Landscapes of Historic Interest in Wales in the Planning and Development Process, Revised (2nd) Edition including revisions to the assessment process (Cadw, *et al,* 2007);
- The Setting of Heritage Assets. Historic Environment Good Practice Advice in Planning: 3 (Historic England, 2015); and
- Understanding the Archaeology of Landscape: A guide to good recording practice (English Heritage, 2007).

1.5 Confidence

Sources used are considered appropriate and adequate for the requirements of this assessment.

1.6 Supporting Statement

The ASIDOHL has been undertaken by Jim Mower, MA Archaeology, ACIfA, employed by Jacobs UK Ltd on behalf of the Welsh Government. Mr Mower is experienced in undertaking impact assessment in relation to the historic environment and has completed such work on road schemes for Buckinghamshire County Council and Essex County Council.

1.7 Sources Consulted

The following sources were consulted:

- Cadw, 1998. Register of Landscapes of Outstanding Historic Interest in Wales. Cadw, CCW, ICOMOS UK;
- Ggat.org.uk. (2017). Merthyr Tydfil Main. [online] Available at: http://www.ggat.org.uk/cadw/historic_landscape/Merthyr%20Tydfil/English/Merthyr_Main.htm [Accessed 11 January 2017]; and
- Landmap-maps.naturalresources.wales. (2017). Map. [online] Available at: http://landmap-maps.naturalresources.wales/ [Accessed 11 January 2017].

Figure 1 (Annex 3) shows the MTLOHI in relation to the proposed scheme and all HLCAs with the potential to be impacted by it.

Chapters within this ES relevant to Cultural Heritage include:

- Chapter 5 – Scheme Description;
- Chapter 9 – Cultural Heritage;
- Chapter 10 – Landscape and Visual Impact;
- Chapter 12 – Geology and Soils; and
- Chapter 14 – Noise and Vibration.

2. Stage 2: Assessment of Direct Impacts

Stage 2 describes and quantifies the direct, physical impacts of development on HLCAs affected by the proposed scheme. This is expressed in absolute terms (the percentage or proportion of the surface area of the HLCA directly affects) and in relative terms (the percentage or proportion of elements within the HLCA that are predicted to be affected). Each element is recorded using the categories adopted by the Welsh Archaeological Trusts.

2.1 Results of Assessment

The proposed scheme would result in a direct physical impact on 15 of the 79 HLCAs that contribute towards the MTLOHI as a result of land-take, landscaping and mounding and the placement of compound / set down areas. HLCAs predicted to experience direct, physical impacts as a result of the proposed scheme are presented in Table 2.1 and shown on Figure 1 (Annex 3). A summary of overall magnitude of direct impacts on the HLCAs is presented in Table 2.32.

Table 2.1 : HLCAs potentially directly impacted by the proposed scheme

HLCA	Name
HLCA 7	Coed Meurig
HLCA 10	Taf Fawr Valley and River
HLCA 11	Cefn-coed-y-cymmer
HLCA 12	Cefn Coed Cemetery & Jewish Burial Ground and Essential Setting with Significant Views
HLCA 13	Taf Fechan
HLCA 14	Graig Quarry and Tramroad
HLCA 15	Y Graig, Gurnos
HLCA 17	Gurnos Farm and Bunkers Hill
HLCA 18	Gurnos and Galon-Uchaf
HLCA 19	Bon-y-maen
HLCA 20	Bryniau Quarries
HLCA 21	Dowlais
HLCA 22	Pantcadifor, Rhyd-y-bedd and Caeracca
HLCA 24	Pengarnddu
HLCA 25	Dowlais Top

The proposed scheme would not have a direct impact on HLCA 26: Dowlais Great Tip, Trecatti, Trehir and Twyn-y-Waun as the footprint of the proposed scheme does not cross this historic landscape.

2.1.1 HLCA 7: Coed Meurig

Coed Meurig comprises an agricultural enclosed landscape of traditional hedge banks and drystone boundaries associated with post-medieval farms. This HLCA encompasses an area either side of the A465 from the Merthyr Road junction in the west to the A465 junction with the A470 in the north west of Merthyr Tydfil (between chainage 8300 to 10700). The area includes minor industrial characteristics in the form of tips extending from workings to the south.

Plate 1. HLCA 7: Coed Meurig (Photo: GGAT 2017)

Absolute and relative direct physical impacts on HLCA 7 are presented in Table 2.2. The overall magnitude of these impacts is presented in Table 2.3.

Table 2.2 : Direct physical impacts on HLCA 7: Coed Meurig

Direct physical impacts - absolute				
Absolute Impact (Loss of Area): 9.54 ha of 58 ha = 16.4% of HLCA		Magnitude & Score: Moderate = 3		
Direct physical impacts - relative				
Elements lost	**Site Category**	**Magnitude**	**Landscape Value**	**Landscape Value Effect**
Drystone and turfstone walling and fields. 9.5 ha would be permanently removed (16.4% of HLCA)	C = 2	Slight = 2	Low = 2	Slightly Reduced = 2
Post-Medieval lofted cowshed. 0.063 ha would be permanently removed (0.1% of HLCA)	C = 2	Moderate = 3	Low = 2	Lost = 6
Summary: 16.4% of the overall HLCA would be permanently lost or removed by development. Drystone and turfstone walling and fields comprising 16.4% of the HLCA and post medieval farm buildings comprising 0.1% of the HLCA would be permanently lost or removed by development				

Table 2.3 : Overall magnitude of direct physical impacts on HLCA 7: Coed Meurig

Score	**Grading**
(2 +2 + 2 + 2)+(2 +3 +2 + 6) ÷ 2 + 3 = 13.5 (13)	Moderate

2.1.2 HLCA 10: Taf Fawr River Valley

Please note that within HLCA 10: Taf Fawr River Valley includes Cefn Coed Cemetery which is also a Registered Park and Garden which has been assessed separately as HLCA 12 Cefn Coed Cemetery and Jewish Burial Ground. Thus a proportion of HLCA 10 has been assessed in this section whilst the remainder has been assessed under HLCA 12. Figure 1 (Annex 3) depicts the extent of these areas.

The Historic Landscape Characterisation database provided on Glamorgan and Gwent Archaeological Trust (GGAT) website indicates that the Taff Fawr River Valley comprises a river valley landscape and is characterised, at its northern limit, by the establishment of the Cefn Coed Cemetery in 1858, which included the laying out of the ground, and erection of chapels, lodge and boundary wall. By 1919, the cemetery had expanded to take in an area to the west side of the Taf, linked by a bridge. In 1860, the Jewish Community purchased land for a Jewish Burial Ground.

This HLCA encompasses areas either side of the existing A465 from Grawen Lane in the east to Afon Taf Fawr where it passes under the A645 to the west (at chainage 10900) and a drainage pond to the south of the existing A470 Junction roundabout.

Plate 2. HLCA 10: Taf Fawr River Valley (Photo: GGAT 2017)

Plate 3. HLCA 10: Taf Fawr Valley and River (Photo: Skeye 2017)

Absolute and relative direct physical impacts on HLCA 10 are presented in Table 2.4. The overall magnitude of these impacts is presented in Table 2.5.

Table 2.4 : Direct physical impacts on HLCA 10: Taf River Valley

Direct physical impacts - absolute				
Absolute Impact (Loss of Area): 1.52 ha of 28 ha = 5.4 % of HLCA		Magnitude & Score: Slight = 2		
Direct physical impacts - relative				
Elements lost	**Category**	**Magnitude**	**Landscape Value**	**Landscape Value Effect**
Woodland. 1.12 ha would be permanently removed (4% of HLCA)	U = 1	Slight = 2	Low = 2	Slightly reduced = 2
Open Fields. 0.4 ha would be permanently removed 1.4% of HLCA)	U = 1	Slight = 2	Low = 2	Very Slightly reduced = 1
Summary: 5.4% of the overall HLCA would be permanently lost or removed by development. Woodland comprising 4% of the HLCA and open fields comprising 1.4% of the HLCA would be permanently lost or removed by development.				

Table 2.5 : Overall magnitude of direct physical impacts on HLCA 10: Taf Fawr River Valley

Score	**Grading**
(1 + 2 + 2 + 2) + (1 + 2 + 2 + 1) ÷ 2 + 2 = 8.5 (9)	Moderate

2.1.3 HLCA 11: Cefn-coed-y-cymmer

Cefn-coed-y-cymmer is an industrial worker's squatter settlement which has retained its identity, despite the 20th century developments that have taken place around it. The HLCA is characterised by an unplanned layout, comprising early housing with a strong vernacular influence and non-conformist chapels of both rural and urban type and includes the transport corridor elements such as the turnpike road from Cefn to Cwm Taf, the Brecon-Merthyr road and Cefn-coed-y-cymmer railway viaduct. This HLCA encompasses areas either side of the A465 between Lower Vaynor Road Merthyr Road (chainage 11400), to the Taff Trail in the west (chainage 10900).

Plate 4. HLCA 11: Cefn-coed-y-cymmer (Photo: Skeye 2017)

Absolute and relative direct physical impacts on HLCA 11 are presented in Table 2.6. The overall magnitude of these impacts is presented in Table 2.7.

Table 2.6 : Direct physical impacts on HLCA 11: Cefn-coed-y-cymmer

Direct physical impacts - absolute				
Absolute Impact (Loss of Area): 1 ha of 50 ha = 2% of HLCA		Magnitude & Score: Very Slight = 1		
Direct physical impacts - relative				
Elements lost	**Site Category**	**Magnitude**	**Landscape Value**	**Landscape Value Effect**
Scrub and woodland. 0.6 ha would be permanently removed (1.20% of HLCA)	D = 1	Very Slight = 1	Very Low = 1	Slightly Reduced = 2
Existing tracks and roads. 0.4 ha would be permanently removed / altered (0.80% of HLCA)	D = 1	Very Slight = 1	Very Low = 1	Slightly Reduced = 2
Summary: 2% of the overall HLCA would be permanently lost or removed by development, including the removal of 1.20% of scrub and woodland and 0.80% of existing roads / tracks would be affected.				

Table 2.7 : Overall magnitude of direct physical impacts on HLCA 11: Cefn-coed-y-cymmer

Score	**Grading**
(1 + 1 + 1 + 2) + (1 +1 + 1 +2) ÷ 2 + 1 = 6	Slight

2.1.4 HLCA 12: Cefn Coed Cemetery & Jewish Burial Ground and Essential Setting with Significant Views

Cefn Coed cemetery is recorded as one of the oldest and largest general public cemeteries in the Merthyr Tydfil area. The majority of the HLCA area survives in its entirety in its original layout. Further information regarding the history of the cemetery is set out in Section 2.1.2 under HLCA 10: Taf Fawr River Valley. This HLCA encompasses an area to the north of the existing A465 Afon Taf Fawr in the east (chainage 10800) and the A470 Junction to the west (chainage 10700).

Plate 5. HLCA 12: Cefn Coed Cemetery & Jewish Burial Ground and Essential Setting with Significant Views (Photo: Skeye 2017)

Plate 6. HLCA 12: Cefn Coed Cemetery & Jewish Burial Ground and Essential Setting with Significant Views (Photo: Skeye 2017)

Absolute and relative direct physical impacts on HLCA 12 are presented in Table 2.8. The overall magnitude of these impacts is presented in Table 2.9.

Table 2.8 : Direct physical impacts on HLCA 12: Cefn Coed Cemetery & Jewish Burial Ground and Essential Setting with Significant Views

Direct physical impacts - absolute				
Absolute Impact (Loss of Area): 1.7 ha of 15 ha = 11.34% of HLCA		Magnitude & Score: Slight = 2		
Direct physical impacts - relative				
Elements lost	**Site Category**	**Magnitude**	**Landscape Value**	**Landscape Value Effect**
Open grassland within registered park and garden/cemetery area. 0.4 ha would be permanently removed (2.67% of HLCA)	C = 2	Very Slight = 1	Low = 2	Considerably Reduced = 4
Woodland within registered park and garden/cemetery area. 0.6 ha would be permanently removed (4% of HLCA)	C = 2	Very Slight = 1	Low = 2	Considerably Reduced = 4
Scrub and woodland. 0.7 ha would be permanently removed (4.67% of HLCA)	D = 1	Slight = 2	Very Low = 1	Moderately Reduced = 2
Summary: 11.33% of the overall HLCA would be permanently lost or removed by the development, comprising 2.67% of open grassland, 4% of woodland and 4.67% of scrub and woodland.				

Table 2.9 : Overall magnitude of direct physical impacts on HLCA 12: Cefn Coed Cemetery & Jewish Burial Ground and Essential Setting with Significant Views

Score	**Grading**
(2 + 1 + 2 + 4) + (2 + 1 + 2 + 4) + (1 + 2 + 1 + 2) ÷ 3 + 2 = 10	Moderate

2.1.5 HLCA 13: Taf Fechan

Taf Fechan comprises a transport corridor within the Taf Fechan Valley which is characterised by 19th century public rail networks, including the B&M/LNWR Joint Railway and the Glais Viaduct at Pontsarn. This HLCA encompasses two areas to the north of the existing A465 (at chainage 11400). The eastern area is located to the west of Gurnos Farm and the western area is located to the north of Lower Vaynor Road.

Plate 7. HLCA 13: Afon Taf Fechan (Photo: Skeye 2017)

Absolute and relative direct physical impacts on HLCA 13 are presented in Table 2.10. The overall magnitude of these impacts is presented in Table 2.11.

Table 2.10 : Direct physical impacts on HLCA 13: Taf Fechan

Direct physical impacts - absolute				
Absolute Impact (Loss of Area): 0.31 ha of 160 ha = 0.19% of HLCA		Magnitude & Score: Very Slight = 1		
Direct physical impacts - relative				
Elements lost	**Site Category**	**Magnitude**	**Landscape Value**	**Landscape Value Effect**
Scrub and woodland. 0.3 ha would be permanently removed (0.19% of HLCA)	D = 1	Very Slight = 1	Very Low = 1	Slightly Reduced = 2
Existing tracks and roads. 0.01 ha would be permanently removed / altered (0.01% of HLCA)	D = 1	Very Slight = 1	Very Low = 1	Slightly Reduced = 2
Summary: 0.39% of the overall HLCA would be permanently lost or removed by the development, comprising the removal of 0.19% of open fields and scrub and woodland and 0.01% of existing roads / tracks would be affected.				

Table 2.11 : Overall magnitude of direct physical impacts on HLCA 13: Taf Fechan

Score	**Grading**
(1 + 1 + 1 + 2) + (1 + 1 + 1+ 2) ÷2 + 1 = 6	Slight

2.1.6 HLCA 14: Graig Quarry and Tramroad

It is acknowledged that HLCA 14: Graig Quarry and Tramroad is part of a wider area included in the Cyfarthfa Iron Works which is another Historic Landscape Characterisation area provided on GGAT website. Figure 1 (Annex 3) depicts the extent of HLCA 14 which has been considered for this assessment. Founded in 1765, the Cyfarthfa Iron Works became one of the largest iron works in the world during the early 1800s. It is recognised as a nationally and internationally important landscape which is characterised by industrial features such as the Charging Bank and Blast Furnaces, Pont-y-Cafnau Iron Bridge, Cyfarthfa Cinder Tips, and the limestone quarry and associated tram road.

This HLCA encompasses an area to the north and south of the existing A465 east of Lower Vaynor Road (between chainage 11400 to 11500). The area of the HLCA included within the working footprint of the proposed scheme comprises an existing bridge within the HLCA over the Afon Taf Fechan.

Plate 8. HLCA 14: Graig Quarry and Tramroad (Photo: GGAT 2017)

Absolute and relative direct physical impacts on HLCA 14 are presented in Table 2.12. The overall magnitude of these impacts is presented in Table 2.13.

Table 2.12 : Direct physical impacts on HLCA 14: Graig Quarry and Tramroad

Direct physical impacts - absolute				
Absolute Impact (Loss of Area): 0.3 ha of 19 ha = 1.58% of HLCA		Magnitude & Score: Very Slight = 1		
Direct physical impacts - relative				
Elements lost	**Site Category**	**Magnitude**	**Landscape Value**	**Landscape Value Effect**
Woodland Plantation. 0.2 ha would be permanently removed (1.05% of HLCA)	D = 1	Very Slight = 1	Very Low = 1	Slight = 2
Scrub and woodland. 0.1 ha would be permanently removed (0.53% of HLCA)	D = 1	Very Slight = 1	Very Low = 1	Slight = 2
Summary: 1.58% of the overall HLCA would be permanently lost or removed by the development, comprising the removal of 1.05% of woodland plantation and 0.53% of scrub and woodland.				

Table 2.13 : Overall magnitude of direct physical impacts on HLCA 14: Graig Quarry and Tramroad

Score	Grading
(1 + 1 + 1 + 2) + (1 + 1 + 1 + 2) ÷ 2 + 1 = 6	Slight

2.1.7 HLCA 15: Y Graig, Gurnos

Y Graig, Gurnos comprises a remnant of land associated with Gurnos Farm to the south of the existing A465 at Gurnos. Characterised by scrub woodland and pasture, HLCA 15 also contains a network of tracks and a small number of minor extractive features, possibly gravel pits. This HLCA encompasses areas to the south of the existing A465 between the Taf Fechan in the west (at chainage 11500) and to the north of Ty Gwaunfarren in the east (chainage 12100). The areas of the HLCA included within the working footprint of the proposed scheme, comprises tracks, scrub and woodland.

Plate 9: HLCA 15: Y Graig, Gurnos (Photo: GGAT 2017)

Absolute and relative direct physical impacts on HLCA 15 are presented in Table 2.14. The overall magnitude of these impacts is presented in Table 2.15.

Table 2.14 : Direct physical impacts on HLCA 15: Y Graig, Gurnos

Direct physical impacts – absolute				
Absolute Impact (Loss of Area): 5.3 ha of 19 ha = 27.9% of HLCA		Magnitude and Score: Moderate = 3		
Direct physical impacts - relative				
Elements lost	**Category**	**Magnitude**	**Landscape Value**	**Landscape Value Effect**
Tracks. 1.3 ha would be permanently removed. 6.8% of HLCA)	D = 1	Slight = 2	Low = 2	Moderately reduced = 3
Scrub and woodland. 4ha would be permanently removed (21.1% of HLCA)	U = 1	Slight = 2	Low = 2	Moderately reduced = 3
Summary: 27.9% of the overall HLCA would be permanently lost or removed by development. Tracks comprising 6.8% of the HLCA and scrub and open woodland comprising 21.1% of the HLCA would be permanently lost or removed by development.				

Table 2.15 : Overall magnitude of direct physical impacts on HLCA 15: Y Graig, Gurnos

Score	Grading
(1 + 2 + 2 + 3) + (1 + 2 + 2 + 3) ÷ 2 + 3 = 11	Moderate

2.1.8 HLCA 17: Gurnos Farm and Bunkers Hill

Gurnos Farm and Bunkers Hill comprises a late 18th century agricultural landscape characterised predominantly by planned medium-large regular enclosures with dry stone walls. It also includes a transport corridor comprising a tramroad to Morlais Castle Quarries and a possible route of a Roman road. This HLCA encompasses areas to the north of the existing A465 between Lakeside Gardens in the west (chainage 11500) to Pontsarn Road in the east (chainage 13800).

Plate 10. HLCA 17: Gurnos Farm and Bunkers Hill (Photo: GGAT 2017)

Absolute and relative direct physical impacts on HLCA 17 are presented in Table 2.16. The overall magnitude of these impacts is presented in Table 2.17.

Table 2.16 : Direct physical impacts on HLCA 17: Gurnos Farm and Bunkers Hill

Direct physical impacts - absolute				
Absolute Impact (Loss of Area): 8.9 ha of 80ha = 11.14 % of HLCA			Magnitude & Score: Slight = 2	
Direct physical impacts - relative				
Elements lost	**Site Category**	**Magnitude**	**Landscape Value**	**Landscape Value Effect**
Woodland Plantation. 0.7 ha would be permanently removed (0.88% of HLCA)	C = 2	Very Slight = 1	Low = 2	Moderately Reduced = 3
Open fields. 7.1 ha would be permanently removed (8.88% of HLCA)	C = 2	Slight = 2	Low = 2	Moderately Reduced = 3
Scrub and woodland. 0.3 ha would be permanently removed (0.38% of HLCA)	D = 1	Very Slight = 1	Very Low = 1	Slightly Reduced = 2
Existing tracks and roads. 0.8 ha would be permanently removed/altered (1% of HLCA)	D = 1	Very Slight = 1	Very Low = 1	Slightly Reduced = 2
Summary: 11.14% of the overall HLCA would be permanently lost or removed by development, this includes				

0.88% of woodland plantation, 8.88% open fields, 0.38% of scrub and woodland and 1% of existing roads / tracks would be effected.

Table 2.17 : Overall magnitude of direct physical impacts on HLCA 17: Gurnos Farm and Bunkers Hill

Score	Grading
(2 + 1 + 2 + 3)+(2 + 2 + 2 + 3) + (1 + 1 + 1 + 2) + (1 + 1 + 1 + 2) ÷ 4 + 2 = 8.75 (9)	Moderate

2.1.9 HLCA 18: Gurnos and Galon-Uchaf

Gurnos and Galon Uchaf is an existing urban landscape, built on former agricultural land during the mid-1900s. The landscape is characterised by council housing estates, commercial buildings, educational and health facilities, and industrial features. This HLCA encompasses areas to the south of the existing A465 between Gurnos Road in the west (at chainage 11500) to Pontsarn Road in the east (at chainage 13800).

Plate 11. HLCA 18: Gurnos and Galon-Uchaf (Photo: GGAT 2017)

Absolute and relative direct physical impacts on HLCA 18 are presented in Table 2.18. The overall magnitude of these impacts is presented in Table 2.19.

Table 2.18 : Direct physical impacts on HLCA 18: Gurnos and Galon-Uchaf

Direct physical impacts - absolute				
Absolute Impact (Loss of Area): 4.4 ha of 199 ha = 2.21% of HLCA		Magnitude & Score: Very Slight = 1		
Direct physical impacts - relative				
Elements lost	**Site Category**	**Magnitude**	**Landscape Value**	**Landscape Value Effect**
Scrub and woodland. 1.4 ha would be permanently removed (0.7% of HLCA)	D = 1	Very Slight = 1	Very Low = 1	Slightly Reduced = 2
Existing tracks and roads. 3 ha would be permanently removed/altered (1.51% of HLCA)	D = 1	Very Slight = 1	Very Low = 1	Slightly Reduced = 2

Summary: 2.21% of the overall HLCA would be permanently lost or removed by development, including the removal of 0.7% of scrub and woodland and 1.51% of existing roads / tracks would be affected.

Table 2.19 : Overall magnitude of direct physical impacts on HLCA 18: Gurnos and Galon-Uchaf

Score	Grading
(1 + 1 + 1 + 2) + (1 + 1 + 1 + 2) ÷ 2 + 1 = 6	Slight

2.1.10 HLCA 19: Bon-y-maen

Bon-y-maen was formerly agricultural post-medieval farm land with irregular fields, but is now a modern industrial estate, comprising mixed industrial and commercial units and a sports ground. This HLCA encompasses areas to the south of the existing A465 between Rocky Road to the west (chainage 14100) and Pant Road in the east (chainage 14700).

Plate 12. HLCA 19: Bon-y-maen (Photo: Skeye 2017)

Absolute and relative direct physical impacts on HLCA 19 are presented in Table 2.20. The overall magnitude of these impacts is presented in Table 2.21.

Table 2.20 : Direct physical impacts on HLCA 19: Bon-y-maen

Direct physical impacts - absolute				
Absolute Impact (Loss of Area): 3.3 ha of 28 ha = 11.79% of HLCA		Magnitude & Score: Slight = 2		
Direct physical impacts - relative				
Elements lost	**Site Category**	**Magnitude**	**Landscape Value**	**Landscape Value Effect**
Scrub and woodland. 1.7 ha would be permanently removed (6.07% of HLCA)	D = 1	Slight = 2	Very Low = 1	Slightly Reduced = 2
Modern hardstanding. 0.8 ha would be permanently removed (2.86% of HLCA)	D = 1	Very Slight = 1	Very Low = 1	Slightly Reduced = 2

Existing tracks and roads. 0.8 ha would be permanently removed / altered (2.86% of HLCA)	D = 1	Very Slight = 1	Very Low = 1	Slightly Reduced = 2
Summary: 11.79% of the overall HLCA would be permanently lost or removed by development, including 6.07 % of scrub and woodland, 2.86% of modern hardstanding and 2.86 % of existing roads / tracks would be affected.				

Table 2.21 : Overall magnitude of direct physical impacts on HLCA 19: Bon-y-maen

Score	Grading
(1 + 2 + 1 + 2) + (1 + 1 + 1 + 2) + (1 + 1 + 1 + 2) ÷ 3 + 2 = 7.33 (7)	Slight

2.1.11 HLCA 20: Bryniau Quarries

Bryniau Quarries is a historical extractive industrial landscape, associated with Dowlais and Ivor Iron Works and is characterised by quarries and associated tramroads. This HLCA encompasses areas to the north and south of the existing A465 between Rocky Road in the west (chainage 14100) and High Street in the east (chainage 16000).

Plate 13. HLCA 20: Bryniau Quarries (Photo: GGAT 2017)

Absolute and relative direct physical impacts on HLCA 20 are presented in Table 2.22. The overall magnitude of these impacts is presented in Table 2.23.

Table 2.22 : Direct physical impacts on HLCA 20: Bryniau Quarries

Direct physical impacts - absolute				
Absolute Impact (Loss of Area): 1.1 ha of 20 ha = 5.50% of HLCA		Magnitude & Score: Slight = 2		
Direct physical impacts - relative				
Elements lost	**Site Category**	**Magnitude**	**Landscape Value**	**Landscape Value Effect**
Former quarry area. 0.8 ha would be permanently removed (4% of HLCA)	C = 2	Very Slight = 1	Very Low = 1	Moderately Reduced = 3
Scrub and woodland. 0.02 ha would be permanently removed	D = 1	Very Slight = 1	Very Low = 1	Slightly Reduced = 2

(0.10% of HLCA)				
Existing tracks and roads. 0.28 ha would be permanently removed / altered (1.40% of HLCA)	D = 1	Very Slight = 1	Very Low = 1	Slightly Reduced = 2
Summary: 5.50% of the overall HLCA would be permanently lost or removed by development, this includes the removal of 4% of the area within the former quarry area, 0.10% of scrub and woodland and 1.40% of existing roads / tracks would be affected.				

Table 2.23 : Overall magnitude of direct physical impacts on HLCA 20: Bryniau Quarries

Score	Grading
(2 + 1 + 1 + 3) + (1 + 1 + 1 + 2) + (1 + 1 + 1 + 2) ÷ 3 + 2 = 7.66 (8)	Slight

2.1.12 HLCA 21: Dowlais

Dowlais initially began as a settlement of dispersed cottages dating to the 1700s, although it has expanded and its layout has changed from a characteristic grid system by the mid-1800s to the wider expansive development seen today. The area is characterised by industrial housing which is still extract, but it is also dominated by public and religious buildings, such as the Dowlais Ironworks Stables and the Memorial Library. This HLCA encompasses areas from Bryniau Road in west (chainage 13900) to High Street in the east (chainage 16000).

Plate 14. HLCA 21: Dowlais (Photo: Skeye 2017)

Absolute and relative direct physical impacts on HLCA 21 are presented in Table 2.24. The overall magnitude of these impacts is presented in Table 2.25.

Table 2.24 : Direct physical impacts on HLCA 21: Dowlais

Direct physical impacts - absolute				
Absolute Impact (Loss of Area): 3.4 ha of 91 ha = 3.74% of HLCA		Magnitude & Score: Very Slight = 1		
Direct physical impacts - relative				
Elements lost	**Site Category**	**Magnitude**	**Landscape Value**	**Landscape Value Effect**
Open fields. 0.2 ha would be permanently removed (0.22% of HLCA)	D = 1	Very Slight = 1	Very Low = 1	Slightly Reduced = 2

Scrub and woodland. 3.2 ha would be permanently removed (3.52% of HLCA)	D = 1	Very Slight = 1	Very Low = 1	Slightly Reduced = 2
Summary: 3.74% of the overall HLCA would be permanently lost or removed by development, this includes the removal of 0.22% of open fields and 3.52% of scrub and woodland.				

Table 2.25 : Overall magnitude of direct physical impacts on HLCA 21: Dowlais

Score	Grading
(1 + 1 + 1 + 2) + (1 + 1 + 1 + 2) ÷ 2 + 1 = 6	Slight

2.1.13 HLCA 22: Pantcadifor, Rhyd-y-bedd and Caeracca

Pantcadifor, Rhyd-y-bedd and Caeracca is a roadside settlement dating from the late 1700s and was formerly associated with local quarries within the area. The area is characterised by later regular terrace houses, 20th century social housing and a large cemetery and two chapels. This HLCA encompasses areas to the north of the existing A465 between Pant Road in the west (chainage 14700) to the Hafod in the east (chainage 15100).

Plate 15. HLCA 22: Pantcadifor, Rhyd-y-bedd and Caeracca (Photo: Skeye 2017)

Absolute and relative direct physical impacts on HLCA 22 are presented in Table 2.26. The overall magnitude of these impacts is presented in Table 2.27.

Table 2.26 : Direct physical impacts on HLCA 22: Pantcadifor, Rhyd-y-bedd and Caeracca

Direct physical impacts - absolute				
Absolute Impact (Loss of Area): 1.7 ha of 67 ha = 2.55% of HLCA		Magnitude & Score: Very Slight = 1		
Direct physical impacts - relative				
Elements lost	**Site Category**	**Magnitude**	**Landscape Value**	**Landscape Value Effect**
Open fields. 0.5 ha would be permanently removed (0.75% of HLCA)	C = 2	Very Slight = 1	Very Low = 1	Slightly Reduced = 2
Scrub and woodland. 0.5 ha would be permanently removed (0.75% of HLCA)	D = 1	Very Slight = 1	Very Low = 1	Slightly Reduced = 2
Modern hardstanding. 0.2 ha would be permanently removed (0.30% of HLCA)	D = 1	Very Slight = 1	Very Low = 1	Slightly Reduced = 2
Existing tracks and roads. 0.5 ha would be permanently removed / altered (0.75% of HLCA)	D = 1	Very Slight = 1	Very Low = 1	Slightly Reduced = 2
Summary: 2.55% of the overall HLCA would be permanently lost or removed by development, this includes the removal of 0.75% of open fields and scrub and woodland, 0.30% of modern hardstanding and 0.75% of existing roads / tracks would be affected.				

Table 2.27 : Overall magnitude of direct physical impacts on HLCA 22: Pantcadifor, Rhyd-y-bedd and Caeracca

Score	Grading
(2 + 1 + 1 + 2) + (1 + 1 + 1 + 2) + (1 + 1 + 1 + 2) + (1 + 1 + 1 + 2) ÷ 4 + 1 = 6.25 (6)	Slight

2.1.14 HLCA 24: Pengarnddu

The landscape of Pengarnddu is characterised by a transport corridor associated with the limestone quarries at Twynau Gwynion. The landscape also comprises extensive remains of the Dowlais Free Drainage System which comprises a system of reservoirs and leats which formerly provided water to the Dowlais Ironworks and pre-date the early 1800s. This HLCA encompasses areas to the north of the existing A465 between High Street in the east (chainage 16000) to the Hafod in the west (chainage 15100).

Plate 16. HLCA 24: Pengarnddu (Photo: Skeye 2017)

Absolute and relative direct physical impacts on HLCA 24 are presented in Table 2.28. The overall magnitude of these impacts is presented in Table 2.29.

Table 2.28 : Direct physical impacts on HLCA 24: Pengarnddu

Direct physical impacts - absolute				
Absolute Impact (Loss of Area): 4.66 ha of 88 ha = 4.30% of HLCA		Magnitude & Score: Slight = 2		
Direct physical impacts - relative				
Elements lost	**Site Category**	**Magnitude**	**Landscape Value**	**Landscape Value Effect**
Open fields. 3.38 ha would be permanently removed (3.84% of HLCA)	C = 2	Very Slight = 1	Low = 2	Slightly Reduced = 2
Scrub and woodland. 1.28 ha would be permanently removed (1.45% of HLCA)	D = 1	Very Slight = 1	Very Low = 1	Slightly Reduced = 2
Summary: 4.30% of the overall HLCA would be permanently lost or removed by development, this includes the				

removal of 3.84% of open fields and 1.45% of scrub and woodland.

Table 2.29 : Overall magnitude of direct physical impacts on HLCA 24: Pengarnddu

Score	Grading
(2 + 1 + 2 + 2) + (1 + 1 + 1 + 2) ÷ 2 + 2 = 8	Slight

2.1.15 HLCA 25: Dowlais Top

Dowlais Top comprises reclaimed industrial land which has been redeveloped and is characterised by modern buildings such as commercial, retail and light industry units. This HLCA encompasses areas to the north and south of the existing A465 between chainage 15200 and 16000.

Plate 15. HLCA 25: Dowlais Top (Photo: Skeye 2017)

Absolute and relative direct physical impacts on HLCA 25 are presented in Table 2.30. The overall magnitude of these impacts is presented in Table 2.31.

Table 2.30 : Direct physical impacts on HLCA 25: Dowlais Top

Direct physical impacts - absolute				
Absolute Impact (Loss of Area): 0.17 ha of 67 ha = 0.25% of HLCA		Magnitude & Score: Very Slight = 1		
Direct physical impacts - relative				
Elements lost	**Site Category**	**Magnitude**	**Landscape Value**	**Landscape Value Effect**
Scrub and woodland. 0.12 ha would be permanently removed (0.18% of HLCA)	D = 1	Very Slight = 1	Very Low = 1	Slightly Reduced = 2
Existing tracks and roads. 0.05 ha would be permanently removed / altered (0.07% of HLCA)	D = 1	Very Slight = 1	Very Low = 1	Slightly Reduced = 2

Summary: 0.25 % of the overall HLCA would be permanently lost or removed by development, this includes the removal of 0.18% of scrub and woodland and 0.05 % of existing tracks and roads.

Table 2.31 : Overall magnitude of direct physical impacts on HLCA 25: Dowlais Top

Score	Grading
(1 + 1 + 1 + 2) + (1 + 1+ 1 + 2) ÷ 2 + 1 = 6	Slight

2.1.16 Summary

A summary of overall magnitude of direct impacts on each HLCA is presented in Table 2.32.

Table 2.32 : Summary of overall magnitude of direct impacts on HLCAs.

HLCA	Name	Score	Magnitude
HLCA 7	Coed Meurig	13.5 (13)	Moderate
HLCA 10	Taf Fawr River Valley	8.5 (9)	Moderate
HLCA 11	Cefn-coed-y-cymmer	6	Slight
HLCA 12	Cefn Coed Cemetery & Jewish Burial Ground and Essential Setting with Significant Views	10	Moderate
HLCA 13	Taf Fechan	6	Slight
HLCA 14	Graig Quarry and Tramroad	6	Slight
HLCA 15	Y Graig, Gurnos	11	Moderate
HLCA 17	Gurnos Farm and Bunkers Hill	8.75 (9)	Moderate
HLCA 18	Gurnos and Galon-Uchaf	6	Slight
HLCA 19	Bon-y-maen	7.33 (7)	Slight
HLCA 20	Bryniau Quarries	7.66 (8)	Slight
HLCA 21	Dowlais	6	Slight
HLCA 22	Pantcadifor, Rhyd-y-bedd and Caeracca	6.25 (6)	Slight
HLCA 24	Pengarnddu	8	Slight
HLCA 25	Dowlais Top	6	Slight

3. Stage 3: Assessment of Indirect Impacts

Stage 3 describes and quantifies the indirect impacts of the development on all HLCAs affected by the proposed scheme. Indirect impacts are categorised as being mainly physical or visual in nature. Physical impacts can result from an increased risk of exposure, increased management needs, the severance, fragmentation or alteration of related elements, the frustration of historic land use practices or a frustration of access. Indirect non-physical (visual) impacts can occur as a result of impacts on elements of an HLCA from which a development can be seen, impact on the visual connection between elements, the creation of inappropriate connections between elements and visual impact of the development itself resulting from its form or appearance.

Indirect non-physical (visual) impacts have been identified as a result of a walkover survey. HLCAs predicted to experience indirect non-physical (visual) impacts as a result of the proposed scheme are presented in Table 3.1 and shown on Figure 1 (Annex 3).

Table 3.1 : HLCAs which would experience indirect non-physical impacts from the proposed scheme

HLCA	Name
HLCA 7	Coed Meurig
HLCA 10	Taf Fawr River Valley
HLCA 11	Cefn-coed-y-cymmer
HLCA 12	Cefn Coed Cemetery & Jewish Burial Ground and Essential Setting with Significant Views
HLCA 13	Taf Fechan
HLCA 14	Graig Quarry and Tramroad
HLCA 15	Y Graig, Gurnos
HLCA 17	Gurnos Farm and Bunkers Hill
HLCA 18	Gurnos and Galon-Uchaf
HLCA 19	Bon-y-maen
HLCA 20	Bryniau Quarries
HLCA 21	Dowlais
HLCA 22	Pantcadifor, Rhyd-y-bedd and Caeracca
HLCA 24	Pengarnddu
HLCA 25	Dowlais Top
HLCA 26	Dowlais Great Tip, Trecatti, Trehir and Twyn-y-Waun

3.1 Results of Assessment

The proposed scheme would indirectly impact 16 of the 79 HLCAs that contribute to the MTLOHI. Indirect physical and non-physical impacts on each HLCA are presented in Table 3.2 to Table 3.33. A summary of the magnitude of indirect impacts on each HLCA is presented in Table 3.34.

3.1.1 HLCA 7: Coed Meurig

Table 3.2 : Indirect physical and non-physical impacts on HLCA 7: Coed Meurig

Indirect, physical impacts		
Impacts	**Category and Score**	**Magnitude and Score**
Severance of fields within a unified landscape from one another	C = 2	Slight = 2
Frustration of historic landscape use	C = 2	Slight = 2
Indirect (non-physical) visual impacts		
Impacts	**Category and Score**	**Magnitude and Score**
Development form and appearance – embanked road introduced into landscape element	C = 2	Moderate = 3

Table 3.3 : Overall magnitude of indirect physical and non-physical impacts on HLCA 7: Coed Meurig

Score	**Grading**
(2 + 2) + (2 + 2) ÷ 2 = 4 (2 + 3) ÷ 1 = 5 (4 + 5) x 28 ÷ 20 = 12.6 (13)	Moderate

3.1.2 HLCA 10: Taf Fawr River Valley

Table 3.4 : Indirect physical and non-physical impacts on HLCA 10: Taf Fawr River Valley

Indirect, physical impacts		
Impacts	**Category and Score**	**Magnitude and Score**
Amenity value of woodland element reduced	U = 1	Slight = 2
Amenity value of field element reduced	U = 1	Slight = 2
Indirect (non-physical) visual impacts		
Impacts	**Category and Score**	**Magnitude & Score**
Development form and appearance – introduction of bridge and supports into woodland elements	U = 1	Severe = 5
Development form and appearance – introduction of bridge and supports into field elements	U = 1	Severe = 5

Table 3.5 : Overall magnitude of indirect physical and non-physical impacts on HLCA 10: Taf Fawr River Valley

Score	**Grading**
(1 + 2) + (1 + 2) ÷ 2 = 3 (1 + 5) + (1 + 5) ÷ 2 = 6 (3 + 6) x 28 ÷ 20 = 12.6 (13)	Moderate

3.1.17 Summary

A summary of overall magnitude of direct impacts on each HLCA is presented in Table 3.34.

Table 3.34 : Summary of overall magnitude of indirect impacts on HLCAs.

HLCA	**Name**	**Score**	**Magnitude**
HLCA 7	Coed Meurig	12.6 (13)	Moderate
HLCA 10	Taff Fawr River Valley	12.6 (13)	Moderate
HLCA 11	Cefn-coed-y-cymmer	4.2 (4)	Slight
HLCA 12	Cefn Coed Cemetery & Jewish Burial Ground and Essential Setting with Significant Views	16.8 (17)	Considerable
HLCA 13	Taf Fechan	3.5 (4)	Slight
HLCA 14	Graig Quarry and Tramroad	8.4 (8)	Slight
HLCA 15	Y Graig, Gurnos	10.72 (11)	Moderate
HLCA 17	Gurnos Farm and Bunkers Hill	13.06 (13)	Moderate
HLCA 18	Gurnos and Galon-Uchaf	8.4 (8)	Slight
HLCA 19	Bon-y-maen	4.9 (5)	Slight
HLCA 20	Bryniau Quarries	12.6 (13)	Moderate
HLCA 21	Dowlais	9.8 (10)	Moderate
HLCA 22	Pantcadifor, Rhyd-y-bedd	10.5 (11)	Moderate

HLCA	Name	Score	Magnitude
	and Caeracca		
HLCA 24	Pengarnddu	14.46 (14)	Considerable
HLCA 25	Dowlais Top	4.2 (4)	Slight
HLCA 26	Dowlais Great Tip, Trecatti, Trehir and Twyn-y-Waun	5.6 (6)	Slight

4. Stage 4: Evaluation of Relative Importance

Stage 4 evaluates the relative importance of the HCLAs directly and / or indirectly affected by the development, undertaken in relation to:

a) the whole of the HLCA concerned;

b) the whole of the historic landscape on the Register; and

c) an evaluation of the relative importance of affected HLCAs in a national context and a determination of the average overall value of the HLCAs affected.

It has been established that the proposed scheme would result in a direct physical impact on 15 HLCAs (as set out in Table 2.1) and indirect non-physical impacts on 16 HLCAs (as set out in Table 3.1) of this report. An evaluation of the relevant importance of each HLCA is presented in Tables 4.3 to 4.17 A summary of the average overall values for HLCAs affected by the proposed scheme is presented in Table 4.18.

It should be noted that in relation to nine of the 16 HLCAs, this concerns: Cefn-coed-y-cymmer (HLCA 11), Taf Fechan (HLCA 13), Graig Quarry and Tramroad (HLCA 14), Gurnos and Galon-Uchaf (HLCA 18), Bon-y-maen (HLCA 19), Bryniau Quarries (HLCA 20), Dowlais (HLCA 21), Pantcadifor, Rhyd-y-bedd and Caeracca (HLCA 22) and Dowlais Top (HLCA 25), the elements of these HLCAs which are included within the footprint of the proposed scheme comprise scrub and woodland, existing roads / tracks / bridges and areas of existing modern hardstanding. Therefore only one table, Table 4.1 has been included which is relevant to each of these nine HLCA, to ensure unnecessary duplication of tables.

Table 4.1 : Evaluation of relative importance HLCA 11, 13, 14, 18, 19, 20, 21, 22 and 25

These nine HLCAs comprise residential settlements, transport corridors, industrial extractive and modern urban landscapes. The small elements within these HLCAs which would be effected by the proposed scheme comprise scrub and woodland, existing roads/tracks/bridges and areas of existing modern hardstanding. These elements are not listed as key characteristics for the HLCAs, therefore these areas have been assessed to be of Very Low overall value in relation to the Registered Landscape as a whole and nationally (see Table 4.2).

Table 4.2 : Overall score for evaluation of relative importance stages a) – c) for HLCA 11, 13, 14, 18, 19, 20, 21, 22 and 25

Score a	Score b	Score c	Overall Score
(11 x Poor @ 1) = 11 ÷ 55 x 100 = 20	(11 x Poor @ 1) = 11 ÷ 55 x 100 = 20	(11 x Poor @ 1) = 11 ÷ 55 x 100 = 20	(20 + 20 + 20) ÷ 16 = 3.75

4.1.1 HLCA 7: Coed Meurig

HLCA 07 (Coed Meurig) comprises an agricultural landscape characterised by traditional drystone and hedged boundaries and sheep pens. The area includes a number of post-medieval farms, areas of ancient woodland and only minor intrusion from historic industrial activity. The elements within this HLCA which would be affected by the proposed scheme comprise woodland, open fields, tracks and scrub and woodland. Only a small part of these elements are key characteristics for the HLCA (such as the woodland and open fields), therefore the areas of the HLCA which would be effected by the proposed scheme have been assessed to be of Low overall value in relation to the Registered Landscape as a whole and nationally (see Table 4.4).

Table 4.4 : Overall score for evaluation of relative importance stages a) – c) for HLCA 07 Coed Meurig.

Score a	Score b	Score c	Overall Score
(2 x Very High @ 5) + (2 x High @ 4) + (1 x Moderate @ 3) + (5 x Low @ 2) + (1 x Poor @ 1) = 32 ÷ 55 x 100 = 58.18	(1 x Very High @ 5) + (3 x High @ 4) + (1 x Moderate @ 3) + (4 x Low @ 2) + (2 x Poor @ 1) = 30 ÷ 55 x 100 = 54.54	(1 x Very High @ 5) + (1 x High @ 4) + (4 x Moderate @ 3) + (3 x Low @ 2) + (2 x Poor @ 1) = 29 ÷55 x 100 = 52.72	(58.18 + 54.54 + 52.72) ÷ 16 = 10.34

HLCA 10 (Taf Fawr River Valley) comprises the valley of the Afon Taf to the north of the Cyfarthfa Ironworks. The character of the area has been affected by the establishment of Cefn Cemetery in 1858. The area also formed the corridor of the construction railway for the Llwyn-Onn Reservoir, built between 1914 and 1927. The elements within this HLCA which would be affected by the proposed scheme comprise woodland, open fields and scrub and woodland. These elements are not listed as key characteristics for the HLCAs, therefore these areas which would be affected have been assessed to be of Low overall value in relation to the Registered Landscape as a whole and nationally (see Table 4.6).

Table 4.6 : Overall score for evaluation of relative importance stages a) – c) for HLCA 10: Taf Fawr River Valley.

Score a	Score b	Score c	Overall Score

HLCA 12 (Cefn Coed Cemetery & Jewish Burial Ground and Essential Setting with Significant Views) comprises the Cefn Coed Cemetery which is still extant in its original layout. This area is also included within a Registered Park and Garden. The area experiences intrusion from the existing A465 and A470 road network. The area within the proposed scheme comprises of scrub and woodland associated with the Registered Park and Garden and thus has been assessed to be of Low overall value in relation to the Registered Landscape as a whole and nationally (see Table 4.8).

Table 4.8 : Overall score for evaluation of relative importance stages a) – c) for HLC 12: Cefn Coed Cemetery & Jewish Burial Ground and Essential Setting with Significant Views

HLCA 15 (Y Graig, Gurnos) comprises an area of scrubland, open fields and trackways. The area is a remnant of land associated with Gurnos Farm, but severed from it by the existing A465. Historic mapping shows that the area contained a network of tracks leading to the Taf Fechan Valley and the Gurnos Quarry and lime kilns. A small number of extractive features are present, possibly gravel pits. HLCA 15 has been assessed to be of Low overall value in relation to the Registered Landscape as a whole and nationally (see Table 4.10).

Table 4.10 : Overall score for evaluation of relative importance stages a) – c) for HLCA 15: Y Graig, Gurnos

HLCA 17 (Gurnos Farm and Bunkers Hill) comprises an agricultural landscape characterised by medium-large regular enclosures with associated dry stone walls. It also includes a transport corridor comprising a tramroad to Morlais Castle Quarries, and a possible route of a Roman road associated with the crossing of the Taf Fechan at Pont Sarn. The elements within this HLCA which would be affected by the proposed scheme comprise woodland, open fields, tracks and scrub and woodland. Only the open fields are listed as a key characteristic for this HLCA, therefore the areas that would be effected have been assessed to be of Low overall value in relation to the Registered Landscape as a whole and nationally (see Table 4.12).

Table 4.12 : Overall score for evaluation of relative importance stages a) – c) for HLCA 17 Gurnos Farm and Bunkers Hill

Score a	Score b	Score c	Overall Score
(2 x Very High @ 5) + (2 x High @ 4) + (1 x Moderate @ 3) + (5 x Low @ 2) + (1 x Poor @ 1) = 32 ÷ 55 x 100 = 58.18	(1 x Very High @ 5) + (2 x High @ 4) + (2 x Moderate @ 3) + (4 x Low @ 2) + (2 x Poor @ 1) = 29 ÷ 55 x 100 = 52.72	(1 x Very High @ 5) + (1 x High @ 4) + (4 x Moderate @ 3) + (3 x Low @ 2) + (2 x Poor @ 1) = 29 ÷55 x 100 = 52.72	(58.18 + 52.72 + 52.72 ÷ 16 = 10.22

HLCA 24 (Pengarnddu) comprises a transport corridor associated with the limestone quarries at Twynau Gwynion. The landscape also comprises extensive remains of the Dowlais Free Drainage System. The elements within this HLCA which would be affected by the proposed scheme comprise open fields, scrub and woodland and reservoirs. Only the reservoir is listed as a key characteristic for this HLCA, therefore the areas which would be effected have been assessed to be of Low overall value in relation to the Registered Landscape as a whole and nationally (see Table 4.14).

Table 4.14 : Overall score for evaluation of relative importance stages a) – c) for HLCA 24: Pengarnddu

Score a	Score b	Score c	Overall Score
(4 x High @ 4) + (3 x Moderate @ 3) + (2 x Low @ 2) + (2 x Poor @ 1) = 31 ÷ 55 x 100 = 56.36	(2 x High @ 4) + (2 x Moderate @ 3) + (3 x Low @ 2) + (4 x Poor @ 1) = 24 ÷ 55 x 100 = 43.63	(1 x High @ 4) + (2 x Moderate @ 3) + (2 x Low @ 2) + (6 x Poor @ 1) = 20 ÷ 55 x 100 = 36.36	(56.36 + 43.63 + 36.36 ÷ 16 = 8.52

HLCA 26 (Dowlais Great Tip, Trecatti, Trehir and Twyn-y-Waun) comprises an industrial landscape associated with Dowlais Ironworks. The area includes industrially altered upland Common: intensive area of extractive features; including early to mid-19th century coal and ironstone workings and dominated by tippings. HLCA 09 has been assessed to be of Very Low overall value in relation to the Registered Landscape as a whole and nationally (see Table 4.16).

Table 4.16 : Overall score for evaluation of relative importance stages a) – c) for HLCA 26: Dowlais Great Tip, Trecatti, Trehir and Twyn-y-Waun.

Score a	Score b	Score c	Overall Score
(1 x Low @ 2) + (10 x Poor @ 1) = 12 ÷ 55 x 100 = 21.81	(1 x Low @ 2) + (10 x Poor @ 1) = 12 ÷ 55 x 100 = 21.81	(1 x Low @ 2) + (10 x Poor @ 1) = 12 ÷ 55 x 100 = 21.81	(21.81 + 21.81 + 21.81 ÷ 16 = 4.08

4.1.8 Summary

Table 4.17 : Summary of overall scores for evaluation of relative importance and grade of overall value of each HLCA

HLCA	Score	Grade
HLCA 7. Coed Meurig	(58.18 + 54.54 + 52.72) ÷ 16 = 10.34	Low
HLCA 10: Taf Fawr River Valley	(43.63 + 36.36 + 45.45) ÷ 16 = 7.84	Low
HLCA 11: Cefn-coed-y-cymmer	(20 + 20 + 20) ÷ 16 = 3.75	Very Low
HLCA 12: Cefn Coed Cemetery & Jewish Burial Ground and Essential Setting with Significant Views	(52.72 + 32.72 + 27.27 ÷ 16 = 7.04	Low
HLCA 13: Taf Fechan	(20 + 20 + 20) ÷ 16 = 3.75	Very Low
HLCA 14: Graig Quarry and Tramroad	(20 + 20 + 20) ÷ 16 = 3.75	Very Low
HLCA 15: Y Graig, Gurnos	(38.18 + 45.45 + 34.54 ÷ 16 = 7.38	Low
HLCA 17: Gurnos Farm and Bunkers Hill	(58.18 + 52.72 + 52.72 ÷ 16 = 10.22	Low
HLCA 18: Gurnos and Galon-Uchaf	(20 + 20 + 20) ÷ 16 = 3.75	Very Low
HLCA 19: Bon-y-maen	(20 + 20 + 20) ÷ 16 = 3.75	Very Low
HLCA 20: Bryniau Quarries	(20 + 20 + 20) ÷ 16 = 3.75	Very Low
HLCA 21: Dowlais	(20 + 20 + 20) ÷ 16 = 3.75	Very Low
HLCA 22: Pantcadifor, Rhyd-y-bedd and Caeracca	(20 + 20 + 20) ÷ 16 = 3.75	Very Low
HLCA 24: Pengarnddu	(56.36 + 43.63 + 36.36 ÷ 16 = 8.52	Low
HLCA 25: Dowlais Top	(20 + 20 + 20) ÷ 16 = 3.75	Very Low
HLCA 26: Dowlais Great Tip, Trecatti, Trehir and Twyn-y-Waun	(21.81 + 21.81 + 21.81 ÷ 16 = 4.08	Very Low

Table 4.18: Overall score for evaluation of relative importance and grade of overall value of the MTLOHI

Score	Grade of overall value
10.34 + 7.84 + 3.75 + 7.04 + 3.75+ 3.75 + 7.38 + 10.22 + 3.75 + 3.75 + 3.75 + 3.75 + 3.75 + 8.52 + 3.75 + 4.08) ÷ 16 = 5.57 (6)	Low

4.2 Assessment of Value

Merthyr Tydfil Registered Historic Landscape is a fragmented industrial landscape with elements dating from the 17th to 19th centuries. The landscape comprised HLCAs ranging in value from Very Low to Low in relation to the entire landscape on the register as well as in a national context. HLCA 7, Coed Meurig, HLCA 10: Taf Fawr River Valley, HLCA 12: Cefn Coed Cemetery & Jewish Burial Ground and Essential Setting with Significant Views, HLCA 15: Y Graig, Gurnos, HLCA 17: Gurnos Farm and Bunkers Hill and HLCA 24: Pengarnddu have been assessed to be of Low value. The other 10 HLCAs have been assessed to be of Very Low value. The average overall value of the HLCAs has been assessed to be of Low value as a result of the contribution made by their industrial and agricultural character to our overall understanding of the landscape on the register.

5. Stage 5: Assessment of Overall Significance of Impact

Stage 5 combines the results of assessment undertaken during Stages 1 to 4. Stage 5 assesses the overall significance of the impact of the proposed scheme and the effect of it on the overall historic landscape area as recorded on the Register.

Overall significance is established through a scoring of the value of each HLCA affected in relation to the effect of the proposed scheme and the consequent reduction in value of the historic landscape area as recorded on the Register.

Table 5.1 presents an assessment of the value of each HLCA, the predicted impact of the proposed development on them and consequential reduction of the value of each HLCA on the register. Table 5.1 also presents the overall significance of impact the proposed scheme would have on each HLCA. The significance of impact has been determined with consideration of the value of the HLCA, the level of impact of the proposed scheme would have on the HLCA and the predicted reduction of the value of the HLCA due to that impact.

Table 5.1 : Value of and impact on HLCA as a result of the proposed development

HLCA	Value of HLCA	Impact of development	Reduction of Value of the HLCA on Register	Total Score for historic landscape character
HLCA 7 - Coed Meurig	Low – 2	Medium – 4	Low – 3	Slight
HLCA 10: Taf Fawr River Valley	Low – 2	Medium – 4	Low – 3	Slight
HLCA 11: Cefn-coed-y-cymmer	Very Low – 1	Low – 2	Very Low – 1	Slight
HLCA 12: Cefn Coed Cemetery & Jewish Burial Ground and Essential Setting with Significant Views	Low – 2	High - 7	Medium – 6	Moderate
HLCA 13: Taf Fechan	Very Low – 1	Very Low – 1	Very Low – 1	Very Slight
HLCA 14: Graig Quarry and Tramroad	Very Low – 1	Low – 3	Low – 2	Slight
HLCA 15: Y Graig, Gurnos	Low – 2	Low – 2	Low – 2	Slight
HLCA 17: Gurnos Farm and Bunkers Hill	Low – 2	Medium – 4	Medium – 4	Moderate
HLCA 18: Gurnos and Galon-Uchaf	Very Low – 1	Low – 2	Low – 2	Slight
HLCA 19: Bon-y-maen	Very Low – 1	Very Low – 1	Very Low – 1	Very Slight
HLCA 20: Bryniau Quarries	Very Low – 1	Medium – 4	Medium – 4	Slight
HLCA 21: Dowlais	Very Low – 1	Low – 3	Low – 3	Slight
HLCA 22: Pantcadifor, Rhyd-y-bedd and Caeracca	Very Low – 1	Low – 3	Low – 2	Slight
HLCA 24: Pengarnddu	Low – 2	Medium – 4	Medium – 4	Moderate
HLCA 25: Dowlais Top	Very Low – 1	Very Low – 1	Very Low – 1	Very Slight
HLCA 26: Dowlais Great Tip, Trecatti, Trehir and Twyn-y-Waun	Very Low – 1	Low - 2	Very Low - 1	Slight

Overall impact of development on the historic landscape on the Register: Slight

Defined by ASIDOHL2 as there will be some marginal land loss and / or visual intrusion to each of the HLCAs resulting in some elements to be removed or changed.

Reduction of value of the historic landscape on the Register: Medium to Very Low

Defined by ASIDOHL2 as the impact of a development on key elements of the historic landscape such that the value of some HLCAs will be changes but will still be appreciable, whilst other HLCAs will remain essentially unchanged.

5.1 Mitigation

Landscape survey work would provide a descriptive and interpretative record of the relevant landscape, producing an analysis of its development and use. Level 1 is a basic visual record of the location, date, type and condition of the monument in question. It comprises a written account and drawing and will be informed by consultation of readily available documentary information. Level 2 is a more detailed investigation than Level 1. It comprises a descriptive and interpretative record of the monument in question and its wider landscape, based on photographic, documentary and cartographic research.

Landscape survey to Level 1 standards (English Heritage, 2007) are proposed for Y Graig, Gurnos (HLCA 15).

The mitigation measures presented below will provide a record of the landscape associated with the Cefn Coed Cemetery and Jewish Burial Ground (HLCA 12) Grade II Registered Park and Garden in advance of construction.

The following measures are proposed for impacts predicted to result from construction:

- a Level 1 landscape survey (English Heritage, 2007); and
- a Level 2 landscape survey (English Heritage, 2007).

The following measures are proposed for impacts predicted to result from operation (please refer to ES Chapter 5: Proposed Scheme Description):

- sympathetic building materials and design; and
- landscaping and screen planting.

In addition, mitigation for individual heritage assets is provided within Chapter 9: Cultural Heritage of the ES on a case by case basis.

6. Concluding Statement

The proposed scheme comprises online dualling of the existing A465 between Hirwaun and Dowlais Top, with some off-line elements at the Hirwaun end. The A465 runs east to west and bisects the northern half of the MTLOHI. The MTLOHI comprises 79 distinct HLCAs, the majority of which have a connection to the extractive and mineral processing industries prevalent in the area from the late eighteenth to the early twentieth centuries. It is this industrial heritage that gives the MTLOHI its distinctive character.

Assessment has identified 15 HLCAs that would experience direct physical impacts as a result of construction of the proposed scheme. Sixteen HLCAs would also experience an indirect (non-physical) visual impact as a result of operation of the proposed scheme. The relative importance of impacted areas of the HLCAs has been assessed to be Low overall.

HLCAs predicted to experience an impact as a result of the proposed scheme demonstrate an agricultural or otherwise non-industrial character (e.g. HLCA 7, HLCA 10, HLCA 12, and HLCA 17), poor legibility (HLCA 15), residential settlement (e.g. HLCA 11, HLCA 21 and HLCA 22), industrial (e.g. HLCA 14 and HLCA 20) or comprise predominantly industrial land (e.g. HLCA 18, HLCA 19, HLCA 25 and HLCA 26).

The overall impact of the development on the historic landscape on the Register has been assessed to be Slight. This is a result of professional judgement in consideration of the following:

- Assessment has identified High impact on one HLCA, Medium impacts on five HLCAs, Low impacts on seven HLCAs and Very Low impacts on the remaining three HLCAs;
- Of the HLCAs, the proposed scheme would only have an impact on two industrial historic landscapes within the MTLOHI. This concerns HLCA 14: Graig Quarry Tramroad on which a Low impact is predicted to occur and HLCA 20: Bryniau Quarries on which a Medium value impact is predicted to occur. However the value of the areas of these HLCAs which would be impacted has been assessed to be very low given that they comprise scrub and woodland;
- The proposed scheme would be seen in the context of the existing A465. While new elements of infrastructure would be visible from 16 of the 79 HLCAs comprising the historic landscape on the register, this would not:
    - impact on visual connections between related elements within the historic landscape on the Register or those within individual HLCA;
    - create inappropriate visual connections between elements; or
    - visually intrude or encroach on the historic landscape on the Register.

Overall, the proposed scheme would impact on the historic landscape on the Register in such a way that identified physical impacts are unlikely to affect its overall value. However, the proposed scheme may result in a Medium to Very Low (non-physical) reduction in the overall value of the landscape due to the introduction of new elements of infrastructure into the landscape.

Annex 1 – Legislative and Policy Background

Legislation or policy	Relevant points
The Highways Act 1980	The Highways Act 1980 is an Act of the Parliament dealing with the management and operation of the road network in England and Wales. It consolidates (with amendments) several earlier pieces of legislation.
Planning (Listed Buildings and Conservation Areas) Act 1990	Planning authorities are required to have special regard to the desirability of preserving a Listed Building, its setting or any features of special architectural or historic interest which it may possess. Designation as a Listed Building provides planning authorities with additional controls over the demolition and alteration of historic buildings through the process of gaining Listed Building Consent (LBC).
Wales Spatial Plan (Welsh Assembly Government, 2008)	The Wales Spatial Plan (WSP) sets out to ensure that planning proposals throughout Wales are integrated, sustainable and made in compliance with the shared vision described in the WSP for managing change in the historic environment.
Planning Policy Wales Edition 9 (PPW) (Welsh Assembly Government December 2016)	Local authorities to consider protection of the historic environment in decision-making and in the preparation of their plans and strategies.
Circular 60 / 96 Planning and the Historic Environment: Archaeology (Welsh Government, 1996a)	Where nationally important designated or undesignated archaeological remains are likely to be affected by a proposed development there should be a presumption in favour of their preservation in situ. Remains of local or regional importance may also be worthy of preservation in situ or, alternatively, preservation by record.
Historic Environment (Wales) Act, 2016	An Act of the National Assembly of Wales to make provision amending certain aspects of the law relating to scheduled monuments and Listed Buildings; to establish a Register of Historic Parks and Gardens; to require local planning authorities to establish historic environment records relating to their areas; to establish an Advisory Panel for the Welsh Historic Environment; and for connected purposes.
Circular 61 / 96 Planning and the Historic Environment: Historic Buildings and Conservation Areas (Welsh Government , 1996b)	A central objective of central government policy is to secure the preservation of Listed Buildings and any features of special architectural or historic interest which they might possess.
Technical Advice Note (Wales) 12: Design (Welsh Government, 2014)	The setting and views of historic buildings, parks and gardens and archaeological sites should be considered during the planning process and the design of a development of a proposed scheme and, if necessary, how setting and views should be protected.
Rhondda Cynon Taf County Borough Council Local Development Plan up to 2021 (LDP) (Adopted March 2011) (RCTCBC, 2011)	Policy CS 1: Development in the North In the Northern Strategy Area the emphasis will be on building strong, sustainable communities. This will be achieved by:- 1. Promoting residential and commercial development in locations which will support and reinforce the roles of Principal Towns and Key Settlements; 2. Providing high quality, affordable accommodation that promotes diversity in the residential market; 3. Ensuring the removal and remediation of dereliction by promoting the re-use of under used and previously developed land and buildings; 4. Promoting large scale regeneration schemes in the Principal Town of Aberdare and in the Key Settlements of Mountain Ash, Ferndale and

Legislation or policy	Relevant points
	Treorchy; 5. Promoting accessibility by securing investment in new roads, public transport improvements, walking and cycling; 6. Encouraging a strong, diverse economy which supports traditional employment and promotes new forms of employment in the leisure and tourism sectors; 7. Protecting the cultural identity of the Strategy Area by protecting historic built heritage and the natural environment, 8. Promoting and enhancing transport infrastructure services to support growth and investment, and 9. Reducing daily out commuting by private car and promoting sustainable forms of travel. Policy EB101: The Historic Built Environment (SPG) 2010 This Supplementary Planning Guidance (SPG) gives detailed guidance to owners and occupiers of land and buildings within the historic built environment, and anyone wishing to develop within it or make alterations to it, and is a material consideration in the determination of relevant planning applications.
Merthyr Tydfil County Borough Council Local Development Plan 2006-2021 (LDP) (Adopted May 2011) (MTCBC, 2011)	*Strategic Objective 11* To ensure the continued protection and enhancement of the natural, cultural, built and historic environment. *Policy BW6: Townscape and Built Heritage* The Council will protect and support the enhancement of the unique built heritage of the County Borough. Development proposals will only be permitted where it can be demonstrated they would preserve or enhance the architectural quality, character and setting of any of the following: 1. Listed Buildings; 2. Scheduled Ancient Monuments; 3. Conservation Areas; 4. Registered Historic Parks and Gardens of Special Historic Interest; 5. townscape character and the local distinctiveness of settlements; and 6. other historic, archaeological and cultural features of acknowledged importance. Policy AS4: Historic Landscape There will be a presumption in favour of the protection, conservation and enhancement of: 1. Gelligaer Common, and 2. the main settlement of Merthyr Tydfil in accord with their status as landscapes of Historic Interest in Wales. The extent of these areas is shown on the LDP Proposals Map and proposals for development will only be permitted where they would maintain or enhance the character and integrity of the landscape.

Annex 2 – Citation in Register

Merthyr Tydfil occupies a natural basin at the head of the Taf valley. High hills and ridges reach 450 m above OD on all sides, with development constrained to the basin floor and smaller tributary valleys of the Taf, which itself provides the only natural route out of the basin to the south east. However, it is not topography alone that has shaped the town, but the mineral resources contained within its hinterland. It was probably the largest iron-making town in the world in the early to mid-1900s, with an output calculated to be a quarter of that of the entire United States of America. The town, and its associated landscape, was rapidly transformed from a modest village in the 1750s to the largest town in Wales by 1801.

Despite extensive recent land reclamation and the sanitisation of the surrounding waste tips, overall Merthyr still retains its industrial landscape character as the most significant Welsh town of the Industrial Revolution. The town and its environs remain a potent example of an internationally renowned industrial landscape of the 18th and 19th centuries and a permanent reminder of man's exploitation of the landscape.

The primarily late 18th to 19th centuries landscape comprises numerous relict elements and foci set within the present landscape. These individual elements consist of the remains of large ironworks, remnants of the associated coal mining industry, water power eats, an early iron bridge, communication systems, including early tramroads, tips, terraced industrial housing, and the ironmasters house, Cyfarthfa Castle. Merthyr Tydfil, however, retains not only its economic significance, but also its importance as a religious, literary and political centre.

The area identified here contains many and diverse elements, which include Merthyr's Dowlais Ironworks, established in 1759, and probably the first such works to use coke in South Wales. It was followed by the foundation of other ironworks such as Plymouth in 1763, Cyfarthfa in 1765 and Penydarren in 1784. Other subsidiary works were created in the early 19th century at Ynysfach by Cyfarthfa, Ivor by Dowlais, Dyffryn by Plymouth, with further forges at Pentrebach, a part of Plymouth.

Surviving remains include the renowned furnace bank at the Cyfarthfa Ironworks, where six out of its seven late 18th century blast-furnaces, and its ranges of calcining kilns, survive substantially intact. At the Dowlais Ironworks the remains include the great stables and the blast-engine house, which have been restored. The remains of the Ynysfach Ironworks consist of one blast engine house and four early 19th century furnaces. The engine house is also restored and acts as a museum of the iron industry.

Locally, early communication systems survive, though to varying degrees. Adjoining the Cyfarthfa Ironworks lies the Pontycafnau bridge built in 1793, and the first ever iron railway bridge to be built. The bridge has added significance in that it had a combined use as an aqueduct. The Gurnos tramroad which used the Pontycafnau bridge carried limestone from the Gurnos quarries and exists today as a scenic footpath retaining its stone sleeper blocks. The remains of limekilns and fulling mills survive on either side of the route. Elsewhere, the line of the Penydarren tramroad, built in 1802 to carry iron by horse-drawn tram, survives and is also historically significant as the route of the first steam-hauled railway journey by Richard Trevithick's 1804 locomotive. The tramroad also includes a tunnel constructed under the Plymouth Ironworks.

Short sections of the famous Glamorganshire Canal, built in the 1790s, also survive as important landscape features, including a restored section in front of Chapel Row. This is crossed by the relocated Rhydycar bridge which is an early iron girder bridge dating from the 1790s. Chapel Row itself was built by the Cyfarthfa Iron Company as workers' houses, one of which is restored, both as an example of a period ironworker's cottage and also as the birthplace of the renowned composer Dr Joseph Parry. In a sharp distinction which reflects the other social extreme of the Merthyr ironmasters' activities, Cyfarthfa Castle, overlooking the Cyfarthfa Ironworks, was the largest and grandest ironmaster's house in Merthyr Tydfil, and amongst the most notable surviving industrialist's house in Wales. The house is situated in 64 ha of grounds, which were landscaped by the Crawshay family to include woodlands and a lake. This grand house and its parkland setting also provide an interesting and important contrast to the other relict landscape features of Merthyr.

STRUCTURE OF THE ENVIRONMENTAL STATEMENT

The proposed scheme would commence at Abergavenny and terminate at Hirwaun, and has been divided into seven Sections:

Section One:	Abergavenny to Gilwern
Section Two:	Gilwern to Brynmawr
Section Three:	Brynmawr to Tredegar
Section Four:	Tredegar to Dowlais Top
Section Five:	Dowlais Top to A470 Junction
Section Six:	A470 Junction to Baverstock
Section Seven:	Baverstock to Hirwaun

The draft Line Order would apply to all Sections. In addition, draft Side Roads Orders and Compulsory Purchase Orders have been published for Sections One and Four.

An environmental assessment has been undertaken of the proposed scheme and each of its Sections. This Environmental Statement reports the results of the environmental assessment. The Environmental Statement comprises two Volumes and a Non-Technical Summary.

The Non-Technical Summary provides a bilingual (English and Welsh) summary, in non-technical language, of the environmental assessment. It is available as a separate document and is also bound into the front of Volume 1.

Volume 1 of the Environmental Statement provides a more detailed report of the environmental assessment and comprises the following documents:

Volume 1.0	Introduction to the Environmental Assessment
Volume 1.1	Assessment of Section One: Abergavenny to Gilwern
Volume 1.2	Assessment of Section Two: Gilwern to Brynmawr
Volume 1.3	Assessment of Section Three: Brynmawr to Tredegar
Volume 1.4	Assessment of Section Four: Tredegar to Dowlais Top
Volume 1.5	Assessment of Section Five: Dowlais Top to A470 Junction
Volume 1.6	Assessment of Section Six: A470 Junction to Baverstock
Volume 1.7	Assessment of Section Seven: Baverstock to Hirwaun
Volume 1.8	Summary and Overall Assessment of Proposed Scheme
Volume 1.9	Drawings Folder

Volume 2 provides the detailed environmental assessment of certain environmental factors, and comprises the following specialist reports:

Volume 2.1	Air Quality
Volume 2.2	Cultural Heritage and Gazeteer
Volume 2.3	Ecology
Volume 2.4	Landscape and Visual (including Visual Impact Schedules)
Volume 2.5	Noise

This document comprises Volume 2.2 Cultural Heritage.

Glossary

Ashlar
decorative masonry formed from stone blocks which fit accurately together so that only fine mortar joints are required between them. The blocks are finely worked and the external faces are finished to form a uniform, flat surface.

Adit
a tunnel into a coal level, used either as an entrance to the mine or as a means of drainage.

Barrow
includes several types of earth covered funerary mounds with cremated or inhumed remains, primarily dating from the Neolithic (long barrows) and Early Bronze Age (round barrows) periods.

Cairn
a stone mound covering a cremation or inhumation found mainly in the Bronze Age periods.

Cropmark
a mark visible on aerial photographs caused by differential growth and colouration of field of crops over the archaeological features.

Crows-foot tips
a series of early spoil heaps formed by tipping from a barrow or cart forming a distinctive star-shaped pattern.

Find-spot
the site of a random or isolated or stray find which may indicate further archaeological material is present nearby.

Holloway
an early farm or parish road consisting of an unmetalled surface surrounded by high banked hedges formed through the erosion over time of the track.

Leat
an artificial watercourse made to channel water from source to an area for industrial usage.

Lithic scatter
a series of flint artifacts found on the surface and usually exposed by erosion or ploughing. Dating from the Palaeolithic to Early Bronze Age periods.

Motte and bailey castle
a defensive structure erected during the early stages of the Norman invasion consisting of a large artificial mound, or motte, surmounted by a wooden, and later a stone, keep (tower). The whole structure was surrounded by a large wooden bailey, often later replaced by a stone curtain wall.

Palaeoenviromental
the scientific technique of determining ancient landscapes and environment and climate characteristics from looking at macro fossils, pollen and faunal remains, often from within wetland sites.

Relict palaeosols
an ancient soil surface which has survived, often by being completely buried (e.g. under barrows).

Rusticated masonry
stone that has been worked on the external face to produce different effects from cyclopean (or rock-faced) to vermiculated (a worm-track effect).

Ridge & Furrow
the pattern formed by strip farming of land based on the medieval system of 'open' field agriculture. Medieval ridge and furrow tends to form the soil into a larger series of troughs and banks than those found in post-medieval ridge and furrow.

Stratified deposits
the layers of natural/soils and man-made deposits which build up over a long timespan on an archaeological site. The stratigraphy can be examined to determine the sequence and timespan of the site.

Tramroad
a rail or plateway carrying goods carts/trams and usually drawn by ponies.

Turfstone walling
boundary walls formed from an internal drystone core covered by a layer of earth and turves for added stability.

Quoins
the stones found at the corner of an external wall which support the greater stresses found there; usually of higher quality than ordinary stonework.

Voussoirs
the wedged-shaped blocks of stone which form the curve of an arch.

1.0 Introduction

1.1 Introduction to Cultural Heritage

1.1.1 The modern landscape is the result of human activity over thousands of years. It contains traces of settlements and of remains of human actions going back over 10,000 years. Many of these traces are not obvious and are often found as sub-surface remains or as field and enclosure systems. The remains of castles and abbeys are perhaps obvious but equally obvious and relevant are the remains of industrial workings and buildings whose impact on both the landscape and the fabric of society have been great. Archaeological remains are a finite and non-renewable resource, often vulnerable to damage and destruction.

1.2.1 Current Legislative and Policy Framework

1.2.2 The 1979 Ancient Monuments and Archaeological Areas Act is the primary legislation for cultural heritage remains and, among other issues, deals with Scheduled Ancient Monuments and their protection.

1.2.3 The built heritage is generally dealt with and protected by the Planning (Listed Buildings and Conservation Areas) Act 1990 and Regulations (SI No 90/1519).

1.2.4 Cadw: Welsh Historic Monuments is an executive agency of the Welsh Office which has the responsibility for dealing with the archaeological and the built heritage of Wales.

1.2.5 The policy framework for dealing with archaeological remains and the built heritage in Wales is established in Planning Guidance for Wales (1996) and supplemented in WO Circular 60/96 Planning and the Historic Environment: Archaeology and in WO Circular 61/96 Planning and the Historic Environment: Historic Buildings and Conservation Areas. These policies establish that where nationally important archaeological remains, whether scheduled or not, and their settings are affected by proposed development there should be a presumption in favour of their physical preservation. Remains of local importance may also be particularly worthy of preservation and identified in development plans. Where preservation *in situ* is not possible the remains should be fully recorded.

1.2.6 It is an objective of central government policy to secure the preservation of historic buildings, and the demolition of Grade I or Grade II* listed buildings should occur only in wholly exceptional circumstances. The first option when considering the future of listed buildings should be the continuation or reinstatement of the original use of the building.

Within Conservation Areas the purpose of actions must be to either enhance or maintain the character or appearance of a Conservation Area.

1.2.7 Cadw is in the process of compiling a Register of Landscapes, Parks and Gardens of Special Historic Interest in Wales. A draft was issued for consultation in 1996. Although the Register conveys no statutory control, full account should be taken of Historic Landscapes, Parks and Gardens when dealing with development proposals.

1.2.8 As well as the designations of Scheduled Ancient Monuments, Listed Buildings and Conservation Areas (which are protected by the legislation identified in paragraphs 1.21 and 1.22), there are sites of historic interest which are not given statutory designations. These sites are usually protected from development by policies contained within Structure and Local Plans. They include:

- sites held on the regional Sites and Monuments Record (SMR); and
- sites identified as being of historic importance by the planning authority, for example, Historic Landscapes and Heritage Routes.

1.3 Purpose of the Assessment

1.3.1 The purpose of assessment of cultural heritage remains is:

- to determine the extent and importance of such remains;
- to consider their value;
- to identify the potential impacts of the proposed scheme, including their magnitude and significance; and
- to propose mitigation of the impact.

1.4 Layout of the Document

1.4.1 Volume 2.2 is organised in eleven chapters. This first chapter introduces the current legislative and policy framework concerning cultural heritage. The second is concerned with the methods used in the archaeological programme to date and outlines criteria for assessing site value and the magnitude and significance of impact. The third chapter describes the historical background of the area from prehistoric times to present day. Chapters 4 to 10 set out the existing cultural heritage data, the impacts and the mitigation proposals for each of the seven Sections. Chapter 11 summarises the key points of the assessment and provides its conclusions. The cultural heritage sites are described in detail in the Gazeteer. Supporting survey information is provided in the appendices.

2.0 Methods

2.1 Volume 11 of the Design Manual for Roads and Bridges

2.1.1 Volume 11 (Section 3, Part 2) of the Design Manual for Roads and Bridges (DMRB) outlines three stages of assessment for archaeological remains (DMRB, Chapter 8) and for the built heritage (DMRB, Chapter 13).

2.1.2 For assessment of both archaeological remains and the built heritage the three stages are broadly similar, but more detailed work is required at each stage in assessing archaeological remains, particularly at Stage 3. In view of the nature of the majority of the archaeological remains and the built heritage (i.e. most of the relevant built heritage is industrial archaeology), both aspects have been dealt with as a single study which covers Stages 2 and 3.

2.1.3 The study for Stages 2 and 3 was based on a brief prepared by Cadw for the Welsh Office (CO15L986 PP) and the proposals submitted by Babtie Group. The CADW brief outlined the key issues for study, which comprised:

- a walk-over survey;
- documentary research;
- a photographic survey; and
- an earthwork survey.

2.1.4 Stage 2 culminated in a report, which recommended further action including an archaeological evaluation and test-pit programme, and palaeoenvironmental and geophysical surveys. These recommendations were accepted by Cadw.

2.1.5 The study was carried out primarily within a corridor extending 50m either side of the proposed scheme, but went beyond this limit for extended sites or groups of sites and linear features. A wider search area was not deemed necessary, since the intention of the study was to focus on the Preferred Route which had already been announced (July 1995). The Stage 2 assessment started in January 1996 and the Stage 3 assessment in September 1996.

2.2 Stage 1 Assessment

2.2.1 The Stage 1 assessment was carried out by two organisations. The first, the Glamorgan-Gwent Archaeological Trust, was commissioned to do preliminary studies of the route and

published its report in 1994. This report was then supplemented in July 1995 by a rapid walkover survey of the route, including standing structures, by Dr. Peter Wakelin of Cadw. These two pieces of work highlighted the archaeological potential of the area, especially in terms of industrial archaeology.

2.2.2 The Stage 1 assessment included:

- the collation of all data held in the regional Sites and Monuments Record (SMR);
- a review of readily available vertical and oblique aerial photographic information;
- a review of first edition Ordnance Survey maps and other readily available historic maps; and
- field visits to determine the present condition of all known archaeological sites.

2.3 Stage 2 Assessment

2.3.1 The Stage 2 assessment was undertaken in 1996, and involved a detailed desk top study, a walkover survey, a photographic and ground survey of buildings, and a ground survey of earthwork sites, which excluded areas of dry stone or turf stone walling.

2.3.2 The desk top study included:

- collation of data on archaeological sites held by the regional SMR and confirmation of any new information added to the SMR since the Stage 1 assessment;
- information contained within Cadw's supplementary survey;
- information from Cadw relating to Scheduled Ancient Monuments, Listed Buildings and the Register of Historic Parks, Gardens and Landscapes;
- information on Listed Buildings and Conservation Areas held by the local planning authorities;
- examination of aerial photographs held by the Royal Commission on Ancient and Historical Monuments (Wales), as well as oblique aerial photographs of the proposed scheme which were commissioned by the Welsh Office Highways Directorate;
- the study of local information from museums and libraries and some personal recollections; and
- the commissioning of documentary and cartographic research, with Cadw's approval, from Mr. Philip Riden. The research involved examination of the Badminton Estate maps of the 18th Century, 19th Century tithe and Ordnance Survey maps, the Quarter Sessions deposited plans of public works in the Gwent Record Office and other secondary sources. Additional historical research has been undertaken by John van Laun.

2.3.3 The walkover survey involved:

- the whole 41.5 km length of the proposed scheme;
- the recording of all sites within a 50m corridor either side of the proposed scheme and in certain instances extending up to 100m, for example where linear or landscape features extended beyond the 50m corridor;
- the plotting of each site with a unique number on 1:2500 Ordnance Survey base maps;
- the compilation of field notes onto pro-forma recording sheets; and
- walking each parcel of land twice.

2.3.4 The photographic and ground survey was limited to buildings and structures most likely to suffer an impact:

- a photographic record of occupied buildings using 35mm and medium format cameras. 57 buildings and structures were recorded in this way; and
- a photographic record, supplemented by ground survey, of unoccupied buildings or structures. 20 buildings and structures were recorded in this way.

The photographs were taken for archiving purposes and are not included in this Environmental Statement.

2.3.5 Earthwork sites which were likely to suffer an impact due to their proximity to the proposed scheme boundaries (nine in number) were also subjected to ground survey.

2.3.6 The Stage 2 Assessment walkover survey recorded 282 sites and features of archaeological and cultural heritage interest which included leats, industrial buildings, earthwork sites, tramroads, industrial settlements, railways, Turnpike roads, culverts, farm buildings, holloways and landscapes of dry stone walls or turf walls.

2.3.7 The report from this Stage 2 assessment led to the Welsh Office commissioning further site surveys. These surveys formed the Stage 3 assessment.

2.4 Stage 3 Assessment

2.4.1 The Stage 3 assessment included:

- geophysical survey;
- the excavation of test pits;
- one palaeoenvironmental study; and
- archaeological evaluation trial trenches.

2.4.2 The details of these surveys are contained in sub-chapters 2.5 to 2.8.

2.5 Geophysical Survey

Introduction

2.5.1 Three geophysical survey locations were agreed with the Welsh Office to assist in assessing the archaeological potential of areas with no apparent archaeology in three distinct topographic zones, to ascertain whether further investigations (e.g. excavation) should be undertaken. Details are contained in Appendix I. The survey sites were selected on the basis of their perceived suitability on geological and topographical grounds as sites for past human activity. The three zones comprised the Usk Valley, the south-facing slopes to the east of Hirwaun, and upland pastures west of Cefn Coed-y-Cymmer. For the Usk Valley and the land east of Hirwaun it was considered that the underlying deposits were likely to be receptive to magnetometry. The upland areas were included to help assess the potential for and cost-effectiveness of geophysical survey on the remainder of the unimproved upland along the proposed scheme.

2.5.2 A general description of the survey areas follows:

- Area 1 east of Hirwaun, SO 9680 0530 to SO 9740 0550, Chainage 3900 to 4000, was on a south-facing slope above the River Cynon (Figure 22/24, Volume 1.9). The soil is a fine loamy upland type overlying sandstone.
- Area 2 west of Cefn Coed-y-Cymmer, SO 0230 0750 to SO 0270 0780, Chainage 30700 to 30950, was on a south-facing pasture slope (Figure 22/19, Volume 1.9). The soil is a fine loamy waterlogged upland type overlying sandstone.
- Area 3 east of Blaencarno Common, SO 0993 0928 to SO 1018 0936, Chainage 12350 to 12600 (Figure 22/14, Volume 1.9). The soil is a fine loamy waterlogged type overlying sandstone.
- Area 4 west near Pen-y-Worlod SO 2930 1340 to SO 2980 1320, Chainage 39400 to 39550, is in the River Usk valley (Figure 22/2, Volume 1.9). The soil is a coarse loamy type over sandstone.
- Area 4 west of River Usk SO 2850 1370 and SO 2870 1370, Chainage 40300 to 40750, is in the River Usk valley and close to the find spot of Neolithic and Bronze Age lithics at Llanfoist sewage treatment works (Figure 22/2, Volume 1.9).

2.5.3 The geophysical survey was undertaken by Stratascan between 21st and 28th January 1997 and used only magnetometry.

Magnetometry: technique and equipment configuration

2.5.4 Although the changes in the magnetic field resulting from differing features in the soil are usually weak, changes as small as 0.2 nanoTesla (nT) in an overall field strength of 48,000nT can be accurately detected using an appropriate instrument.

2.5.5 The mapping of the anomaly in a systematic manner will provide an indication of the type of material present beneath the surface. Strong magnetic anomalies will be generated by buried iron-based objects or by kilns or hearths. More subtle anomalies such as pits and ditches can be seen if they contain more humic material which is normally rich in magnetic iron oxides when compared with the subsoil. For example, the cutting and subsequent silting or backfilling of a ditch may result in a larger volume of weakly magnetic material being accumulated in the trench compared to the undisturbed subsoil. A weak magnetic anomaly should therefore appear in plan along the line of the ditch.

2.5.6 The magnetic survey was carried out using an FM36 Fluxgate Gradiometer, manufactured by Geoscan Research. The instrument consists of two fluxgates mounted 0.5m vertically apart, and very accurately aligned to nullify the effects of the earth's magnetic field. Readings relate to the difference in localised magnetic anomalies compared with the general magnetic background.

Sampling interval, depth of scan, resolution and data capture

2.5.7 Readings were taken at 0.5m centres along traverses 1m apart. This equates to 800 sampling points in a full 20m x 20m grid. All traverses were surveyed in a 'parallel' rather than 'zigzag' mode. The FM36 has a typical depth of penetration of 0.5m to 1.0m. This would be increased if strongly magnetic objects have been buried in the site. The collection of data at 0.5m centres provides an optimum resolution for the technique. The readings were logged consecutively into the data logger which in turn was daily down-loaded into a portable computer whilst on site. At the end of each survey area, data was transferred to the office for processing and presentation.

Processing, presentation of results and interpretation

2.5.8 Processing was performed using specialist software known as Geoplot 2. This can emphasise various aspects contained within the data but which are often not easily seen in the raw data. Basic processing of the magnetic data involves 'flattening' the background levels with respect to adjacent traverses and adjacent grids. 'Despiking' is also performed

to remove the anomalies resulting from small iron objects often found on agricultural land. Once the basic processing has flattened the background it is then possible to carry out further processing which may include low pass filtering to reduce 'noise' in the data and hence emphasise the archaeological or man-made anomalies.

2.5.9 The following schedule shows the basic processing carried out on all processed magnetometer data used in this report:

Zero mean grid	Threshold = 0.25 standard deviation
Zero mean traverse	Last mean square fit = off
Despike	X radius = 1 Y radius = 1
	Threshold = 3 standard deviation
	Spike replacement = mean

2.5.10 The presentation of the data for each site involves a print-out of raw data both as grey scale and trace plots, together with grey scale plots of the processed data and, if appropriate, after further processing to emphasise various aspects within the data. Magnetic anomalies have been identified and plotted into the 'Abstraction of Anomalies' drawing for each site (Figures 13, 19, 25 and 31), numbered for ease of reference.

2.6 Test Pit Programme

2.6.1 The test pit programme was designed to examine 16 areas along the proposed scheme which, although containing no obvious archaeology, were considered to have potential to contain archaeological remains on the basis of their topographic location in relation to the underlying geology. This programme was complementary to the geophysical survey. It was agreed that the areas should be sampled by the hand excavation of 69 pits, 2m x 2m square, approximately every 100m along the length of each area with additional pits in some areas or where warranted by the results of the geophysical survey. The test pit survey was undertaken in September and October 1996 and 59 of the pits were excavated. A general description of the survey areas follows. Further details are contained in Appendix II.

2.6.2 Area 1

South-facing land overlooking River Cynon between SO 9680 0530 and SO 9740 0550, Chainage 3900 to 4000 (Figure 22/22, Volume 1.9). Total length 580m, 6 test pits. Test pits not excavated because of access problems.

2.6.3 Area 2

Land between SO 9780 0580 and SO 9800 0620, Chainage 4100 to 4400 (Figure 22/22, Volume 1.9). Programme included land north and south of the A465 which comprised rough pasture plus a series of nineteenth century (or earlier) drystone walled enclosures, 2 holloways and sheep corralling channels (running north/south). Length 460m, 5 test pits excavated.

2.6.4 Area 3

Between SO 9860 0660 and 9885 0690, Chainage 5000 to 5500 (Figure 22/21, Volume 1.9). The area included a series of nineteenth century (or earlier) drystone walled enclosures, a holloway, and Post-Medieval coppiced woodland. Length 300m, 5 test pits excavated.

2.6.5 Area 4

Between SO 9960 0700 and SO 9990 0700, Chainage 6200 to 6500 (Figure 22/20, Volume 1.9). This area is located south of the A465 within rough heathland pasture with a high water catchment. Interspersed within this area is evidence of early industrial activity including a substantial metalled track running from north to south, the remnants of a dam, a sluice system and quarry tipping. North of these features, but south of the A465, the land remains undisturbed suggesting the potential for later prehistoric activity. Length 320m, 3 test pits excavated.

2.6.6 Area 5

Between SO 0130 0720 and SO 0160 0720, Chainage 7400 to 7700 (Figure 22/19, Volume 1.9). This small area of marshy pasture land is located between the old A465 and the present A465 (to the south). To the northwest and southwest are the remains of a Bronze Age landscape. It would appear that this strip of land has been little disturbed. Length 340m, 4 test pits excavated.

2.6.7 Area 6

Between SO 0230 0750 and SO 0270 0780, Chainage 9050 to 9400 (Figure 22/19, Volume 1.9). Area surveyed follows the proposed scheme across Nant Ffrwd and the western slopes of Taf Fawr. Within this area is (little disturbed) improved pasture land (south-facing) which is enclosed within a drystone walled landscape, early nineteenth century in date. Length 520m, 5 test pits excavated.

2.6.8 Area 7

Between SO 0360 0820 and SO 0410 0840, Chainage 10200 to 10750 (Figure 22/18, Volume 1.9). Within this area, south of the present A465, is a drystone wall landscape. Length 490m, 5 test pits excavated.

2.6.9 Area 8

Between SO 0545 0862 and SO 0570 0867, Chainage 11700 to 12250, east of Gurnos Farm (Figure 22/18, Volume 1.9). Particular interest was placed on a circular drystone walled feature and rough pasture directly to the east, where a possible prehistoric quern stone (Site No. 201) suggests prehistoric activity. The sample was increased so that 13 test pits were excavated over a length of 260m.

2.6.10 Area 9

Between SO 0993 0928 and SO 1018 0936, Chainage 12350 to 12600. This area south of the A465 is rough grazing and is little disturbed. Length 300m, 3 test pits proposed but not excavated due to access problems.

2.6.11 Area 10

Between SO 1160 0997 and SO 1180 1012, Chainage 18500 to 18700 (Figure 22/13, Volume 1.9). There is a record of a Bronze Age hoard being found in this area when the A465 was constructed in 1964. Length 250m, 3 test pits were excavated.

2.6.12 Area 11

Between SO 1327 1075 and SO 1340 1076, Chainage 20300 to 20550 (Figure 22/12, Volume 1.9). Within land between the Sirhowy River and Nant-y-Bwch is a sequence of drystone walls and earthworks that possibly pre-date industrialisation of the valley. Length 150m, 2 test pits excavated.

2.6.13 Area 12

Between SO 1132 1422 to SO 1164 1443, Chainage 22200 to 22350, north and south of the proposed scheme (Figure 22/11, Volume 1.9). Within this area there are slightly undulating, south-facing slopes with drystone walled field enclosures with associated sheep folds and barns and a well-preserved section of the Trefil Tramroad. Length 350m, 4 test pits excavated.

2.6.14 Area 13

Between SO 1652 1283 and SO 1700 1284, Chainage 23300 to 23700 (Figure 22/10, Volume 1.9). Within this area are substantial peat deposits and a possible (ancient) relict landscape with the potential for prehistoric material. Length 510m, 6 test pits excavated. A pollen analysis was undertaken (see sub-chapter 2.7).

2.6.15 Area 14

In Clydach Dingle around site No.120, SO 1920 1284, Chainage 26150 to 26600, there is an industrial settlement and related small-scale quarrying/mining with a tramroad incline (Figure 22/8, Volume 1.9). Length 170m, 2 test pits.

2.6.16 Area 15

Between SO 2067 1243 and SO 2090 1246, Chainage 28850 to 28950 (Figure 22/7, Volume 1.9). The area is undisturbed south-facing pasture land, north of the A465, between Brynmawr sewage treatment works and water works, above the Clydach Gorge. Oblique aerial photographs show possible circular features close to the survey area. Length 220m, 2 test pits excavated with no archaeological remains.

2.6.17 Area 16

Between SO 2298 1347 and SO 2320 1369, Chainage 30700 to 30950 (Figure 22/6, Volume 1.9). Part of early industrial landscape near leat keeper's cottage. Length 300m, 3 pits proposed but not excavated following observations of ground investigation trial pits in area.

2.6.18 Area 17

Archaeological test pit programme and a geophysical survey of land between SO 3297 2133 and SO 3291 2138, chainage 33500 to 33800. Approximately 130m north of the present road, Neolithic and Bronze Age lithics were recovered when the Llanfoist sewage treatment works was constructed in 1965. The area slopes gently east towards the River Usk. An additional area for geophysical survey, included within Area 17, is located east of Pen-y-Worlod Farm (between SO 3287 2137 and SO 3285 2137). The results of the geophysical survey are provided in Appendix II. It was intended that test pitting in this area would relate to the results of the geophysical survey. At the time of writing, these test pits have not been excavated.

2.7 Assessment of Palaeoenvironmental Potential

2.7.1 Peat was identified as suitable to contain pollen which might inform the palaeoenvironmental record. This peat was in an unimproved upland pasture area north and east of Garn Lydan, and in test pits in Area 10. Assessment of palaeoenvironmental potential was undertaken for the Garn Lydan site only. Analysis was undertaken by Professor M. J. C. Walker at the Department of Geography, University of Wales, Lampeter. A full copy of the palaeoenvironmental report is contained in Appendix III.

2.7.2 Excavation through a possible tramroad (Site No. 123) near SO 175 126 revealed a thin peat lens (approximately 20cm in thickness) beneath some 50cm of made ground. A 30cm monolith was taken through the peat sequence and the underlying minerogenic deposits.

2.7.3 Samples for pollen analysis were removed from the monolith at 2cm intervals and subjected to standard laboratory treatment, including digestion in 10% potassium hydroxide (KOH), heating in 40% hydrofluoric acid (HF) and acetolysis (Moore *et al.*, 1991). The residues were mounted in safranin-stained glycerine jelly and counted under x400 magnification. No pollen was recovered from the lowermost samples (22 and 24cm), and only trace pollen was present in the sample from 20cm. All the remaining samples proved to be polleniferous. As this was a preliminary analysis (i.e. partial rather than full), a sum of 100 land pollen only was examined.

2.8 Evaluation Trial Trenching

2.8.1 The Stage 2 assessment identified 43 sites that required evaluation by trenching to help in the assessment of the nature, importance and state of preservation of archaeological remains likely to suffer an impact by the proposed scheme and to assist in determining the appropriate level of mitigation. The Stage 3 evaluation works comprised hand and machine excavation. Evaluation strategies were implemented according to site type and are described in paragraphs 2.8.2 to 2.8.5.

2.8.2 For tramroads, railways and similar remains the evaluation technique aimed to assess the state of preservation as well as identifying relevant dimensions of structural remains. The recording of stratified deposits established the sequential phasing in time of each feature. The evaluation involved hand excavation down to track/sleeper level and careful recording of track-related remains. Machine trenching of the body of the earthwork was designed to minimise the disturbance of surviving remains, such as sleepers, while providing a cross section through the feature. Where appropriate, more than one evaluation trench was excavated in order to establish the direction of the feature, continuity of stratification within the section and the possible recovery of any railway/tramroad furniture.

2.8.3 For leat systems the trenches were hand excavated, in order to reduce possible interference with existing groundwater and drainage conditions.

2.8.4 More specific evaluation proposals were developed and implemented for the leat keeper's cottage (No. 99) and weir system (No. 100), for the Dukestown cast iron weir (No. 145) and a settlement and field system at Baverstock (No. 232).

Table 2.1 Sites subject to evaluation trial trenching

Site No.	Name/description	Method of excavation
3	Tramroad/cart track, Llanfoist Farm	*Hand excavation followed by machine trenching*
4	Merthyr, Tredegar & Abergavenny Railway SO 2902 1353	*Hand excavation followed by machine trenching*
4(i)	Llanvihangel Railway, Llanfoist	*Hand excavation followed by machine trenching*
11	Track/road, Pen-y-Worlod Farm, Llanfoist SO 2828 1383	*Machine trenching, hand excavation in places*
31	Abergavenny-Merthyr Turnpike Road SO 2597 1432	*Hand excavation followed by machine trenching*
36	Canal bridge (eccentric arched), Gilwern SO 2537 1452	*Hand clearance of surface*
50	Primitive Methodist Chapel and grave yard SO 2427 1428	*Machine clearance of tarmac, and debris followed by hand excavation*
51	Llam-march Tramroad, Gilwern	*Hand excavation followed by machine trenching*
70	Llam-march Tramroad, Saleyard	*Hand excavation followed by machine trenching*
78	Clydach Railroad, Cheltenham SO 2222 1275	*Hand excavation followed by machine trenching*
86	Merthyr-Govilon Turnpike Road (Main Road) SO 1968 1216	*Machine trenching followed by hand excavation*
91	Track between Blackrock and Cheltenham SO 2160 1264	*Hand excavation followed by machine trenching*
98	Revetting within bank of River Clydach	*Hand clear and excavate where necessary*
99	Leat keeper's cottage & outbuildings, Clydach SO 2298 1342	*Hand excavation followed by machine trenching*
100	Weir, sluice and leat system, Clydach	*Hand excavation, only within sensitive areas under threat from proposed scheme*
107	Industrial settlement, Nant Gwyn	*Clearance followed by hand excavation*
111	Llangattock Tramroad, Brynmawr SO 1967 1236	*Clearance followed by hand excavation*
113	Clydach Railroad branch & colliery level SO 2003 1218	*Hand excavation followed by machine trenching*
114	Merthyr, Tredegar & Abergavenny Railway SO 1972 1208	*Hand excavation followed by machine trenching*
120	Industrial settlement, Clydach Dingle	*Limited hand excavation within the Dingle area. Debris clearance and evaluation around the industrial buildings and watercourses*
123	Tramroad, Garn Lydan SO 1753 1269	*Hand excavation followed by machine trenching*
133	Trefil Tramroad, Nant y Croft SO 1427 1152	*Hand excavation followed by machine trenching*
138	Rassau Tramroad, Nant y Croft	*Hand excavation followed by machine trenching*
142	Merthyr, Tredegar & Abergavenny Railway SO 1354 1084	*Hand excavation followed by machine trenching*
145	Cast Iron weir, Dukestown SO 1342 1077	*Hand excavation*
150	Bronze Age find spot, Tafarnaubach SO 1170 1010	*Machine trenches followed by hand excavation*
192	Branch line of Brecon & Merthyr Railway SO 0678 0856	*Hand excavation followed by machine trenching*
202	Drystone walled landscape and sheep pen, Gurnos	*Hand excavation*
216	Stone structure, Cefn Coed-y-Cymmer	*Hand clearance and excavation where necessary.*
229	Track, Lech Sychrhyd SO 9959 0700	*Machine trenching and limited hand excavation*
232	Settlement and field systems, Baverstock SO 0073 0730	*Machine trenching followed by hand excavation*
252	Bute Colliery R (Tower Road), Hirwaun SO 9523 0517	*Machine trenching followed by hand excavation*
255 A	Aberdare & Rhondda Railway SO 9535 0508	*Hand excavation followed by machine trenching*
255 B	Tramroad B, branch of Aberdare & Rhondda SO 9583 0496	*Hand excavation followed by machine trenching*
255 C	Tramroad C, Hirwaun SO 9579 0496	*Hand excavation followed by machine trenching*
260	Walled enclosure, Pen-Twyn, Gilwern	*Debris clearance followed by machine trenching*
263	Section of Clydach Railroad, Pont Harn Issac SO 2045 1233	*Hand excavation followed by machine trenching*
264	West section of Clydach Railroad, Brynmawr SO 1968 1215	*Hand excavation followed by machine trenching*
265	Disgwylfa Tramroad branch, Clydach Dingle SO 1928 1280	*Hand excavation followed by machine trenching*
273	Tramroad, Hirwaun SO 9562 0497	*Hand excavation followed by machine trenching*
275	Tramway branch-Hirwaun Common Railway SO 9597 0500	*Hand excavation followed by machine trenching*
276	The Hirwaun Common Railway, Hirwaun SO 9617 0499	*Hand excavation followed by machine trenching*
277	Branch-line of Hirwaun Common Railway SO 9616 0498	*Hand excavation followed by machine trenching*

2.8.5 For standing structures, it was important to determine the state of preservation, define the limit of the historic fabric and to assess the potential range of associated sub-surface features, such as those around the leat keeper's cottage (Site No. 99). This involved hand and machine excavation of associated features to define their maximum extents.

2.8.6 Details of the sites evaluated, and the method of excavation are provided in Table 2.1. Site locations are shown on Figures 22/1-24 in Volume 1.9.

2.9 Assessment Criteria

Establishing existing value

2.9.1 Sites have been assessed for their importance using a set of scoring criteria, and values have been assigned to them, according to categories established by Cadw.

Site assessment

2.9.2 Non-statutory criteria for assessing the national importance of archaeological remains have been published in Annex 4 of Planning Policy Guidance Note 16: Archaeology and Planning. Six criteria have been adopted as guidance for this assessment. Scores have been awarded to each guidance criterion (as indicated below) and added together for each site. The higher the score the more important the site:

- Period: Each site is categorised according to its archaeological/historic period: Prehistoric, Roman and Medieval score 2 and all others score 0.
- Rarity: The rarity value has been assessed as either common (1), moderate (2) or scarce (3). It should be noted that sites which portray the typical and commonplace as well as the rare are important within a national and regional context.
- Documentation: The archaeological significance of each monument may be enhanced by the existence of supporting documentary evidence and is graded none (1), with cartographic evidence (2) and including documentary history (3).
- Group Value: The value of a single monument may be greatly enhanced by its association with related contemporary monuments. The category is graded into none (1), minor group value (2) and including , major sites and /or linear features (3).
- Survival/Condition: The survival and condition of each monument is important to assess the archaeological value both above and below ground. Survival/condition is graded poor (1), moderate (2) and good (3).

- Diversity: This classifies the archaeological diversity of the features present in terms of period and typology. Diversity is graded as single-phase (1) and multi-phase monuments (2).

2.9.3 Of the eight criteria, those relating to fragility/vulnerability and potential were not considered appropriate for the proposed scheme. "Potential" relates to the potential of the site to have archaeological remains. Many of the sites did not have potential as a result of their nature (for example, a tramway) or being above ground level. "Fragility/vulnerability" relates to the vulnerability of the site to damage. This potential for damage has been taken into account in the impact assessment; accordingly, this criterion has not been used, so as to avoid double-counting of the same factor.

Site categorisation

2.9.4 The categories defined by Cadw and the criteria for classification are outlined in the following paragraphs.

Category A - Sites of National Importance
These include Scheduled Ancient Monuments, Listed Buildings and those sites which meet Cadw criteria for scheduling or listing. These sites are to be preserved *in situ*.

Category B - Sites of Regional or County Importance
These include sites that do not meet the criteria for scheduling or listing, but are nevertheless of particular importance within the region. Preservation *in situ* is the preferred option but if loss or damage cannot be avoided, appropriate detailed recording will be undertaken.

Category C - Sites of District or Local Importance
These include sites which are not of sufficient importance to justify preservation if threatened. Category C will merit adequate recording in advance of loss or damage.

Category D - Minor or Damaged Sites
These include sites of minor importance or so badly damaged that little remains to justify their inclusion into a higher category. Rapid recording, either in advance or during destruction is required.

2.9.5 The site assessment scoring system has been related to site classification categories defined by Cadw as follows:

- sites with scores ranging from 13-15 have been classified as Category A;
- sites with scores ranging from 11-12 have been classified as Category B;
- sites with scores ranging from 9-10 have been classified as Category C; and
- sites with scores ranging from 0-8 have been classified as Category D.

2.10 Site Impact

2.10.1 Site impact can be either direct or indirect and result in:

- loss;
- damage;
- severance of linear features;
- reduction of the group value of associated features; and
- adverse affects on the setting of features.

2.10.2 The magnitude of impact on each site can be assigned to one of four categories:

- slight: sites affected by the proposed scheme but where the impact on the site and/or its setting is minimal;
- moderate: sites which would be affected by the proposed scheme but where loss or impact on the setting would be partial (including severance);
- severe: sites which will be affected, but not completely lost, by the proposed scheme; and
- very severe: sites which will be affected by the proposed scheme and which would have a maximum effect on the site or the setting.

Impact has been assessed irrespective of the status and value of the site.

2.10.3 Significance of impact has been assigned for each affected site, taking into account the value of the site and the magnitude of the impact. The definition of significance is set out in Table 2.2.

Table 2.2 Assessment of significance

	Impact magnitude			
Site value	Very severe	Severe	Moderate	Slight
Category A	Very significant	Very significant	Significant	Minor
Category B	Significant	Significant	Minor	Not significant
Category C	Minor	Minor	Not significant	Not significant
Category D	Not significant	Not significant	Not significant	Not significant

2.11 Proposed Mitigation Measures

2.11.1 Mitigation measures have been proposed for each site which would be affected by the proposed scheme. The degree of mitigation proposed depends on the archaeological interest of the site and the extent to which it could be affected. Where archaeological action would be required, measures fall into ten categories:

- full excavation;
- limited excavation;
- strip and record;
- detailed earthworks survey;
- detailed building survey to standards set by RCHME 1991 or equivalent levels for structures:

  Level 1: Visual survey- basic sketch plan - photograph of the setting - exterior record

  Level 2: Descriptive survey - scale ground plan, elevation photographs, exterior/interior record

  Level 3: Fully analytical survey - written description of development and use, including survey at levels 1 and 2

  Level 4: Full survey - for buildings of special importance. Includes 3D drawings, internal detail of room plans and including external detail to level 3
- photographic record;
- watching brief;
- palaeoenvironmental sampling;
- preserve in *situ*;
- no access to construction activity including site compounds and storage facilities etc; and
- consultation with the engineering team regarding the detailed design.

3.0 Historical Background

3.1 Introduction

3.1.1 Past developments affect the potential for survival of prehistoric, Roman and Medieval remains. Indeed, continuing development in the Post-Medieval period will have destroyed earlier remains. During the construction of the existing road in the 1960s, much of the immediate area either side of the road was damaged. Indeed, a number of settlements were partially destroyed including those of Blackrock (Clydach Gorge) and Cefn Coed-y-Cymmer. Along with many buildings, agricultural and industrial landscapes were also damaged including Post-Medieval drystone and turfstone walled field systems and an industrial heritage that is dominant throughout this region of Wales.

3.2 Prehistoric Period (before 55 BC)

3.2.1 Within the 50m corridor of the A465, the evidence for prehistoric activity is restricted to four areas:

- the flood plain of the River Usk, south of Abergavenny;
- the industrial estate at Tafarnaubach;
- Blaencarno Common, north of Merthyr Tydfil; and
- improved pastures north of Gurnos.

3.2.2 Each area has revealed limited evidence, usually in the form of find spots. The exception is near Tafarnaubach Industrial Estate, where a significant hoard from the Bronze Age was discovered. There is no evidence for any earlier prehistoric activity either within or outside the 50 metre corridor.

3.2.3 A Neolithic flint scatter, found prior to the construction of Llanfoist sewage treatment works, is similar to part of a contemporary assemblage retrieved from an excavation in Flannel Street, Abergavenny in 1965.

3.2.4 Within the Clydach Gorge there appears to be no evidence of any prehistoric activity, although two hillforts are located north and south of the gorge. A Bronze Age settlement has been recorded below the Blorange, close to the village of Llanfoist.

3.2.5 Either side of the A465, near Baverstock but outside the 50m corridor, a number of Bronze Age barrows and cairns occur, clustered into cemeteries. Barrow/cairn cemeteries are located north and south of the Baverstock settlement (No.232) and north of Merthyr Common. Possibly related to the latter cemetery is a small Bronze Age cairn (No.175), on a south-facing slope, north of the A465 on Blaencarno Common.

3.2.6 At Gurnos there is fragmentary evidence of prehistoric activity, although the potential for prehistoric finds is restricted by the present road, limestone quarrying and town development. One hundred and fifty metres east of Gurnos Farm, and recorded during the walkover survey, was a large single stone with an acute smooth-bowled surface on one edge which could be a quernstone.

3.3 Roman Period (55 BC - AD 450)

3.3.1 There is no evidence of Roman remains within the 50 metre corridor. Within the general area there appear to be only two sites of Roman date, the town of Abergavenny, known to the Romans as Gobannium, and a possible Roman road west of Gurnos Farm. At Abergavenny a fort and settlement were established around AD 50 and, according to the derivation of its name, possible pre-Roman iron-working was already in operation at that time (Rivet & Smith 1979:369).

3.3.2 The fort, close to the site of the later Medieval castle, would have had commanding views across the Usk valley to the west. Excavations of the fort revealed a structure of substantial size and proportion. Gobannium was one of a series of four forts/towns along the Usk. To the south was Burrium (Usk) and Isca (Caerleon) and to the north, Cicucium (Brecon). It is therefore important to consider the Usk as a route between the four fortified settlements.

3.3.3 Further west, and close to Gurnos Farm, is the possible route of a north/south aligned Roman road that would have linked the fort and settlement at Brecon with the Roman legionary fortress at either Isca (Caerleon) or the fort at Tamium (Cardiff). Documentation is confused and any possible road may have since been destroyed due to quarrying activity or commercial forest planting west of Gurnos Farm. No definitive evidence of the road has been found. A single sherd of Roman pottery was found in a trial trench near Gurnos.

3.4 Medieval Period (1066-1600)

3.4.1 There appears to be little or no visible evidence of settlement during the early Medieval period either within or outside the study area. Much of the early Post-Medieval industrial activity within the Clydach Gorge commenced around the 1660s. There is a possiblity that settlement prior to 1550 did exist, although Riden (1996) has suggested the contrary.

3.4.2 In Abergavenny the site of a Norman motte and bailey castle stands overlooking the Usk Valley. To the west of the castle the town retains part of the Medieval street plan. Both the castle and Medieval town were probably influenced by the Roman Fort and later Romano-Celtic settlement (Olding, pers.com.).

3.4.3 At Cefn Coed-y-Cymmer an Early Medieval coin hoard (No.215) dating from the 1340s was discovered approximately 50 metres south of the A465, during construction of St John's Church in 1880. Close to Grawen Cottages (No.218) a series of hut circles, considered to be of Early Medieval date, was uncovered during the construction of the existing A465.

3.4.4 There is a possibility that much of the drystone and, in particular, turfstone walling along the entire route of the A465 could date to either the late Medieval or Post-Medieval periods. Tithe maps of 1819, around the Llanfoist area for example, suggest little or no deviation or change within the surviving walled field systems recorded within the walkover survey.

3.5 Post-Medieval Period (1600-1950)

3.5.1 This period marks a dramatic change to both the landscape and settlement either side of the present A465. The majority of sites recorded in the walkover survey date from this period Early Post-Medieval industrial activity is confined to one area, the Clydach Gorge. This area, approximately 4 km by 0.5 km, marks the birthplace of the Industrial Revolution in Wales, between 1700 and 1800.

3.5.2 Industrialisation spread rapidly throughout the Gorge. During this period new towns emerged throughout the valleys. Each industrial complex was served by a complex network of tramroads, leats, canals and roads. These were later superseded with the emergence of the railways. The Abergavenny, Tredegar & Merthyr Railway was the first of a number of communication links that ran roughly along the same route as the present A465. At Dowlais, east of Merthyr Tydfil, a series of railway lines converged and linked mid Wales with the 'Valleys'. The 'Heads of the Valley' line had become, by 1870, part of a fully

integrated railway network. The demise of the railways during the 1960s also marks a decline and change in industrial practice, from heavy to light industry.

3.5.3 Prior to the railways, there appears to have been a limited road network which linked the larger settlements along the present route. The walkover survey did locate a number of roads/tracks that ran between Abergavenny and Llanfoist, Llanfoist and Gilwern, and Gilwern and Brynmawr. These were later amalgamated into a Turnpike road in 1812 that ran between Abergavenny and Merthyr. The Turnpike road remained the only main road until the opening of the existing road in 1966.

3.5.4 The purpose of the transport network was to serve industry, not necessarily the community. Both canals and tramroads were the main transportation routes for raw materials. Tramroads transported the raw material (coal, limestone and ironstone) from the quarry to the furnace, then from the furnace to the foundry and finally, from the foundry to the canal. Before this, during the initial stages of the Industrial Revolution, pack-horses would have served a similar function. Using the horse, coal, ironstone and limestone were transported from quarries and mines to the furnaces and then onto the canals for export via horse-drawn trucks suspended on rails. From the latter part of the 18th century, pack-horses were replaced by railroads and tramroads.

3.5.5 The Clydach Railroad, for example, built and financed by the Brecknock & Abergavenny Canal Co. in 1793, served as a link between collieries at Brynmawr, at the head of the Clydach Gorge and a long established iron forge at Glangrwyney on the Usk, a short distance downstream from the mouth of the Clydach. Initially, the railroad was laid as an edge-rail which was cast in 4ft sections.

3.5.6 This tramroad was later connected to two others which ran parallel to it and down the Gorge to the Brecon & Abergavenny Canal at Gilwern and Govilon. Further west, between Brynmawr and the head of the Rhymney Valley, other tramroads were laid from the ironworks in each valley to run north to collieries, ironstone pits and limestone quarries. Some were linked together to create a rudimentary west-east route, giving the ironworks access to the Brecon & Abergavenny Canal as well as the two branches of the Monmouthshire Canal which ran to Crumlin and Pontypool.

3.5.7 Many of the earliest tramroads now run close to or are bisected by the present road. At Hirwaun, at least six tramroads (and two railway lines), all dating from the early to mid 19th century, are severed by the existing A465. A number of tramroads dating from the late 18th and early 19th centuries are dispersed along the present route, and include the Bailey's Disgwylfa Tramroad (c.1818), Bailey's Llangattock Tramroad (c.1830s), Brinore Tramroad

(c.1815), Castle Morlais Quarries Tramroad (c.1803), Clydach Railroad (c.1793), Gurnos Tramroad (c.1792), Hirwaun to Aberdare Tramroad (c.1790s), Llam-march Tramroad (c.1795 and 1811) and the Trefil Tramroad (c.1797).

3.5.8 The most complex section of tramroad is located within the Clydach Gorge and involves two tramroads, the Clydach Railroad (No.44) and Llan-march Tramroad (No.51). Both run, in places, parallel to one another and served similar purposes in providing raw materials to the local ironworks and forges within the lower Clydach at Saleyard, Clydach Village and Llanelly.

3.5.9 By the time the Heads of the Valley Railway was promoted in the late 1850s, much of its proposed route followed a line already adopted by existing tramroads. Despite this, the construction of a locomotive-operated railway through rugged terrain was a formidable challenge and proved too expensive for the Merthyr, Tredegar & Abergavenny Railway. The project was finally completed by the London and North Western Railway in 1862. Other sections and branch lines were later added, some jointly built with Rhymney Railway and the Brecon & Merthyr Railway. The route to Merthyr was completed in 1879. This line was principally built to transport iron, and in later years coal, from works at the Heads of the Valley to the Midlands. Passenger traffic was minimal. The route was considered a major engineering accomplishment, with some of the steepest gradients and tightest curves in Britain. Because of this massive engineering feat with the construction of embankments, revetting, viaducts and cuttings, the line can never have been in profit, especially at a time when the iron industry in this part of Britain began its slow demise. The route was finally closed in 1958, but after this date, there were plans to build a new trunk road on much the same route as the railway which would link the Midlands with Swansea and Neath, the new rising centres for heavy industry. The road was originally conceived as long ago as 1947, although detailed planning did not commence for another ten years. Construction started in 1960 and was completed in 1966. The route linked the Ross Spur of the M5 (now the M50) with the A40 through to Neath and Swansea. As with their railway counterparts a century earlier, road engineers were faced with considerable engineering problems, especially through the Clydach Gorge and across a number of wide river valleys and ravines. In places, the road simply overlaid existing former London, Northern & Western Railway (LNWR) trackbeds.

3.5.10 The emerging transport network appears to have been constructed as an integrated system around industry. Areas such as the Clydach Gorge, Brynmawr, Merthyr Tydfil and Hirwaun were ideal locations for early entrepreneurs; the raw material, the manufacturing base and the ease of transportation to market formed the basis of the Industrial Revolution in Wales. The ability to utilise raw materials, such as ironstone, limestone and coal, and manufacture

the product nearby was to set standards for industrialisation elsewhere in Britain. Within the Clydach Gorge, the iron industry was concentrated around the settlements of Maes-y-Gwartha and Saleyard. Indeed, the growth of both settlements is attributed to demand for iron.

3.5.11 One of the earliest commercial furnaces within the region was established at Llanelly, several kilometres west of Gilwern. Schubert (1957: 371) has suggested that there was a furnace at Llanelly (No.66) as early as 1590, which was rebuilt on a new site in 1606. However, the earliest recorded evidence appears to be an agreement of 1663 under which Capel Hanbury, who had another ironworks at Pontypool, was 'allowed to have liberty' to build a weir to divert water from the River Clydach to his ironworks in Llanelly (Riden 1993: 23). The gorge was too remote for a forge alone to have been built: such a scheme would only have been feasible if a source of pig-iron from a blast furnace was nearby.

3.5.12 A blowing-house, containing the bellows which powered the furnace, stood on the opposite side of the furnace from the bank, with the water-wheel at its western end. There appears to be no trace of either the head- or tail-race which carried water to and from the wheel. In line with Cadw's report, the walkover survey identified 'ponds, arches and terraces' to the west and north of the furnace, which must be connected with the supply of water to the furnace. Nothing of this sort is noted on the tithe map, which does not mark any watercourse approaching the furnace from the north, but there may be better evidence on John Aram's plan.

3.5.13 Llanelly Forge (No.58) stood a short distance lower down the valley than the furnace, beyond the grounds of Clydach House on the northern bank of the river. It was powered by water carried along by a leat which left the Clydach just downstream of the mouth of Nant Dyar and ran along the northern bank of the river to near the bottom of the lane running down from Clydach House. Here it swung away from the river, skirting the garden of Clydach House on the west and a large storage pond. The tithe map shows a weir on the leat feeding the west end of the pond and the leat continuing around the north side of the pond to end at a point level with the dam wall of the pond.

3.6 Post-Industrial Period (1950-present)

3.6.1 The decline in Britain's industrial and manufacturing base can be roughly traced back to the early post-war era. This decline is most noticeable in South Wales. Along the 'Heads of the Valley' road, the traditional manufacturing base has been replaced over the past twenty years by a number of large trading estates which are mainly component and service

industry based. Recorded within the study area (50m corridor) are various elements of the road itself (including three viaducts [Nos. 206, 221a, 221b] and two fast-food restaurants (Nos. 33 and 196). The 'Heads of the Valley' road, designed and constructed during the 1950s and 60s was considered at the time to be a major link between the two industrial heartlands of the Midlands and South Wales. However, as the traditional industries have declined and new smaller hi-tech industrial units emerge, the demand for a more integrated traffic system has not.

3.7 Overall Context

Cultural heritage designations

3.7.1 Within the wider context of the proposed road scheme there are several cultural heritage sites which enjoy statutory and non-statutory protection, through designation. Most of these sites lie well outside of the possible effects of the proposed road scheme. These designations comprise:

- Scheduled Ancient Monuments;
- Listed Buildings;
- Conservation Areas; and
- Landscapes, Parks and Gardens of Special Interest.

3.7.2 At the eastern end of the A465, the designated cultural heritage sites are clustered in Section One of the proposed scheme, especially around the town of Abergavenny. The long history of this town as a Roman fort, a relatively prosperous medieval market town and later a communications junction for industrial exports, is attested by the designation of Abergavenny Bridge as a Scheduled Ancient Monument (SAM MM010), and of Abergavenny Conservation Area within the town. These sites both would fall outside the wider impact of the proposed scheme.

3.7.3 Further west along the A465 there are important designations within the Clydach Gorge in Section Two. This locality's importance during the Industrial Revolution in south Wales is reflected by the designation of two Scheduled Ancient Monuments. One area centres on Llanelly Furnace (SAM BR 160) (site No.66) and the Clydach Ironworks and Smart's Bridge (site Nos. 93 & 94)(SAM BR 161). Clydach House (site No.64) at Saleyard, dated to 1693, is a Grade II* Listed Building. These sites all would fall within the immediate road corridor, although impacts are likely to be confined to their setting.

3.7.4 Within Section Three of the proposed scheme, at Dukestown, the Nine Arches viaduct (site No. 143), built for the Merthyr, Tredegar and Abergavenny line in 1864, is a Listed Building. This would fall outside the scope of the proposed scheme, although the associated disused railway line (site No.142) would be affected.

3.7.5 In Section Four, at Butetown, the existing A465 runs close to a Conservation Area and a Scheduled Ancient Monument. The Butetown Conservation Area lies approximately 300m to the south of the proposed road scheme and centres on an area of well-preserved historic worker's housing. Within Butetown Conservation Area there are three Listed Buildings. To the east of this area, south of Llechryd, there are two further Listed Buildings. The proposed scheme at this point would have no direct impact on the Conservation Area, although it may have an effect on its setting, through the proposed improvements to the adjacent slip roads. Rhymney Upper Furnace is a Scheduled Ancient Monument (SAM GM 403), but lies well outside the effects of the proposed scheme.

3.7.6 In 1996 Cadw issued a draft consultation Register of Landscapes, Parks and Gardens of Special Interest. Part 2.1 of the Register deals with landscapes of exceptional and great historic interest, of which No.14 is Merthyr Tydfil Landscape of exceptional historic interest. This designation falls within Section Five of the proposed scheme.

3.7.7 Within Section Six, at Cefn Coed-y-Cymmer, the existing road viaduct (site No. 206) carries the A465 directly over the course of the Gurnos Tramroad and Leat (site Nos. 207 and 208), which together are a Scheduled Ancient Monument (SAM GM478). No direct impact from the proposed scheme is anticipated. The Tai Mawr leat for Cyfartha Ironworks is also a Scheduled Ancient Monument (SAM GM 479) and is located well beyond the proposed scheme, approximately 0.5km to the south.

3.7.8 In Section Seven, the A465 passes approximately 0.5km to the south of the Scheduled Ancient Monument of Hirwaun Ironworks (SAM BR 157). No direct impact is anticipated.

3.7.9 In summary, the Scheduled Ancient Monuments along the proposed scheme comprise:

- Abergavenny Bridge (SAM MM010);
- Llanelly Furnace (SAM BR 160) (site No.160);
- Clydach Ironworks and Smart's bridge (site Nos. 93 & 94) together form SAM BR 161;
- Rhymney Upper Furnace (SAM GM 403);
- Gurnos Tramroad and leat (site Nos. 207 & 208) (SAM GM478);
- Tai Mawr leat (SAM GM 479); and
- Hirwaun Ironworks (SAM BR 157).

3.7.10 The two Conservation Areas along the proposed scheme comprise:

- Abergavenny Conservation Area; and
- Butetown Conservation Area.

3.7.11 The important Listed Buildings along the proposed scheme comprise:

- Clydach House at Saleyard, (site No.64); and
- Dukestown, the Nine Arches viaduct (site No. 143).

3.7.12 The Borough of Merthyr Tydfil is No.14 in the Register of Landscapes, Parks and Gardens of Special Historic Interest in Wales.

Summary of discoveries

3.7.13 The range of cultural heritage sites identified within the 50m corridor along the proposed scheme include:

- prehistoric sites, including lithic scatters, cairns, stone monuments, stray finds and cropmarks;
- Post-Medieval agricultural features, including farm houses/cottages and farm buildings, field buildings, holloways/tracks, and drystone and turfstone walling;
- early Post-Medieval industrial sites and features, including 17th-18th century leats, sluice and weir systems, canals, tramroads, bridges and associated dwellings/ buildings;
- late Post-Medieval industrial sites and features, including 19th-mid 20th century mineral extraction and processing, railways, tramroads, associated buildings and furniture, reservoirs and associated leats, tracks and pumping houses, bridges and roads;
- Post-Industrial buildings and features, including mid 20th century to present fast-food restaurants, roads, bridges and transport furniture (milestones, sign-posts, lamp-posts and railway fencing);
- Post-Medieval religious buildings and associated features, including chapels, churches and associated graveyards; and
- sites of palaeoenvironmental interest, including peat and relict palaeosols.

4.0 Section One: Abergavenny To Gilwern

4.1 Existing Context

General

4.1.1 Archaeological sites along Section One comprise:

- prehistoric sites, including lithic scatters;
- post-medieval agricultural features, including farm dwellings and outbuildings, field boundaries, field systems, holloways and tracks;
- post-medieval industrial sites and features including a canal, canal wharf and embankment, tramroad tunnel, railways, tramroads, associated furniture, bridges and dwellings, and a public house;
- Post-Industrial features including restaurants, roads and bridges; and
- a site of religious significance with a chapel and cemetery.

4.1.2 A total of 40 sites were recorded in this area. Of these:

- 4 are of national importance (Category A);
- 15 are of regional importance (Category B);
- 7 are of local importance (Category C); and
- 14 are minor or damaged sites (Category D).

4.1.3 Details of these sites are provided in Table 4.1. Site locations are provided on Figures 22/1-4 in Volume 1.9.

Geophysical survey and test pitting programme

4.1.4 Within this Section, two areas were investigated for archaeological remains using geophysical survey (Areas 17 and 18). No significant archaeological features or remains were recorded.

Table 4.1 Summary of archaeological sites in Section One

Site no	Site name	Grid reference	Site value	Form	Type	Period	Specific date	Description
1	Ysbytty Farm, Abergavenny	SO 3032 1293	B	Buildings and Cropmarks	Farmhouse & outbuildings	Post-Medieval	-	Late 18th/19th farmhouse and buildings with associated cropmarks to the east.
2	Prehistoric find spot, Llanfoist water treatment works, Abergavenny	SO 2980 1330	B	Findspot	Prehistoric lithic scatter	Neolithic/ Bronze Age	-	Findspot includes a barbed and tanged arrowhead and associated lithics.
3	Cart track, Llanfoist Farm	SO 2945 1331	D	Linear Feature	Trackway	Post-Medieval	-	Linear fenced track to north of Llanfoist Farm. Evaluation reveals earlier refuge dump (c.20th material recovered).
4	Merthyr, Tredegar & Abergavenny Railway	SO 2900 1350	B	Linear Feature	Railway	Post-Medieval	1862	Dismantled line of MT&A Railway. Line follows the route of the earlier Llanvihangel Railway. MT&A Railway taken-over by London & North-Western Railway.
4(i)	Llanvihangel Railway, Llanfoist	SO 2900 1350	B	Linear Feature	Tramroad	Post-Medieval	1812	Llanvihangel opened 1812 and later bought-out by the MT&A Railway in 1862. Linked Govilon to Llanvihangel via Abergavenny.
5	Railway furniture, Llanfoist	SO 2889 1355	D	Site	Fence-post	Post-Medieval	-	Railway fence post within field boundary. Iron maker: E.Hampton, Abergavenny
6	Evesham House & lodge, Llanfoist	SO 2870 1360	B	Buildings	Domestic dwelling	Medieval	-	Early Post-Medieval House with associated lodge. At rear of Evesham House is an early oak door casement of possible 16th century date.
7	Evesham House outbuildings, Llanfoist	SO 2870 1362	B	Buildings	Outbuildings	Post-Medieval	-	Late 18th/early 19th farm buildings. Later converted for domestic habitation. Outbuildings consist of a substantial stone-clad roof.
8	Turnpike Road, under skew bridge, Llanfoist	SO 2795 1387	D	Linear Feature	Road	Post-Medieval	1812	Route of Merthyr-Abergavenny Turnpike road.
9	Railway skew bridge, Llanfoist	SO 2800 1385	A	Structure	Railway bridge	Post-Medieval	1862	A masonry skew bridge carrying the MT & A Railway above the Merthyr-Govilon Turnpike Road.
10	Pen-y-Worlod Farm & outbuildings, Llanfoist	SO 2838 1388	B	Buildings	Farmhouse & outbuildings	Medieval		A substantial farmhouse with many original features including an ingelnook fireplace and bressumer and large oak door with iron batten and studding. To west of the farmhouseare a series of outbuilding including cowshed and threshing barn - typical of the local vernacular.
11	Track/road, Pen-y-Worlod Farm, Llanfoist	SO 2830 1383	D	Linear Feature	Road	Post-Medieval	1812	Route of original Turnpike road and includes a single-arched bridge and substantial earthen cutting towards Abergavenny.

Site no	Site name	Grid reference	Site value	Form	Type	Period	Specific date	Description
12	Footbridge, Pen-y-Worlod Cottages, Llanfoist	SO 2863 1374	C	Structure	Footbridge	Post-Medieval	-	A single large slabbed footbridge spanning across a small brook, east of Pen-y-Worlod Farm.
13	Cadfor farmhouse & outbuildings, Llanfoist	SO 2765 1413	B	Buildings	Farmhouse & outbuildings	Post-Medieval	-	Two separate farm units (eastern & western) with late 18th/early 19th century outbuildings and later farmhouses.
14	Worker's cottage and bridge, Govilon	SO 2674 1427	C	Building and Structure	Domestic dwelling and road bridge	Post-Medieval	-	The partly demolished remains of a two-storey cottage and associated bridge, dating from the mid 19th century.
15	House platform, Nr. Cwm Shenkin	SO 2672 1430	D	Site	Demolished dwelling	Post-Medieval	-	The remains of a masonry house platform.
16	Field barn, Govilon	SO 2657 1432	B	Building	Field barn	Post-Medieval	1808	A threshing field-barn with a datestone of 1808.
17	Field barn, Govilon	SO 2659 1432	C	Building	Field barn	Post-Medieval	-	A partly rebuilt field-barn. Possibly contemporary with site No.16
18	Farm building platform, Hopyard Farm	SO 2632 1430	D	Site	Demolished farm building	Post-? Medieval	-	The remains of a cellared building found below a 17th/18th century barn.
19	Rose Cottage, Govilon	SO 2675 1423	C	Building	Domestic dwelling	Post-Medieval	1865	A small, two-storey cottage with a date stone of 1865.
20	Drystone wall./Ridge & Furrow landscape, Govilon	SO 2650 1420	D	Field Enclosure & Cropmarks	Drystone walled field boundaries and ridge & furrow	Post-Medieval ?	-	An extensive drystone walled landscape with ridge and furrow.
21	Farm cottages, Maes-y-Berllan, Govilon	SO 2698 1424	D	Buildings	Domestic dwellings	Post-Medieval	-	A small farmstead complex north of the A465.
22	Ty-Clyd, Govilon	SO 2691 1404	C	Building	Domestic dwelling	Post-Medieval	-	A house of special architectural interest.
23	Farm complex, Govilon	SO 2673 1415	D	Buildings	Agricultural outbuildings	Post-Medieval	-	A series of three farm outbuildings forming part of an L-shaped courtyard.
24	Ridge and furrow landscape, Cadfor Farm	SO 2750 1400	D	Cropmarks	Ridge & furrow	Post-Medieval	-	Poorly defined Post-Medieval ridge and furrow marks.
25	Hopyard Farm, Glanbaiden	SO 2620 1440	B	Buildings	Farmhouse & outbuildings	Post-Medieval	-	A late 17th/early 18th century farmhouse with cross-passage way.
26	Remains of walled garden, Hopyard Farm, Glanbaiden	SO 2622 1435	D	Site	Enclosed garden	Post-Medieval	-	The remnants of a walled garden associated with Glanbaiden House estate.
27	Glanbaiden House, Glanbaiden	SO 2614 1438	B	Building	Domestic dwelling	Post-Medieval	-	An early 18th century Georgian manor house built in the classical style of architecture.
28	Glanbaiden Farm, Glanbaiden	SO 2615 1442	B	Buildings	Farmhouse & outbuildings	Post-Medieval	-	A 17th farmhouse and outbuildings.
29	Glanbaiden Lodge and drive, Glanbaiden	SO 2613 1422	B	Building & Linear Feature	Domestic dwelling and road	Post-Medieval	-	A picturesque gatehouse serving Glanbaiden House.
30	Parkland, Glanbaiden House, Glanbaiden	SO 2610 1435	D	Landscape Feature	Parkland	Post-Medieval	-	The remnants of a parkland landscape associated with Glanbaiden House.

Site no	Site name	Grid reference	Site value	Form	Type	Period	Specific date	Description
31	Abergavenny-Merthyr Turnpike Road, Glanbaiden	SO 2599 1431	D	Linear Feature	Road	Post-Medieval	1812	The line of the Abergavenny/Merthyr Turnpike road of 1812.
32	Aberbaiden Lodge, Aberbaiden	SO 2582 1444	B	Building	Domestic dwelling	Post-Medieval	-	A two-storey classically derived gatehouse belonging to Aberbaiden Farm.
33	Little Chef Restaurant, Gilwern	SO 2572 1444	D	Building	Restaurant	Post-Industrial	1979	A modern restaurant.
34	Brecknock & Abergavenny Canal	SO 2540 1453 to SO 2568 1434	A	Linear Feature	Canal	Post-Medieval	1798	The Brecknock & Abergavenny Canal Act was passed in 1793 and the canal was completed in 1798. Further tramroads were built to the canal as an added transport link.
35	Canal bridge (eccentric arched), Gilwern	SO 2569 1434	A	Structure	Canal bridge	Post-Medieval	1798	A small eccentrically arched bridge contemporary with the construction of the canal.
36	Canal bridge (eccentric arched), Gilwern	SO 2537 1452	A	Structure	Canal bridge	Post-Medieval	1798	A small eccentrically arched bridge contemporary with the construction of the canal.
39	Drystone wall landscape, Gilwern	SO 2520 1440	D	Field System	Drystone walled field boundaries	Post-Medieval	c.1798	A drystone walled landscape with many mature taxa.
40	Holloway/road, Gilwern	SO 2539 1447	D	Linear Feature	Road	Post-Medieval	-	The remnant of a small parish road which originally ran over the eccentric bridge (No.36).
260	Walled enclosure, Pen-Twyn, Gilwern	SO 2457 1442	D	Site	Enclosed Garden	Post-Medieval	-	Drystone walled enclosure probably once a walled (vegetable and fruit) garden, circular in shape and located on a north facing slope. Evaluated
261	Walled road, Govilon	SO 2620 1437 to SO 2710 1433	C	Linear Feature	Road	Post-Medieval	-	Between Govilon and Glanbaiden Farm is a narrow country lane which has drystone walling either side. Present on 19th century tithe maps.

4.2 Impacts and Mitigation

4.2.1 The potential impacts on the cultural heritage sites in Section One comprise:

- loss;
- damage;
- severance of linear features;
- reduction of the group value of associated features; and
- adverse affects on the setting of features.

4.2.2 Details of the potential impacts, their magnitude and significance for each site which may be affected by the proposed scheme are provided in Table 4.2.

4.2.3 Measures to mitigate adverse impacts in this Section include:

- full excavation;
- limited excavation;
- ground/building survey and abandon;
- preservation *in situ*; and
- consultation over detailed design.

In addition, all areas outside the known archaeology will be subject to a watching brief during construction.

4.2.3 Details of measures proposed to mitigate the effects on each site and subsequent residual impact are provided in Table 4.2.

Table 4.2 Impact and mitigation measures in Section One

Site no	Approx chainage	Description	Site value	Potential impact	Impact magnitude	Significance of impact	Mitigation	Residual impact
19	37500	Rose Cottage - building	C	total loss of building	Very severe	Minor	Building Survey Level 3	n/a
20	37300-37400	DSW/Ridge & Furrow landscape	D	further severance	Slight	Not significant	Limited Excavation	n/a
24	38400	Ridge and Furrow landscape	D	further severance	Moderate	Not significant	Limited Excavation	n/a
31	36600-36900	Abergavenny-Merthyr Turnpike Road, Glambaiden	D	encroachment of embankment	Severe	Not significant	Strip & record	n/a
32	36600	Aberbaiden Lodge, Aberbaiden - building	B	effect on setting	Slight	Not significant	Building Survey Level 2	n/a
33	36500	Little Chef Restaurant Gilwern - building	D	total loss of building	Very severe	Not significant	Building Survey Level 2	n/a
34	35200-36700	Brecknock & Abergavenny Canal	A	re-alignment of canal either side of road.	Moderate	Significant	Strip & record	n/a
36	36200	Canal Bridge (eccentric arched), Gilwern	A	possible alteration of abutments	Severe	Very significant	Strip & record	n/a
39	36100-35800	Drystone wall landscape, Gilwern	D	further severance of walls	Moderate	Not significant	Limited Excavation	n/a
40	36200	Holloway/road, Gilwern	D	further severance of road	Slight	Not significant	Limited Excavation and Strip & record	n/a

5.0 Section Two: Gilwern To Brynmawr

5.1 Existing Context

General

5.1.1 Archaeological sites along Section Two comprise:

- Post-Medieval agricultural features, including farm dwellings and outbuildings, field boundaries, field systems, holloways and tracks;
- Post-Medieval industrial ironworks, furnace and forge (2 Scheduled Ancient Monuments) sites and features including a canal, a railway, a Turnpike road, tramroads, associated furniture, bridges, worker housing, industrial settlement, a weir and leat system, a public house, limeworks and quarries;
- Post-Industrial features including roads and bridges; and
- sites of religious significance including two chapels and a cemetery.

5.1.2 A total of 87 sites were recorded in this area. Of these:

- 12 are of national importance (Category A);
- 28 are of regional importance (Category B);
- 28 are of local importance (Category C); and
- 19 are minor or damaged sites (Category D).

5.1.3 Details of these sites are provided in Table 5.1. Site locations are provided on Figures 22/5-8 in Volume 1.9.

Geophysical survey and test pitting programme

5.1.4 Within this Section, one area was investigated using archaeological test pitting (Area 15). No significant archaeological features or remains were recorded.

Table 5.1 Summary of archaeological sites in Section Two

Site no	Site name	Grid reference	Site value	Form	Type	Period	Specific date	Description
37	Canal workers cottages, Gilwern	SO 2471 1454	C	Buildings	Domestic dwellings	Post-Medieval	-	Two small sets of workers cottages facing onto the canal.
38	Navigation Inn, Gilwern	SO 2458 1450	B	Building	Public house	Post-Medieval	-	A two-storey, purpose-built inn, adjacent to the Brecknock & Abergavenny Canal.
41	Leat below Gilwern Embankment	SO 2443 1450	A	Linear Feature	Leat	Post-Medieval	-	A leat system built to serve Danybont woolen mill.
42	Gilwern Embankment - Brecknock & Abergavenny Canal	SO 2446 1446	A	Earthworks	Embankment	Post-Medieval	1797	A stretch of embankment built in 1797 over the Clydach River and incorporating two masonry aqueducts.
43	Canal aqueducts, Gilwern	SO 2439 1451	A	Structure	Aqueduct	Post-Medieval	1797	Two masonry aqueducts carrying the B & A Canal over the Clydach River and the Clydach Railroad.
44	Clydach Railroad, Gilwern to Cheltenham	SO 2300 1369 to SO 2437 1448	B	Linear Feature	Railroad	Post-Medieval	1794	A railroad built by the B & A Canal Company to link the collieries at Brynmawr to the iron forge Glangrwyne on the Usk.
45	Pack-horse bridge, Gilwern	SO 2441 1442	B	Structure	Pack-horse bridge	Post-Medieval	-	A small bridge over a canal sluice system, which was possibly used as a pack-horse bridge.
46	Lean-to building and drystone wall, Gilwern	SO 2440 1442	D	Building and Field System	Outbuilding and Drystone walled field boundaries	Post-Medieval	-	A lean-to structure belonging to now demolished building.
47	Overflow sluice system, B & A Canal, Gilwern	SO 2442 1443	B	Structure	Sluice	Post-Medieval	1797	An overflow system used to control water levels in the canal.
48	Lion Hotel, Gilwern	SO 2437 1438	C	Building	Hotel	Post-Medieval	1840-1880?	A much altered building built between the OS mapping of the area in 1840 and 1880 and related to an adjacent terrace of cottages.
49	Terrace cottages, Gilwern	SO 2433 1436	C	Buildings	Domestic dwellings	Post-Medieval	1840-1880?	A row of terraced worker's cottages consisting of three dwellings built in the same architectural style as the Lion Hotel, and three earlier dwellings to the east and west.
50	Primitive Methodist Chapel and grave yard, Gilwern	SO 2427 1429	B	Building	Chapel	Post-Medieval	1838	A former Primitive Methodist chapel and cemetery built in 1838 and now derelict.
51	Llam-march Tramroad, Gilwern	SO 2440 1439 to SO 2328 1379	B	Linear Feature	Tramroad	Post-Medieval	1795	Built in 1795 to connect the Clydach Ironworks to the collieries and ironstone mines on the hillside to the south and laid with edge rail. It was extended to the canal wharf at Gilwern in 1809.
52	Machine House , Clydach Railroad	SO 2419 1439	B	Building	Weighbridge	Post-Medieval	1798	A machine house built as a toll house with weighbridge in 1798.

Site no	Site name	Grid reference	Site value	Form	Type	Period	Specific date	Description
53	Forge Hammer Inn, Gilwern	SO 2378 1408	C	Building	Public house	Post-Medieval	-	A two-storey public house which served the iron-making community during the latter half of the 19th.
54	Pwll Rhys waterfall footbridge	SO 2375 1410	D	Structure	Footbridge	Post-Medieval	-	A cast-iron footbridge over the Clydach River with masonry abutments.
55	Branch of the Llam-march Tramroad, Llanelly.	SO 2355 1396 to SO 2378 1408	B	Linear Feature	Tramroad	Post-Medieval	1795	The branch line of the Llam-march Tramroad.
56	A465 concrete revetting, Gilwern	SO 2420 1423	D	Structure	Revetting	Post-Industrial	-	Concrete revetting under present A 465 (visible on northern side).
57	Culvert/buttress, River Clydach, Maes-y-Gwartha	SO 2365 1410	D	Structure	Culvert	Post-Medieval	-	Remains of two arched culverts, probably contemporary and related to the nearby forge
58	Llanelly Forge, Maelog Bungalow, Maes-y-Gwartha	SO 2355 1405	B	Site	Iron forge	Post-Medieval	1663 - 1884	Site of Llanelly Forge which dates back to before 1663. Forge stands close to Llam-march Tramroad. Later it was used to produce tin plate. It closed in 1884. Remains of a leat, pond and dam system are located to the north and west of site.
59	Dam and parallel leat, Llanelly Forge, Maes-y-Gwartha	SO 2351 1402	B	Earthworks & Linear Feature	Industrial water courses	Post-Medieval	1663	The earthwork remains of a dam and parallel leat system which once fed the Llanelly Forge. Both earthworks are located north of the forge.
60	Forge House, Tin plate works, Maes-y-Gwartha	SO 2352 1399	B	Buildings	Tin plate works	Post-Medieval	-	Part of Llanelly Forge complex includes the tin plate works, now a domestic building. Continued in use until the late 19th century.
61	Llanelly Bridge, Maes-y-Gwartha	SO 2353 1396	A	Structure	Tramroad bridge	Post-Medieval	1795	A masonary bridge with two phases of construction over River Clydach. Its initial use would have been transportation of raw materials and goods to and from the forge by pack-horses. Later, the second phase accommodated the Llam-march Tramroad.
62	Forge Row, Llanelly, Maes-y-Gwartha	SO 2345 1392	B	Buildings	Domestic dwellings	Post-Medieval	c.1813	A row of 20 workers cottages that date possibly to the 17th century. The central row have steeper pitched roofs suggesting that they were once thatched.
63	Culvert, River Clydach, Saleyard	SO 2339 1383	C	Structure	Culvert	Post-Medieval	-	On the north bank of the River Clydach is a dry-block stone culvert which fed water into the Clydach from industrial buildings located north of Clydach House (No.64).
64	Clydach House, Saleyard	SO 2325 1382	A	Building	Domestic dwelling	Post-Medieval	1693	A three-storey Grade II listed house with an extensive ornamental front garden and built around 1693. House was the residence for the clerk of the Clydach Ironworks.

Site no	Site name	Grid reference	Site value	Form	Type	Period	Specific date	Description
65	Industrial buildings, Clydach House, Saleyard	SO 2331 1392	D	Buildings	Industrial complex	Post-Medieval	-	Located to the rear of Clydach house is a substantial building which probably has an industrial use and is associated with the nearby Llanelly Furnace.
66	Llanelly Furnace, Saleyard	SO 2323 1386	B	Site	Iron furnace	Post-Medieval	c.1684	Site is west of Clydach House: dates from mid 17th century. There are remains of a charcoal-fired blast furnace. Although a SAM, site has been extensively developed.
67	Terraces, arches and ponds, Llanelly Furnace, Saleyard	SO 2318 1377	C	Earthworks	Industrial watercourses	Post-Medieval	c.17th	West of the Llanelly furnace are the earthwork remains of a series of terraces, arches and ponds. These features dates from the late 17th century.
68	Former road bridge, Saleyard	SO 2330 1375	C	Structure	Road bridge	Post-Medieval	-	To the south of the present A465 at the Saleyard junction is a former road bridge that spans the River Clydach. Visible are the abutments and iron parapet.
69	Llam-march Tramroad bridge, Saleyard	SO 2329 1373	B	Structure	Tramroad	Post-Medieval	1795	Between the present A465 and former Llam-march Tramroad is a probable purpose-built Tramroad bridge which dates to 1812 (or earlier). Either side, on the north and south banks of the Clydach are related revetting and water channeling.
70	Llam-march Tramroad, Saleyard	SO 2327 1367	C	Linear Feature	Tramroad	Post-Medieval	1795	The Llam-march Tramroad was built in order to transport raw materials and goods from Saleyard to the Canal at Gilwern.
71	Farmstead, Brunant	SO 2375 1394	D	Buildings	Farmhouse & outbuildings	Post-Medieval	-	To south of Saleyard, located on an east-west ridge is a farmstead known as Burnant. Architecture and materials used suggest an 18th century date.
72	Clydach Villa, Cheltenham	SO 2291 1348	C	Building	Domestic dwellings	Post-Medieval	-	A substantial Victorian detached gentry house.
73	Lamb House and industrial unit, Cheltenham	SO 2282 1333	C	Buildings	Domestic dwelling and industrial unit	Post-Medieval	-	A group of buildings located east of Cheltenham on Main Road consisting of a 19th century cottage, a three-storey industrial warehouse(?) and small utility building.
74	Sunnyside - Terrace cottages, Cheltenham	SO 2279 1332	C	Buildings	Domestic dwelling	Post-Medieval	-	A terrace of four workers cottages - 18th/19th century date.
76	Worker's cottages incl. Oak Cottage, Cheltenham	SO 2267 1313	B	Buildings	Domestic dwelling	Post-Medieval	-	A row of four workers cottages including Oak Cottage (detached) next to the route of the Clydach Railroad within the village of Cheltenham. Early 19th century date.
77	Great Western Railway notice, Cheltenham	SO 2270 1318	B	Site	Sign-post	Post-Medieval	c.1920	Located next to Oak Cottage and on route of the Clydach Railroad is a G.W.R. sign dating to 1920.

Site no	Site name	Grid reference	Site value	Form	Type	Period	Specific date	Description
78	Clydach Railroad, Cheltenham	SO 2195 1274 to SO 2300 1369	C	Linear Feature	Railroad	Post-Medieval	1794	Running east-west through Cheltenham is the route of the central section of the Clydach Railroad.
79	Oak House, Cheltenham	SO 2258 1302	B	Building	Domestic dwelling	Post-Medieval	-	Part of a row of three houses dating from the late 18th/early 19th centuries.
75	Terrace cottages, Craig Amy, Cheltenham	SO 2273 1323	C	Buildings	Domestic dwelling	Post-Medieval	-	A terrace of three workers cottages - 18th/19th century date.
80	Ebenezer Welsh Chapel, Cheltenham	SO 2255 1397	C	Building	Chapel	Post-Medieval	-	A 19th century chapel located to the south of the Main road.
81	English Wesleyan Chapel, Cheltenham	SO 2250 1292	B	Building	Chapel	Post-Medieval	1829	A chapel built in 1829 and rebuilt in 1891 with attached school.
82	James Terrace cottages, Cheltenham	SO 2246 1290	C	Buildings	Domestic dwelling	Post-Medieval	-	A group of six terraced cottages to the north of Main road.
83	Siloam Chapel Graveyard, Cheltenham	SO 2247 1281	C	Site	Cemetery	Post-Medieval	-	A walled cemetery dating from the mid-19th century to 1968, the related chapel has been demolished.
84	Spring, gully and drystone wall., Cheltenham	SO 2239 1283	D	Site	Water-course	Post-Medieval	-	A spring, gully and extensive drystone wall.
85	Penrheol Las and Big House, Cheltenham	SO 2223 1281	D	Buildings	Domestic dwellings	Post-Medieval	-	An early to mid.-19th century farm cottage.
86	Merthyr -Govilon Turnpike Road (Main Road)	SO 1964 1213 to SO 2323 1437	C	Linear Feature	Road	Post-Medieval	1812	The route of the Turnpike road, of c.1881-12, which became Main road through Blackrock and Cheltenham.
87	Derelict cottage, Rock & Fountain Inn, Main Road	SO 2199 1278	C	Building	Domestic dwelling	Post-Medieval	-	A small, late 18th century cottage.
88	Masonry culvert, Main Road	SO 2193 1277	D	Structure	Culvert	Post-Medieval	-	An arched masonry culvert.
89i	Tramroad, Daren Ddu Limestone Quarry to Blackrock	SO 2154 1262 to SO 2190 1294	B	Linear Feature	Tramroad	Post-Medieval	-	A tramroad from Daren Ddu Limestone Quarry to Blackrock.
89ii	Tramroad, Daren Ddu Limestone Quarry to Limekilns	SO 2185 1275 to SO 2205 1287	B	Linear Feature	Tramroad	Post-Medieval	-	A tramroad from the Blackrock limekilns to Darren Ddu Quarry.
90	Blackrock Lime Kilns, Main Road	SO 2181 1275	A	Structure	Lime kilns	Post-Medieval	1889	Limekilns supplied from the Darren Ddu Quarry and linked to the Clydach Railroad.
91	Track/road between Blackrock and Cheltenham	SO 2153 1255 to SO2188 1274	C	Linear Feature	Tramroad	Post-Medieval	-	Part of the Clydach Railroad.
92	Haman's Cottages, Clydach	SO 2282 1319	B	Buildings	Domestic dwelling	Post-Medieval	-	Three-storey worker's cottages related to the nearby Clydach Ironworks.
93	Smart's Bridge, Clydach	SO 2287 1327	A	Structure	Tramroad Bridge	Post-Medieval	1824	A cast-iron bridge over the Clydach river to the Clydach Ironworks, dated 1824.

Site no	Site name	Grid reference	Site value	Form	Type	Period	Specific date	Description
94	Clydach Iron Works, Clydach	SO 2290 1320	A	Site	Ironworks	Post-Medieval	c.1797	A coke-fired ironworks in operation from 1797 to 1861 and superseded the charcoal-fired Llanelly Furnace.
95	Section of (branch) tramroad, Clydach Ironworks	SO 2289 1305 to SO 2230 1250	D	Linear Feature	Tramroad	Post-Medieval	-	Tramroad to the west of the Clydach Ironworks.
96	Site Office and dwellings, Clydach	SO 2287 1332	D	Site	Industrial and domestic units	Post-Medieval	-	The sub-surface remains of a Works Office related to the Clydach Ironworks.
97	Pant Glas Bridge, Clydach	SO 2293 1333	A	Structure	Tramroad bridge	Post-Medieval	-	A masonry tramroad bridge to Clydach Ironworks.
98	Masonry revetting within Clydach river bank	SO 2297 1339	C	Structure	Revetting	Post-Medieval	-	The remains of a masonry revetment along the banks of the Clydach river.
99	Leat keeper's cottage, outbuildings, weir and sluice system, Clydach	SO 2299 1344	A	Buildings & Structure	Leat cottage & water courses	Post-Medieval	pre-1797	A masonry building along the banks of the Clydach river, adjacent to the weir in the Clydach river, and the leat system supplying Llanelly Furnace.
100	Leat System, Clydach	SO 2301 1343 to SO 2315 1358	A	Linear Feature	Leat	Post-Medieval	c.1663-1797	The remains of an early drystone and earth banked leat running from the weir to supply Llanelly Furnace.
101	Hafod Inn, Blackrock	SO 2158 1261	D	Building	Public house	Post-Medieval	c.1891	A late 19th century public house which appears to have been modernised in the early 20 th century.
102	Drum & Monkey Inn, Blackrock	SO 2155 1257	C	Buildings	Public house	Post-Medieval	-	The much altered masonry-built public house formally known as the Prince Albert possibly
103	Craig Cottage, Blackrock	SO 2149 1258	C	Building	Domestic dwelling	Post-Medieval	-	A mid-19th century masonry-built cottage.
104	Cottages, Blackrock	SO 2145 1252	C	Buildings	Domestic dwelling	Post-Medieval	-	A row of much altered cottages formally known as the Rose cottage, the Old Blackrock Inn and the Crown Inn.
105	Blackrock Quarry, Blackrock	SO 2129 1250	D	Site	Mineral extraction	Post-Medieval	-	A limestone quarry.
106	Road and foot bridges, Blackrock	SO 2114 1249	D	Structures	Road bridge	Post-Medieval	c.1811-12	A masonry road bridge for the Turnpike Road (Main Road) and a parallel footbridge.
107	Squatter's settlement/industrial site, Nant Gwyn	SO 2114 1248	C	Site	Settlement	Post-Medieval	-	The remains of a industrial site and drystone walled watercourse.
108	Track and drystone wall landscape, Main Road	SO 2108 1249	D	Linear Feature & Field System	Drystone walled field boundaries	Post-Medieval	pre-1811-12	A substantial revetted east/west track.
109	Milestone, Nr. Pont Gam	SO 2096 1260	C	Site	Milestone	Post-Medieval	1812	Turnpike Road (Main Road) milestone.
110	Drystone wall landscape, Water Works, Pont Gam	SO 2077 1250	D	Field System	Drystone walled field boundaries	Post-Medieval	-	A drystone walled landscape.
111	Llangattock Tramroad, Brynmawr	SO 1945 1236 to SO 2209 1310	C	Linear Feature	Tramroad	Post-Medieval	c.1830	The course of the Llangattock to Brynmawr Tramroad.

Site no	Site name	Grid reference	Site value	Form	Type	Period	Specific date	Description
112	Clydach Railroad & Cwm Nantmelyn Bridge	SO 2022 1226	A	Linear Feature & Structure	Tramroad and Tramroad bridge	Post-Medieval	1794	The course of the Clydach Railroad and impressive causeway and bridge along the northern face of the Clydach gorge.
113	Branch line of the Clydach Railroad & colliery level	SO 2008 1218	B	Linear Feature & Site	Tramroad and mineral extraction	Post-Medieval	-	The southern branch line of the Clydach Railroad to colliery levels.
114	Merthyr, Tredegar & Abergavenny Railway	SO 1968 1207 to SO 2190 1288	B	Linear Feature	Railway	Post-Medieval	1862	The course of the MT&A railway along the southern face of the Clydach gorge and associated revetments.
115	Ffynnon Gistfaen religious waterfall, River Clydach	SO 2068 1238	D	Site	Religious site	Post-Medieval	-	A waterfall site possibly with special religious importance.
116	Devil's Bridge, Cheltenham	SO 2154 1249	B	Structure	Pack-horse bridge	Post-Medieval	-	A substantial masonry bridge over the Clydach river probably used as a pack-horse bridge to transport coal/ironstone before the advent of tramroads.
117	Clydach Bridge Cottages, Brynmawr	SO 1955 1212	B	Buildings	Domestic dwellings	Post-Medieval	1836	A row of four worker's cottages.
118	Clydach Bridge, Brynmawr	SO 1964 1213	B	Structure	Road bridge	Post-Medieval	1812	The remaining single arch of a four-arched bridge which carried the Turnpike Road across the Clydach river at Brynmawr.
119	Skew bridge, Brynmawr	SO 1979 1211	C	Structure	Footbridge	Post-Medieval	c.1862	The partial remains of an accommodation bridge over the line of the MT&A railway.
120	'Squatters' settlement & water courses, Clydach Dingle	SO 1922 1287	B	Buildings & Earthwork	Settlement	Post-Medieval	-	The remains of a squatter settlement consisting of single-unit cottages.
122	Bailey's Disgwylfa Tramroad, Clydach Dingle	SO 1905 1215 to SO 1935 1287	B	Linear Feature	Tramroad	Post-Medieval	c.1818	The course of Bailey's Disgwylfa Tramroad used to transport limestone to Bailey's Nantyglo Ironworks.

5.2 Impacts and Mitigation

5.2.1 The potential impacts on the cultural heritage sites in Section Two comprise:

- loss;
- damage;
- severance of linear features;
- reduction of the group value of associated features; and
- adverse affects on the setting of features.

5.2.2 Details of the potential impacts, their magnitude and significance for each site which may be affected by the proposed scheme are provided in Table 5.2.

5.2.3 Measures to mitigate adverse impacts in this Section include:

- full excavation;
- limited excavation;
- ground/building survey; preservation *in situ*;
- consultation over detailed design; and

5.2.4 In addition, all areas outside the known archaeology will be subject to a watching brief during construction.

5.2.5 Details of measures proposed to mitigate the effects on each site and subsequent residual impact are provided in Table 5.2.

Table 5.2 Impact and mitigation measures in Section Two

Site No	Approx Chainage	Description	Site value	Potential impact	Impact magnitude	Significance	Mitigation	Residual impact
48	35200	Lion Hotel, Gilwern	C	total loss of building	Very severe	Minor	Building Survey Level 4	n/a
49	35100	Terrace Cottages, Gilwern	C	total loss of building	Very severe	Minor	Building Survey Level 4 and Limited Excavation	n/a
50	35000	Primitive Methodist Chapel and Grave Yard, Gilwern	B	total loss of building	Very severe	Significant	Building Survey Level 4, Excavation, Grave recording and Strip & record	n/a
51	34000-35200	Llanmarch Tramroad, Gilwern	B	further severance of tramroad	Severe	Significant	Strip & record	n/a
53	34500	Forge Hammer Inn, Gilwern	C	impact on setting	Moderate	Not significant	Building Survey Level 4	n/a
69	33900	Llanmarch Tramroad Bridge, Saleyard	B	impact on setting and on bridge abutments	Moderate	Minor	Building Survey Level 4	water drainage & vehicle vibration impact
70	33800-33900	Llanmarch Tramroad, Saleyard	C	further severance of tramroad	Severe	Minor	Strip & record	n/a
83	32700	Siloam Chapel Graveyard, Cheltenham	C	impact on graveyard boundary and possibly on burials	Very severe	Minor	Photographic record, Grave recording, Ground Survey and Strip & record	n/a
86	32800-29800	Merthyr-Govilon Turnpike Road (Main Road)	C	partial re-alignment of road	Severe	Minor	Strip & record	n/a
88	32100	Masonry culvert, Main Road	D	affects course of culvert	Moderate	Not significant	Preserve in situ	water drainage and impact from vehicle vibration
91	31600-32800	Clydach Railroad between Blackrock and Cheltenham	C	further severance course of tramroad	Severe	Minor	Strip & record	n/a
97	33300	Pant Glas, Clydach	A	impact on setting	Slight	Minor	No access to construction traffic	water drainage and impact from vehicle vibration
99	33400	Leat Keepers Cottage, Outbuildings and Weir	A	effect on setting from embankment and associated leat	Severe	Very significant	Building Survey Level 4, Excavation, Consolidation of standing remains	water run-off and drainage from road embankment

Site No	Approx Chainage	Description	Site value	Potential impact	Impact magnitude	Significance	Mitigation	Residual impact
100	33400-33800	Leat System	A	total loss	Very severe	Very significant	Excavation	n/a
102	31700	Drum and Monkey Inn, Blackrock	C	total loss	Very severe	Minor	Building Survey Level 4	n/a
103	31600	Craig Cottage, Blackrock	C	effect on setting	Severe	Minor	Building Survey Level 4	n/a
104	31500-31600	Cottages, Blackrock	C	total loss	Very severe	Minor	Building Survey Level 4	n/a
106	31200	Road and Foot Bridges, Blackrock	D	alteration for additional traffic	Very severe	Not significant	Building Survey Level 3	n/a
107	31200	Industrial Settlement, Nant Gwyn	C	total loss	Very severe	Minor	Excavation	n/a
108	31200	Track and drystone wall landscape, Main Road	D	further severance of walls	Moderate	Not significant	Limited excavation	n/a
111	29800-32000	Llangattock Tramroad, Brynmawr	C	further severance of tramroad	Severe	Minor	Strip & record	n/a
112	29100.000-29500.000	Clydach Railroad and Cwm Nant Melyn Bridge	A	effect on setting and severance	Severe	Very significant	Limited excavation and Strip & record	n/a
113	29000	Branch-line of the Clydach Railroad and Colliery Level	B	further encroachment on tramroad and levels	Severe t	Significant	Excavation	n/a
114	29800-31000	Merthyr, Tredegar and Abergavenny Railway	B	substantial removal of course of line	Very severe	Significant	Limited excavation	n/a
118	29700	Clydach Bridge, Brynmawr	B	effect on setting	Slight	Not significant	Preserve in situ	n/a
119	29800	Skew bridge, Brynmawr	C	total loss	Very severe	Minor	Preserve or Building Survey Level 3	n/a
263	30600	Southern section of Clydach Railroad, Pont Harri Issac	B	further severance of tramroad	Severe	Significant	Limited excavation and Strip & record	n/a
264	30600-31000	Western section of Clydach Railroad, Brynmawr	B	further encroachment of roundabout	Very severe t	Significant	Strip & record	n/a

6.0 Section Three: Brynmawr to Tredegar

6.1 Existing Context

General

6.1.1 Archaeological sites along Section Three comprise:

- the site of a find of prehistoric Bronze Age metal hoard;
- post-medieval agricultural features, including farm dwellings and outbuildings, field boundaries, field systems, holloways and tracks;
- post-medieval industrial sites and features including railways, leat system, reservoirs, coal tips, tramroads, bridges and domestic dwellings;
- Post-Industrial features including roads and bridges;
- one site of palaeoenvironmental interest; and
- a site of religious significance including a chapel.

6.1.2 A total of 31 sites were recorded in this area. Of these:

- 2 are of national importance (Category A);
- 4 are of regional importance (Category B);
- 5 are of local importance (Category C); and
- 20 are minor or damaged sites (Category D).

6.1.3 Details of these sites are provided in Table 6.1. Site locations are provided on Figures 22/9-12 in Volume 1.9.

Geophysical survey and test pitting programme

6.1.3 Within this Section, four areas were investigated using archaeological test pitting (Areas 11, 12, 13 and 14). No significant archaeological features or remains were recorded in Areas 12, 13 and 14. From one test in Area 11 the remains of a drystone wall, possibly a field boundary, were noted. From the same test pit an unworked piece of flint was also recovered.

Table 6.1 Summary of archaeological sites in Section Three

Site no	Site name	Grid reference	Site value	Form	Type	Period	Specific date	Description
121	Local open-cast coal workings & terraces, Brynmawr	SO 1847 1288	D	Site	Mineral extraction	Post-Medieval	-	Linear platforms and open-cast workings of coal-seams.
123	Tramroad, Garn Lydan	SO 1753 1275 to SO 1756 1261	D	Linear Feature	Tramroad	Post-Medieval	-	A north/south linear platform, possibly related to a localised tramroad.
124	Farmhouse and outbuildings, Garn Lydan	SO 1747 1242	D	Buildings	Farmhouse & outbuildings	Post-Medieval	-	The remains of two dwellings and outbuildings.
125	Tramroad, Garn Lydan	SO 1803 1271 to SO 1703 1258	D	Linear Feature	Tramroad	Post-Medieval	-	An east/west tramroad to coal seams at Garn Lydan coal-seams.
126	Coal workings and quarrying, Brynmawr	SO 1800 1270	D	Site	Mineral extraction	Post-Medieval	-	Extensive disused coal and ironstone workings.
127	Cwm Gwybedog patches and leats, Garn Lydan	SO 1694 1240	C	Earthworks & Linear Feature	Mineral extraction and leat	Post-Medieval	-	Early 19th century patch workings for the supply coal and ironstone to Ebbw Vale and Beaufort Ironworks.
128	Drift mines, Garn Lydan	SO 1702 1230	D	site	Mineral extraction	Post-Medieval	-	Localised drift mines.
129	Farmhouse & DRYSTONE WALL, Afon Ebbw	SO 1646 1219	D	Buildings	Domestic dwelling & drystone walled field boundaries	Post-Medieval	-	A mid-19th century, masonry-built farmhouse and field boundaries.
130	Tramroad, Afon Ebbw	SO 1643 1209	D	Linear Feature	Tramroad	Post-Medieval	-	The line of a north/south tramroad.
131	Primrose Cottage, Rassau Brook	SO 1538 1173	D	Building	Domestic dwelling	Post-Medieval	-	A mid-19th century masonry-built cottage.
132	D.S.W landscape, Nant y Croft	SO 1400 1100	D	Field System	Drystone walled field boundaries	Post-Medieval	-	An extensive drystone walled landscape.
133	Trefil Tramroad, Nant y Croft	SO 1407 1160 to SO 1458 1158	B	Linear Feature	Tramroad	Post-Medieval	1797-1860	The line of the Trefil tramroad at its junction with the Rassau tramroad.
134	Lamp stand and manhole cover, Nant y Croft	SO 1478 1158	D	Site	Tramroad furniture	Post-Medieval	-	An early 20th century lampstand and man-hole cover along the line of the Trefil tramroad.
135	Quarry and DRYSTONE WALL, Nant y Croft	SO 1500 1160		Site & Field System	Mineral extraction and drystone walled field boundaries	Post-Medieval	-	A limestone quarry partially enclosed by drystone walling.
136	Craig House, Nant y Croft	SO 1490 1159	D	Building	Domestic dwelling	Post-Medieval	-	A early 19th century cottage.
137	Hirgan Farmstead and outbuildings	SO 1433 1134	D	Buildings	Farmhouse and outbuildings	Post-Medieval	-	A farmstead, outbuildings and sheep-fold.

Site no	Site name	Grid reference	Site value	Form	Type	Period	Specific date	Description
138	Rassau Tramroad, Nant y Croft	SO 1470 1155 to SO 1569 1154	C	Linear Feature	Tramroad	Post-Medieval	-	The line of Rassau tramroad at its junction with Trefil tramroad.
139	Mineral Line, Nant y Croft	SO 1475 1150 to SO 1500 1152	D	Linear Feature	Tramroad	Post-Medieval	-	A mineral line to Ebbw Vale possibly an extension of the Rassau tramroad.
140	Farmstead and outbuildings, Nant y Croft	SO 1517 1152	C	Buildings	Farmhouse and outbuildings	Post-Medieval	-	Two farmsteads and associated tofts.
141	Old Hargan Fach and DRYSTONE WALL landscape	SO 1372 1099	D	Building & Field System	Farmhouse, outbuildings and drystone walled field boundaries	Post-Medieval	-	A one-storey masonry-built cottage and outbuildings.
142	Merthyr, Tredegar & Abergavenny Railway	SO 1363 1083 to SO 1334 1092	C	Linear Feature	Railway	Post-Medieval	1864	Course of t MT&A railway including curved viaduct across Afon Sirhowy.
143	Railway viaduct, Dukestown	SO 1329 1093	A	Structure	Viaduct	Post-Medieval	1863	A nine arch masonry viaduct across the Afon Sirhowy, built for the MT&A railway.
144	Earthworks and DRYSTONE WALL, Dukestown	SO 1323 1083	D	Earthworks & Field System	Drystone walled field boundaries	Post-Medieval	-	A series of earthworks and platforms including a drystone walled sheepfold.
145	Cast iron weir, Dukestown	SO 1342 1077	B	Structure	Weir	Post-Medieval	-	A cast-iron and masonry weir across the Afon Sirhowy.
146	Trefil Tramroad, Nant y Bwch	SO 1295 1111 to 1313 1076	B	Linear Feature	Tramroad	Post-Medieval	1797-1860	The Trefil tramroad was built to carry limestone from the quarries at Trefil to a junction with the Rassau tramroad.
147	Merthyr, Tredegar & Abergavenny Railway, Waundeg	SO 1325 1093 to SO 1274 1064	C	Linear Feature	Railway	Post-Medieval	1863	A section of the MT&A railway.
266	Reservoir, Garn Lydan	SO 1766 1279	D	Site	Reservoir	Post-Medieval	pre-1880	A small pond, north of the Preferred Route at Garn Lydan which is the remnant of a slightly larger reservoir marked on the OS of 1880 described as belonging to Nantyglo Ironworks.
267	Blaen y Cwm Reservoir, Garn Lydan	SO 175 129	D	Site	Reservoir	Post-Medieval	post-1880	North of the preferred route at Garn Lydan is the Blaen y Cwm Reservoir. This is the post-1880 successor to the a much smaller reservoir on the same site, and supplied water to the Nantyglo Ironworks..

6.2 Impacts and Mitigation

6.2.1 The potential impacts on the cultural heritage sites in Section Three comprise:

- loss;
- damage;
- severance of linear features;
- reduction of the group value of associated features; and
- adverse affects on the setting of features.

6.2.2 Details of the potential impacts, their magnitude and significance for each site which may be affected by the proposed scheme are provided in Table 6.2.

6.2.3 Measures to mitigate adverse impacts in this Section include:

- full excavation;
- limited excavation;
- strip and record;
- ground/building survey;
- preservation *in situ;*
- palaeoenvironmental sampling; and
- consultation over detailed design.

6.2.4 In addition, all areas outside the known archaeology will be subject to a watching brief during construction.

6.2.5 Details of measures proposed to mitigate the effects on each site and subsequent residual impact are provided in Table 6.2.

Table 6.2 Impact and mitigation measures in Section Three

Site No	Approx Chainage	Description	Site Value	Potential impact	Impact magnitude	Significance	Mitigation	Residual impact
120	28900	Industrial Settlement and Drift Mines, Clydach Dingle	B	further encroachment , loss of water-courses	Severe	Significant	Limited excavation and Strip & record	n/a
123	27100	Tramroad, Garn Lydan	D	further severance	Severe	Not significant	Limited excavation	n/a
133	23400-23700	Trefil Tramroad, Nant y Croft	B	severance of course of tramroad	Severe	Significant	Excavation and Strip & record	n/a
142	21600-22600	Merthyr, Tredegar and Abergavenny Railway	C	further severance	Severe	Minor	Limited excavation (incl.strip and record)	n/a
144	22100	Earthworks and DSW, Dukestown	D	loss of some earth-works	Slight	Not significant	Excavation	n/a
145	22300	Cast Iron Weir, Dukestown	A	effect on setting	Slight	Minor	Building Survey Level 3	n/a

7.0 Section Four: Tredegar to Dowlais Top

7.1 Existing Context

General

7.1.1 Archaeological sites within Section Four comprise:

- prehistoric sites, including a Bronze Age round barrow;
- post-medieval agricultural features, including farm dwellings, farm buildings, field boundaries, field systems, holloways and tracks;
- post-medieval industrial sites and features including railways, a tunnel and bridge, station house, leat system, crows-foot, allotments, coal tips, tramroads, associated furniture and bridges and dwellings;
- Post-Industrial features including restaurants, roads and bridges; and
- sites of palaeoenvironmental interest.

7.1.2 A total of 41 sites were recorded in this area. Of these:

- none are of national importance (Category A);
- 10 are of regional importance (Category B);
- 9 are of local importance (Category C); and
- 22 are minor or damaged sites (Category D).

7.1.3 Details of these sites are provided in Table 7.1. Site locations are provided on Figures 22/12-16 in Volume 1.9.

Geographical survey and test pitting programme

7.1.4 Within this Section, one area was investigated using geophysical survey (Area 9) and one other using archaeological test pitting (Area 10). No significant archaeological features or remains were recorded in either area.

Table 7.1 Summary of archaeological sites in Section Four

Site no	Site name	Grid reference	Site value	Form	Type	Period	Specific Date	Description
148	Siloam Chapel, Tafarnaubach	SO 1204 1047	B	Building	Chapel	Post-Medieval	1844	A chapel with datestones of 1844 & 1877 plus a Welsh inscription.
149	Welfare Hall, Tafarnaubach	SO 1188 1036	C	Building	Public hall	Post-Medieval	1937	A brick-built hall of 1937.
150	Bronze Age find spot, Tafarnaubach	SO 1170 1010	C	Find spot	Prehistoric metal hoard	Bronze Age	-	The findspot of a Bronze Age hoard of two socketed palstaves.
151	Farmstead, Bryn Bach	SO 1253 1052	D	Buildings	Demolished farmhouse & outbuildings	Post-Medieval	-	The remains of a demolished farmstead.
152	Leat system and 'kettle-hole' quarries, Princetown	SO 1134 0982	D	Linear Feature & Earthworks	Leat and mineral extraction	Post-Medieval	-	An extensive industrial landscape comprising a leat system, kettle-hole quarries and crowsfoot.
153	Mining tips and quarry, Princetown	SO 111 096 to SO 112 096	D	Site and Earthworks	Mineral extraction and workings	Post-Medieval	-	Coal tips and quarrying levels.
154	Industrial building, Princetown	SO 1100 0970	C	Building	Railway building	Post-Medieval	-	A brick and concrete-built industrial building and related cropmarks to the west.
155	Demolished buildings, Princetown	SO 1111 0970	D	Site	Demolished buildings	Post-Medieval	-	A demolished masonry building probably with an industrial function.
156	Drystone wall landscape, Blaen Rhymney	SO 107 097 to SO 113 096	D	Field System	Drystone walled field boundaries	Post-Medieval	-	A drystone walled landscape.
157	Railway bridge and tunnel, Llechryd	SO 1057 0961	B	Structures	Railway bridge and tunnel	Post-Medieval	1863	A multi-phase tunnel and embankment to carry the MT&A railway over the River Rhymney.
158	Drystone wall landscape, Blaen Rhymney	SO 1054 0964	D	Field System	Drystone walled field boundaries	Post-Medieval	-	A drystone walled landscape along western the banks of the River Rhymney.
159	Drystone wall and building platforms, Afon Rhymney	SO 1050 0978	D	Field System & Earthworks	Drystone walls & demolished building	Post-Medieval	-	A drystone walled landscape along the bank of the River Rhymney, related to an agricultural building.
160	Northern section of leat system, Blaen Rhymney	SO 1045 0994 to SO 1052 0960	D	Linear Feature	Leat	Post-Medieval	-	The northern section of an earth and drystone revetted leat to the Butetown reservoir.
161	Road platform, Pleasant View, Llechryd	SO 1039 0956 to SO 1033 0953	D	Linear Feature	Road	Post-Medieval	-	The remains of a the 'B' class road to Merthyr.
162	Drystone wall & turfstone wall system, Butetown	SO 1010 0930	D	Field Systems	Drystone and turf-stone walled boundaries	Post-Medieval	-	An extensive drystone and turfstone walled landscape to the north of Bute Town reservoir.
163	Railway furniture, Butetown	SO 0960 0910	D	Site	Fence-posts	Post-Medieval	-	An east/west line of concrete posts along the course of the MT&A railway.

Site no	Site name	Grid reference	Site value	Form	Type	Period	Specific Date	Description
164	Drystone wall landscape, Butetown Reservoir	SO 0940 0900	D	Field System	Drystone walled field boundaries	Post-Medieval	-	A drystone walled landscape to the south of the A465.
165	Leat system, Butetown Reservoir	SO 0980 0927	C	Linear Feature	Leat	Post-Medieval	-	The remains of an earthen leat with drystone revetting to the Bute Town reservoir.
166	Masonary bridge, Graig Lwyd	SO 1019 0929	D	Structure	Road bridge	Post-Medieval	-	A small road bridge over a stream flowing into Bute Town reservoir.
167	Gullies and earthworks, Butetown	SO 1020 0934	D	Earthworks	Water courses	Post-Medieval	-	A series of gullies and earthworks related to the nearby leat-system.
168	Skew bridge, Llechryd	SO 1042 0944	B	Structure	Road bridge	Post-Medieval	-	A concrete road bridge over the MT&A railway.
169	Station House, Llechryd	SO 1046 0951	B	Building	Railway Building	Post-Medieval	-	The Rhymney Bridge Station House on the MT&A railway.
170	Southern section of leat system, Llechryd	SO 1052 0953 to SO 1053 0950	C	Linear Feature	Leat	Post-Medieval	-	A leat running into Bute Town Reservoir.
171	Gullies and tips, Princetown	SO 1110 0969 to SO 1111 0963	D	Earthworks	Mineral workings	Post-Medieval	-	A north/south gully possibly associated with quarrying.
172	Drystone wall , Princetown	SO 1120 0965	D	Field System	Drystone walls	Post-Medieval	-	A drystone walled landscape.
173	Drystone wall & turfstone wall landscape, Blaencarno Common	SO 0860 0890	D	Field Systems	Drystone and turf-stone walled boundaries	Post-Medieval	-	A drystone and turfstone walled landscape.
174	Ventilation/water shafts, Blaencarno Common	SO 0883 0891	D	Earthworks	Mineral extraction	Post-Medieval	-	A number of ventilation shafts associated with mining on Blaencarno Common.
175	Bronze Age Cairn, Blaencarno Common	SO 0887 0890	B	Findspot	Prehistoric funerary monument	Bronze Age	-	A small doughnut-shaped cairn, probably Bronze Age in date.
176	Industrial earthworks, Merthyr Common	SO 0851 0890	D	Earthworks	Mineral workings	Post-Medieval	-	A number of heavy scratches and coal tips, west of Blaencarno Common
177	Railway furniture, Merthyr Common	SO 0842 0862	D	Site	Fence-posts	Post-Medieval	-	A line of concrete posts delineating the course of the MT&A railway.
178	Coal tippings, Blaencarno Farm	SO 0890 0876	C	Earthworks	Mineral workings	Post-Medieval	-	Spoil tips shown on the 1880 OS.
179	'Dig for Victory' allotments, Blaencarno Farm	SO 0892 0884	B	Earthworks	Allotments	Post-Medieval	1940-1945	A series of W.W.II allotments consisting of low drystone walls.
180	Culvert, Blaencarno	SO 0899 0890	C	Structure	Culvert	Post-Medieval	1863	A culvert below the A465, probably constructed for the MT&A railway.
181	Drystone wall landscape, Blaencarno	SO 0975 0910	D	Field System	Drystone walled field boundaries	Post-Medieval	-	A drystone walled landscape and watercourses.

Site no	Site name	Grid reference	Site value	Form	Type	Period	Specific Date	Description
182	Railway furniture, Blaencarno	SO 0920 0930	D	Site	Fence-posts	Post-Medieval	-	A line of concrete posts delineating the course of the MT&A railway.
183	Station House, Dowlais Top	SO 0800 0845	B	Buildings	Railway building	Post-Medieval	-	A station house for Rhymney Bridge built along the course of the Brecon & Merthyr railway close to the junction with the LNWR Dowlais Extension.
184	Abergavenny, Tredegar & Merthyr Railway, Dowlais	SO 0804 0849 to SO 0839 0863	B	Linear Feature	Railway	Post-Medieval	1863	The main line of the Brecon & Merthyr railway.
185	Brecon & Merthyr Railway embankment, Dowlais	SO 0750 0836	C	Linear Feature	Railway embankment	Post-Medieval	1869	A section of embankment for the Brecon & Merthyr railway.
186	Eastern leat system, Upper Reservoir, Dowlais	SO 0750 0834 to SO 0729 0848	C	Linear Feature	Leat	Post-Medieval	-	A well preserved east/west leat with a brick lining, incorporating two aqueducts.
187	Aqueducts under leat, Upper Reservoir, Dowlais	SO 0733 0842	B	Structure	Aqueducts	Post-Medieval	-	Two masonry aqueducts along the length of the leat.
195	Lower Reservoir, Dowlais	SO 0730 0830	B	Structure	Reservoir	Post-Medieval	pre-1850	The smaller of two inter-linked reservoirs
196	McDonald's Restaurant, Dowlais Top	SO 0783 0822	D	Building	Restaurant	Post-Industrial	1989	Within the A465 corridor is one of two (post-industrial) fast food restaurant. The McDonald's drive-in, building with no external architectural features.
269	Merthyr, Tredegar & Abergavenny Railway, Llechryd	SO 1033 0920 to SO 1070 0962	C	Linear Feature	Railway	Post-Medieval	1863	The course of the MT & A Railway across the Afon Rhymni over a masonry and brick bridge and a leat south of Llechryd station house, below a now infilled concrete skew bridge.

7.2 Impacts and Mitigation

7.2.1 The potential impacts on cultural heritage sites in Section Four comprise:

- loss;
- damage;
- severance of linear features;
- reduction of the group value of associated features; and
- adverse affects on the setting of features.

7.2.2 Details of the potential impacts, their magnitude and significance for each site which may be affected by the proposed scheme are represented in Table 7.2.

7.2.3 Measures to mitigate adverse impacts in this Section include:

- full excavation;
- limited excavation;
- ground/building survey; preservation *in situ*; and
- consultation over detailed design.

7.2.4 In addition, all areas outside the known archaeology will be subject to a watching brief during construction.

7.2.5 Details of measures proposed to mitigate the effects on each site and subsequent residual impact are provided in Table 7.2.

Table 7.2 Impact and mitigation measures in Section Four

Site No	Approx Chainage	Description	Site value	Potential impact	Impact magnitude	Significance	Mitigation	Residual impact
150	20500	Bronze Age find spot, Tafarnaubach	C	partial removal of peat levels	Severe	Minor	Limited excavation	n/a
152	20000	Leat system and 'Kettle-hole' Quarries, Princetown	D	partial removal of quarries and kettle holes	Moderate	Not significant	Excavation	n/a
153	19900	Mining tips and Quarry, Princetown	D	partial removal of tips and quarries	Moderate	Not significant	Ground Survey, Limited excavation, Strip & record	n/a
154	19800	Industrial Building, Princetown	C	total loss	Very severe	Minor	Building Survey Level 3, Excavation (strip and record)	n/a
155	19800	Earthworks (demolished buildings), Princetown	D	total loss	Very severe	Not significant	Building Survey Level 3, Excavation (strip and record)	n/a
157	19300	Railway Bridge and Tunnel, Llechryd	B	further loads and encroachment of embankment	Moderate	Minor	Building Survey Level 3 (equiv.)	water drainage and impact from vehicle vibration
160	19200	Northern section of leat system, Blaen Rhymney	B	further severance of leat	Severe	Significant	Excavation	n/a
161	19000-19100	Road platform, Pleasant View, Llechryd	D	further severance	Severe	Not significant	Excavation	n/a
167	18800	Gullies and Earthworks, Bute Town	D	encroachment of embankment	Slight	Not significant	Limited excavation	n/a
168	19000	Skew Bridge, Llechryd	B	partial loss	Severe	Significant	Preserve in situ	n/a
169	19100	Station House, Llechryd	B	total loss	Severe	Significant	Building Survey Level 4	n/a
173	18300	Drystone wall and turfstone wall landscape, Blaencarno Common	D	severance	Slight	Not significant	Limited excavation and Strip & record	n/a

Site No	Approx Chainage	Description	Site value	Potential impact	Impact magnitude	Significance	Mitigation	Residual impact
179	17400	'Dig for Victory' allotments, Blaencarno Farm	B	further encroachment	Moderate	Minor	Limited excavation	n/a
180	17500	Culvert, Blaencarno	C	encroachment of embankment	Moderate	Not significant	Building Survey Level 3 (equiv.)	n/a
196	16200	McDonald's Restaurant	D	total loss	Very severe	Not significant	Building Survey Level 2	n/a
269	18400-18700	Merthyr, Tredegar & Abergavenny Railway, Llechryd	C	further severance	Severe	Minor	Preserve in situ	n/a

8.0 Section Five: Dowlais Top to A470 Junction

8.1 Existing Context

General

8.1.1 Archaeological sites along Section Five comprise:

- prehistoric sites, including the site of a possible prehistoric find and a possible Roman road;
- medieval hut circles, and a coin hoard;
- post-medieval agricultural features, including a model farm and outbuildings, field boundaries, field systems, holloways and tracks;
- post-medieval industrial sites and features, including railways, tramroads, associated furniture, bridges and worker housing; and
- Post-Industrial features including roads and viaducts/bridges.

8.1.2 A total of 38 sites were recorded in this area. Of these:

- 5 are of national importance (Category A);
- 11 are of regional importance (Category B);
- 9 are of local importance (Category C); and
- 13 are minor or damaged sites (Category D).

8.1.3 Details of these sites are provided in Table 8.1. Site locations are provided on Figures 22/16-19 in Volume 1.9.

Geophysical survey and test pitting programme

8.1.4 Within this Section, one area was investigated using geophysical survey (Area 6) and three others using archaeological test pitting (Areas 6, 7 and 8). No significant archaeological features or remains were recorded in Areas 6 and 7. In Area 8, a Roman pottery sherd and a piece of worked flint was recovered, close to the route of a probable Roman road, Site No. 205(ii).

Table 8.1 Summary of archaeological sites in Section Five

Site no.	Site name	Grid ref.		Form	Type	Period	Specific date	Description
188	Upper Reservoir, Dowlais	SO 0720 0850	B	Structure	Reservoir	Post-Medieval	-	Upper Reservoir, which is related to Lower Reservoir, is larger of the two and has leat systems feeding into and out of it.
189	Pumping station, Upper Reservoir, Dowlais	SO 0705 0851	B	Building	Industrial building	Post-Medieval	post-1850	A brick-built pumping station related to Upper Reservoir.
190	Inspection road, Upper Reservoir, Dowlais	SO 0728 0846 to SO 0692 0868	D	Linear Feature	Road	Post-Medieval	-	A inspection road for the Upper Reservoir.
191	Western leat system, Upper Reservoir, Dowlais	SO 0688 0867 to SO 0692 0849	B	Linear Feature	Leat	Post-Medieval	-	A north/south orientated leat with extensive brick and masonry lining.
192	Branch line of Brecon & Merthyr Railway, Dowlais	SO 0668 0887 to SO 0733 0844	C	Linear Feature	Railway	Post-Medieval	1869	The north/south cutting for the Brecon & Merthyr railway line.
193	Branch line of Brecon & Merthyr Railway, Dowlais	SO 0675 0856 to SO 0666 0859	D	Linear Feature	Railway	Post-Medieval	1869	An east/west line between the Brecon & Merthyr railway and a branch line of the Brecon & Merthyr railway.
194	Brecon & Merthyr Railway (to Pontsticill), Dowlais	SO 0664 0884 to SO 0651 0840	C	Linear Feature	Railway	Post-Medieval	1863	The Brecon & Merthyr railway main line.
197	Drystone wall landscape, Gurnos	SO 0485 0870	D	Field System	Drystone walled field boundaries	Post-Medieval	-	A drystone walled landscape.
198	Lime Kilns, Castle Morlais Tramroad, Gurnos	SO 0471 0872	B	Structure	Lime kilns	Post-Medieval	-	Three circular limekilns constructed of drystone walling adjacent to the Castle Morlais tramroad related to Gurnos Farm.
199	Coppice and drystone wall landscape, Gurnos	SO 0470 0870	D	Landscape Feature & Field System	Woodland and drystone walled field boundaries	Post-Medieval	-	An area of coppiced land.
200	Castle Morlais Quarries Tramroad, Gurnos	SO 0473 0892 to SO 0473 0867	B	Linear Feature	Mineral extraction	Post-Medieval	1803	The course of the Castle Morlais tramroad used to transport limestone to the Dowlais Ironworks.
201	Possible quern stone, Gurnos	SO 0455 0866	B	Findspot	Prehistoric quern stone	Neolithic	-	A possible quern-stone of prehistoric date.
202	Drystone wall landscape and sheep fold, Gurnos	SO 0450 0865	C	Field System	Drystone walled field boundaries and sheep fold	Post-Medieval	-	Between Gurnos Farm and the Castle Morlais Tramroad on the northern side of the A465 is an extensive drysone walled landscape including a sheepfold.
203	Gurnos Farm workers cottages, Gurnos Farm	SO 0435 0863	C	Buildings	Domestic dwellings	Post-Medieval	-	Three farm worker's cottages similar in style to Gurnos Farm
204	Gurnos 'model' Farm, Gurnos	SO 0430 0864	B	Buildings	Farmhouse and outbuildings	Post-Medieval	pre-1880	A model farm laid-out around a courtyard related to improvement of worker's cottages and agricultural land.

Site no.	Site name	Grid ref.		Form	Type	Period	Specific date	Description
205	DRYSTONE WALL landscape, Gurnos Farm	SO 0423 0860	D	Field System	Drystone walled filed boundaries.	Post-Medieval	-	A drystone walled landscape enclosing an area of coppice.
206	Viaduct, Taf Fechan, Cefn Coed-y-Cymmer	SO 0335 0815	A	Structure	Road bridge	Post-Medieval	1963	One of the A465 road bridges designed by engineers Rendel, Palmer & Tritton with twin parabolic arch ribs.
207	Gurnos Leat system, Cefn Coed-y-Cymmer	SO 0342 0829 to SO 0373 0767	A	Linear Feature	Leat	Post-Medieval	1792	A leat below the A465, built of brick and masonry it runs parallel to the Taf Fechan to Cyfartha Ironworks.
208	Gurnos Tramroad, Cefn Coed-y-Cymmer	SO 0341 0830 to SO 0372 0767	A	Linear Feature	Tramroad	Post-Medieval	-	Gurnos tramroad below the present A465 built to supply Cyfartha Ironworks.
209	Footbridge over Brecon & Merthyr Railway, Cefn	SO 0327 0821	C	Structure	Footbridge	Post-Medieval	-	An iron-girder accommodation bridge over the course of the Brecon & Merthyr railway.
210	Gurnos Limestone Quarry, Gurnos	SO 0355 0828	A	Site	Mineral extraction	Post-Medieval	-	A quarry excavated partly to supply Cyfartha Ironworks with limestone with a network of tramways on the quarry floor.
211	Railway bridge, Brecon & Merthyr line, Cefn	SO 0324 0814	C	Structure	Railway bridge	Post-Medieval	1863 rebuilt 1964	A bridge to carry the Brecon & Merthyr railway across a cutting for the A465.
212	Capel Tabor and cemetery, Cefn Coed-y-Cymmer	SO 0297 0808	B	Building and Earthworks	Chapel and cemetery	Post-Medieval	c.1850	Capel Tabor rebuilt in a Neo-classical style in 1904 with associated cemetery.
213	Medieval hut circles, Cefn Coed-y-Cymmer	SO 0297 0804	C	Site	Medieval hut circles	Medieval	-	The site of a series of hut-circles, discovered during construction of the A465????
214	St. John's Church, Cefn Coed-y-Cymmer	SO 0329 0806	B	Building	Church	Post-Medieval	1880	A 'Gothic' church designed by George Edward Robinson in 1880.
215	Medieval coin hoard, Cefn Coed-y-Cymmer	SO 0328 0805	C	Findspot	Coin hoard	Medieval	ter-minus post quem 1325	The findspot of a hoard of Medieval coins.
216	Stone structure, Cefn Coed-y-Cymmer	SO 0372 0430	D	Structure	Mineral extraction	Post-Medieval	-	Stone structure, initially considered to be of prehistoric provenance. Evaluation however, suggests that the large slabs form part of a scree slope/quarry area.
217	Drystone wall landscape, Gurnos	SO 0408 0840	D	Field System	Drystone walled field boundaries	Post-Medieval	-	A substantial drystone wall c.150m long.
218	Grawen Cottages, Cefn Coed-y-Cymmer	SO 0285 0814	B	Buildings	Domestic dwellings	Post-Medieval	-	A two-storey terrace of worker's cottages
219	Drystone wall landscape, Coed Meurig	SO 0238 0748	D	Field System	Drystone walled field boundaries	Post-Medieval	-	A drystone walled field-system related to the lofted cowshed.
220	Buttressing under the Nant Ffrwd Viaduct	SO 0248 0752	D	Structure	Road bridge section	Post-Medieval	1963	The remains of earlier masonry abutments within the Nant Ffrwd concrete viaduct.

Site no.	Site name	Grid ref.		Form	Type	Period	Specific date	Description
221	Viaducts (A465), Cefn Coed-y-Cymmer	SO 0335 0815 (A); SO 0282 0789 (B); SO 0250 0750 (C).	A	Structure	Road bridges	Post-Medieval	1963	Two 1960's concrete viaducts designed by Rendel, Palmer & Tritton using twin parabolic arch ribs.
222	Lofted cow shed, Coed Meurig Farm	SO 0226 0745	A	Building	Cow shed	Post-Medieval	pre-1850	A masonry lofted cowshed associated with Coed Meurig Farm.
270	Brecon & Merthyr Railway, Taf Fechan	SO 0343 0853 to SO 0325 0816	D	Linear Feature	Railway	Post-Medieval	1863	On the western bank of the Taf Fechan, either side of the A465 is the route of the Brecon & Merthyr Railway.
271	Coed Meurig Farm	SO 0234 0742	C	Buildings	Farmhouse and outbuildings	Post-Medieval	pre-1846	Coed Meurig homestead associated with the lofted cowshed and described in the schedule of 1846 as being a farm of 37 acres belonging to Lord Dynevor.

8.2 Impacts and Mitigation

8.2.1 The potential impacts on the cultural heritage sites in Section Five comprise:

- loss;
- damage;
- severance of linear features;
- reduction of the group value of associated features; and
- adverse affects on the setting of features.

8.2.2 Details of the location and potential impacts, their magnitude and significance for each site which may be affected by the proposed scheme are provided in Table 8.2.

8.2.3 Measures to mitigate adverse impacts in this section include:

- full excavation;
- limited excavation;
- ground/building survey;
- preservation *in situ*; and
- consultation over detailed design.

In addition, all areas outside the known archaeology will be subject to a watching brief during construction.

8.2.4 Details of measures proposed to mitigate the effects on each site and subsequent residual impact are provided in Table 8.2.

Table 8.2 Impact and mitigation measures in Section Five

Site No	Approx Chainage	Description	Site value	Potential impact	Impact magnitude	Significance	Mitigation	Residual Impact
191	15100	Western Leat system, Upper Reservoir, Dowlais	B	further severance	Slight	Not significant	Limited excavation	N/A
192	14800-15500	Branchline of Brecon-Merthyr Railway, Dowlais	C	encroachment of embankment	Severe	Minor	Preserve in situ	N/A
197	13000-13100	Drystone wall landscape, Gurnos	D	partial loss of walls	Slight	Not significant	Excavation	N/A
201	12800	Possible Quern Stone, Gurnos	B	effect on setting	Slight	Not significant	Excavation	N/A
205	12400	Drystone wall landscape (i) incorp. possible Roman Road (ii), Gurnos	D	further severance of walls and road	Severe	Not significant	Excavation, Strip & record	N/A
211	11300	Railway Bridge, Brecon and Merthyr Line, Cefn	C	total loss	Very severe	Minor	Building Survey Level 3	N/A
213	1000	Medieval Hut Circles, Cefn Coed-y-Cymmer	C	further cutting	Very severe	Minor	Strip and record	N/A
217	12000-12300	Drystone wall landscape, Gurnos	D	partial severance	Slight	Not significant	Limited excavation	N/A
219	10200	Drystone wall landscape, Coed Meurig	D	further severance	Moderate	Not significant	Limited excavation	N/A
270	11300-11600	Brecon & Merthyr Railway, Taf Fechan	D	encroachment from embankment	Moderate	Not significant	Ground Survey and Limited excavation	N/A

9.0 Section Six: A470 Junction to Baverstock

9.1 Existing Context

General

9.1.1 Archaeological sites along Section Six comprise:

- post-medieval agricultural features, including a farm house and lofted cow shed, field boundaries, field systems, holloways and tracks;
- post-medieval industrial sites and features including coal and ironstone drift mines and tips, the remains of a worker's settlement, and a public house; and
- Post-Industrial features including roads and bridges.

9.1.2 A total of 7 sites were recorded in this area. Of these:

- 2 sites are of national importance (Category A);
- none of regional importance (Category B);
- 2 are of local importance (Category C); and
- 3 are minor or damaged sites (Category D).

9.1.3 Details of these sites are provided in Table 9.1. Site locations are provided on Figures 22/19-20 in Volume 1.9.

Geophysical survey and test pitting programme

9.1.4 Within this Section, one area was investigated using archaeological test pitting (Area 5). No significant archaeological features or remains were recorded.

9.2 Impacts and Mitigation

9.2.1 The potential impacts on the cultural heritage sites in Section Six comprise:

- loss;
- damage;
- severance of linear features;
- reduction of the group value of associated features; and
- adverse affects on the setting of features.

9.2.2 Details of the potential impacts, their magnitude and significance for each site which may be affected by the proposed scheme are provided in Table 9.2.

9.2.3 Measures to mitigate adverse impacts in this Section include:

- full excavation;
- limited excavation;
- ground/building survey;
- preservation *in situ*;
- palaeoenvironmental sampling; and
- consultation over detailed design.

In addition, all areas outside the known archaeology will be subject to a watching brief during construction.

9.2.4 Details of measures proposed to mitigate the effects on each site and subsequent residual impact are provided in Table 9.2.

Table 9.1 Summary of archaeological sites in Section Six

Site no	Site name	Grid reference	Site value	Form	Type	Period	Specific date	Description
224	Coal tippings (S. of old A465), Baverstock	SO 0260 0720 to SO 0100 0720	D	Earthworks	Mineral workings	Post-Medieval	-	A sequence of coal tips related either to the Cyfartha or Llwydcoed Ironworks.
225	DRYSTONE WALL landscape and sheep fold, Coed Meurig	SO 0220 0735	D	Field System	Drystone walled field boundaries and sheep fold	Post-Medieval	-	A drystone walled complex incorporating a sheep fold, related to Coed Meurig Farm.
226	Stone rubble-demolished cottage, Baverstock	SO 0110 0740	D	Site	Demolished building	Post-Medieval	-	An area of masonry rubble indicating the site of a demolished cottage.
231	Fairfield House (Giants Head Inn), Baverstock	SO 0055 0728	C	Building	Public house	Post-Medieval	-	A modernised cottage once used as the 'Giant's Head Inn.'
232	Settlement and field system, Baverstock	SO 0073 0730	A	Earthworks & Field Systems	Settlement and enclosures	Medieval Post-Medieval	-	A complex of turfstone walled field boundaries representing gardens, enclosures and drainage systems. rubble concentrations indicate the sites of demolished cottages.
233	Coal workings and tips, Baverstock	SO 0069 0727	C	Earthworks	Mineral workings	Post-Medieval	-	The remains of early open-cast iron workings, possibly aided by water extraction located on the hill behind the Baverstock settlement.

Table 9.2 Impact and mitigation measures in Section Six

Site No	Approx Chainage	Description	Site value	Potential impact	Impact magnitude	Significance	Mitigation	Residual impact
222	10100	Lofted Cow shed, Coed Meurig	A	total loss	Very severe	Very significant	Building Survey Level 3	n/a
224	9500-8500	Mineral Workings and Drift Mines, Baverstock	D	partial loss of tips and mines	Moderate	Not significant	Ground Survey andLimited Excavation	n/a
231	8400	Fairfield House (Giant's Head Inn), Baverstock	C	total loss	Very severe	Minor	Building Survey Level 4	n/a
232	8500-8600	Settlement and Field System, Baverstock	A	total loss of settlement	Very severe	Very significant	Excavation	n/a
233	8500	Mineral Workings and Tips, Baverstock	C	partial loss of tips and mines	Severe	Minor	Photographic Record, Ground Survey and Limited Excavation	n/a

10.0 Section Seven: Baverstock to Hirwaun

10.1 Existing Context

General

10.1.1 Archaeological sites along Section Seven comprise:

- post-medieval agricultural features, including a farmstead, farm buildings, field boundaries, field systems, holloways and tracks;
- post-medieval industrial sites and features, including railways, tramroads, associated furniture, bridges and culverts, dwellings, tips, a reservoir; and
- Post-Industrial features including roads and bridges.

10.1.2 A total of 38 sites were recorded in this area. Of these:

- none are of national importance (Category A);
- 2 are of regional importance (Category B);
- 15 are of local importance (Category C); and
- 21 are minor or damaged sites (Category D).

10.1.3 Details of these sites are provided in Table 10.1. Site locations are provided on Figures 22/20-24 in Volume 1.9.

Geophysical survey and test pitting programme

10.1.4 Within this Section, one area was investigated using geophysical survey (Area 1) and three others using archaeological test pitting (Area 2, 3 and 4). No significant archaeological features or remains were recorded in any of these areas.

Table 10.1 Summary of archaeological sites in Section Seven

Site no	Site name	Grid reference	Site value	Form	Type	Period	Specific date	Description
227	Drystone wall landscape, Baverstock	SO 9970 0717	D	Field System	Drystone walled field boundaries	Post-Medieval	-	A drystone walled field-system.
228	Drystone wall & turfstone wall, Lech Sychrhyd	SO 9947 0700	D	Field Systems	Drystone and turf-stone walled boundaries	Post-Medieval	-	The remnants of a drystone and turstone walled field-system now bisected by the A465.
229	Track, Lech Sychrhyd	SO 9960 0704 to SO 9958 0680	D	Linear Feature	Farm track	Post-Medieval	-	A north/south track, visible as a slightly raised platform.
230	Dam and possible sluice system, Lech Sychrhyd	SO 9969 0690	C	Earthworks	Water courses	Post-Medieval	-	A possible small-scale damming system incorporating banks and sluice along a stream.
234	Nant Hir Reservoir	SO 9890 0690	B	Structure	Reservoir	Post-Medieval	-	The Nant Hir Reservoir built by the Aberdare Water Works Co.
235	Holloway, Nant Hir	SO 9885 0690	D	Linear Feature	Farm track	Post-Medieval	-	A small holloway parallel to the Nant Hir Reservoir.
236	Drystone wall landscape, Nant Hir	SO 9875 0684	D	Field System	Drystone walled field boundaries	Post-Medieval	-	An extensive drysatone walled landscape either side of the A465.
237	Field barn and stable, Nant Hir	SO 9885 0686	C	Buildings	Field barn	Post-Medieval	-	Masonry farmbuildings adjacent to the Nant Hir Reservoir.
238	Holloway/sheep fold, Nant Hir	SO 9883 0687 to SO 9875 0698	C	Linear Feature	Farm track and sheep fold	Post-Medieval	-	An deep holloway running north/south across the A465 incorporating mature taxa and a coralling area.
239	Drystone wall landscape, Nant Melyn	SO 9798 0625	D	Field System	Drystone walled field boundaries	Post-Medieval	-	An extensive drystone walled landscape.
240	Holloway, Nant Melyn	SO 9770 0622 to SO 9789 0623	D	Linear Feature	Farm track	Post-Medieval	-	An east/west aligned holloway connecting to a farm track leading to Nantmoel Farm.
241	Holloway, Llyncoch	SO 9768 0608 to SO 9785 0585	D	Linear Feature	Farm track	Post-Medieval	-	A north/south holloway lined with substantial rubble walls.
242	Holloway, Court Farm	SO 9734 0564 to SO 9735 0547	D	Linear Feature	Farm track	Post-Medieval	pre-1851	Remnants of the holloway/track running either side of the A465 and appears to have once served Court Farm. Truncated by the Vale of Neath Mineral railway.
243	Skew bridge over Vale of Neath Railway	SO 9727 0552	B	Structure	Road bridge	Post-Medieval	c.1851	A skew bridge built to carry the road over the Vale of Neath Mineral railway (later the GWR).
244	Rectangular platform, Hirwaun	SO 9674 0544	D	Site	Demolished industrial building	Post-Medieval	-	A rectangular building platform.
245	Drystone wall landscape, Parc-Hensol Farm	SO 9675 0528	D	Field System	Drystone walled field boundaries	Post-Medieval	-	An extensive drystone walled field system around the derelict farmstead of Parc Hensol.
246	Farmstead, Parc-Hensol	SO 9677 0526	C	Buildings	Derelict farmhouse and outbuildings	Post-Medieval	-	A partly demolished farmstead on land along te banks of the River Cynon.

Site no	Site name	Grid reference	Site value	Form	Type	Period	Specific date	Description
247	Bridge remains, River Cynon	SO 9682 0529	D	Structure	Footbridge	Post-Medieval	-	The remains of a wrought iron bridge across the River Cynon.
248	Track, River Cynon, Hirwaun	SO 9697 0529	D	Linear Feature	Track	Post-Medieval	-	A small metalled track running alongside the River Cynon.
249	Cynon farmhouse, Hirwaun	SO 9640 0526	D	Buildings	Farmhouse and outbuildings	Post-Medieval	-	A masonry cottage with modern alterations.
250	Hirwaun-Aberdare Tramroad, Hirwaun	SO 9590 0548 to SO 9667 0513	C	Linear Feature	Tramroad	Post-Medieval	c.1790-c.1870	The Hirwaun-Aberdare tramroad built for the Hirwaun Ironworks to the canal at Aberdare.
251	Pig-pens, Hirwaun	SO 9544 0535	D	Building	Pig-pens	Post-Medieval	-	Uncoursed masonry pig-pens.
252	Bute Colliery Road (Tower Road), Hirwaun	SO 9534 0527 to SO 9506 0500	C	Linear Feature	Tramroad	Post-Medieval	-	The course of the dismantled Bute Colliery to Hirwaun Tramway running along Tower Road..
253	Turfstone wall landscape, Hirwaun	SO 9525 0533	D	Field System	Turf-stone wall boundaries	Post-Medieval	-	A turfstone walled landscape.
254	Coal tips, Bryngelli Estate, Hirwaun	SO 9520 0534	D	Earthworks	Mineral workings	Post-Medieval	-	Extensive coal tippings.
255 A	Railway A, Aberdare & Rhondda Railway	SO 9578 0514 to SO 9506 0501	C	Linear Feature	Tramroad	Post-Medieval	-	The course of the Aberdare & Rhondda main line railway.
255 B	Tramroad B, Branch of Aberdare & Rhondda	SO 9581 0512 to SO 9589 0476	C	Linear Feature	Tramroad	Post-Medieval	aban-doned by 1880	A tramroad from nearby pits to the Aberrdare & Rhondda railway built on an earthen embankment.
255 C	Tramroad C, Hirwaun	SO 9587 0510 to SO 9567 0471	C	Linear Feature	Tramroad	Post-Medieval	post-1880	The course of a tramway intersects and truncates Tramroad B.
256	Culvert, Aberdare-Rhondda Tramroad, Hirwaun	SO 9582 0506	D	Structure	Culvert	Post-Medieval	-	A small culvert constructed of drystone walling beneath the course of the Aberdare-Rhondda Tramroad.
257	Culvert, Hirwaun to Aberdare Tramroad, Hirwaun	SO 9648 0519	C	Structure	Culvert	Post-Medieval	-	A culvert below the line of the Hirwaun-Aberdare Tramroad repaired with modern repairs.
258	Vale of Neath Mineral Railway (western section)	SO 9530 0617 to SO 9413 0641	C	Linear Feature	Railway	Post-Medieval	1851	The broad gauge Vale of Neath Mineral Railway, it was later re-built as a the standard gauge Great Western Railway.
259	Branch of the Hirwaun-Aberdare Tramroad	SO 9408 0591 to SO 9525 0556	C	Linear Feature	Tramroad	Post-Medieval	-	A branch of the Hirwaun-Aberdare Tramroad following the present-day Rhigos road (A 4059).
272	Neath Mineral Railway (eastern section), Hirwaun	SO 9700 0559 to SO 9760 0543	C	Linear Feature	Railway	Post-Medieval	c.1851	The Vale of Neath mineral railway survives to the east of Hirwaun below contemporary masonry road bridge on the A465.

Site no	Site name	Grid reference	Site value	Form	Type	Period	Specific date	Description
273	Tramroad, Hirwaun	SO 9566 0520 to SO 9559 0491	D	Linear Feature	Tramroad	Post-Medieval	-	A local tramroad, surviving as a track, which transported ironstone from the Knobby Drift Ironstone pit to the Hirwaun Ironworks.
274	Knobby Drift Ironstone Pit, Johnson Park, Hirwaun	SO 9559 0491	D	Site	Mineral extraction	Post-Medieval	pre-1870	This ironstone pit was served by a tramway which fell into disuse before it was surveyed for the O.S. in the 1870s (No. 273).
275	Tramway branch-Hirwaun Common Railway	SO 9597 0500 to SO 9598 0470	C	Linear Feature	Tramroad	Post-Medieval	pre-1880	A tramway survives as a north/south track and is marked on the O.S.map of 1880 and was a branch line of the Hirwaun Common Railway.
276	The Hirwaun Common Railway, Hirwaun	SO 9495 0618 to SO 9662 0481	C	Linear Feature	Tramroad	Post-Medieval	pre-1840	The Hirwaun Common Mineral Railway was marked as a tramroad on the tithe map of c.1840 and a conventional locomotive-operated railway on the O.S. map of c.1880.
277	Branch-line of Hirwaun Common Railway, Hirwaun	SO 9617 0500 to SO 9634 0478	C	Linear Feature	Tramroad	Post-Medieval	pre-1880	At the point where the Hirwaun Common Mineral Railway crosses the A465, a branch line diverges to the south and currently survives as a footpath. This branch line is marked on the 1880 O.S.

10.2 Impacts and Mitigation

10.2.1 The potential impacts on the cultural heritage sites in Section Seven comprise:

- loss;
- damage;
- severance of linear features;
- reduction of the group value of associated features; and
- adverse affects on the setting of features.

10.2.2 Details of the potential impacts, their magnitude and significance for each site which may be affected by the proposed scheme are provided in Table 10.2.

10.2.3 Measures to mitigate adverse impacts in this Section include:

- full excavation;
- limited excavation;
- ground/building survey;
- preservation *in situ*; and
- consultation over detailed design.

In addition, all areas outside the known archaeology will be subject to a watching brief during construction.

10.2.4 Details of measures proposed to mitigate the effects on each site and subsequent residual impact are provided in Table 10.2.

Table 10.2 Impact and mitigation measures in Section Seven

Site No	Approx Chainage	Description	Site value	Potential impact	Impact magnitude	Significance	Mitigation	Residual impact
235	6600	Holloway, Nant Hir	D	further severance	Slight	Not significant	Strip & record	n/a

11.0 Summary and Conclusions

11.1 Introduction

11.1.1 The assessment of cultural heritage has included extensive surveys of existing cultural heritage features, to enable the assessment of the potential impact of the proposed scheme on cultural heritage overall.

11.1.2 Surveys were restricted to an area 50m either side of the road corridor of the proposed scheme although, where linear features continue beyond this boundary, the survey was extended. The survey included both Stage 2 and 3 assessment and comprised:

- detailed desk-top study and walk-over survey (Stage 2);
- a photographic record of 58 buildings and structures within their settings (Stage 2);
- a detailed photographic record and ground survey of 15 building structures (Stage 2);
- ground-survey of 6 earthwork sites (Stage 2);
- evaluation trial-trenching of 43 sites (Stage 3);
- geophysical survey of three areas (Stage 3);
- test-pitting, proposed for 16 areas and completed in 14 (Stage 3);
- assessment of palaeoenvironmental potential at 1 site (Stage 3).

11.2 Existing

11.2.1 A number of statutory and non-statutory cultural heritage designations are recognised along the proposed scheme (Figures 22/1-24). These include:

- two Conservation Areas, one at Abergavenny and one at Butetown;
- the New Cemetery (Late 19th century) at Llanfoist, designated a Grade II Historic Park; and
- an Historic Landscape around Merthyr Tydfil, which will include the area north of the town including a length of the A465.

11.2.2 A total of 282 sites have been recorded within the study area (details of these sites are contained in the Gazeteer and illustrated on Figures 22/1-24). Archaeological remains date to the prehistoric and Roman periods (the Medieval period is under-represented due to the low demographics during this period). Sites recorded are of mainly Post-Medieval date and relate to industrial processes and their associated infrastructure. These include a canal, drystone and turfstone walling, earthworks sites, farm buildings, holloways, industrial buildings and settlements, leats, railways, religious sites and buildings, tramroads and turnpike roads. The largest concentration of sites, mainly of an industrial nature, is located

within the Clydach Gorge (Section Two).

11.2.3 Discoveries from the test-pitting programme have been of a possible palaeoenvironmental sequence, which may provide contemporary landscape information relevant to a Bronze Age hoard discovered nearby at Rassau, a sherd of Roman pottery east of Gurnos and a second palaeoenvironmental sequence south of Tafarnaubach.

11.2.4 Geophysical survey of three areas revealed little or no significant archaeological remains.

11.2.5 The results of the test-pitting programme and geophysical survey suggests that there is little potential for the survival of archaeological remains other than those identified by the surveys to date.

11.2.6 The sites were scored, utilising some of the Secretary of State's non-statutory criteria for scheduling Ancient Monuments, and subsequently were classified into four levels of importance. Defined by Cadw, these are:

- Category A: Sites of National Importance. These include Scheduled Ancient Monuments, Listed Buildings and those sites which meet the criteria for scheduling or listing;
- Category B: Sites of Regional or County Importance. These include sites that do not meet the criteria for scheduling or listing, but are nevertheless of particular importance within the region. Preservation *in situ* would be the preferred option but if loss or damage cannot be avoided, appropriate detailed recording will be undertaken;
- Category C: Sites of District or Local Importance. These include sites which are not of sufficient importance to justify preservation if threatened, but would merit adequate recording in advance of loss or damage; and
- Category D: Minor or Damaged Sites. These include sites of minor importance or so badly damaged that little remains to justify their inclusion into a higher category. Detailed recording, either in advance or during destruction would be required.

11.2.7 The number of each category of site in each Section is contained in Table 11.1. The largest number of sites (112) are Category D sites, of the lowest value. There are roughly the same number of sites in Categories B (70) and C (76). Category A sites comprise the least number (24).

11.2.8 Four of the Category A sites are scheduled as Ancient Monuments and one is a Grade II* listed building . One Category B site is also a Scheduled Ancient Monument.

Categories

Table 11.1 Number of sites per cultural heritage category in each Section

	Cultural heritage value				
Section	A	B	C	D	Total
1	4	14	6	17	41
2	12	30	27	18	87
3	1	3	6	21	31
4	0	11	10	22	43
5	6	10	9	11	36
6	1	0	2	3	6
7	0	2	16	20	38
Total	24	70	76	112	282
%	8.5	25	27	40	

11.3 Impacts and Mitigation

11.3.1 The potential impact on each site may be considered in terms of:

- loss;
- damage;
- severance, particularly of grouped and/or linear features;
- the group value and its relationship with other associated sites; and
- the effect on the archaeological setting.

11.3.2 Following design modifications, a total of 91 sites (approximately one-third of the total) would suffer some form of impact. The details of the impact to each site are provided in Chapters 4 to 10. The number of sites affected and the magnitude of impact is summarised in Table 11.2. Two-thirds of the sites to be affected are in the value Categories C and D. The remainder are in Category B (18) and A (9).

Table 11.2 Number of sites and magnitude of impact

	Impact				
Category	Slight	Moderate	Severe	Very Severe	Total
A	2	1	3	3	9
B	4	3	9	2	18
C	0	4	17	12	33
D	9	12	7	3	31
Total	15	20	36	20	91

11.3.3 The significance of each impact has been defined, using Table 2.2 in Chapter 2. The number of impacts and their significance, for each Section, is summarised in Table 11.3 and described in the following paragraphs.

Table 11.3 Significance of impact by Section

Section	Significance				Total	Residual
	Not significant	Minor	Significant	Very significant		
1	7	0	1	2	10	0
2	5	14	6	3	28	4*
3	2	2	2	0	6	0
4	8	5	3	0	16	1*
5	7	3	0	0	10	0
6	1	2	0	2	5	0
7	9	7	0	0	16	0
Totals	39	34	12	6	91	

* vibration, water, drainage

Section One: Abergavenny to Gilwern

11.3.4 This Section is broadly of lowland improved pasture and arable farming. The majority of the sites recorded in this Section relate to the agriculture industry, including farm buildings, holloways, field systems and dwellings. Also present are the remains of a railway and turnpike road. The nature of the cultural heritage changes around the Gilwern area as it approaches the industrial region of the Clydach Gorge.

11.3.5 The most significant sites to be affected are the Brecon and Monmouthshire Canal (Category A) and the accommodation bridge (Category A) over the canal at Gilwern. In general, the remaining impacts have been classified as not significant.

Section Two: Gilwern to Brynmawr

11.3.6 Virtually the entire Section is formed by the steep-sided Clydach Gorge which comprises a gentle gradient rising to the upland zone beyond Brynmawr. During the 17th and 18th centuries, the area was rapidly industrialised. The sites in this area include canals, tramroads, railways, leats, ironworking, quarrying and related settlement and religious sites. The importance of this area is reflected in the designation of two Scheduled Ancient Monuments, Clydach Ironworks, including Smarts Bridge (Category A), and the Llanelly Furnace (Category B), and of a Grade II* Listed Building, Clydach House (Category A), at Saleyard.

11.3.7 Section Two contains the greatest number of sites to be affected. The leat system (Category A) at Clydach would be very severely affected as well the western length of the Clydach Railroad at Brynmawr (Category A) and the Primitive Methodist Chapel (Category B) and graveyard at Gilwern. The associated leat keeper's cottage and outbuildings (Category A) would be severely affected along with lengths of the Clydach Railroad, the Llam-march

Tramroad (Category B) and a branch-line of the Clydach Railroad and colliery levels (Category B) below Brymawr. The remaining impacts would be of minor or of no significance.

Section Three: Brynmawr to Tredegar

11.3.8 The topography within this Section is predominantly of upland pasture. Sites recorded include prehistoric remains, agricultural buildings and field systems. Also present are the remains of intense 19th century industrial activity with related settlement and religious sites.

11.3.9 Within Section Three, the only two significantly affected sites are the industrial settlement and drift mines at Clydach Dingle (Category B) and the Trefil Tramroad (Category B) at Nant-y-Croft. The other impacts are confined to sites that are either minor or not significantly affected.

Section Four: Tredegar to Dowlais Top

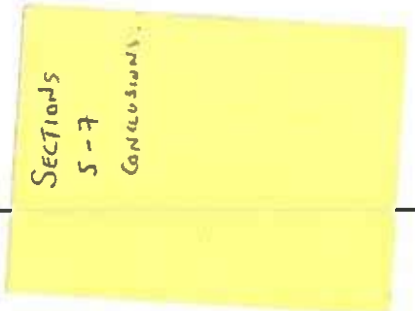
11.3.10 The topographic character of this area is defined by the prevalence of unimproved upland pasture. Sites within this Section include a prehistoric site, agricultural buildings and field systems, transport features and mineral workings.

11.3.11 Within Section Four those sites that would be significantly affected include the northern length of a leat system (Category B) at Blaen Rhymney and the skew bridge (Category B) and station house (Category B) at Llechryd. All other sites are categorised as either suffering minor or not significant impact.

Section Five: Dowlais Top to A 470 Junction

11.3.12 The topographic nature of this Section consists of undulating upland pasture. Sites recorded within this Section are chronologically diverse and include prehistoric remains, a possible Roman road, Medieval coin hoard and hut circles, Post-Medieval agricultural buildings and field systems. Also present is a Scheduled Ancient Monument, the Gurnos Tramroad (Category A) including the leat system (Category A).

11.3.13 Within this Section the majority of impacts are considered to be minor or not significant.



Section Six: A 470 Junction to Baverstock

11.3.14 The topographic character of this area consists of unimproved upland pasture. Sites recorded within this Section are mainly of Post Medieval date, consisting of a settlement, agricultural farm buildings and field systems. Industrial sites include extensive early coal and ironstone workings with associated tramroads.

11.3.15 Within this Section there would be two very significant impacts. These are the lofted cowshed (Category A) at Coed Meurig and the Baverstock settlement (Category A) and field system. The remaining impacts would be of minor or no significance.

Section Seven: Baverstock to Hirwaun

11.3.16 The topographic nature within this Section varies from unimproved upland pasture to intermediate improved upland pasture. The site distribution is concentrated towards the western part of the Section, around Hirwaun. The sites recorded towards the west of the Section include farm buildings, holloways, field systems and a 1960's viaduct. Around Hirwaun there are a series of early 19th century industrial features which include tramroads, railways and mineral workings.

11.3.17 Within this Section the potential impacts are considered to be not significant.

11.4 Conclusions

11.4.1 A number of statutory and non-statutory Cultural Heritage designations are recognised along the proposed scheme. These include:

- two Conservation Areas at Abergavenny and Butetown. Both are located outside the proposed scheme and their setting would not be directly affected;
- the New Cemetery (Late 19th century) at Llanfoist, designated a Grade II Historic Park, which would not be affected by the proposed scheme; and
- a draft Historic Landscape around Merthyr Tydfil which will include the area north of the town including a length of the A465. The setting would not be affected.

11.4.2 The impact on individual sites would be mitigated in a number of ways which include full excavation, limited excavation, strip and record, detailed earthwork survey, detailed building survey, photographic record, palaeoenvironmental sampling, preservation *in situ*, protection

from damage during construction activity, and discussion with the designers during the detailed design process. The details of the mitigation proposed for each site are contained in Volumes 1.1 to 1.7.

11.4.3 Although the geophysical survey and test-pitting programme produced limited results, it would be prudent to maintain a watching brief during construction and related works along the remainder of the proposed scheme away from the identified archaeological sites.

11.4.4 As a result of the mitigation proposed, there are only five sites (out of the original 91 affected) at which a residual impact would be present. This impact would comprise vibration from traffic and water from carriageway drainage, neither of which are considered to be significant.

Appendix I:

Archaeological Ground Surveys

Introduction

A series of archaeological ground surveys were carried out by Babtie Group surveyors under the supervision of Babtie Group's Assistant Project Archaeologist during the period from March 1996 to October 1996.

Methodology

The archaeological ground-surveys were carried out by Babtie Group surveyors using a total-station theodolite with data-loggers, digital levels and full support kit.

The resultant data was transferred to server software PC Moss (version 10.4) and then to AutoCad 12 Key Terrafirma software (version 2.0) for data manipulation and final plotting. The data was produced as a hard copy at a scale compatible with the fullest understanding of the site.

After the survey data was initially processed and contoured, visual checks were made of the surveys on a graphics screen. The initial draft plots of each survey were visually checked by the Project Manager in the field, as part of the Babtie Group Quality Assurance plan. Any amendments to the detail or format were then made and the final approved drawing was plotted at a suitable scale. These figures are attached to this appendix.

The Babtie surveyors worked to a lateral tolerance of +/-50mm on soft surfaces and a height tolerance of +/-10mm. The survey work conforms to specification of Geodetic Surveying Services SD12/96.

Results

Each survey concentrated specifically on the archaeological features, but also included spot heights, contours and sections, where these were important to understanding the nature of the site. In addition the surveys included orientation, OS datum/grid, property boundaries, topographical data and scales and the plots were annotated to highlight the most important archaeological features. The co-ordinate values shown in the drawings were determined from the existing ground controls allowing the archaeological data to be combined with the general topographical surveys and Ordnance Survey data. The relationship of the archaeology to the A465 was also shown enabling any potential impact of the proposed scheme to be determined in advance and allow design solutions to be engineered which would least affect the sites.

In the case of Site Nos.99 & 100 (leat keeper's cottage, leat, weir and sluice system) the proposed scheme design was superimposed over the site in order to determine the level of impact.

The archaeological evaluations undertaken at 'The leat keeper's cottage, weir and leat' (site Nos.99 & 100), the 'Dukestown weir' (site No.145) and the 'Baverstock settlement and field-system' (site No.232) were added to the ground surveys.

Sites Surveyed: Stage 1

Building ground surveys:

Babtie No.	Site Name/Description
14	Worker's cottage and bridge, Govilon
36	Canal bridge (eccentric arched), Gilwern
50	Primitive Methodist Chapel, Gilwern
68	Former road bridge, Saleyard
69	Llam-march Tramroad bridge, Saleyard
98	Kilns within Clydach river bank
99	Leat keeper's cottage, weir and sluice, Clydach
106	Road and foot bridges, Blackrock
107	Industrial site, Nant Gwyn
120	Squatter settlement & watercourses
145	Cast iron weir, Dukestown
154	Industrial building, Princetown
157	Railway bridge and tunnel, Llechryd
222	Lofted cow shed, Coed Meurig Farm
260	Walled enclosure, Gilwern

Earthwork Surveys:

Babtie No.	Site Name/Description
83	Siloam chapel cemetery
100	Leat system, Clydach
113	Branch line of Clydach Railroad & colliery level
155	Earthworks (demolished building), Princetown
160	Northern section of leat system, Blaen Rhymney
232	Settlement and field system, Baverstock

Total = 21 Archaeological ground surveys

Appendix II

Test-pit Programme

Introduction

The supplement to the Phase 1 Draft Report recommended an archaeological test-pit programme which included the excavation and recording of 72 test-pits. Sixteen areas along the proposed scheme were considered as having potential for archaeological remains on the basis of their topographic location relative to the underlying geology. As a result of these recommendations a programme of 69 test-pits was agreed by the Welsh Office, as part of the archaeological mitigation measures of the A465 Abergavenny to Hirwaun Dualling.

To date, 59 hand-excavated test-pits were completed during the period from September to October 1996. The remaining eleven test-pits could not be excavated due to conflicts with seasonal agricultural land use and a Geophysical survey. The Geophysical survey was undertaken by Stratascan on behalf of Babtie Group.

Test-pit size was standardised throughout the programme - 2m square, depth varied according to the exposure of the underlying drift or solid geology or excavation to 1.2m, whichever greater. The location and results of the completed test-pits are summarised below. The locations of the test-pits are shown on the attached figures.

Area 1.

Geophysical survey and archaeological test-pit programme of land between SO 9680 0530 and SO 9740 0550. Within this area the Geophysical survey included land south of the A465 as well as a survey north of the farmstead of Parc-Hensol (SO 9683 0533), meadow land east of the River Cynon (SO 9688 0529) and on the south-west facing ridge east of the Neath Mineral Railway. An archaeological test-pit programme will commence in May 1997.

Area 2

Archaeological test-pit programme of land between SO 9780 0580 and SO 9800 0620. Programme included land north and south of the A465 - rough pasture plus a series of nineteenth century (or earlier) drystone walled enclosures, 2 holloways and sheep corralling channels (running north/south). A Geophysical survey was completed and is reported in supplement 2.

Test pit 1:2

Excavation depth: 0.29m.

Land use: Improved pasture

Drift Geology: Cambic stagnogley soils

Solid Geology: Sandstone

No archaeological features or artifacts recorded

Test pit 2:2

Excavated depth: 0.53m

Land use: Improved pasture

Drift Geology: Cambic stagnogley soils

Solid Geology: Sandstone

Archaeology present: occasional slag within a mid brown clay (A horizon)

Test pit 3:2

Excavated depth: 0.55m

Land use: Improved pasture

Drift Geology: Cambic stagnogley soils

Solid Geology: Sandstone

Archaeology present: small selection of 19th pottery sherds within the upper sequence.

Test pit 4:2

Excavated depth: 0.30m

Land use: Coppice woodland

Drift Geology: Cambic stagnogley soils

Solid Geology: Sandstone

No archaeological features or artifacts recorded

Test pit 5:2

Excavated depth: 0.34m

Land use: Coppice woodland

Drift Geology: Cambic stagnogley

Solid Geology: Sandstone

No archaeological features or artifacts recorded

Area 3

Geophysical survey and archaeological test-pit programme of land between SO 9860 0660 and 9885 0690. The area included a series of nineteenth century (or earlier) drystone walled enclosures as well as a holloway. Also present is evidence of a Post-Medieval coppice woodland.

Test-pit 1:3

Excavated depth: 0.38m
Land use: Improved upland pasture
Drift Geology: Cambic stagnogley soils
Solid Geology: Sandstone
No archaeological features or artifacts recorded

Test-pit 2:3

Excavated depth: 0.41m
Land use: Improved upland pasture
Drift Geology: Cambic stagnogley soils
Solid Geology: Sandstone
No archaeological features or artifacts recorded

Test-pit 3:3

Excavated depth: 0.48m
Land use: Improved upland pasture
Drift Geology: Cambic stagnogley soils
Solid Geology: Sandstone
No archaeological features or artifacts recorded

Test-pit 4:3

Excavated depth: 0.56m
Land use: Improved upland pasture
Drift Geology: Cambic stagnogley soils
Solid Geology: Sandstone
No archaeological features or artifacts recorded

Test-pit 5:3

Excavated depth: 0.48m

Land use: Improved upland pasture

Drift Geology: Cambic stagnogley soils

Solid Geology: Sandstone

No archaeological features or artifacts recorded

Area 4

Archaeological test-pit programme of land between SO 9960 0700 and SO 9990 0700. This area is located south of the A465 within rough heath-land pasture with a high water-catchment. Interspersed within this area is evidence of early industrial activity including a substantial metalled track running north/south, the remnants of a dam, sluice system and quarry tipping. North of these features, but south of the A465 the land remains undisturbed suggesting the potential for later prehistoric activity. Test-pit sediments within this area revealed a glacial sediment sequence constructed of a light till fabric.

Test-pit 1:4

Excavated depth: 0.51m

Land use: Unimproved upland pasture

Drift Geology: Cambic stagnohumic gley soils

Solid Geology: Sandstone

No archaeological features or artifacts recorded

Test-pit 2:4

Excavated depth: 0.28m

Land use: Unimproved upland pasture

Drift Geology: Cambic stagnohumic gley soils

Solid Geology: Sandstone

No archaeological features or artifacts recorded

Test-pit 3:4

Excavated depth: 0.47m

Land use: Unimproved upland pasture

Drift Geology: Cambic stagnohumic gley soils

Solid Geology: Sandstone

No archaeological features or artifacts recorded

Area 5

Archaeological test-pit programme of land between SO 0130 0720 and SO 0160 0720. This small area of marshy pasture land is located between the old A465 and the present A465 (to the south). To the north-west and south-west are the remains of a Bronze Age landscape. It would appear that this strip of land has been little disturbed.

Test-pit 1:5

Excavated depth: 0.43m
Land use: Rough upland pasture
Drift Geology: Cambic stagnohumic gley soils
Solid Geology: Sandstone
No archaeological features or artifacts recorded

Test-pit 2:5

Excavated depth: 0.55m
Land use: Rough upland pasture
Drift Geology: Cambic stagnohumic gley soils
Solid Geology: Sandstone
No archaeological features or artifacts recorded

Test-pit 3:5

Excavated depth: 0.52m
Land use: Rough upland pasture
Drift Geology: Cambic stagnohumic gley soils
Solid Geology: Sandstone
No archaeological features or artifacts recorded

Test-pit 4:5

Excavated depth: 0.63m
Land use: Rough upland pasture
Drift Geology: Cambic stagnohumic gley soils
Solid Geology: Sandstone
No archaeological features or artifacts recorded

Area 6

Geophysical survey and archaeological test-pit programme of land between SO 0230 0750 and SO 0270 0780. Area surveyed follows the proposed scheme across Nant Ffrwd and the western slopes of the Taf Fawr. Within this area is (little disturbed) improved pasture land (south-facing) which is enclosed within a drystone walled landscape, (early nineteenth century in date).

Test-pit 1:6

Excavated depth: 0.30m

Land use: Improved upland pasture

Drift Geology: Cambic stagnohumic gley soils

Solid Geology: Sandstone

No archaeological features or artifacts recorded

Test-pit 2:6

Excavated depth: 0.65m

Land use: Improved upland pasture

Drift Geology: Cambic stagnohumic gley soils

Solid Geology: Sandstone

Archaeology present: Charcoal and coke fragments within [003]

Test-pit 3:6

Excavated depth: 0.72m

Land use: Improved upland pasture

Drift Geology: Cambic stagnohumic gley soils

Solid Geology: Sandstone

Archaeology present: 19th/20th century pottery and occasional coal fragments in [002]

Test-pit 4:6

Excavated depth: 0.48m

Land use: Improved upland pasture

Drift Geology: Cambic stagnohumic gley soils

Solid Geology: Sandstone

No archaeological features or artifacts recorded

Test-pit 5:6

Excavated depth: 0.58m

Land use: Improved upland pasture

Drift Geology: Cambic stagnohumic gley soils

Solid Geology: Sandstone

No archaeological features or artifacts recorded

Area 7

Archaeological test-pit programme of land between SO 0360 0820 and SO 0410 0840. Within the area, south of the present A465, the proposed scheme would take an east/west direction and would potentially affect an historic landscape which includes drystone walling and possible prehistoric activity in the form of 2 large limestone slabs of uncertain provenance (now evaluated).

Test pit 1:7

Excavation depth: 1.30m.

Land use: Disused open-cast quarry

Drift Geology: Humo-feric podzols

Solid Geology: Sandstone

No archaeological features or artifacts recorded

Test pit 2:7

Excavation depth: 0.26m.

Land use: Disused open-cast quarry

Drift Geology: Humo-feric podzols

Solid Geology: Sandstone

No archaeological features or artifacts recorded

Test pit 3:7

Excavation depth: 0.46m.

Land use: Disused open-cast quarry

Drift Geology: Humo-feric podzols

Solid Geology: Sandstone

No archaeological features or artifacts recorded

Test pit 4:7

Excavation depth: 0.35m.

Land use: Improved upland pasture

Drift Geology: Humo-feric podzols

Solid Geology: Sandstone

No archaeological features or artifacts recorded

Test pit 5:7

Excavation depth: 0.24m.

Land use: Improved upland pasture

Drift Geology: Humo-feric podzols

Solid Geology: Sandstone

No archaeological features or artifacts recorded

Area 8

Archaeological test-pit programme of land between SO 0545 0862 and SO 0570 0867. A series of test-pits were excavated to the north of the A465, east of Gurnos Farm. Particular interest was placed on a circular drystone walled feature and rough pasture directly to the east which reveal minor prehistoric activity; a possible prehistoric quern stone (find No. 201) has been found nearby.

Test pit 1:8

Excavation depth: 0.32m.

Land use: Improved upland pasture

Drift Geology: Humo-feric podzols

Solid Geology: Sandstone

No archaeological features or artifacts recorded

Test pit 2:8

Excavation depth: 0.60m.

Land use: Improved upland pasture

Drift Geology: Humo-feric podzols

Solid Geology: Sandstone

No archaeological features or artifacts recorded

Test pit 3:8

Excavation depth: 0.46m.

Land use: Improved upland pasture

Drift Geology: Humo-feric podzols

Solid Geology: Sandstone

No archaeological features or artifacts recorded

Test pit 4:8

Excavation depth: 0.36m.

Land use: Improved upland pasture

Drift Geology: Humo-feric podzols

Solid Geology: Sandstone

No archaeological features or artifacts recorded

Test pit 5:8

Excavation depth: 0.20m.

Land use: Improved upland pasture

Drift Geology: Humo-feric podzols

Solid Geology: Sandstone

No archaeological features or artifacts recorded

Test pit 6:8

Excavation depth: 0.35m.

Land use: Improved upland pasture

Drift Geology: Humo-feric podzols

Solid Geology: Sandstone

No archaeological features or artifacts recorded

Test pit 7:8

Excavation depth: 0.46m.

Land use: Improved upland pasture

Drift Geology: Humo-feric podzols

Solid Geology: Sandstone

No archaeological features or artifacts recorded

Test pit 8:8

Excavation depth: 0.80m.

Land use: Improved upland pasture

Drift Geology: Humo-feric podzols

Solid Geology: Sandstone

No archaeological features or artifacts recorded

Test pit 9:8

Excavation depth: 0.13m.

Land use: Improved upland pasture

Drift Geology: Humo-feric podzols

Solid Geology: Sandstone

No archaeological features or artifacts recorded

Test pit 10:8

Excavation depth: 0.29m.

Land use: Improved upland pasture

Drift Geology: Humo-feric podzols

Solid Geology: Sandstone

No archaeological features or artifacts recorded

Test pit 11:8

Excavation depth: 0.11m.

Land use: Improved upland pasture

Drift Geology: Humo-feric podzols

Solid Geology: Sandstone

No archaeological features or artifacts recorded

Test pit 12:8

Excavation depth: 0.60m.

Land use: Improved upland pasture

Drift Geology: Humo-feric podzols

Solid Geology: Sandstone

Archaeology present: Slate fragments and burnt limestone within [002]

Test pit 13:8

Excavation depth: 0.96m.

Land use: Improved upland pasture

Drift Geology: Humo-feric podzols

Solid Geology: Sandstone

Archaeology present: Roman(?) pottery sherd, 19th/20th pottery, glass, two undated nails, coal, charcoal and lime in [002]. Coke and coal in [003]

Area 9

Archaeological test-pit programme of land between SO 0993 0928 and SO 1018 0936. This area, south of the A465 is rough grazing and is little disturbed. It is proposed that test-pitting is undertaken to incorporate the drystone walled enclosures, leat system and a series of earthworks and gullies which are all within the proposed widening of the A465.

Area 10

Archaeological test-pit programme of land between SO 1160 0997 and SO 1180 1012. Due to the discovery of a Bronze Age hoard within the immediate area it was proposed that a series of test-pits and a geophysical survey was carried out on the open pasture to the south of the A465.

Test pit 1:10

Excavation depth: 1.0m.

Land use: Improved upland pasture

Drift Geology: Cambic stagnohumic gley soils

Solid Geology: Sandstone

Archaeology present: 19th/20 century pottery and iron fragments in [001]

Test pit 2:10

Excavation depth: 0.70m.

Land use: Improved upland pasture

Drift Geology: Cambic stagnohumic gley soils

Solid Geology: Sandstone

No archaeological features or artifacts recorded

Test pit 3:10

Excavation depth: 0.29m.

Land use: Improved upland pasture

Drift Geology: Cambic stagnohumic gley soils

Solid Geology: Sandstone

Archaeology present: Charcoal flecks in [002]

Area 11

Archaeological test-pit programme of land between SO 1327 1075 and SO 1340 1076. Within land between the River Sirhowy and Nant-y-Bwch is a sequence of drystone walls and earthworks that possibly pre-date industrialisation of the valley.

Test pit 1:11

Excavation depth: 0.34m.

Land use: Improved pasture

Drift Geology: Cambic stagnohumic gley soils

Solid Geology: Sandstone

Archaeology present: Drystone wall remains and a clay pipe bowl within [002]

Test pit 2:11

Excavation depth: 0.40m.

Land use: Improved pasture

Drift Geology: Cambic stagnohumic gley soils

Solid Geology: Sandstone

Archaeology present: 19th and early 20th century pottery and glass, plus one piece of (waste) flint in [002]

Area 12

Archaeological test-pit programme of land between SO 1132 1422 to SO 1164 1443 and SO 1135 1417 to SO 1167 1440 north and south of the proposed scheme. Much of the Preferred Route within the surveyed area takes in slightly undulating, south-facing slopes with drystone wall field enclosures, associated sheep folds and barns. Also directly within the line of the proposed scheme is a well-preserved section of the Trefil Tramroad.

Test pit 1:12

Excavation depth: 0.45m.

Land use: Improved upland pasture

Drift Geology: Cambic stagnohumic gley soils

Solid Geology: Sandstone

No archaeological features or artifacts recorded

Test pit 2:12

Excavation depth: 0.40m.

Land use: Improved upland pasture

Drift Geology: Cambic stagnohumic gley soils

Solid Geology: Sandstone

No archaeological features or artifacts recorded

Test pit 3:12

Excavation depth: 0.25m.

Land use: Improved upland pasture

Drift Geology: Cambic stagnohumic gley soils

Solid Geology: Sandstone

No archaeological features or artifacts recorded

Test pit 4:12

Excavation depth: 0.27m.

Land use: Improved upland pasture

Drift Geology: Cambic stagnohumic gley soils

Solid Geology:

No archaeological features or artifacts recorded

Area 13

Borehole survey for peat collection, geophysical survey and archaeological test-pit programme on land between SO 1652 1283 to SO 1700 1284 and SO 1652 1280 to SO 1700 1281. Within this area are substantial peat deposits and a possible (ancient) relict landscape with the potential for prehistoric material (Pollen analysis was undertaken by Professor Mike Walker, University of Wales Lampeter - see results in Appendix III). Within this area, six test-pits were excavated.

Test-pit 1:13

Excavated depth: 0.68m

Land use: Upland open heath

Drift Geology: Cambic stagnohumic gley soils

Solid Geology: Sandstone

No archaeological features or artifacts recorded

Test-pit 2:13

Excavated depth: 0.53m

Land use: Upland open heath

Drift Geology: Cambic stagnohumic gley soils

Solid Geology: Sandstone

No archaeological features or artifacts recorded

Test-pit 3:13

Excavated depth: 0.33m

Land use: Upland open heath

Drift Geology: Cambic stagnohumic gley soils

Solid Geology: Sandstone

No archaeological features or artifacts recorded

Test-pit 4:13

Excavated depth: 0.36m

Land use: Upland open heath

Drift Geology: Cambic stagnohumic gley soils

Solid Geology: Sandstone

No archaeological features or artifacts recorded

Test-pit 5:13

Excavated depth: 0.27m

Land use: Upland open heath

Drift Geology: Cambic stagnohumic gley soils

Solid Geology: Sandstone

No archaeological features or artifacts recorded

Test-pit 6:13

Excavated depth: 0.50m

Land use: Upland open heath

Drift Geology: Cambic stagnohumic gley soils

Solid Geology: Sandstone

No archaeological features or artifacts recorded

Area 14

Archaeological test-pit programme in and around site No. 120 (SO 1920 1284). To the north of the A465 is an industrial settlement and related small-scale quarrying/ mining with a near-by tramroad incline. Archaeological potential is therefore high. Two test-pits excavated.

Test-pit 1:14

Excavated depth: 1.05m

Land use: Disturbed scrub-land

Drift Geology: Cambic stagnohumic gley soils

Solid Geology: Sandstone

Archaeology present: Pottery (c.20th century) and metal fragments within [001]

Test-pit 2:14

Excavated depth: 1.20m

Land use: Disturbed scrub-land

Drift Geology: Cambic stagnohumic gley soils

Solid Geology: Sandstone

No archaeological features or artifacts recorded

Area 15

A geophysical survey and archaeological test-pit programme was carried out on land between SO 2067 1243 and SO 2090 1246..The area for survey is undisturbed south-facing pasture land, north of the A465, between the sewage works and water-works, above the Clydach Gorge. Oblique aerial photographs show possible circular features close to the proposed survey area. Two test-pits were excavated.

Test-pit 1:15

Excavation depth of 0.45m

Land use: Improved pasture

Drift Geology: Humo-feric podzols

Solid Geology: Sandstone

No archaeological features or artifacts recorded

Test-pit 2:15

Excavation depth: 1.0m

Land use: Improved pasture

Drift Geology: Humo-feric podzols

Solid Geology: Sandstone

Archaeology present: Charcoal fragments within [002]

Area 16 - Not subject to any further archaeological ground investigation

Area 17

Archaeological test-pit programme and a geophysical survey of land between SO 3297 2133 to SO 3291 2138. Approximately 30m north of the present road, Neolithic and Bronze Age lithics were recovered when the Llanfoist water treatment plant was constructed in 1965. The area for investigation (water meadows) slopes gently east towards the River Usk. An additional area for geophysical survey, and included within Area 17, is land located east of Pen-y-Worlod Farm at SO 3287 2137 to SO 3285 2137. The results of the geophysical survey are published in Appendix I. Archaeological test-pitting will commence in July 1997.

Appendix III

Palaeoenvironmental Report

Pollen data from Garn Lydan, Mid-Glamorgan

M.J.C. Walker
(Department of Geography, University of Wales, Lampeter)

Introduction

This report describes the pollen record from a thin peat profile near Garn Lydan, approximately 3km to the north of Ebbw Vale, Mid Glamorgan, South Wales. The analyses were undertaken as part of the mitigation for the upgrading of the A465 Abergavenny to Hirwaun road.

Field and Laboratory Work

Excavation through a trackway near National Grid Reference SO 175 126 revealed a thin peat lens (approximately 20cm in thickness) beneath some 50cm of made ground. A 30cm monolith was taken through the peat sequence and the underlying minerogenic deposits. This was removed to the laboratory where the stratigraphy proved to be as follows:

0-1 cm	Base of made ground: fine stones and grit within a silt/clay matrix. Some organic inclusions and plant fibres recorded
1-3 cm	Dark brown organic horizon with some silt/clay material
3-16 cm	Dark-brown to black peat: very compact and fine-grained, with occasional plant fibres, but no recognisable plant macrofossils
16-18 cm	Fine-grained, paste-like organic silt/clay
18-24 cm	Fine-grained, cream-coloured clay, with fine grit particles
24-27 cm	Gritty horizon, becoming increasingly stony with depth.

The sediments probably accumulated in a pool that formed in a small depression in the bedrock. They do not appear to be the typical blanket peats that are widespread in the South Wales uplands. The upper part of the sequence has almost certainly been truncated, probably during the construction of the trackway that now runs across the site.

Samples for pollen analysis were removed from the monolith at 2cm intervals and subjected to standard laboratory treatment, including digestion in 10% KOH, heating in 40% HF and acetolysis (Moore *et al.*, 1991). The residues were mounted in safranin-stained glycerine jelly and counted under x400 magnification. No pollen was recovered from the lowermost samples 22 and 24cm), and only trace pollen was present in the sample from 20cm. All the remaining samples proved to be polleniferous. As this was a preliminary analysis, a sum of 100 land pollen only was employed.

The pollen record

The pollen results reflects a largely open landscape, but with some local stands of *Betula* (birch), *Quercus* (oak), *Alnus* (alder) and *Corylus* (hazel). Relatively high counts for *Tilia* (lime) in the sample from the base of the organic sequence indicate a local presence of this tree. Two episodes of landscape change are apparent in the record. The first is from heathland, reflected in the lower part of the pollen results by high counts for Ericaceae (heathers), *Calluna vulgaris* (ling) and *Pteridium* (bracken), to a grassland marked by the rise in Poaceae (grasses) and associated herbaceous taxa such as *Potentilla* (tormentil) and *Plantago lanceolata* (ribwort plantain). In the upper part of the results, Ericaceae and *Calluna* increase once again, suggesting a re-expansion of the local heathland.

A possible explanation for these changes is that they reflect human impact on the landscape, with the succession from heathland to grassland associated with an expansion of farming activity. This would have been predominantly pastoral in nature as indicated, for example, by the increase in *Plantago lanceolata*, a weed frequently associated in historic and prehistoric pollen records with grazing animals (Behre, 1986). However, a single grain resembling cereal pollen was recovered from 12cm suggesting, perhaps, some local arable activity. If this explanation is correct, a reduction in agricultural practices may be reflected in the upper region of the results where the fall in Poaceae pollen is accompanied by an increase in pollen of heathland taxa.

The age of the sequence cannot be established on present evidence, but it clearly postdates the expansion of *Alnus* into the South Wales uplands, and also the *Ulmus* (decline), which occurred around 7000 ^{14}C years BP and 5000 ^{14}C years BP respectively (e.g. Smith & Cloutman, 1988). One clue may lie in the presence of *Fagus* (beech) pollen, small quantities of which are found in the upper levels of the results. *Fagus sylvatica* did not arrive in Britain until around 2000 yrs BP and apparently did not expand into Wales until *c.*1000 BP (Birks, 1989). If these *Fagus* grains were derived from beech trees growing locally in the Welsh uplands, as opposed to being the product of long-distance transfer, their presence in the Garn Lydan sequence would imply that the sediments accumulated during the historic as opposed to the prehistoric period. However, radiocarbon dating is required in order to confirm this tentative suggestion.

Conclusion

The short peat sequence from Garn Lydan contains a pollen record which shows evidence of a change from open heathland to grassland and back once again to heathland. These landscape changes may reflect the expansion and subsequent contraction of agricultural activity in the area. The age of the profile cannot be established on present evidence, but may date from the historic period.

Acknowledgements

I am grateful to Ian Clewes for preparing the pollen slides.

A465 ABERGAVENNY- HIRWAUN DUALLING

PHASE 1 ARCHAEOLOGICAL REPORT

1. Introduction

1.1 In July 1995 the Secretary of State for Wales announced the preferred route for dualling the A465 between Abergavenny and Hirwaun. In January 1996 Babtie Group were commissioned by the Welsh Office to do a Phase 1 Archaeological Survey. This document reports on the Phase 1 Archaeological Survey.

1.2 A brief (CO15L986 PP) for the survey was prepared by Cadw on behalf of the Welsh Office and required two phases of work with reports, culminating in the Cultural Heritage sections of the Environmental Statement. Phase 1 included a walk-over survey, documentary search, photographic and earthwork survey leading to a report categorising the sites and recommending further action during the second phase. Phase 1 work is now complete although the photographic and earthwork survey data are not included within this report.

1.3 The preliminary categorisation has identified a number of sites requiring further evaluation and these have been broadly agreed with Cadw in advance of the formal submission of the Phase 1 report. In addition to the sites requiring evaluation and listed in section 9.7 there are other areas where non-intrusive (geophysical) and intrusive surveys will be required, see section 9.9. Provisional recommendations for these additional areas are included in the Phase 1 report.

2. Background

2.1 This report is the result of a walkover survey which was undertaken by Babtie between January and April 1996. Prior to the walkover, studies were conducted by Glamorgan-Gwent Archaeological Trust (GGAT) (1994) and Dr Peter Wakelin of Cadw (1995). Both studies recognised a number of archaeological sites which are covered within this report. Additional information has been supplied by Cadw and GGAT. A list of scheduled sites within one kilometre of the proposed route was obtained from Cadw and is incorporated within the Phase 1 report. Sites recorded within the Glamorgan-Gwent Archaeological Trust Sites and Monuments Record are also included. In addition, local authorities were contacted for information concerning Listed Buildings within a one kilometre corridor of the A465

3. Methodology

3.1 The walkover survey covered 41.5 kilometres between Abergavenny and Hirwaun. The aims and objectives of the survey were to identify and record new and existing sites within a 50 metre corridor either side of the present road. The survey also included sites that extended beyond the 50 metre corridor and up to 100 metres. Sites were plotted on 1:2500 Ordnance Survey maps and field notes made for each site on recording forms. Each parcel of land was walked twice and ground and weather conditions were recorded. Each site was given a unique identification number.

3.2 A total of 277 sites has been recorded, the majority of which was previously unrecorded. New sites include leats, industrial buildings, earthwork structures, tramroads, 'squatter' settlements, railways, turnpike roads, culverts, revetting, farm buildings, holloways and drystone/turfstone walled field systems. After completion of the walkover survey, the identified sites were plotted onto road design plans using Auto CAD.

3.3 The value of each site has been assessed by applying as guidance the Secretary of State's non-statutory criteria for assessing the national importance of an ancient monument as outlined in Planning Policy Guidance (PPG 16), Archaeology and Planning Annex 4. The sites have therefore been categorised as being of national (A), regional and county (B), local (C) or minor (D) importance. Sites either outside the 50 metre corridor or not directly impacted by the proposed route were categorised as NFA; No Further Action.

3.4 Agreement was reached with Cadw on which sites required photographic or earthwork surveys in Phase 1. Fifty-seven sites have been recorded photographically in both 35mm and medium format, seventeen of them also have been surveyed, and a further three have been surveyed only (see below).

(s) = setting photograph only

3.5 Proposals have been prepared for further evaluation of some sites, see section 9.

4. Sources of Cultural Heritage Information

4.1 Information concerning archaeological and cultural heritage remains has been obtained through a number of sources in line with DMRB, Volume 11, Section 3, Chapter 8 Cultural Heritage. Sources consulted were:

- Glamorgan-Gwent Archaeological Trust Sites and Monuments Record (SMR). The SMR was consulted between January and May 1996. In addition, prior to Babtie undertaking the walkover survey (Phase 1), GGAT had been commissioned to produce a summary of the known archaeology along the route. The report, made available to Babtie included sites from the SMR plus sites recorded by their fieldworkers (Glamorgan-Gwent Archaeological Trust (1995).

- Cadw:Welsh Historic Monuments. Cadw was consulted for a list of Scheduled Ancient Monuments and Historic Parks and Listed Buildings. A list of industrial and Post-Medieval sites prepared by Cadw was also made available.

- Royal Commission on Ancient and Historical Monuments, Wales - Aerial Photographic Library. Aerial photographs of the study area held by RCAHM Wales were examined in order to assess the extent of archaeological features within the 50 metre corridor.

- Historical Research. Babtie appointed Mr Phillip Riden, a specialist in industrial archaeology, to research the historical and industrial background to the route. Mr Riden's brief included examination of the 18th century Badminton Estate maps, 19th century tithe and Ordnance Survey maps, the Quarter Sessions deposited plans of public works in the Gwent Record Office, as well as secondary sources.

- Local History Sources. Information has been obtained from various local publications as well personal comments from residents and from professional organisations including museums and libraries along the route

- Cartographic Information. Information concerning the identification and location of old and newly discovered sites has been transferred to Ordnance Survey 1:2500 maps, using Auto CAD.

5. Summary of Discoveries

5.1 The range of cultural heritage sites identified within the 50 metre corridor along the proposed A465 dualling include:

- Prehistoric sites including lithic scatters, cairns, stone monuments, stray finds and cropmarks;

- Post-Medieval agricultural features including farm houses/cottages and farm buildings, field buildings, holloways/tracks, and drystone and turfstone walling;

- Early Post-Medieval Industrial sites and features including 17th-18th century leats, sluice and weir systems, canals, tramroads, bridges and associated dwellings/ buildings;

- Late Post-Medieval Industrial sites and features including 19th-mid 20th century mineral extraction and processing, railways, tramroads, associated buildings and furniture, reservoirs and associated leats, tracks and pumping houses, bridges and roads.

- Post-Industrial buildings and features including mid 20th century to present fast-food restaurants, roads, bridges and transport furniture;

- Post-Medieval Religious Buildings and associated features including chapels, churches and associated grave yards, and

- Sites of palaeoenvironmental interest including peat and relict palaeosols.

6. Historical Background

6.1 Introduction

Past developments affect the potential for survival of prehistoric, Roman and Medieval remains. Indeed, continuing development in the Post-Medieval period will have destroyed earlier remains. During the initial construction of the road in the 1960's, much of the immediate area either side of the road was damaged. Indeed, a number of settlements were completely severed including those of Blackrock (Clydach Gorge) and Cefn-coed-y-cymmer. Along with many buildings, complete agricultural and industrial landscapes were also damaged including earlier Post-Medieval drystone and turfstone walled field systems and as well as an industrial heritage that is the 'hallmark' for this region of Wales.

6.2 Prehistoric Period

Within the 50 metre corridor of the A465, the evidence for prehistoric activity is restricted to five areas; the flood plain of the Usk, south of Abergavenny; Rassau Trading Estate, Tafarnaubach, Blaencarno Common; and the area around Gurnos and Cefn-coed-y-cymmer. Each area has revealed limited evidence, usually in the form of find spots although, near Rassau Trading Estate, a significant hoard from the Bronze Age was discovered. There is no evidence for any earlier prehistoric activity either within or outside the 50 metre corridor.

A Neolithic flint scatter, found prior to the construction of the sewage works, south of Abergavenny (close to the River Usk), is comparable with part of a contemporary assemblage retrieved from an excavation in Flannel Street, Abergavenny in 1965.

Within the Clydach Gorge there appears to be no evidence of any prehistoric activity, although two hillforts are located north and south of the gorge. A Bronze Age settlement has been recorded below the Blorange, close to the village of Llanfoist. It has been suggested that until the Iron Age, much of the lower reaches of the gorge were impassable (van Laun; pers.com.). Towards the Late Iron Age and Early Roman periods, there is evidence elsewhere in South Wales for the commercial use of wood. It is probably only then that the lower extent of the Clydach Gorge was fully exploited.

Either side of the A465, near Baverstock but outside the corridor are a number of Bronze Age barrows and cairns, clustered into cemeteries. Barrow/cairn cemeteries are located north and south of the Baverstock settlement (No.232) and north of

Merthyr Common. Possibly related to the latter cemetery is a small Bronze Age cairn (No.175), on a south facing slope, north of the A465 on Blaencarno Common.

At Gurnos and Cefn-coed-y-cymmer there is fragmentary evidence of prehistoric activity although the potential for prehistoric finds is restricted by the present road, limestone quarrying and town development. 150 metres east of Gurnos Farm, and recorded during the walkover survey was a large single stone with an acute smooth-bowled surface on one edge which could be a quernstone.

Just east of Cefn-coed-y-cymmer and south of the road, away from commercial quarrying are two large slabs of limestone partially embedded into a west facing slope. Underneath the slabs appear to be supported by small uprights. At the southern end, the slabs are submerged into disturbed earth and stone. This site although of questionable origin, may represent a chambered structure of an 'earth-fast' type.

6.3 The Roman Period (55 BC - AD 450)

There is no evidence of Roman remains within the 50 metre corridor. Within the general area there appears to be only two sites of Roman date; the town of Abergavenny, known to the Romans as Gobannium and a possible Roman road, west of Gurnos Farm. At Abergavenny a fort and settlement were established around AD 50 and according to the derivation of its name, possible pre-Roman iron-working was in operation (Rivet & Smith 1979:369).

The fort, close to the site of the later Medieval castle would have had commanding views across the Usk valley to the west. Excavations of the fort revealed a structure of substantial size and proportion and Gobannium was one of a series of four forts/towns along the Usk. To the south was Burrium (Usk) and Isca (Caerleon) and to the north, Cicucium (Brecon). It is therefore important to consider the Usk as a route-way between the four fortified settlements.

Further west, and close to the Gurnos Farm is the possible route of a north/south aligned Roman road that would have linked the fort and settlement at Brecon with the Roman legionary fortress at either Isca (Caerleon) or the fort at Tamium (Cardiff). Documentation is confused and any possible road may have since been destroyed due to quarrying activity or commercial forest planting west of Gurnos Farm. No evidence for the road has been found.

6.4 Early Medieval Period

There appears to be little or no visible evidence of settlement during the early Medieval period either within or outside the 50 metre corridor. Much of the early Post-Medieval industrial activity within the Clydach Gorge commences around the 1660s. The possibility cannot be discounted that pre-industrial settlement did not exist prior to 1600, although, Riden (1996) has suggested the contrary.

In Abergavenny the site of a Norman motte and bailey castle stands overlooking the Usk Valley. To the west of the castle the town retains part of the Medieval street

plan. Both the castle and Medieval town were probably influenced by the Roman Fort and later Romano-Celtic settlement (Olding, pers.com.).

At Cefn-coed-y-cymmer an Early Medieval coin hoard (No.215) dating from 1340s was discovered approximately 50 metres south of the A465, during construction of St John's Church in 1880. Close to Grawen Cottages (No.218) a series of hut circles, considered to be of Early Medieval date was uncovered during the construction of the A465.

There is a possibility that much of the drystone and, in particular, turfstone walling along the entire route of the A465 could date to either the early Post-Medieval or late Early Medieval periods. Tithe maps of 1819 around the Llanfoist area for example, suggest little or no deviation or change within the surviving walled field systems recorded within the walkover survey.

6.5 Post-Medieval Period

This period marks a dramatic change to both the landscape and settlement either side of the present A465. The majority of sites recorded in the walkover survey date from this period. Early Post-Medieval industrial activity is confined to one area - the Clydach Gorge. This area, approximately 4 km by 0.5 km marks the birth place of the Industrial Revolution in Wales, between 1700 and 1800.

Industrialisation spread rapidly throughout the Gorge. During this period new towns emerged throughout the valleys. Each industrial complex was served by a complex network of tramroads, leats, canals and roads. These were later superseded or integrated with the emergence of the railways. The Abergavenny, Tredegar & Merthyr Railway was the first of a number of communication links that ran roughly in the same route as the present A465. At Dowlais, north of Merthyr Tydfil, a series of railway lines converged and linked mid Wales with the 'Valleys'. The Heads of the Valley' line had become by 1870, part of a fully integrated railway network. The demise of the railways during the 1960s also marks a decline and change in industrial practice; from heavy to light 'blue-chip' industry.

Prior to the railways, there appears to have been a limited road network which linked together the larger settlements along the present route. The walkover survey did locate a number of roads/tracks that ran between Abergavenny and Llanfoist, Llanfoist and Gilwern, and Gilwern and Brynmawr. These were later amalgamated into a Turnpike road in 1812 that ran between Abergavenny and Merthyr. The Turnpike road remained the only main road until the opening of the 'Heads of the Valley' road in 1966.

The transport network served industry and not necessarily the community. Both canals and tramroads were the main source of transportation of raw materials. Tramroads transported the raw material (coal, limestone and ironstone) from the quarry to the furnace, then from the furnace to the foundry and finally, from the foundry to the canal. Before this, during the initial stages of the industrial revolution, pack-horses would have served a similar function.

In 1793, the Brecknock & Abergavenny Canal Company built the Clydach Railroad and was laid from a forge at Glangrwyney up the Clydach Gorge to Brynmawr. This tramroad was later connected to two others which ran parallel to it and down the Gorge to the Brecon & Abergavenny Canal at Gilwern and Govilon. Further west, between Brynmawr and the head of the Rhymney Valley, other tramroads were laid from the ironworks in each valley to run north to collieries, ironstone pits and limestone quarries. Some were linked together to create a rudimentary west-east route, giving the ironworks access to the Brecon & Abergavenny Canal as well as the two branches of the Monmouthshire Canal which ran to Crumlin and Pontypool.

Many of the earliest tramroads run close to or are cut by the present road. At Hirwaun, at least six tramroads (and two railway lines), all dating from the early to mid 19th century, are severed by the A465. A number of tramroads date from the late 18th, early 19th centuries and include the Bailey's Disgwylfa Tramroad (c.1818), Bailey's Llangattock Tramroad (c.1830s) Brinore Tramroad (c.1815), Castle Morlais Quarries Tramroad (c.1803), Clydach Railroad (c.1793), Gurnos Tramroad (c.1792), Hirwaun to Aberdare Tramroad (c.1790s), Llam-march Tramroad (c.1795 and 1811) and the Trefil Tramroad (c. 1797).

The most complex section of tramroad is located within the Clydach Gorge and involves two tramroads; the Clydach Railroad (No.44) and Llan-march Tramroad (No.51). Both run, in places, parallel to each other. They also served similar purposes in providing raw materials to the local ironworks and forges within the lower Clydach at Saleyard, Clydach Village and Llanelly.

The Clydach Railroad was built and financed by the Brecknock & Abergavenny Canal Co. in 1793 and served as a link between collieries at Brynmawr, at the head of the Clydach Gorge and a long established iron forge at Glangrwyney on the Usk, a short distance downstream from the mouth of the Clydach. Initially, the railroad was laid as an edge-rail which was cast in 4ft sections

By the time the Heads of the Valley Railway was promoted in late 1850s, much of the proposed route followed a line already adopted by existing tramroads. Despite this however, the construction of a locomotive-operated railway through rugged terrain was a very formidable challenge and proved too expensive for the Merthyr, Tredeger & Abergavenny Railway. The project was finally completed by the London and North Western Railway in 1862. Others sections and branch lines were later added , some jointly built with Rhymney Railway and the Brecon & Merthyr Railway. The route to Merthyr was completed in 1879. The line was principally built to transport iron, and in later years coal, from works at the Heads of the Valley to the Midlands. Passenger traffic was minimal. The route was considered a major engineering accomplishment with some of the steepest gradients and tightest curves in Britain. Despite this massive engineering feat with the construction of embankments, revetting, viaducts and cuttings, the line can never have been in profit, especially at a time when the iron industry in this part of Britain began its slow demise. The route was finally closed in 1958, but after this date, there were plans to build a new trunk road on much the same route as the railway and would link the Midlands with Swansea and Neath, the new rising centres for heavy industry. The road was originally conceived as far back as 1947, although detailed planning did not commence for another ten years. Construction started in 1960 and was completed in 1966. The route linked the Ross Spur of the M5 (now the M50) with the A 40 through to Neath and Swansea. Similar

to their railway counterparts, a century earlier, road engineers were faced with considerable engineering problems especially through the Clydach Gorge and across a number of wide river valleys and ravines. In places, the road simply overlaid existing former LNWR railway trackbeds.

Both transportation and the artificial watercourses were constructed as an integrated system around industry. Areas such as the Clydach Gorge, Brynmawr, Merthyr Tydfil and Hirwaun were ideal locations for early entrepreneurs; the raw material, the manufacturing base and the transportation to the market formed the basis of the Industrial Revolution in Wales. The need to utilise raw materials, such as ironstone, limestone and coal and manufacture the product close by was to set standards for industrialisation elsewhere in Britain. Within the Clydach Gorge, the iron industry is concentrated around the settlements of Maes y Gwartha and Saleyard. Indeed, the growth of both settlements is attributed to demand for iron.

One of the earliest commercial furnaces within the region was established at Llanelly, several kilometres west of Gilwern. Schubert (1957: 371) has suggested that there was a furnace at Llanelly (No.66) as early as 1590, which was rebuilt on a new site in 1606. However, the earliest recorded evidence appears to be an agreement of 1663 under which Capel Hanbury, who had another ironworks at Pontypool, was allowed to have liberty to build a weir to divert water from the River Clydach to his ironworks in Llanelly (Riden 1993, 23). The gorge was too remote for a forge alone to have been built: such a scheme would only have been feasible if a source of pig-iron from a blast furnace was nearby.

A blowing-house, containing the bellows which powered the furnace, stood on the opposite side of the furnace from the bank, with the water-wheel at its western end. There appears to be no trace of either the head- or tail-race which carried water to and from the wheel, although this question probably merits closer investigation. In line with Cadw's report, the walkover survey identifies `Ponds, arches and terraces' to the west and north of the furnace, which must be connected with the supply of water to the furnace. Nothing of this sort is marked on the tithe map, which does not mark any watercourse approaching the furnace from the north, but there may be better evidence on John Aram's plan.

Llanelly Forge (No.58) stood a short distance lower down the valley than the furnace, beyond the grounds of Clydach House on the left bank of the river. It was powered by water carried in a leat which left the Clydach just downstream from the mouth of Nant Dyar and ran along the left bank of the river to near the bottom of the lane running down from Clydach House. Here it swung away from the river, skirting the garden of Clydach House on the left and a large storage pond on the right. The tithe map shows a weir on the leat feeding the W end of the pond and the leat continuing around the north side of the pond to end at a point level with the dam wall of the pond.

7. Site Categorisation

7.1 The sites have been assessed for their importance in line with the categories defined in the Cadw brief. The details for categorisation are in Appendix 1

Category A - Sites of National Importance

These include Scheduled Ancient Monuments, Listed Buildings and those sites which meet the criteria for scheduling or listing. These sites to be preserved in situ.

Category B - Sites of Regional or County Importance
Sites that do not meet the criteria for scheduling or listing, but are nevertheless of particular importance within the region. Preservation *in situ* is the preferred option but if loss or damage cannot be avoided, appropriate detailed recording will be undertaken.

Category C - Sites of District or Local Importance

Sites which are not of sufficient importance to justify preservation if threatened. Category C will merit adequate recording in advance of loss or damage.

Category D - Minor or Damaged Sites

Sites of minor importance or so badly damaged that little remains to justify their inclusion into a higher category. Rapid recording, either in advance or during destruction is required.

Category E - Sites requiring further investigation

Sites whose importance or mitigation requirements can not be fully determined from Phase 1. Each site will be subject to further investigation. After which, sites can be categorised A - D.

Category N.F.A. (No Further Action)

Sites beyond the 50 metre corridor.

7.2 The 277 sites recorded at present have been categorised as follows:

7.2.1 Category A - Sites of National Importance

Seventeen sites have been classed as being of national importance; Nos. 9, 34, 35, 36, 61, 64, 90, 93, 94, 97, 99, 112, 206, 207, 208, 221,222

No. 64 is a Listed Building and Nos. 93, 94, 207/208 are Scheduled Ancient Monuments

7.2.2 Category B - Sites of Regional or County Importance.

Fifty-three have been classed as being of regional or county importance;

Nos. 1, 6, 7, 10, 26, 27, 28, 29, 32, 38, 44, 45, 47, 49, 55, 58, 59, 62, 66, 69, 76, 77, 79, 89i, 89ii, 92, 116, 117, 118, 122, 146, 152, 157, 160, 168, 169, 175, 179, 183, 184, 187, 189, 191, 195, 198, 200, 201, 204, 212, 214, 218, 234, 243

No. 66 is a Scheduled Ancient Monument

7.2.3 Category C - Sites of Local or District Importance

Fifty sites have been classified as being of local or district importance;
Nos. 12, 14, 19, 21, 22, 48, 49, 53, 63, 67, 68, 72, 73, 74, 75, 82, 83, 87, 102, 103, 104, 119, 127, 140, 147, 149, 152, 154, 165, 176, 178, 180, 185, 186, 194, 203, 209, 211, 215, 230, 231, 233, 237, 238, 246, 250, 257, 269, 271, 272

7.2.4 Category D - Minor or Damaged Sites

Ninety-one sites are of minor importance;
Nos. 5, 8, 15, 18, 20, 23, 24, 30, 33, 39, 40, 44, 45, 46, 56, 65, 71, 84, 88, 101, 105, 106, 110, 116, 121, 124, 125, 126, 128, 129, 130, 131, 132, 134, 135, 136, 137, 139, 141, 144, 151, 153, 155, 156, 158, 159, 161, 162, 163, 164, 166, 167, 170, 171, 172, 173, 174, 177, 181, 182, 190, 193, 196, 197, 199, 205, 217, 219, 220, 223, 224, 225, 226, 227, 228, 235, 236, 239, 240, 241, 242, 245, 247, 248, 249, 251, 253, 254, 256, 266, 267, 268, 274

7.2.5 Category E - Sites for further Evaluation

Forty-three sites require archaeological evaluation;
Nos. 3, 4, 4i, 11, 31, 36, 50, 51, 70, 78, 86, 91, 98, 99, 100, 107, 111, 113, 114, 120, 123, 133, 138, 142, 145, 146, 150, 192, 202, 216, 229, 232, 255A, 255B, 255C, 260, 263, 264, 265, 273, 275, 276, 277

7.2.6 No Further Action

Twenty-eight sites to receive no further action (NFA).
Nos. 2, 13, 16, 17, 25, 37, 41, 42, 43, 52, 54, 57, 60, 80, 81, 85, 95, 96, 109, 115, 143, 148, 210, 213, 244, 261, 262, 270,

7.3 Cadw have indicated that listing is under consideration for Nos. 6, 9, 10,13, 22, 27, 28, 34, 38, 61, 69, 79, 85, 90, 97, 109, 116, 143, 214; and consideration is being given to the scheduling of sites Nos. 42, 100, 112, 113

8. Site Impact

8.1 Impact on each site may be considered in terms of

- loss;
- damage;

- severance, particularly linear features;

- the group value, the relationship with other associated sites;

- and the effect on the archaeological setting.

8.2 The level of impact can be considered in one of three levels:

- slight - sites affected by the proposals but where the impact on the site and its setting is minimal;

- moderate - sites which would be affected by the route but where loss or impact on the setting would be partial (including severance);

- severe - sites which will be substantially affected or completely lost by the proposals;

8.3 A total of 130 sites will suffer some form of impact which has been provisionally assessed as:

Slight - thirty-six sites

Nos. 29, 30, 36, 51, 68, 69, 86, 99, 100, 112, 114, 123, 133, 137, 141, 152, 153, 157, 160, 167, 170, 179, 202, 219, 236, 238, 239, 241, 245, 264, 265, 268, 269, 273, 275, 276;

Moderate - sixty-five sites

Nos. 3, 4, 4i, 10, 11, 12, 20, 24, 29, 30, 31, 39, 51, 68, 69, 70, 91, 99, 110, 112, 119, 120, 133, 137, 141, 142, 152, 153, 157, 160, 167, 170, 179, 180, 192, 200, 202, 205, 219, 223, 227, 228, 229, 236, 238, 239, 241, 245, 252, 255A, 255B, 255C, 256, 260, 263, 264, 265, 268, 269, 270, 273, 275, 276

Severe - twenty-nine sites

Nos. 19, 33, 40, 48, 49, 50, 56, 83, 100, 102, 104, 106, 107, 108, 114, 123, 150, 154, 155, 161, 168, 169, 196, 211, 216, 222, 231, 232, 233.

9. Recommendations for Phase 2 Evaluation

9.1 Recommendations in this report for further action form only part of the Phase 2 Archaeological Field Evaluation. The proposals enable the correct reporting of the evaluations, incorporation of the results into the design procedure for the scheme and the production of the Cultural Heritage component of the integrated Environmental Statement being produced by Babtie. It is recommended that 43 sites be evaluated (see section 9.7). Agreement has already been reached on progressing this work.

9.2 Each evaluation action will help in assessing the nature, importance and state of preservation of archaeological remains likely to be impacted by the proposed road improvements. The evaluation actions will assist in determining the appropriate level of mitigation to be reported in the Environmental Statement. On the basis

that these sites all contain important archaeological features it is anticipated that the Phase 2 works will comprise extensive hand excavation, with some machine excavation where necessary, and survey. The type of site encountered will determine the evaluation measures pursued and will influence the proposals for the mitigation strategies. The evaluation strategies will be implemented according to site type.

9.3 For tramroads, railways and similar remains the evaluation technique will seek to assess the state of preservation and be directed towards identification of relevant dimensions and structural remains. The recording of stratified deposits will attempt to establish sequential phasing of the feature. The evaluation will involve hand excavation of a 2m length of the feature down to track/sleeper level and careful recording of track related remains. Subsequent machine trenching of the body of the earthwork will be designed to minimise the disturbance to surviving remains such as sleepers while providing a cross section through the feature. Where appropriate more than one evaluation trench will be excavated to establish the direction of the feature, continuity of stratification within the section and the possible recovery of any railway/tramroad furniture.

9.4 For leat systems trenching will be by hand to reduce possible impacts on existing ground water and drainage conditions. Trenches will be 1-2m wide as appropriate.

9.5 In evaluating standing structures, the aims will be to assist in determining importance and state of preservation, define the limit of the historic fabric and to assess the potential range of associated sub-surface features, such as burials at site No.50. This may involve hand and machine excavation of associated features to define their maximum extents. Where standing structures such as culverts and bridges are incorporated into linear features, the wider setting will be considered for its 'group value'. This point will also be applied to linear features that progress beyond the 50 metre corridor.

9.6 Evaluation strategy for other earthworks will include trial trenching of certain features to determine the likely range and value of sub-surface stratigraphy, the extents of the associated features and the state of preservation of the remains.

9.7 It is proposed to evaluate forty-three sites. The majority of these sites are of an early industrial nature and include tramroads, leats, railways and associated buildings.

Site No.	Site Name/Description	N.G.R	Class
3	**Tramroad/cart track, Llanfoist Farm** *Method of excavation: Hand excavation followed by machine trenching (two trenches)*	**SO 2945 1331**	**E**
4	**Merthyr, Tredegar & Abergavenny Railway** *Method of excavation: Hand excavation followed by machine trenching (single trench)*	**SO 2902 1353**	**E**

4(i)	**Llanvihangel Railway, Llanfoist**	**SO 2902 1353**	**E**
	Method of excavation: Hand excavation followed by machine trenching (two trenches)		
11	**Track/road, Pen-y-Worlod Farm, Llanfoist**	**SO 2828 1383**	**E**
	Method of excavation: Machine trenching, hand excavation in places (single trench)		
31	**Abergavenny-Merthyr Turnpike Road,**	**SO 2597 1432**	**E**
	Method of excavation: Hand excavation followed by machine trenching (two trenches)		
36	**Canal bridge (eccentric arched), Gilwern**	**SO 2537 1452**	**(A)E**
	Method of excavation: Hand excavation (surface clearance and evaluation)		
50	**Primitive Methodist Chapel and grave yard**	**SO 2427 1428**	**(B)E**
	Method of excavation: Machine clearance of tarmac, and debris followed by hand excavation (surface excavation and evaluate)		
51	**Llam-march Tramroad, Gilwern**	**SO 2328 1377**	**E**
	Method of excavation: Hand excavation followed by machine trenching (two trenches)		
70	**Llam-march Tramroad, Saleyard**	**SO 2329 1373**	**E**
	Method of excavation: Hand excavation followed by machine trenching (two trenches)		
78	**Clydach Railroad, Cheltenham**	**SO 2222 1275**	**(C)E**
	Method of excavation: Hand excavation followed by machine trenching (two or more trenches)		
86	**Merthyr-Govilon Turnpike Road (Main Road)**	**SO 1968 1216**	**(C)E**
	Method of excavation: Machine trenching followed by hand excavation where necessary (single trench)		
91	**Track between Blackrock and Cheltenham**	**SO 2160 1264**	**(B)E**
	Method of excavation: Hand excavation followed by machine trenching (two trenches)		
98	**Kilns (?) within Clydach river bank**	**SO 2297 1339**	**(C)E**
	Method of excavation: Hand clean, excavate where necessary (surface clearance and hand excavation)		
99	**Leat keeper's cottage & outbuildings, Clydach**	**SO 2298 1342**	**(A)E**
	Precise strategy to be determined with CADW after survey		
100	**Weir, sluice and leat system, Clydach**	**SO 2313 1355**	**(A)E**
	Method of excavation: Hand excavation, only within sensitive areas under threat (two or more trenches)		

43. Canal aqueduct over Clydach Rail Road, Gilwern **SO 2439 1451** **NFA**

Type: aqueduct

i) Period: 1797
ii) Rarity: scarce (3)
iii) Documentation: SMR, Cadw, tithe map 1847, O.S. 1880 and documentary histories (3)
iv) Group Value: associated with B & A Canal (No.34), embankment (No.42) (3)
v) Survival/Condition: good (3)
vi) Diversity: single-phase structure (1)

Impact: slight Total: 13

44. Clydach Railroad, Gilwern to Cheltenham **SO 2300 1369 to SO 2437 1448** **B**

Type: tramroad

i) Period: 1798
ii) Rarity: moderate (2)
iii) Documentation: SMR, Cadw, tithe map 1847, O.S. 1880 and documentary histories (3)
iv) Group Value: associated with the B & A Canal (No.34), embankment (No.42), aqueducts (No.34) (3)
v) Survival/Condition: moderate (2)
vi) Diversity: single-phase linear feature (1)

Impact: slight Total: 11

45. Pack-horse bridge, Gilwern **SO 2441 1442** **B**

Type: bridge

i) Period: early 19th century
ii) Rarity: scarce (3)
iii) Documentation: none (1)
iv) Group Value: associated with B & A canal (No.34), lean-to building (No.46) and overflow sluice (No.47) (3)
v) Survival/Condition: good (3)
vi) Diversity: single-phase structure (1)

Impact: slight Total: 11

46. Lean-to building and D.S.W, Gilwern **SO 2440 1442** **D**

Type: building

i) Period: 19th century
ii) Rarity: common (1)
iii) Documentation: none (1)
iv) Group Value: associated with pack-horse bridge (No.45) (2)
v) Survival/Condition: poor (1)
vi) Diversity: single-phase building (1)

Impact: slight Total: 6

47. Overflow Sluice system, B & A Canal, Gilwern **SO 2442 1443** **B**

Type: artificial watercourse

i) Period: late 18th century
ii) Rarity: scarce (3)
iii) Documentation: documentary histories (van Laun 1989) (2)
iv) Group Value: associated with pack-horse bridge (No.45) and B & A Canal (No.34) (3)
v) Survival/Condition: good (3)
vi) Diversity: single-phase structure (1)

Impact: slight Total: 12

48. Lion Hotel, Gilwern **SO 2437 1438** **C**

Type: buildings
i) Period: mid 19th century
ii) Rarity: common (1)
iii) Documentation: O.S. 1880, 1891 (2)
iv) Group Value: associated with row of cottages (No.49) (2)
v) Survival/Condition: moderate (2)
vi) Diversity: multi-phase building (2)

Impact: severe Total: 9

Action: Photographic Record

49. Terrace cottages, Gilwern **SO 2433 1436** **C**

Type: buildings
i) Period: mid to late 19th century
ii) Rarity: common (1)
iii) Documentation: O.S. 1880 (2)
iv) Group Value: associated with Lion Hotel (No. 48) (2)
v) Survival/Condition: moderate (2)
vi) Diversity: multi-phase dwellings (2)

Impact: severe Total: 9

Action: Photographic Record

50. Primitive Methodist Chapel and grave yard, Gilwern **SO 2427 1429** **(B)E**

Type: building
i) Period: 1838
ii) Rarity: moderate (2)
iii) Documentation: SMR, Cadw, O.S. 1880, 1891 (3)
iv) Group Value: associated and incorporated within the settlement of Gilwern (2)
v) Survival/Condition: good (3)
vi) Diversity: single-phase building (1)

Impact: severe Total: 11

Action: Photographic Record, Ground Survey and Excavation

51. Llam-march Tramroad, Gilwern **SO 2440 1439 to SO 2328 1379** **E**

Type: tramroad
i) Period: 1795 and 1811/12
ii) Rarity: moderate (2)
iii) Documentation: SMR, O.S. 1880 and documentary histories (Rattenbury 1980, van Laun 1989) (3)
iv) Group Value: associated with bridge (No.69) and Clydach Ironworks (No.94) (3)
v) Survival/Condition: poor (1)
vi) Diversity: multi-phase linear feature (2)

Impact: high Total: 11

Action: Evaluation

52. Machine House (weighbridge), Clydach Railroad **SO 2419 1439** **NFA**

Type: building

i) Period: c.1810

ii) Rarity: scarce (3)

iii) Documentation: SMR, Cadw, O.S. 1880 and documentary histories (Rattenbury 1980) (3)

iv) Group Value: associated with Clydach Railroad (No.44) (2)

v) Survival/Condition: good (3)

vi) Diversity: single-phase building (1)

Impact: slight Total: 12

53. Forge Hammer Inn, Gilwern **SO 2378 1408** **C**

Type: building

i) Period: mid 19th century

ii) Rarity: common (1)

iii) Documentation: O.S. 1880 (2)

iv) Group Value: associated with branch line of Llam-march Tramroad (No.55) (3)

v) Survival/Condition: moderate (2)

vi) Diversity: multi-phase building (2)

Impact: moderate Total: 10

Action: Photographic Record (setting)

54. Pwll Rhys waterfall footbridge **SO 2375 1410** **NFA**

Type: bridge

i) Period: c1930

ii) Rarity: common (1)

iii) Documentation: none (1)

iv) Group Value: none (1)

v) Survival/Condition: good (3)

vi) Diversity: single-phase structure (1)

Impact: slight Total: 7

55. Branch of the Llam-march Tramroad, Llanelly. **SO 2355 1396 to SO 2378 1408** **B**

Type: tramroad

i) Period: c.1812

ii) Rarity: moderate (2)

iii) Documentation: O.S. 1880, documentary histories (Rattenbury 1980 and van Laun 1989) (3)

iv) Group Value: associated with Forge Hammer Inn (No.53), Llanelly Forge (No.58) (3)

v) Survival/Condition: moderate (2)

vi) Diversity: single-phase linear feature (1)

Impact: moderate Total:11

56. A465 concrete revetting, Gilwern **SO 2420 1423** **D**

Type: road

i) Period: pre 1963

ii) Rarity: common (1)

iii) Documentation: unknown (0)

iv) Group Value: present A465 (2)

v) Survival/Condition: unknown (0)

vi) Diversity: unknown (0)

Impact: moderate Total: 3

57. Culvert/buttress, River Clydach, Maes y Gwartha **SO 2365 1410** **NFA**

Type: artificial watercourse

i) Period: early 19th century
ii) Rarity: moderate (2)
iii) Documentation: none (1)
iv) Group Value: associated with Llanelly Forge (No.58) (2)
v) Survival/Condition: moderate (2)
vi) Diversity: single-phase structure (1)

Impact: slight Total: 8

58. Llanelly Forge, Maelog Bungalow, Maes y Gwartha **SO 2355 1405** **B**

Type: industrial monument

i) Period: c.1660
ii) Rarity: scarce (3)
iii) Documentation: Cadw, SMR and documentary histories (Rattenbury 1980 and van Laun 1989) (3)
iv) Group Value: associated with branch line (No.55), culvert (No.57), dam/leat (No. 59) and bridge (No.61) (3)
v) Survival/Condition: poor (sub-surface feature) (1)
vi) Diversity: multi-phase monument (2)

Impact: slight Total: 12

59. Dam and parallel leat, Llanelly Forge, Maes y Gwartha **SO 2351 1402** **B**

Type: earthworks and water course

i) Period: 18th century (?)
ii) Rarity: scarce (3)
iii) Documentation: Cadw, SMR and documentary histories (Rattenbury 1980 and van Laun 1989) (3)
iv) Group Value: associated with Llanelly Forge (No.58) (2)
v) Survival/Condition: poor (earthworks and sub-surface features) (1)
vi) Diversity: multi-phase earthworks (2)

Impact: slight Total: 11

60. Forge House, Tin plate works, Maes y Gwartha **SO 2352 1399** **NFA**

Type: building

i) Period: early 19th century
ii) Rarity: moderate (2)
iii) Documentation: SMR, Cadw, tithe maps and documentary histories (van Laun 1989) (3)
iv) Group Value: associated with Llanelly Forge (No.58) and bridge (No.61) (3)
v) Survival/Condition: poor (incorporated into later building) (1)
vi) Diversity: multi-phase building (2)

Impact: slight Total: 11

61. Llanelly Bridge, Maes y Gwartha **SO 2353 1396** **A**

Type: bridge

i) Period: early 19th century (c.1812)
ii) Rarity: moderate (2)
iii) Documentation: SMR, Cadw (of historic interest), O.S. 1880 and documentary histories (3)
iv) Group Value: associated with Llanelly Forge (No.58), Tinplate Works (No.60) (3)
v) Survival/Condition: good (3)
vi) Diversity: multi-phase structure (2)

Impact: slight Total: 13

62. Forge Row, Llanelly, Maes y Gwartha **SO 2345 1392** **B**

Type: buildings

i) Period: late 17th and 19th centuries
ii) Rarity: scarce (3)
iii) Documentation: SMR, Cadw (of historical interest), O.S.1880 and documentary histories (3)
iv) Group Value: associated with Llanelly forge (No.58) (2)
v) Survival/Condition: moderate (2)
vi) Diversity: multi-phase dwellings (2)

Impact: slight Total: 12

63. Culvert, River Clydach, Saleyard **SO 2339 1383** **C**

Type: standing structure

i) Period: 18th/19th century (?)
ii) Rarity: moderate (2)
iii) Documentation: none (1)
iv) Group Value: associated with Clydach House (No.64) (2)
v) Survival/Condition: good (3)
vi) Diversity: single-phase structure (1)

Impact: slight Total: 9

64. Clydach House, Saleyard **SO 2325 1382** **A**

Type: building

i) Period: 1693
ii) Rarity: scarce(3)
iii) Documentation: Cadw (Listed Building), SMR, O.S. 1880 and documentary histories (3)
iv) Group Value: associated with culvert (No.63)and Llanelly Furnace (No.66) (3)
v) Survival/Condition: good (3)
vi) Diversity: multi-phase building (2)

Impact: slight Total: 14

65. Industrial buildings, Clydach House, Saleyard **SO 2331 1392** **D**

Type: industrial buildings

i) Period: 17th-18th century (?)
ii) Rarity: scarce (3)
iii) Documentation: unknown (0)
iv) Group Value: associated with Clydach House (No.64) and Llanelly Furnace (No.66) (3)
v) Survival/Condition: poor (1)
vi) Diversity: single-phase buildings (1)

Impact: slight Total: 8

66. Llanelly Furnace, Saleyard **SO 2323 1386** **B**

Type: industrial monument

i) Period: 1684
ii) Rarity: scarce (3)
iii) Documentation: SMR, Cadw (Scheduled Monument), documentary histories (3)
iv) Group Value: associated with Clydach House (No.64), ponds, terraces and dam (No.67) (3)
v) Survival/Condition: poor (sub-surface remains) (1)
vi) Diversity: multi-phase earthworks (2)

Impact: slight Total: 12

67. Terraces, arches and ponds, Llanelly Furnace, Saleyard **SO 2318 1377** **C**

Type: earthworks and standing structures

i) Period: 17th-18th centuries
ii) Rarity: scarce (3)
iii) Documentation: Cadw, SMR, documentary histories (van Laun 1989) (3)
iv) Group Value: associated with Llanelly Furnace (No.66) (2)
v) Survival/Condition: poor (1)
vi) Diversity: single-phase earthwork and structures (1)

Impact: slight Total: 10

68. Former road bridge, Saleyard **SO 2330 1375** **C**

Type: bridge

i) Period: pre 1963
ii) Rarity: common (1)
iii) Documentation: none (1)
iv) Group Value: associated with the original route of the pre 1963 A465 (2)
v) Survival/Condition: good (3)
vi) Diversity: multi-phase structure (2)

Impact: high Total: 9

Action: Photographic Record and Ground Survey

69. Llam-march Tramroad bridge, Saleyard **SO 2329 1373** **B**

Type: bridge

i) Period: late 18th century
ii) Rarity: moderate (2)
iii) Documentation: SMR, O.S.1880, documentary histories (van Laun 1989) (3)
iv) Group Value: associated with Llam-march Tramroad (No.70) and road bridge (No.68) (3)
v) Survival/Condition: moderate (2)
vi) Diversity: multi-phase structure (2)

Impact: moderate Total: 12

Action: Photographic Record and Ground Survey

70. Llam-march Tramroad, Saleyard **SO 2327 1367** **E**

Type: tramroad

i) Period: 1812
ii) Rarity: moderate (2)
iii) Documentation: SMR, O.S.1880, tithe map 1847 and documentary histories (van Laun 1989) (3)
iv) Group Value: associated with tramroad bridge (No.69) and Clydach Ironworks (No.94) (3)
v) Survival/Condition: poor (1)
vi) Diversity: single-phase linear feature (1)

Impact: high Total: 10

Action: Evaluation

71. Farmstead, Brunant **SO 2375 1394** **D**

Type: building

i) Period: 18th-19th century
ii) Rarity: common (1)
iii) Documentation: O.S.1880, 1891, tithe maps (2)
iv) Group Value: none (1)
v) Survival/Condition: moderate (2)
vi) Diversity: multi-phase dwelling (2)

Impact: slight Total: 8

72. Clydach Villa, Cheltenham **SO 2291 1348** **C**

Type: building

i) Period: late 19th century
ii) Rarity: common (1)
iii) Documentation: O.S.1880, 1891 (2)
iv) Group Value: associated and incorporated within the settlement of Cheltenham (2)
v) Survival/Condition: good (3)
vi) Diversity: single-phase dwelling (1)

Impact: slight Total: 9

73. Lamb House and industrial unit, Cheltenham **SO 2282 1333** **C**

Type: buildings

i) Period: 18th-19th century
ii) Rarity: common (1)
iii) Documentation: O.S. 1880, 1891 (2)
iv) Group Value: associated and incorporated within the settlement of Cheltenham (2)
v) Survival/Condition: good (3)
vi) Diversity: multi-phase dwellings (2)

Impact: slight Total: 10

74. Sunnyside - Terrace cottages, Cheltenham **SO 2279 1332** **C**

Type: building

i) Period: mid 19th century
ii) Rarity: common (1)
iii) Documentation: O.S. 1880, 1891 (2)
iv) Group Value: associated and incorporated within the settlement of Cheltenham (2)
v) Survival/Condition: moderate (2)
vi) Diversity: multi-phase dwelling (2)

Impact: slight Total: 9

75. Terrace cottages, Craig Amy, Cheltenham **SO 2273 1323** **C**

Type: buildings

i) Period: mid 19th century
ii) Rarity: common (1)
iii) Documentation: O.S. 1880, 1891 (2)
iv) Group Value: associated and incorporated within the settlement of Cheltenham (2)
v) Survival/Condition: moderate (2)
vi) Diversity: multi-phase dwellings (2)

Impact: slight Total: 9

76. Worker's cottages incl. Oak Cottage, Cheltenham **SO 2267 1313** **B**

Type: buildings

i) Period: mid 19th century
ii) Rarity: moderate (2)
iii) Documentation: O.S 1880, 1891, documentary histories (3)
iv) Group Value: associated and incorporated within the settlement of Cheltenham (2)
v) Survival/Condition: moderate (2)
vi) Diversity: multi-phase dwellings (2)

Impact: slight Total: 11

77. G.W.R notice, Cheltenham **SO 2270 1318** **B**

Type: standing structure

i) Period: early 20th century
ii) Rarity: scarce (3)
iii) Documentation: SMR (2)
iv) Group Value: associated with Clydach Railroad (No.78) (3)
v) Survival/Condition: good (3)
vi) Diversity: single-phase monument (1)

Impact: slight Total: 12

78. Clydach Railroad, Cheltenham **SO 2195 1274 to SO 2300 1369** **(C)E**

Type: tramroad

i) Period: late 18th century
ii) Rarity: moderate (2)
iii) Documentation: SMR, Cadw, O.S.1880, tithe map 1847 and documentary histories (3)
iv) Group Value: associated with G.W.R. notice (No.77) and Cheltenham (3)
v) Survival/Condition: poor (1)
vi) Diversity: single-phase linear feature (1)

Impact: high Total: 10

Action: Evaluation

79. Oak House, Cheltenham **SO 2258 1302** **B**

Type: building

i) Period: 18th-19th centuries
ii) Rarity: moderate (2)
iii) Documentation: SMR, O.S. 1880 (3)
iv) Group Value: associated with the settlement of Cheltenham and the Clydach Ironworks (No.94) (2)
v) Survival/Condition: moderate (2)
vi) Diversity: multi-phase dwelling (2)

Impact: slight Total: 11

80. Ebenezer Welsh Chapel, Cheltenham **SO 2255 1397** **NFA**

Type: building

i) Period: mid 19th century
ii) Rarity: moderate (2)
iii) Documentation: Cadw, SMR, O.S. 1880 and documentary histories (3)
iv) Group Value: associated with the settlement of Cheltenham (2)
v) Survival/Condition: moderate (2)
vi) Diversity: single-phase building (1)

Impact: slight Total: 10

81. English Wesleyan Chapel, Cheltenham **SO 2250 1292** **NFA**

Type: building

i) Period: mid to late 19th century
ii) Rarity: moderate (2)
iii) Documentation: Cadw, SMR, O.S. 1880 and documentary histories (3)
iv) Group Value: associated with the settlement of Cheltenham (2)
v) Survival/Condition: moderate (2)
vi) Diversity: multi-phase building (2)

Impact: slight Total: 11

82. James Terrace cottages, Cheltenham **SO 2246 1290** **C**

Type: buildings

i) Period: mid 19th century
ii) Rarity: common (1)
iii) Documentation: SMR, O.S. 1880, 1891 (3)
iv) Group Value: associated and incorporated within the settlement of Cheltenham (2)
v) Survival/Condition: moderate (2)
vi) Diversity: multi-phase dwellings (2)

Impact: slight Total: 10

83. Siloam Chapel Graveyard, Cheltenham **SO 2247 1281** **C**

Type: building

i) Period: mid to late 19th century
ii) Rarity: common (1)
iii) Documentation: SMR, O.S. 1880, 1891 (3)
iv) Group Value: associated and incorporated within the settlement of Cheltenham (2)
v) Survival/Condition: moderate (2)
vi) Diversity: multi-phase graveyard (2)

Impact: severe Total: 10

84. Spring, gully and D.S.W., Cheltenham **SO 2239 1283** **D**

Type: standing structures

i) Period: 18th/19th century (?)
ii) Rarity: common (1)
iii) Documentation: none (1)
iv) Group Value: associated and incorporated within the settlement of Cheltenham (2)
v) Survival/Condition: moderate (2)
vi) Diversity: single-phase structures (1)

Impact: slight Total: 7

85. Penrheol Las and Big House, Cheltenham **SO 2223 1281** **NFA**

Type: building

i) Period: mid 19th century
ii) Rarity: common (1)
iii) Documentation: Cadw (2)
iv) Group Value: associated and incorporated within the settlement of Cheltenham (2)
v) Survival/Condition: poor (1)
vi) Diversity: single-phase dwelling (1)

Impact: slight Total: 7

86. Merthyr -Govilon Turnpike Road (Main Road) **SO 1964 1213 to SO 2323 1437** **(C)E**

Type: road

i) Period: 1812
ii) Rarity: common (1)
iii) Documentation: O.S. 1880, documentary histories (3)
iv) Group Value: associated and incorporated within (2)
v) Survival/Condition: moderate (2)
vi) Diversity: single-phase linear feature (1)

Impact: high Total: 9

Action: Evaluation

87. Derelict cottage, Rock & Fountain Inn, Main Road **SO 2199 1278** **C**

Type: building

i) Period: late 18th/early 19th century
ii) Rarity: moderate (2)
iii) Documentation: O.S.1880, 1891 (2)
iv) Group Value: none (1)
v) Survival/Condition: moderate (2)
vi) Diversity: multi-phase dwelling (2)

Impact: slight Total: 9

88. Masonry culvert, Main Road **SO 2193 1277** **D**

Type: standing structure

i) Period: 19th century (?)
ii) Rarity: common (1)
iii) Documentation: none (1)
iv) Group Value: associated with turnpike road -Main Road (No.86) (2)
v) Survival/Condition: moderate (2)
vi) Diversity: single-phase standing structure (1)

Impact: moderate Total: 7

89i. Tramroad, Daren Ddu Limestone Quarry to Blackrock **SO 2154 1262 to SO 2190 1294** **B**

Type: tramroad

i) Period: 19th century
ii) Rarity: moderate (2)
iii) Documentation: documentary histories (Rattenbury 1980 and van Laun 1989) (3)
iv) Group Value: associated with the Daren Ddu Quarry and lime kilns (No.90) (3)
v) Survival/Condition: moderate (2)
vi) Diversity: single-phase linear feature (1)

Impact: slight Total: 11

89ii. Tramroad, Daren Ddu Limestone Quarry to Limekilns **SO 2185 1275 to SO 2205 1287** **B**

Type: tramroad

i) Period: 19th century
ii) Rarity: moderate (2)
iii) Documentation: documentary histories (Rattenbury 1980 and van Laun 1989) (3)
iv) Group Value: associated with the Daren Ddu Quarry and lime kilns (No.90) (3)
v) Survival/Condition: moderate (2)
vi) Diversity: single-phase linear feature (1)

Impact: slight Total: 11

90. Blackrock Lime Kilns, Main Road **SO 2181 1275** **A**

Type: industrial monument

i) Period: 1889
ii) Rarity: scarce (3)
iii) Documentation: Cadw, SMR and documentary histories (3)
iv) Group Value: associated with Daren Ddu quarry, Clydach Tramroad (No.78) and Turnpike road (No.86) (3)
v) Survival/Condition: good (3)
vi) Diversity: single-phase structure (1)

Impact: slight Total: 13

91. Track/road between Blackrock and Cheltenham **SO 2153 1255 to SO 2188 1274** **(B)E**

Type: tramroad

i) Period: late 18th century
ii) Rarity: moderate (2)
iii) Documentation: SMR, O.S. 1880, documentary histories (Rattenbury 1989 and van Laun 1989) (3)
iv) Group Value: associated with turnpike road (No.86) and Blackrock line kilns (No.90) (3)
v) Survival/Condition: poor (1)
vi) Diversity: single-phase linear feature (1)

Impact: high Total: 10

Action: Evaluation

92. Haman's Cottages, Clydach **SO 2282 1319** **B**

Type: building

i) Period: early 19th century
ii) Rarity: scarce (3)
iii) Documentation: Cadw, SMR, O.S.1880 and documentary histories (van Laun 1989) (3)
iv) Group Value: associated with Clydach Ironworks (No.94) (2)
v) Survival/Condition: moderate (2)
vi) Diversity: multi-phase dwellings (2)

Impact: slight Total: 12

93. Smart's Bridge, Clydach **SO 2287 1327** **A**

Type: bridge

i) Period: 1824
ii) Rarity: scarce (3)
iii) Documentation: Cadw (Scheduled Monument), SMR, O.S.1880 and documentary histories (3)
iv) Group Value: associated with the Clydach Ironworks (No.94) and branch tramroad (No.95) (3)
v) Survival/Condition: good (3)
vi) Diversity: single-phase structure (1)

Impact: slight Total: 13

94. Clydach Iron Works, Clydach **SO 2290 1320** **A**

Type: industrial monument

i) Period: 1797
ii) Rarity: scarce (3)
iii) Documentation: Cadw (Scheduled Monument), SMR, O.S.1880 and documentary histories (3)
iv) Group Value: associated with Haman's Cottages (No. 92), Smart's Bridge (No.93) (3)
v) Survival/Condition: good (3)
vi) Diversity: multi-phase industrial complex (2)

Impact: slight Total: 14

95. Section of (branch) tramroad, Clydach Ironworks **SO 2289 1305 to SO 2230 1250** **NFA**

Type: tramroad

i) Period: 19th century
ii) Rarity: common (1)
iii) Documentation: O.S.1880, documentary histories (Rattenbury 1980) (3)
iv) Group Value: associated with the Clydach Ironworks (No.94) (2)
v) Survival/Condition: poor (1)
vi) Diversity: single-phase linear feature (1)

Impact: slight Total: 8

96. Site Office and dwellings, Clydach **SO 2287 1332** **NFA**

Type: earthworks

i) Period: 19th century
ii) Rarity: common (1)
iii) Documentation: documentary histories (van Laun 1989) and photographic record (3)
iv) Group Value: associated with Smart's Bridge (No.93) and the Clydach Ironworks (No.94) (2)
v) Survival/Condition: unknown (under A465 embankment) (0)
vi) Diversity: unknown (0)

Impact: N/A Total: 6

97. Pant Glas Bridge, Clydach **SO 2293 1333** **A**

Type: bridge

i) Period: 1810
ii) Rarity: moderate (2)
iii) Documentation: Cadw, SMR, O.S.1880 and documentary histories (3)
iv) Group Value: associated with the Llam-march Tramroad (No.70), Clydach Ironworks (No.94) (3)
v) Survival/Condition: good (3)
vi) Diversity: multi-phase structure (2)

Impact: slight Total: 13

Action: Photographic Record

98. Kilns (?) within Clydach river bank **SO 2297 1339** **(C)E**

Type: industrial monument

i) Period: 19th century
ii) Rarity: moderate (2)
iii) Documentation: none (1)
iv) Group Value: associated with Pant Glas Bridge (No.97) and leat keeper's cottage (No. 99) (3)
v) Survival/Condition: moderate (2)
vi) Diversity: single-phase monument (1)

Impact: moderate Total: 9

Action: Photographic Record, Ground Survey and Evaluation

99. Leat keeper's cottage & outbuildings, Clydach **SO 2299 1344** **(A)E**

Type: building

i) Period: 18th century
ii) Rarity: scarce (3)
iii) Documentation: Cadw, O.S.1880, 1891 (3)
iv) Group Value: associated with kilns (No.98), weir and sluice system (No.100) (3)
v) Survival/Condition: moderate (2)
vi) Diversity: multi-phase building (2)

Impact: high Total: 13

Action: Photographic Record, Ground Survey and Excavation

100. Weir, sluice system and leat, Clydach — **SO 2301 1343 to SO 2315 1358** — **(A)E**

Type: artificial watercourse
i) Period: c.1663
ii) Rarity: scarce (3)
iii) Documentation: Cadw and documentary evidence (3)
iv) Group Value: associated with leat keeper's cottage (No.99) (2)
v) Survival/Condition: good (3)
vi) Diversity: multi-phase structure (2)

Impact: high — Total: 13

Action: Photographic Record, Ground Survey and Excavation

101. Hafod Inn, Blackrock — **SO 2158 1261** — **D**

Type: building
i) Period: early 20th century
ii) Rarity: common (1)
iii) Documentation: none (1)
iv) Group Value: associated and incorporated within the settlement of Blackrock (2)
v) Survival/Condition: good (3)
vi) Diversity: single-phase building (1)

Impact: slight — Total: 8

102 Drum & Monkey Inn, Blackrock — **SO 2155 1257** — **C**

Type: building
i) Period: 18th century (?)
ii) Rarity: common (1)
iii) Documentation: O.S.1880, 1891, documentary histories (3)
iv) Group Value: associated and incorporated within the settlement of Blackrock (2)
v) Survival/Condition: poor (1)
vi) Diversity: multi-phase building (2)

Impact: severe — Total: 9

Action: Photographic Record

103 Craig Cottage, Blackrock — **SO 2149 1258** — **C**

Type: buildings
i) Period: mid 19th century
ii) Rarity: common (1)
iii) Documentation: O.S.1880, 1891 (2)
iv) Group Value: associated and incorporated within the settlement of Blackrock (2)
v) Survival/Condition: good (3)
vi) Diversity: single-phase dwelling (1)

Impact: severe — Total: 9

Action: Photographic Record

104 **Cottages, Blackrock** **SO 2145 1252** **C**
Type: buildings
i) Period: 19th century
ii) Rarity: common (1)
iii) Documentation: O.S.1880, 1891 (2)
iv) Group Value: associated and incorporated within the settlement of Blackrock (2)
v) Survival/Condition: moderate (2)
vi) Diversity: multi-phase dwellings (2)

Impact: severe Total: 9

Action: Photographic Record

105 **Blackrock Quarry, Blackrock** **SO 2129 1250** **D**
Type: quarry
i) Period: 19th century
ii) Rarity: common (1)
iii) Documentation: O.S.1880, 1891 (2)
iv) Group Value: associated and incorporated within the settlement of Blackrock (2)
v) Survival/Condition: N/A (0)
vi) Diversity: N/A (0)

Impact: slight Total: 5

106 **Road and foot bridges, Blackrock** **SO 2114 1249** **D**
Type: bridges
i) Period: early 20th century
ii) Rarity: common (1)
iii) Documentation: none (1)
iv) Group Value: associated with turnpike road [Main Road] (No.86) (2)
v) Survival/Condition: poor (1)
vi) Diversity: multi-phase structures (2)

Impact: severe Total: 7

Action: Photographic Record and Ground Survey

107 **Squatter's settlement/industrial site, Nant Gwyn** **SO 2114 1248** **E**
Type: standing structures and earthworks
i) Period: 18th/19th century
ii) Rarity: scarce (3)
iii) Documentation: none (1)
iv) Group Value: associated with the Clydach Railroad (No.78) (2)
v) Survival/Condition: poor (1)
vi) Diversity: multi-phase structures (2)

Impact: severe Total: 9

Action: Photographic Record, Ground Survey and Excavation

108 **Track and D.S.W. landscape, Main Road** **SO 2108 1249** **D**
Type: linear feature and field boundary
i) Period: 18th/19th century
ii) Rarity: common (1)
iii) Documentation: none (1)
iv) Group Value: none (1)
v) Survival/Condition: poor (1)
vi) Diversity: single-phase linear feature (1)

Impact: moderate Total: 5

109	**Milestone, Nr. Pont Gam**	**SO 2096 1260**	**NFA**
	Type: monument		
i)	Period: 1812		
ii)	Rarity: scarce (3)		
iii)	Documentation: O.S.1880, 1891 (2)		
iv)	Group Value: associated with turnpike road (No.86) (2)		
v)	Survival/Condition: moderate (2)		
vi)	Diversity: single-phase monument (1)		
	Impact: slight	Total: 10	
110	**D.S.W. landscape, Water Works, Pont Gam**	**SO 2077 1250**	**D**
	Type: field boundaries		
i)	Period: 18th/19th century		
ii)	Rarity: common (1)		
iii)	Documentation: O.S.1880, 1891 (2)		
iv)	Group Value: none (1)		
v)	Survival/Condition: poor (1)		
vi)	Diversity: single-phase linear feature (1)		
	Impact: slight	Total: 6	
111	**Llangattock Tramroad, Brynmawr**	**SO 1945 1236 to SO 2209 1310**	**(C)E**
	Type: tramroad		
i)	Period: c.1830		
ii)	Rarity: moderate (2)		
iii)	Documentation: SMR, O.S.1880 and documentary histories (Rattenbury 1980, van Laun 1989) (3)		
iv)	Group Value: associated and incorporated within the settlement of Brynmawr (2)		
v)	Survival/Condition: poor (1)		
vi)	Diversity: single-phase linear feature (1)		
	Impact: high	Total: 9	

Action: Evaluation

112	**Clydach Railroad & Cwm Nantmelyn Bridge**	**SO 2022 1226**	**A**
	Type: tramroad and bridge		
i)	Period: 1797		
ii)	Rarity: scarce (3)		
iii)	Documentation: SMR, Cadw and documentary histories (Rattenbury 1980 and van Laun 1989) (3)		
iv)	Group Value: associated with bridge at Brynmawr (No.118) and sections of Railroad (3)		
v)	Survival/Condition: good (3)		
vi)	Diversity: single-phase linear feature and standing structure (1)		
	Impact: high	Total: 13	

Action: Photographic Record (setting)

113	**Branch line of the Clydach Railroad & colliery level**	**SO 2008 1218**	**(B)E**
	Type: tramroad and industrial site		
i)	Period: 18th/19th century		
ii)	Rarity: moderate (2)		
iii)	Documentation: Cadw and documentary histories (2)		
iv)	Group Value: associated with Clydach Railroad (No.112) and coal adits (3)		
v)	Survival/Condition: moderate (2)		
vi)	Diversity: multi-phase linear feature and industrial complex (2)		
	Impact: high	Total: 11	

Action: Photographic Record, Ground Survey and Evaluation

114 **Merthyr, Tredegar & Abergavenny Railway** **SO 1968 1207 to SO 2190 1288** **(B)E**

Type: railway
i) Period: 1862
ii) Rarity: common (1)
iii) Documentation: SMR, O.S.1880 and documentary histories (Rattenbury 1989) (3)
iv) Group Value: associated with skew bridge (119) (2)
v) Survival/Condition: good (3)
vi) Diversity: multi-phase linear feature (2)

Impact: severe Total: 11

Action: Evaluation

115 **Ffynnon Gistfaen religious waterfall, River Clydach** **SO 2068 1238** **NFA**

Type: natural watercourse
i) Period: N/A (0)
ii) Rarity: N/A (0)
iii) Documentation: Cadw (notes) (2)
iv) Group Value: N/A (0)
v) Survival/Condition: N/A (0)
vi) Diversity: N/A (0)

Impact: slight Total: 2

116 **Devil's Bridge, Cheltenham** **SO 2154 1249** **B**

Type: bridge
i) Period: 18th century
ii) Rarity: scarce (3)
iii) Documentation: Cadw, SMR, documentary histories (van Laun 1989) (3)
iv) Group Value: none (1)
v) Survival/Condition: good (3)
vi) Diversity: single-phase standing structure (1)

Impact: slight Total: 11

117 **Clydach Bridge Cottages, Brynmawr** **SO 1955 1212** **B**

Type: buildings
i) Period: 1836
ii) Rarity: moderate (2)
iii) Documentation: O.S.1880 (2)
iv) Group Value: associated with Clydach Railroad (No.112) and bridge (No.118) (3)
v) Survival/Condition: moderate (2)
vi) Diversity: multi-phase dwellings (2)

Impact: moderate Total: 11

118 **Clydach Bridge, Brynmawr** **SO 1964 1213** **B**

Type: bridge
i) Period: 1812
ii) Rarity: moderate (2)
iii) Documentation: O.S.1880 and documentary histories (van Laun 1989) (3)
iv) Group Value: associated with Clydach Railroad (No.112) and Clydach Bridge cottages (No.117) (3)
v) Survival/Condition: moderate (2)
vi) Diversity: single-phase standing structure (1)

Impact: severe Total: 11

Action: Photographic Record

SO 1979 1211 C

119 **Skew bridge, Brynmawr**

Type: bridge
i) Period: mid to late 19th century
ii) Rarity: moderate (2)
iii) Documentation: O.S.1880, 1891 (2)
iv) Group Value: associated with M.T. & A. (LNWR) Railway (3)
v) Survival/Condition: poor (1)
vi) Diversity: single-phase standing structure (1)

Total: 9

Impact: severe

Action: Photographic Record

120 **'Squatters' settlement & water courses, Clydach Dingle SO 1922 1287** E

Type: buildings and earthworks
i) Period: 18th/19th century
ii) Rarity: scarce (3)
iii) Documentation: none (1)
iv) Group Value: associated with Bailey's Daren Disgwylfa Tramroad (No.122) and settlement (No.121) (3)
v) Survival/Condition: poor (1)
vi) Diversity: multi-phase dwellings and earthworks (2)

Total: 10

Impact: severe

Action: Photographic Survey, Ground Survey and Evaluation

121 **Local open-cast coal workings & terraces, Brynmawr** **SO 1847 1288** D

Type: industrial earthworks
i) Period: 19th/20th century
ii) Rarity: common (1)
iii) Documentation: none (1)
iv) Group Value: associated with Bailey's Daren Disgwylfa Tramroad (No.122) and settlement (No.120) (3)
v) Survival/Condition: poor (1)
vi) Diversity: multi-phase earthworks and linear features (2)

Total: 8

Impact: slight

122 **Bailey's Disgwylfa tramroad, Clydach Dingle** **SO 1905 1215 to SO 1935 1287** B

Type: tramroad
i) Period: pre 1818
ii) Rarity: moderate (2)
iii) Documentation: O.S.1880 and documentary histories (Rattenbury 1980) (3)
iv) Group Value: associated with settlement (No.120) and local open-cast coal workings (No.121) (3)
v) Survival/Condition: moderate (2)
vi) Diversity: single-phase linear feature (1)

Total: 11

Impact: slight

123 **Tramroad, Garn Lydan** **SO 1753 1275 to SO 1756 1261** **E**

Type: tramroad
i) Period: 19th century
ii) Rarity: moderate (2)
iii) Documentation: none (1)
iv) Group Value: associated with Cwm Gwybedog patches and linear watercourses (No.127) (3)
v) Survival/Condition: poor (1)
vi) Diversity: single-phase linear feature (1)

Total: 8

Impact: high

Action: Evaluation

124 **Farm house and outbuildings, Garn Lydan** **SO 1747 1242** **D**

Type: building
i) Period: 19th century
ii) Rarity: common (1)
iii) Documentation: none (1)
iv) Group Value: none (1)
v) Survival/Condition: poor (1)
vi) Diversity: multi-phase dwelling (2)

Total: 6

Impact: slight

125 **Tramroad, Garn Lydan** **SO 1803 1271 to SO 1703 1258** **D**

Type: tramroad
i) Period: 19th century (?)
ii) Rarity: moderate (2)
iii) Documentation: none (1)
iv) Group Value: associated with tramroad (No.123) and quarrying (No.126) (2)
v) Survival/Condition: poor (1)
vi) Diversity: single-phase linear feature (1)

Total: 7

Impact: slight

126 **Coal workings and quarrying, Brynmawr** **SO 1800 1270** **D**

Type: quarry
i) Period: 19th/20th century
ii) Rarity: common (1)
iii) Documentation: none (1)
iv) Group Value: associated with tramroad (No.125) (2)
v) Survival/Condition: poor (1)
vi) Diversity: multi-phase earthworks (2)

Total: 7

Impact: slight

127 **Cwm Gwybedog patches and leats, Garn Lydan** **SO 1694 1240** **C**

Type: earthworks
i) Period: early 19th century
ii) Rarity: moderate (2)
iii) Documentation: documentary histories (2)
iv) Group Value: associated with tramroad (No.123) (2)
v) Survival/Condition: moderate (2)
vi) Diversity: multi-phase earthworks (2)

Total: 10

Impact: slight

128 **Drift mines, Garn Lydan** — **SO 1702 1230** — **D**

Type: mine
i) Period: 19th/20th century
ii) Rarity: common (1)
iii) Documentation: none (1)
iv) Group Value: none (1)
v) Survival/Condition: poor (1)
vi) Diversity: multi-phase earthworks (2)

Impact: slight — Total: 6

129 **Farmhouse & D.S.W., Afon Ebbw** — **SO 1646 1219** — **D**

Type: building
i) Period: 19th century
ii) Rarity: common (1)
iii) Documentation: none (1)
iv) Group Value: none (1)
v) Survival/Condition: moderate (2)
vi) Diversity: multi-phase dwelling (2)

Impact: slight — Total: 7

130 **Tramroad, Afon Ebbw** — **SO 1643 1209** — **D**

Type: tramroad
i) Period: unknown
ii) Rarity: common (1)
iii) Documentation: none (1)
iv) Group Value: none (1)
v) Survival/Condition: poor (1)
vi) Diversity: single-phase linear feature (1)

Impact: slight — Total: 5

131 **Primrose Cottage, Rassau Brook** — **SO 1538 1173** — **D**

Type: building
i) Period: mid 19th century
ii) Rarity: moderate (2)
iii) Documentation: none (1)
iv) Group Value: none (1)
v) Survival/Condition: moderate (2)
vi) Diversity: single-phase dwelling (1)

Impact: slight — Total: 7

132 **D.S.W landscape, Nant y Croft** — **SO 1400 1100** — **D**

Type: field boundary
i) Period: unknown
ii) Rarity: common (1)
iii) Documentation: none (1)
iv) Group Value: associated with farmsteads (No.140) (2)
v) Survival/Condition: poor (1)
vi) Diversity: single-phase linear feature (1)

Impact: slight — Total: 6

133 **Trefil Tramroad, Nant y Croft** **SO 1407 1160 to SO 1458 1158** **(B)E**

Type: tramroad
i) Period: 1797
ii) Rarity: scarce (3)
iii) Documentation: CADW, SMR, O.S.1880 and documentary histories (Rattenbury 1980) (3)
iv) Group Value: none (1)
v) Survival/Condition: good (3)
vi) Diversity: single phase linear feature (1)

Impact: high Total: 11

Action: Evaluation

134 **Lamp stand and manhole cover, Nant y Croft** **SO 1478 1158** **D**

Type: standing monument
i) Period: late 19th/early 20th century
ii) Rarity: moderate (2)
iii) Documentation: none (1)
iv) Group Value: associated with Rassau Tramroad (No.138) (2)
v) Survival/Condition: good (3)
vi) Diversity: single-phase monuments (1)

Impact: slight Total: 9

135 **Quarry and D.S.W., Nant y Croft** **SO 1500 1160** **D**

Type: quarry
i) Period: 19th century
ii) Rarity: common (1)
iii) Documentation: O.S.1880, 1891 (2)
iv) Group Value: associated with drystone walled landscape [truncates] (2)
v) Survival/Condition: poor (1)
vi) Diversity: multi-phase quarrying and linear feature (2)

Impact: slight Total: 8

136 **Craig House, Nant y Croft** **SO 1490 1159** **D**

Type: building
i) Period: mid 19th century
ii) Rarity: common (1)
iii) Documentation: none (1)
iv) Group Value: associated and incorporated within the settlement of Nant y Croft (2)
v) Survival/Condition: moderate (2)
vi) Diversity: single-phase dwelling (1)

Impact: slight Total: 7

137 **Hirgan Farmstead and outbuildings** **SO 1433 1134** **D**

Type: buildings
i) Period: mid 19th century
ii) Rarity: common (1)
iii) Documentation: O.S.1880 (2)
iv) Group Value: none (1)
v) Survival/Condition: poor (1)
vi) Diversity: multi-phase dwelling (2)

Impact: moderate Total: 7

Action: Photographic Record

138 **Rassau Tramroad, Nant y Croft** **SO 1470 1155 to SO 1569 1154** **(B)E**

Type: tramroad
i) Period: early 19th century
ii) Rarity: moderate (2)
iii) Documentation: O.S.1880, 1891, documentary histories (3)
iv) Group Value: associated with the settlement of Nant y Croft (2)
v) Survival/Condition: poor (1)
vi) Diversity: single-phase linear feature (1)

Impact: slight Total: 9

Action: Evaluation

139 **Mineral Line, Nant y Croft** **SO 1475 1150 to SO 1500 1152** **D**

Type: tramroad
i) Period: 19th century
ii) Rarity: moderate (2)
iii) Documentation: O.S.1880 (2)
iv) Group Value: none (1)
v) Survival/Condition: poor (1)
vi) Diversity: single-phase linear feature (1)

Impact: slight Total: 7

140 **Farmstead and outbuildings, Nant y Croft** **SO 1517 1152** **C**

Type: buildings
i) Period: late 18th/early 19th century
ii) Rarity: common (1)
iii) Documentation: O.S.1880 (2)
iv) Group Value: associated with surrounding field systems (2)
v) Survival/Condition: moderate (2)
vi) Diversity: multi-phase dwelling (2)

Impact: slight Total: 9

141 **Old Hargan Fach and D.S.W. landscape** **SO 1372 1099** **D**

Type: buildings
i) Period: late 18th/19th century
ii) Rarity: common (1)
iii) Documentation: O.S.1880 (2)
iv) Group Value: associated with surrounding field systems (2)
v) Survival/Condition: poor (1)
vi) Diversity: multi-period dwelling (2)

Impact: moderate Total: 8

142 **Merthyr, Tredegar & Abergavenny Railway** **SO 1363 1083 to SO 1334 1092** **(C)E**

Type: railway
i) Period: 1859
ii) Rarity: common (1)
iii) Documentation: SMR, O.S.1880 and documentary histories including film footage (3)
iv) Group Value: associated with viaduct (No.143) (2)
v) Survival/Condition: poor (1)
vi) Diversity: multi-phase linear feature (2)

Total: 9

Impact: high

Action: Evaluation

143 **Railway viaduct, Dukestown** **SO 1329 1093** **NFA**

Type: standing structure
i) Period: 1859
ii) Rarity: scarce (3)
iii) Documentation: Cadw, SMR, O.S.1880 and documentary histories (3)
iv) Group Value: associated with M.T. & A. Railway (No.142) (3)
v) Survival/Condition: good (3)
vi) Diversity: single-phase standing structure (1)

Total: 13

Impact: slight

144 **Earthworks and D.S.W., Dukestown** **SO 1323 1083** **D**

Type: field boundary and earthworks
i) Period: 19th century
ii) Rarity: common (1)
iii) Documentation: O.S.1880 (2)
iv) Group Value: none (1)
v) Survival/Condition: poor (1)
vi) Diversity: multi-phase linear features and earthworks (2)

Total: 7

Impact: slight

145 **Cast iron weir, Dukestown** **SO 1342 1077** **(B)E**

Type: standing structure
i) Period: mid 19th century
ii) Rarity: scarce (3)
iii) Documentation: SMR, O.S.1880 (3)
iv) Group Value: associated with leat system feeding the Sirhowy Ironworks (2)
v) Survival/Condition: good (3)
vi) Diversity: single-phase standing structure (1)

Total: 13

Impact: slight

Action: Photographic Record, Ground Survey and Excavation

146 **Trefil Tramroad, Nant y Bwch** **SO 1295 1111 to SO 1313 1076** **B**

Type: tramroad
i) Period: 1797
ii) Rarity: scarce (3)
iii) Documentation: SMR, O.S.1880 and documentary histories (3)
iv) Group Value: associated with limestone quarries at Trefil and Ebbw Vale Ironworks (2)
v) Survival/Condition: moderate (2)
vi) Diversity: single-phase linear feature (1)

Total: 11

Impact: slight

147 **Merthyr, Tredegar & Abergavenny Railway, Waundeg** **SO 1325 1093 to SO 1274 1064** **C**

Type: railway
i) Period: 1862
ii) Rarity: common (1)
iii) Documentation: O.S.1880, 1891, documentary histories (3)
iv) Group Value: associated with 'Station Terrace', Waundeg (2)
v) Survival/Condition: moderate (2)
vi) Diversity: single-phase linear feature (1)

Impact: slight — Total: 9

148 **Siloam Chapel, Tafarnaubach** **SO 1204 1047** **NFA**

Type: building
i) Period: mid 19th century
ii) Rarity: moderate (2)
iii) Documentation: O.S.1880 (2)
iv) Group Value: associated and incorporated within the settlement of Tafarnaubach (2)
v) Survival/Condition: good (3)
vi) Diversity: multi-phase building (2)

Impact: slight — Total: 11

149 **Welfare Hall, Tafarnaubach** **SO 1188 1036** **C**

Type: building
i) Period: 1937
ii) Rarity: moderate (2)
iii) Documentation: O.S 1957 (2)
iv) Group Value: associated and incorporated within the settlement of Tafarnaubach (2)
v) Survival/Condition: good (3)
vi) Diversity: single-phase building (1)

Impact: slight — Total: 10

150 **Bronze Age find spot, Tafarnaubach** **SO 1170 1010** **E**

Type: find spot
i) Period: Bronze Age
ii) Rarity: scarce (3)
iii) Documentation: SMR and archaeological reference (2)
iv) Group Value: none (1)
v) Survival/Condition: unknown (0)
vi) Diversity: single-period hoard (1)

Impact: high — Total: 7

Action: Evaluation

151 **Farmstead, Bryn Bach** **SO 1253 1052** **D**

Type: building
i) Period: 19th/20 century
ii) Rarity: common (1)
iii) Documentation: none (1)
iv) Group Value: none (1)
v) Survival/Condition: poor (1)
vi) Diversity: multi-phase dwelling (2)

Impact: slight — Total: 6

152 **Leat system and 'kettle-hole' quarries, Princetown** **SO 1134 0982** **C**

Type: artificial watercourses and quarries

i) Period: 19th century
ii) Rarity: moderate (2)
iii) Documentation: none (1)
iv) Group Value: associated with mining tips (No.153) (2)
v) Survival/Condition: poor (1)
vi) Diversity: multi-phase watercourses and earthworks (2)

Impact: moderate

Total: 8

Action: Photographic Record

153 **Mining tips and quarry, Princetown** **SO 111 096 to SO 112 096** **D**

Type: industrial spoil

i) Period: 19th/20th century
ii) Rarity: common (1)
iii) Documentation: none (1)
iv) Group Value: associated with leat system and quarries (No.152) (2)
v) Survival/Condition: moderate (2)
vi) Diversity: multi-phase tippings (2)

Impact: moderate

Total: 8

154 **Industrial building, Princetown** **SO 1100 0970** **C**

Type: building

i) Period: late 19th century
ii) Rarity: moderate (2)
iii) Documentation: O.S.1880, documentary histories (3)
iv) Group Value: associated with M.T. & A Railway (No.147) and early 19th century building (No.155) (2)
v) Survival/Condition: poor (1)
vi) Diversity: single-phase building (1)

Impact: severe

Total: 9

Action: Photographic Record and Ground Survey

155 **Earthworks (demolished building), Princetown** **SO 1111 0970** **D**

Type: building and earthworks

i) Period: early 19th century
ii) Rarity: common (1)
iii) Documentation: none (1)
iv) Group Value: associated with railway building (No.154) (2)
v) Survival/Condition: poor (1)
vi) Diversity: single-phase building (1)

Impact: severe

Total: 6

Action: Photographic Record and Ground Survey

156 **D.S.W. landscape, Blaen Rhymney** — **SO 107 097 to SO 113 096** — **D**

Type: field boundary
i) Period: 19th century (?)
ii) Rarity: common (1)
iii) Documentation: none (1)
iv) Group Value: none (1)
v) Survival/Condition: poor (1)
vi) Diversity: single-phase linear feature (1)

Impact: slight — Total: 5

157 **Railway bridge and tunnel, Llechryd** — **SO 1057 0961** — **B**

Type: bridge and tunnel
i) Period: early to mid 19th century
ii) Rarity: scarce (3)
iii) Documentation: O.S.1880, 1891 (2)
iv) Group Value: associated with M.T. & A. Railway (No.147) (2)
v) Survival/Condition: good (3)
vi) Diversity: multi-phase standing structures (2)

Impact: moderate — Total: 12

Action: Photographic Record and Ground Survey

158 **D.S.W. landscape, Blaen Rhymney** — **SO 1054 0964** — **D**

Type: field boundary
i) Period: 18th/19th century
ii) Rarity: common (1)
iii) Documentation: none (1)
iv) Group Value: none (1)
v) Survival/Condition: poor (1)
vi) Diversity: multi-phase linear feature (2)

Impact: slight — Total: 6

159 **D.S.W. and building platforms, Afon Rhymney** — **SO 1050 0978** — **D**

Type: field boundary
i) Period: 18th/19th century
ii) Rarity: common (1)
iii) Documentation: none (1)
iv) Group Value: associated with leat (No.160) (2)
v) Survival/Condition: poor (1)
vi) Diversity: multi-phase linear features and earthworks (2)

Impact: slight — Total: 7

160 **Northern section of leat system, Blaen Rhymney** — **SO 1045 0994 to SO 1052 0960** — **B**

Type: artificial watercourse
i) Period: 19th century
ii) Rarity: scarce (3)
iii) Documentation: O.S.1880 (2)
iv) Group Value: associated with bridge and tunnel (No.157) and leat continuation (No.170) (3)
v) Survival/Condition: good (3)
vi) Diversity: single-phase linear feature (1)

Impact: high — Total: 12

Action: Photographic Record and Ground Survey

161 **Road platform, Pleasant View, Llechryd** **SO 1039 0956 to SO 1033 0953** **D**

Type: road
i) Period: unknown
ii) Rarity: common (1)
iii) Documentation: O.S.1880 (2)
iv) Group Value: none (1)
v) Survival/Condition: moderate (2)
vi) Diversity: single-phase linear feature (1)

Impact: high

Total: 7

162 **D.S.W & T.S.W system, Bute Town** **SO 1010 0930** **D**

Type: field boundaries
i) Period: Post-Medieval
ii) Rarity: common (1)
iii) Documentation: none (1)
iv) Group Value: none (1)
v) Survival/Condition: moderate (2)
vi) Diversity: multi-phase linear feature (2)

Impact: slight

Total: 7

163 **Railway furniture, Bute Town** **SO 0960 0910** **D**

Type: standing monument
i) Period: post 1870
ii) Rarity: common (1)
iii) Documentation: none (1)
iv) Group Value: associated with M.T. & A Railway (LNW) Railways (No.147) (3)
v) Survival/Condition: moderate (2)
vi) Diversity: single-phase standing monuments (1)

Impact: slight

Total: 8

164 **D.S.W landscape, Bute Town Reservoir** **SO 0940 0900** **D**

Type: field boundary
i) Period: early Post-Medieval
ii) Rarity: common (1)
iii) Documentation: O.S.1880 (2)
iv) Group Value: associated with leat system (truncated by) (No.165) and Bute Town Reservoir (2)
v) Survival/Condition: poor (1)
vi) Diversity: multi-phase linear feature (2)

Impact: slight

Total: 8

165 **Leat system, Bute Town Reservoir** **SO 0980 0927** **C**

Type: artificial watercourse
i) Period: mid 19th century
ii) Rarity: moderate (2)
iii) Documentation: O.S.1880 (2)
iv) Group Value: associated with Bute Town Reservoir and drystone walling (No.164) (2)
v) Survival/Condition: moderate (2)
vi) Diversity: single-phase linear feature (1)

Impact: slight

Total: 9

166 **Masonary bridge, Graig Lwyd** **SO 1019 0929** **D**

Type: bridge
i) Period: 19th century
ii) Rarity: common (1)
iii) Documentation: none (1)
iv) Group Value: none (1)
v) Survival/Condition: good (3)
vi) Diversity: single-phase standing structure (1)

Impact: slight Total: 7

167 **Gullies and earthworks, Bute Town** **SO 1020 0934** **D**

Type: earthworks
i) Period: unknown
ii) Rarity: commom (1)
iii) Documentation: none (1)
iv) Group Value: possibly associated with leat system (No.165) (1)
v) Survival/Condition: unknown (0)
vi) Diversity: unknown (0)

Impact: slight Total: 3

168 **Skew bridge, Llechryd** **SO 1042 0944** **B**

Type: bridge
i) Period: 20th century
ii) Rarity: moderate (2)
iii) Documentation: O.S 1957 (2)
iv) Group Value: associated with M.T. & A Railway (No.147) and Llechryd Station House (No.169) (3)
v) Survival/Condition: moderate (2)
vi) Diversity: single-phase standing structure (1)

Impact: severe Total: 10

Action: Photographic Record

169 **Station House, Llechryd** **SO 1046 0951** **B**

Type: building
i) Period: post 1870
ii) Rarity: moderate (2)
iii) Documentation: O.S. 1957 and video archive (3)
iv) Group Value: associated with the M.T. & A Railway (No.147) and bridge (No.168) (3)
v) Survival/Condition: poor (1)
vi) Diversity: multi-phase dwelling (2)

Impact: high Total: 11

Action: Photographic Record

170 **Southern section of leat system, Llechryd** **SO 1052 0953 to SO 1053 0950** **D**

Type: artificial watercourse
i) Period: 19th century
ii) Rarity: scarce (3)
iii) Documentation: O.S.1880 (2)
iv) Group Value: associated with leat system, N of A465 (No.160) (2)
v) Survival/Condition: moderate (2)
vi) Diversity: single-phase linear feature (1)

Impact: high Total: 10

Impact: slight Total: 11

190 **Inspection road, Upper Reservoir, Dowlais** **SO 0728 0846 to SO 0692 0868** **D**
Type: road
i) Period: 19th/20th century
ii) Rarity: common (1)
iii) Documentation: O.S.1891 (2)
iv) Group Value: associated with Upper Reservoir (No.188) (2)
v) Survival/Condition: moderate (2)
vi) Diversity: single-phase linear feature (1)

Impact: slight Total: 8

191 **Western leat system, Upper Reservoir, Dowlais** **SO 0688 0867 to SO 0692 0849** **B**

Type: artificial watercourse
i) Period: 19th century
ii) Rarity: moderate (2)
iii) Documentation: O.S. 1880, 1891 (2)
iv) Group Value: associated with Upper Reservoir (188) and inspection road (No.190) (3)
v) Survival/Condition: good (3)
vi) Diversity: single-phase linear feature (1)

Impact: slight Total: 11

Action: Photographic Record

192 **Branch line of Brecon & Merthyr Railway, Dowlais** **SO 0668 0887 to SO 0733 0844** **(C)E**

Type: railway
i) Period: 19th century
ii) Rarity: common (1)
iii) Documentation: O.S.1880, 1891 and documentary Histories (3)
iv) Group Value: associated with two branch lines (Nos. 193 and 194) (2)
v) Survival/Condition: poor (1)
vi) Diversity: multi-phase linear features (2)

Impact: high Total: 9

Action: Evaluation

193 **Branch line of Brecon & Merthyr Railway, Dowlais** **SO 0675 0856 to SO 0666 0859** **D**

Type: railway
i) Period: 19th century
ii) Rarity: common (1)
iii) Documentation: O.S.1880, 1891 and documentary histories (3)
iv) Group Value: associated with two branch lines (Nos. 192 and 194) (2)
v) Survival/Condition: poor (1)
vi) Diversity: single-phase linear feature (1)

Impact: slight Total: 8

194 **Brecon & Merthyr Railway (to Pontsticill), Dowlais** **SO 0664 0884 to SO 0651 0840** **C**

Type: railway
i) Period: 19th century
ii) Rarity: common (1)
iii) Documentation: O.S.1880 and 1891, documentary histories (3)
iv) Group Value: associated with branch lines (Nos.192 and 193) (2)
v) Survival/Condition: poor (1)
vi) Diversity: multi-phase linear feature (2)

Impact: slight Total: 9

195 **Lower Reservoir, Dowlais** **SO 0730 0830** **B**

Type: reservoir

i) Period: 19th century
ii) Rarity: moderate (2)
iii) Documentation: O.S.1891 (2)
iv) Group Value: associated with Upper Reservoir (No.188) and pumping house (No.189) (3)
v) Survival/Condition: good (3)
vi) Diversity: single-phase earthworks (1)

Impact: slight Total: 11

196 **MacDonalds Restaurant, Dowlais Top** **SO 0783 0822** **D**

Type: building

i) Period: 20th century
ii) Rarity: common (1)
iii) Documentation: Aerial Photographs (2)
iv) Group Value: none (1)
v) Survival/Condition: good (3)
vi) Diversity: single-phase fast-food restaurant (1)

Impact: severe Total: 8

Action: Photographic Record

197 **D.S.W. landscape, Gurnos** **SO 0485 0870** **D**

Type: field boundary

ii) Rarity: common (1)
iii) Documentation: O.S.1891 (2)
iv) Group Value: none (1)
v) Survival/Condition: poor (1)
vi) Diversity: single-phase linear feature (1)

Impact: slight Total: 6

198 **Lime Kilns, Castle Morlais Tramroad, Gurnos** **SO 0471 0872** **B**

Type: industrial standing structure

i) Period: early 19th century
ii) Rarity: moderate (2)
iii) Documentation: O.S.1891 (2)
iv) Group Value: associated with castle Morlais Tramroad (No.200) (3)
v) Survival/Condition: moderate (2)
vi) Diversity: multi-phase standing structures (2)

Impact: slight Total: 11

199 **Coppice and D.S.W. landscape, Gurnos** **SO 0470 0870** **D**

Type: coppice

i) Period: 19th century
ii) Rarity: common (1)
iii) Documentation: O.S.1891 (2)
iv) Group Value: associated with lime kilns (No.198) and Castle Morlais Tramroad (No. 200) (3)
v) Survival/Condition: moderate (2)
vi) Diversity: unknown (0)

Impact: slight Total: 8

200 **Castle Morlais Quarries Tramroad, Gurnos** **SO 0473 0892 to SO 0473 0867** **B**

Type: tramroad

i) Period: early 19th century
ii) Rarity: moderate (2)
iii) Documentation: O.S.180, 1891 and documentary histories (3)
iv) Group Value: associated with Castle Quarries and Dowlais Ironworks (3)
v) Survival/Condition: moderate (2)
vi) Diversity: single-phase linear feature (1)

Impact: moderate — Total: 11

201 **Possible quern stone, Gurnos** — **SO 0455 0866** — **B**
Type: find spot
i) Period: Neolithic (2)
ii) Rarity: scarce (3)
iii) Documentation: none (1)
iv) Group Value: none (1)
v) Survival/Condition: good (3)
vi) Diversity: single-period artefact (1)

Impact: slight — Total: 11

202 **D.S.W. landscape and sheep pen, Gurnos** — **SO 0450 0865** — **E**
Type: field boundary
i) Period: Post-Medieval
ii) Rarity: moderate (2)
iii) Documentation: O.S.1880, 1891 (2)
iv) Group Value: associated with Gurnos 'model' Farm (No.204) (2)
v) Survival/Condition: moderate (2)
vi) Diversity: single-phase linear feature (1)

Impact: moderate — Total: 9

Action: Evaluation

203 **Gurnos Farm workers cottages, Gurnos Farm** — **SO 0435 0863** — **C**
Type: building
i) Period: 19th century
ii) Rarity: common (1)
iii) Documentation: O.S.1891 (2)
iv) Group Value: associated with Gurnos 'model' Farm (No..204) (2)
v) Survival/Condition: good (3)
vi) Diversity: single-phase dwellings (1)

Impact: slight — Total: 9

204 **Gurnos 'model' Farm, Gurnos** — **SO 0430 0864** — **B**
Type: buildings
i) Period: 19th century
ii) Rarity: moderate (2)
iii) Documentation: O.S.1880, 1891 and documentary histories (3)
iv) Group Value: associated with farm worker's cottages (No.203) and drystone walling (No.205) (3)
v) Survival/Condition: moderate (2)
vi) Diversity: single-phase dwelling (1)

Impact: slight — Total: 11

205 **D.S.W. landscape, Gurnos Farm** **SO 0423 0860** **D**

Type: field boundary

i) Period: 19th century
ii) Rarity: common (1)
iii) Documentation: O.S.1891 (2)
iv) Group Value: associated with Gurnos 'model' Farm (No.204) (2)
v) Survival/Condition: moderate (2)
vi) Diversity: single-phase linear feature (1)

Impact: moderate Total: 8

206 **Viaduct, Taf Fechan, Cefn-coed-y-cymmer** **SO 0335 0815** **A**

Type: bridge

i) Period: 1964
ii) Rarity: scarce (3)
iii) Documentation: Cadw, engineering documentation (3)
iv) Group Value: associated with present A465 (3)
v) Survival/Condition: good (3)
vi) Diversity: single-phase standing structure (1)

Impact: slight Total: 13

Action: Photographic Record

207 **Gurnos Leat system, Cefn-coed-y-cymmer** **SO 0342 0829 to SO 0373 0767** **A**

Type: artificial watercourse

i) Period: 1792
ii) Rarity: scarce (3)
iii) Documentation: Cadw (Scheduled Monument), SMR, O.S.1880, 1891 (3)
iv) Group Value: associated with Gurnos Tramroad (No.208), Gurnos Quarries and Cyfartha Ironworks (3)
v) Survival/Condition: good (3)

Impact: slight Total: 13

208 **Gurnos Tramroad, Cefn-coed-y-cymmer** **SO 0341 0830 to SO 0372 0767** **A**

Type: tramroad

i) Period: late 18th century
ii) Rarity: scarce (3)
iii) Documentation: Cadw (Scheduled Monument), SMR, O.S.1880, 1891 (3)
iv) Group Value: associated with Gurnos Leat System (No.207), Gurnos Quarries and Cyfartha Ironworks (3)
v) Survival/Condition: moderate (2)
vi) Diversity: single-phase linear feature (1)

Impact: slight Total: 12

209 **Footbridge over Brecon & Merthyr Railway, Cefn** **SO 0327 0821** **C**

Type: bridge

i) Period: 19th century
ii) Rarity: common (1)
iii) Documentation: O.S.1880, 1891(2)
iv) Group Value: associated with Brecon-Merthyr Railway (2)
v) Survival/Condition: good (3)
vi) Diversity: single-phase standing structure (1)

Impact: slight Total: 9

210 **Gurnos Limestone Quarry, Gurnos** **SO 0355 0828** **NFA**
Type: quarry
i) Period: late 18th century
ii) Rarity: moderate (2)
iii) Documentation: Cadw, O.S.1880, 1891 (3)
iv) Group Value: associated with Gurnos Leat (No.207) and Tramroad (No.208) (3)
v) Survival/Condition: good (3)
vi) Diversity: multi-phase monument (2)

Impact: slight Total: 13

211 **Railway bridge, Brecon & Merthyr line, Cefn** **SO 0324 0814** **C**
Type: bridge
i) Period: 20th century
ii) Rarity: common (1)
iii) Documentation: O.S.1891 (2)
iv) Group Value: associated with present A465 and Brecon & Merthyr Railway (2)
v) Survival/Condition: good (3)
vi) Diversity: single-phase standing structure (1)

Impact: severe Total: 9

Action: Photographic Record

212 **Capel Tabor and cemetery, Cefn-coed-y-cymmer** **SO 0297 0808** **B**
Type: building
i) Period: 19th century
ii) Rarity: moderate (2)
iii) Documentation: O.S.1880, 1891 (2)
iv) Group Value: associated and incorporated within the settlement of Cefn-coed-y-cymmer (3)
v) Survival/Condition: good (3)
vi) Diversity: multi-phase building (2)

Impact: slight Total: 12

Action: Photographic Record (setting)

213 **Medieval hut circles, Cefn-coed-y-cymmer** **SO 0297 0804** **NFA**
Type: earthworks
i) Period: Medieval (2)
ii) Rarity: scarce (3)
iii) Documentation: SMR (2)
iv) Group Value: Medieval coin hoard (No.215) (2)
v) Survival/Condition: destroyed (0)
vi) Diversity: N/A (0)

Impact: N/A Total: 9

214 **St. John's Church, Cefn-coed-y-cymmer** **SO 0329 0806** **B**
Type: building
i) Period: late 19th century
ii) Rarity: moderate (2)
iii) Documentation: Cadw, SMR, O.S.1880, 1891 (3)
iv) Group Value: associated and incorporated within the settlement of Cefn-coed-y-cymmer (2)
v) Survival/Condition: good (3)
vi) Diversity: single-phase building (1)

Impact: slight Total: 11

215 **Medieval coin hoard, Cefn-coed-y-cymmer** **SO 0328 0805** **C**

Type: find spot
i) Period: 14th century (2)
ii) Rarity: scarce (3)
iii) Documentation: Cadw, SMR (3)
iv) Group Value: none (1)
v) Survival/Condition: N/A (0)
vi) Diversity: N/A (0)

Impact: slight — Total: 6

216 **Stone structure, Cefn-coed-y-cymmer** — **SO 0372 0430** **E**
Type: stone structure
i) Period: prehistoric(2)?
ii) Rarity: scarce (3)
iii) Documentation: none (1)
iv) Group Value: none (1)
v) Survival/Condition: unknown (0)
vi) Diversity: single-period monument (1)?

Impact: severe — Total: 8

Action: Photographic Record and Evaluation

217 **D.S.W. landscape, Gurnos** — **SO 0408 0840** **D**
Type: field boundary
i) Period: 19th century
ii) Rarity: common (1)
iii) Documentation: O.S.1880, 1891 (2)
iv) Group Value: none (1)
v) Survival/Condition: moderate (2)
vi) Diversity: single-phase linear feature (1)

Impact: slight — Total: 7

218 **Grawen Cottages, Cefn-coed-y-cymmer** — **SO 0285 0814** **B**
Type: building
i) Period: mid 19th century
ii) Rarity: moderate (2)
iii) Documentation: Cadw, SMR, O.S.1880 (3)
iv) Group Value: associated and incorporated within the settlement of Cefn-coed-y-cymmer (2)
v) Survival/Condition: good (3)
vi) Diversity: multi-phase dwellings (2)

Impact: slight — Total: 12

219 **D.S.W. landscape, Coed Meurig** — **SO 0238 0748** **D**
Type: field boundary
i) Period: 18th-19th centuries
ii) Rarity: common (1)
iii) Documentation: O.S.1880, 1891, tithe maps (2)
iv) Group Value: associated with Coed Meurig cowshed (No.222) and farmhouse (No.271) (2)
v) Survival/Condition: moderate (2)
vi) Diversity: single-phase linear feature (1)

Impact: moderate — Total: 8

220 **Buttressing under the Nant Ffrwd Viaduct** **SO 0248 0752** **D**

Type: bridge

i) Period: 20th century
ii) Rarity: moderate (2)
iii) Documentation: unresearched (0)
iv) Group Value: associated with 1964 viaduct (No.221 C) and present A465 (2)
v) Survival/Condition: good (3)
vi) Diversity: single-phase standing structure (1)

Impact: slight Total: 8

221 **Viaducts (A465), Cefn-coed-y-cymmer** **SO 0335 0815 (A)** **A**
SO 0282 0789 (B)
SO 0250 0750 (C)

Type: bridges

i) Period: 1964
ii) Rarity: scarce (3)
iii) Documentation: Cadw, engineering documentation (3)
iv) Group Value: associated with present A465 (3)
v) Survival/Condition: good (3)
vi) Diversity: single-phase standing structures (1)

Impact: slight Total: 13

Action: Photographic Record

222 **Lofted cow shed, Coed Meurig Farm** **SO 0226 0745** **A**

Type: building

i) Period: mid 19th century
ii) Rarity: scarce (3)
iii) Documentation: Cadw, SMR, O.S. 1880, 1891 (3)
iv) Group Value: associated with Coed Meurig Farm house (No.271) (2)
v) Survival/Condition: good (3)
vi) Diversity: multi-phase building (2)

Impact: severe Total: 13

Action: Photographic Record and Ground Survey

223 **D.S.W. landscape, Nant Ffrwd** **SO 0240 0745** **D**

Type: field boundary

i) Period: 19th century
ii) Rarity: common (1)
iii) Documentation: O.S.1880, 1891 (2)
iv) Group Value: possibly associated with Coed Meurig Farm (No.271) (2)
v) Survival/Condition: poor (1)
vi) Diversity: single-phase linear feature (1)

Impact: moderate Total: 7

224 **Coal tippings (S. of old A465), Baverstock** **SO 0260 0720 to SO 0100 0720** **D**

Type: industrial earthworks
i) Period: 19th-20 centuries
ii) Rarity: common (1)
iii) Documentation: O.S. 1891 (2)
iv) Group Value: none (1)
v) Survival/Condition: associated with mineral tips north of Baverstock settlement (No.233) (2)
vi) Diversity: multi-phase earthworks (2)

Impact: slight Total: 8

225 **D.S.W. landscape and sheep pen, Coed Meurig** **SO 0220 0735** **D**

Type: field boundary
i) Period: 19th century
ii) Rarity: common (1)
iii) Documentation: O.S.1880, 1891 (2)
iv) Group Value: associated with Coed Muerig farmhouse (No.271) and cowshed (No.222) (2)
v) Survival/Condition: moderate (2)
vi) Diversity: single-phase linear feature (1)

Impact: slight Total: 8

226 **Stone rubble-demolished cottage, Baverstock** **SO 0110 0740** **D**

Type: earthworks
i) Period: 19th century
ii) Rarity: common (1)
iii) Documentation: O.S.1880, 1891 (2)
iv) Group Value: associated and incorporated within the Baverstock settlement (No.232) (2)
v) Survival/Condition: poor (1)
vi) Diversity: unknown (0)

Impact: slight Total: 6

227 **D.S.W. landscape, Baverstock** **SO 9970 0717** **D**

Type: field boundary
i) Period: 19th century
ii) Rarity: common (1)
iii) Documentation: O.S.1891 (2)
iv) Group Value: associated with drystone walling (No.228) (2)
v) Survival/Condition: poor (1)
vi) Diversity: single-phase linear feature (1)

Impact: moderate Total: 7

228 **D.S.W. & T.S.W. , Lech Sychrhyd** **SO 9947 0700** **D**

Type: field boundary
i) Period: 19th century
ii) Rarity: common (1)
iii) Documentation: O.S.1891 (2)
iv) Group Value: associated with drystone walling (No.227) (2)
v) Survival/Condition: poor (1)
vi) Diversity: multi-phase linear feature (2)

Impact: moderate Total: 8

229 **Track, Lech Sychrhyd** **SO 9960 0704 to SO 9958 0680** **E**

Type: road/track
i) Period: unknown
ii) Rarity: unknown (0)
iii) Documentation: none (1)
iv) Group Value: none (1)
v) Survival/Condition: sub-surface (0)
vi) Diversity: unknown (0)

Impact: high Total: 2

Action: Evaluation

230 **Dam and possible sluice system, Lech Sychrhyd** **SO 9969 0690** **C**
Type: industrial earthworks
i) Period: 19th century (?)
ii) Rarity: moderate (2)
iii) Documentation: none (1)
iv) Group Value: none (1)
v) Survival/Condition: poor (1)
vi) Diversity: multi-phase earthworks (2)

Impact: slight Total: 7

231 **Fairfield House (Giants Head Inn), Baverstock** **SO 0055 0728** **C**
Type: building
i) Period: 19th century
ii) Rarity: moderate (2)
iii) Documentation: O.S.1880, 1891 (2)
iv) Group Value: associated and incorporated within the settlement of Baverstock (2)
v) Survival/Condition: poor (1)
vi) Diversity: multi-phase dwelling (2)

Impact: severe Total: 9

Action: Photographic Record

232 **Settlement and field system, Baverstock** **SO 0073 0730** **E**
Type: earthworks
i) Period: 19th century
ii) Rarity: scarce (3)
iii) Documentation: Cadw, SMR, O.S.1880, 1891 (3)
iv) Group Value: associated with demolished cottage (No.226) and Fairfield House (No.231) (3)
v) Survival/Condition: poor (1)
vi) Diversity: multi-phase settlement (2)

Impact: severe Total: 12

Action: Photographic Record, Ground Survey and Evaluation

233 **Coal workings and tips, Baverstock** **SO 0069 0727** **C**
Type: industrial earthworks
i) Period: 19th century
ii) Rarity: common (1)
iii) Documentation: O.S.1880, 1891 (2)
iv) Group Value: associated with early coal tips (No.224) and Baverstock settlement (232) (2)
v) Survival/Condition: good (3)
vi) Diversity: multi-phase earthworks (2)

Impact: high Total: 10

234 **Nant Hir Reservoir** **SO 9890 0690** **B**

Type: Reservoir

i) Period: 19th century
ii) Rarity: moderate (2)
iii) Documentation: O.S.1880, 1891 (2)
iv) Group Value: associated with holloways (Nos.235 and 238) and field barn (No.237) (3)
v) Survival/Condition: good (3)
vi) Diversity: single-phase earthworks (1)

Impact: slight Total: 11

235 **Holloway, Nant Hir** **SO 9885 0690** **D**

Type: track

i) Period: 18th-19th centuries
ii) Rarity: common (1)
iii) Documentation: O.S.1880, 1891 (2)
iv) Group Value: associated with drystone walling (No.236), field barn (No.237) and holloway (No.238) (2)
v) Survival/Condition: poor (1)
vi) Diversity: multi-phase linear feature (2)

Impact: slight Total: 8

236 **D.S.W. landscape, Nant Hir** **SO 9875 0684** **D**

Type: field boundary

i) Period: 18-19th century
ii) Rarity: common (1)
iii) Documentation: O.S. 1880, 1891 (2)
iv) Group Value: associated with holloways (Nos.235 and 238) and field barn (No.237) (2)
v) Survival/Condition: moderate (2)
vi) Diversity: single-phase linear feature (1)

Impact: moderate Total: 8

237 **Field barn and stable, Nant Hir** **SO 9885 0686** **C**

Type: building

i) Period: early to mid 19th century
ii) Rarity: moderate (2)
iii) Documentation: O.S.1891 (2)
iv) Group Value: associated with drystone walling (No.236) and holloway (No.235) (2)
v) Survival/Condition: moderate (2)
vi) Diversity: multi-phase standing structure (2)

Impact: slight Total: 10

238 **Holloway/sheep pen, Nant Hir** **SO 9883 0687 to SO 9875 0698** **C**

Type: track

i) Period: 18th-19th centuries
ii) Rarity: moderate (2)
iii) Documentation: O.S.1880, 1891 (2)
iv) Group Value: associated with holloway (No.235), drystone walling (No.236) and field barn (No.237) (2)
v) Survival/Condition: moderate (2)
vi) Diversity: multi-phase linear feature (2)

Impact: moderate Total: 10

239 **D.S.W. landscape, Nant Melyn** **SO 9798 0625** **D**

Type: field boundary
i) Period: 19th century
ii) Rarity: common (1)
iii) Documentation: O.S.1891 (2)
iv) Group Value: associated with holloways (Nos. 235 and 238), drystone walling (No.236) and field barn (237) (2)
v) Survival/Condition: poor (1)
vi) Diversity: single-phase linear feature (1)

Impact: moderate Total: 7

240 **Holloway, Nant Melyn** **SO 9770 0622 to SO 9789 0623** **D**

Type: track
i) Period: 19th century
ii) Rarity: common (1)
iii) Documentation: O.S.1891 (2)
iv) Group Value: associated with Nantmoel Farm (1)
v) Survival/Condition: moderate (2)
vi) Diversity: multi-phase linear feature (2)

Impact: slight Total: 8

241 **Holloway, Llyncoch** **SO 9768 0608 to SO 9785 0585** **D**

Type: track
i) Period: 19th century
ii) Rarity: common (1)
iii) Documentation: O.S.1891 (2)
iv) Group Value: possibly associated with Llyncoch Farm (1)
v) Survival/Condition: moderate (2)
vi) Diversity: multi-phase linear feature (2)

Impact: high Total: 8

242 **Holloway, Court Farm** **SO 9734 0564 to SO 9735 0547** **D**

Type: track
i) Period: 18th-19th century
ii) Rarity: common (1)
iii) Documentation: O.S.1891 (2)
iv) Group Value: associated with Court Farm (1)
v) Survival/Condition: poor (1)
vi) Diversity: multi-phase linear feature (2)

Impact: slight Total: 7

243 **Skew bridge over Vale of Neath Railway** **SO 9727 0552** **B**

Type: bridge
i) Period: late 19th century
ii) Rarity: moderate (2)
iii) Documentation: O.S.1891 (2)
iv) Group Value: associated with the Vale of Neath Mineral Railway (No.272) (3)
v) Survival/Condition: good (3)
vi) Diversity: single-phase standing structure (1)

Impact: slight Total: 11

Action: Photographic Record

244	**Rectangular platform, Hirwaun**	**SO 9674 0544**	**NFA**
	Type: building

249 **Cynon farmhouse, Hirwaun** **SO 9640 0526** **D**

Type: building

i) Period: mid 19th century
ii) Rarity: moderate (1)
iii) Documentation: O.S.1891 (2)
iv) Group Value: associated and incorporated within the settlement of Hirwaun (2)
v) Survival/Condition: poor (1)
vi) Diversity: multi-phase dwelling (2)

Impact: slight Total: 8

250 **Hirwaun-Aberdare Tramroad, Hirwaun** **SO 9590 0548 to SO 9667 0513** **C**

Type: tramroad

i) Period: late 18th century
ii) Rarity: moderate (2)
iii) Documentation: Cadw, SMR, O.S.1891 (3)
iv) Group Value: associated with the Hirwaun Ironworks and branch line (No.259) (3)
v) Survival/Condition: poor (1)
vi) Diversity: single-phase linear feature (1)

Impact: slight Total: 10

251 **Pig-pens, Hirwaun** **SO 9544 0535** **D**

Type: building

i) Period: 19th century
ii) Rarity: common (1)
iii) Documentation: none (1)
iv) Group Value: associated with farmstead (1)
v) Survival/Condition: moderate (2)
vi) Diversity: multi-phase building (2)

Impact: slight Total: 7

252 **Bute Colliery Road (Tower Road), Hirwaun** **SO 9534 0527 to SO 9506 0500** **(C)E**

Type: tramroad

i) Period: 19th century
ii) Rarity: moderate (2)
iii) Documentation: O.S.1880, 1891, documentary histories (3)
iv) Group Value: associated with the Aberdare to Rhondda Railway (No.255A) (2)
v) Survival/Condition: poor (1)
vi) Diversity: single-phase linear feature (1)

Impact: high Total: 9

Action: Evaluation

253 **T.S.W. landscape, Hirwaun** **SO 9525 0533** **D**

Type: field boundary

i) Period: 18th/19th century
ii) Rarity: common (1)
iii) Documentation: O.S.1891 (2)
iv) Group Value: none (1)
v) Survival/Condition: moderate (2)
vi) Diversity: single-phase linear feature (1)

Impact: slight Total: 7

254 **Coal tips, Bryngelli Estate, Hirwaun** **SO 9520 0534** **D**

Type: industrial spoil

i) Period: 19th/20th century
ii) Rarity: common (1)
iii) Documentation: none (1)
iv) Group Value: probably associated with collieries to the south (1)
v) Survival/Condition: good (3)
vi) Diversity: multi-phase coal tips (2)

Impact: moderate Total: 8

255A **Railway A, Aberdare & Rhondda Railway** **SO 9578 0514 to SO 9506 0501** **E**

Type: railway

i) Period: 19th century
ii) Rarity: moderate (2)
iii) Documentation: O.S.1880, 1891 (2)
iv) Group Value: associated with converging tramroads (No.255B and 255C) (3)
v) Survival/Condition: poor (1)
vi) Diversity: single-phase linear feature (1)

Impact: high Total: 9

Action: Evaluation

255B **Tramroad B, Branch of Aberdare & Rhondda** **SO 9581 0512 to SO 9589 0476** **E**

Type: tramroad

i) Period: late 19th century tramroad
ii) Rarity: moderate (2)
iii) Documentation: O.S.1880, 1891 (2)
iv) Group Value: associated with Aberdare & Rhondda Railway (No.255A) and tramroad (No.255C) (3)
v) Survival/Condition: moderate (2)
vi) Diversity: single-phase linear feature (1)

Impact: high Total: 10

Action: Evaluation

255C **Tramroad C, Hirwaun** **SO 9587 0510 to SO 9567 0471** **E**

Type: tramroad

i) Period: 19th century
ii) Rarity: moderate (2)
iii) Documentation: O.S.1891 (2)
iv) Group Value: associated with Aberdare & Rhondda Railway (255A) and tramroad (No.255B) (3)
v) Survival/Condition: poor (1)
vi) Diversity: single-phase linear feature (1)

Impact: high Total: 9

Action: Evaluation

256 **Culvert, Aberdare-Rhondda Tramroad, Hirwaun** **SO 9582 0506** **D**

Type: artificial watercourse
i) Period: early to mid 19th century
ii) Rarity: moderate (2)
iii) Documentation: none (1)
iv) Group Value: associated with tramroad (No.255B) (2)
v) Survival/Condition: moderate (2)
vi) Diversity: single-phase standing structure (1)

Impact: high Total: 8

Action: Photographic Record

257 **Culvert, Hirwaun to Aberdare Tramroad, Hirwaun** **SO 9648 0519** **C**

Type: artificial watercourse
i) Period: early to mid 19th century
ii) Rarity: scarce (3)
iii) Documentation: none (1)
iv) Group Value: associated with Hirwaun to Aberdare Tramroad (No.250i) (2)
v) Survival/Condition: moderate (2)
vi) Diversity: single-phase standing structure (1)

Impact: slight Total: 9

Action: Photographic Record

258 **Vale of Neath Mineral Railway (western section)** **SO 9530 0617 to SO 9413 0641** **C**

Type: railway
i) Period: 1851
ii) Rarity: moderate (2)
iii) Documentation: O.S.1880, 1891 (2)
iv) Group Value: associated with skew bridge (No.243) (2)
v) Survival/Condition: good (3)
vi) Diversity: single-phase linear feature (1)

Impact: slight Total: 10

259 **Branch of the Hirwaun-Aberdare Tramroad** **SO 9408 0591 to SO 9525 0556** **C**

Type: tramroad
i) Period: late 18th century
ii) Rarity: moderate (2)
iii) Documentation: Cadw, SMR, O.S.1891 (3)
iv) Group Value: associated with the present A 4059, the Hirwaun Ironworks and branch line (No.250) (2)
v) Survival/Condition: poor (1)
vi) Diversity: single-phase linear feature (1)

Impact: moderate Total: 9

260 **Walled enclosure, Pen-Twyn, Gilwern** **SO 2457 1442** **E**

Type: garden enclosure
i) Period: 19th-20th century
ii) Rarity: common (1)

Appendix 2
Gazetteer of Sites

Appendix 2
Gazetteer of Sites

1. Ysbytty Farm, Abergavenny (SO 3032 1293)
A late eighteenth century/early nineteenth century masonry farmhouse and associated farm buildings including converted threshing barn (retaining the original pitch of a thatched roof) and brick built pig pens with pantile roof. Aerial photos of the land immediately to the east show the remains of a field system, possibly early Post-Medieval in date.

2. Prehistoric find spot, Sewage Works, Abergavenny (SO 2980 1330)
Findspot of Bronze Age flint arrowheads. This site may be contemporary with Neolithic and Bronze Age material recovered from the Flannel Street excavation, Abergavenny in 1965. NB. A large mound (**GGAT/PRN 1781 G**) close to Evesham House is a naturally deposited glacial moraine.
GGAT/PRN 3974 G

3. Tramroad/cart Track, Llanfoist Farm (SO 2945 1331)
A linear fenced track in front of Llanfoist Farm and crossing to run in front of the Transfer Station. Research of the 1880 O.S. and tithe maps suggest that this feature may be a raised cart track.

4. Merthyr, Tredegar & Abergavenny Railway, Llanfoist (SO 2900 1350)
The dismantled line of the Merthyr, Tredegar & Abergavenny Railway (MT & A), originally opened in 1862, crosses the old (Merthyr/Abergavenny) Turnpike road (B4246) on a 'skew' bridge (No.9) from the south. At Llanfoist (SO 2875 1339) the railway heads north again to cross the A465 at SO 2905 1358, along a no-through road known as 'The Cutting.' The railway between Govilon and Abergavenny, largely follows the line of the earlier Llanvihangel Railway (opened 1812) which linked Govilon to Llanvihangel via Abergavenny and was one of a number of tramroads which the MT & A later bought out. The line of the MT & A was eventually taken over by the London & North Western Railway in 1866 and converted to double track railway with tunnels eleven years later. Many of the bridges between Abergavenny and Gilwern were widened to accommodate double track.
GGAT/PRN DO9

5. Railway furniture, Llanfoist (SO 2889 1355)
The remains of cast-iron railway post, re-used as a field post is inscribed 'E.Hampton, Abergavenny'. Approximately 120 metres east of this post is the route of the MT & A Railway and Llanvihangel Railway.

6. Evesham House & lodge, Llanfoist (SO 2870 1360)
A site consisting of Evesham House and Lodge, which are two attached buildings, although they have been separately owned at various times. Both are built of rubble masonry and are considered by Cadw to be 'of special architectural interest'. Evesham House, which is the earliest of the two buildings, was used as Llanfoist Rectory in 1844. The frontage of the main house is now much altered, whereas the rear (west-facing) has an original large oak door casement that is believed to be of 16th century date. Internally there are large chamfered ceiling joists within the present kitchen and the remains of a partially blocked cross-passage way, again suggesting an early Post-medieval date. Externally there have been many alterations especially to the windows during the 19th and early 20th centuries. Associated with the main house, and to the west, is a row of farm outbuildings (No.7).

7. Evesham House outbuildings, Llanfoist (SO 2870 1362)
These late 18th/early 19th century farm outbuildings were later converted to domestic use (probably during the 20th century), but are now unoccupied. The buildings, which are 7-8 bays in length, were probably originally used as a cowshed with a hay loft above. They are constructed of rubble masonry with wooden lintels over the windows. Internally a staircase, partition walls and two fireplaces have been added, but they still retain many of their original features, including part of a stone flag roof and trenched purlin roof trusses typical of local vernacular construction.

8. Turnpike Road, under skew bridge, Llanfoist (SO 2795 1387)
The route of the old Turnpike road (believed to have been built around 1812) runs along the B4246 (also No.31) at this point from Merthyr to Abergavenny. Below the Turnpike road (next to bridge No.9) is a stone culvert within 5-6 m. of the A465 which is probably contemporary with the road. The tithe map indicates that before the building of the Llanvihangel Railway the road from Merthyr to Abergavenny ran more or less east-west. From near the later skew bridge (No.9) the road originally passed close to Pen-y-Worlod cottages and then crossed the associated bridge. From here it ran to a junction with the road from Abergavenny to Llanelen just south of the bridge over the Usk. The route of the road was probably changed when the Llanvihangel Railway was built and the opportunity was taken to run a common road through the village and thus to the bridge over the Usk. This type of road improvement using tramroads

as original Rights of Way seems to have been quite common at the time and would have led to the abandonment of the earlier road past Pen- y-Worlod.

9. Railway skew bridge, Llanfoist (SO 2800 1385)
At Llanfoist the Turnpike road (No.8) is carried across the MT & A railway by a skew bridge, built of well-cut angled sandstone blocks and associated with a c.30m long contemporary wall emanating from the abutments. Underneath the bridge there is a clearly visible 'straight joint' indicating that it has been re-built at some stage of its use. The largest portion of the bridge is to the east and it is likely that this was the original size of the bridge. The most likely period for this addition is after the MT & A Railway was taken over by the LNWR in 1866 and converted to a double track line with bridges, in 1877. Many of the other bridges along the line of the MT & A exhibit similar later additions.

10. Pen-y-Worlod Farm & outbuildings, Llanfoist (SO 2838 1388)
Pen-Y-Worlod Farm ('the end of the meadow') contains several structures of special architectural interest (Cadw). It is known to have formed part of the estate of Christopher Chambre of Llanfoist House, who left the farm in trust to his wife in a will of 1793, passing to his son Francis Chambre, the owner of the 1844 tithe map. However, behind the later facade, and intrusive double-glazing, the farmhouse retains many original features including large inglenook fireplace and bressumer, and large oak front door with iron batten and studding, probably dating back to the 17th century. To the west of the house are a masonry cowshed and threshing barn. The threshing barn retains oak trusses with trenched purlins (the associated carpenter's marks are still visible) typical of the local vernacular buildings. The barn was built on a stone plinth with timber-framed walls. Between these outbuildings and the A465 there is also the remains of a masonry walled garden.

11. Track in front of Pen-y-Worlod Farm, Llanfoist (SO 2830 1383)
Between the southern extent of the walled garden (see above) and the A465 is a banked platform which leads to a east/west track, south of Pen-y-Worlod Farm. This is the remains of the Turnpike road (No.8) which originally followed the line of the B4246, but then crossed the line of the present A465. From here it followed this track down to a footpath which was then carried across a small brook, next to Pen-y-Worlod cottages, on a single-arched bridge and on to Abergavenny. Aerial photos show a fairly wide linear depression along the line of this track..

12. Footbridge, Pen-y-Worlod Cottages, Llanfoist (SO 2863 1374)
A footbridge crosses the same brook as the track No.11 close to the present A465. It is constructed of a single large slab of limestone, but with some attempt at simple decoration along its exposed edges and may be that the slab used was originally part of another building nearby (Llanfoist Priory?). The size of the bridge indicates that it was used by pedestrian traffic only.

13. Cadfor farm house & farm buildings, Llanfoist (SO 2765 1413)
Identified by Cadw as buildings of 'special architectural interest' , the property was known as Upper Cadfor Farm and formed two tenements in 1665, belonging to Walter Morgan of Ty-mawr (Bradney II.351-2). The name appears to be a shortened version of Cad-Ifor ('Ifor's Battle'). The farm and the associated farm buildings are divided into two separate farm units. The western unit is the best preserved, with the buildings forming a courtyard farm. The farmhouse dates from the mid nineteenth century whereas the farm buildings are earlier (possibly late 18th/early 19th centuries). Buildings include a lofted cowshed (uncoursed masonry with large quoin stones, wooden lintels and a Welsh slate roof), a stable complex and a threshing barn (with remains of flagstone roof, which is now part of the eastern farm unit.). The eastern farm unit consists of a modern brick built farmhouse and early outbuildings, probably contemporary with the original farm.

14. Workers cottage and bridge, Govilon (SO 2674 1427)
The partly demolished remains of a two-storey, two-bay cottage dating from the early to mid.19th century. The cottage, which is built on the revetted northern bank of the Cwm Shenkin brook, is linked to the southern bank by a small single-arched masonry bridge which carries a walled road (No.261) from Hopyard Farm to Boat Farm (SO 2709 1435). The building is constructed of large uncoursed sandstone with well-cut quoins, large masonry lintels, a pantile roof and first floor windows (now blocked). Originally a single bay cottage with a gable-end chimney and central entrance, a second room was later added to the eastern gable.

15. House platform, Nr. Cwm-Shenkin (SO 2672 1430)
The remains of a platform and the walls of a masonry-built house cut into bank adjacent walled road No.261. The building has now been largely demolished.
GGAT/PRN 4103 G

16. Field-barn, Govilon (SO 2657 1432)
A threshing barn built of well-cut, coursed sandstone blocks with full-height double doors to the front and rear elevations, air vents and a date-stone of 1808 above the doors facing onto the roadside. The building is partly incorporated into drystone walling parallel to the road. Despite its solid construction the rear of the barn has partially collapsed and this led to two the addition of two later buttresses to rear wall in an effort to support it. The location and construction of this building indicate that this was probably the field-barn of a large estate farm.

17. Field-barn, Govilon (SO 2659 1432)
Field-barn on the opposite side of the road to No.16, but considerably altered. The lower section of the barn on the east and south side is constructed of coursed masonry. The upper section reveals recent breeze-block repair work. This barn is probably later than No.16 although it may have been part of a unified farm complex.

18. Farm building platform, Hopyard Farm (SO 2632 1430)
The remains of a cellared building was found below a 17th/18th century barn at Hopyard Farm which was being converted to domestic use (See site No.25). These remains are no longer visible.

19. Rose Cottage, Govilon (SO 2675 1423)
A small two-storey farmworker's cottage with inscribed date-stone (1865) built of coursed sandstone, rusticated quoins, a Welsh slate roof and a masonry garden wall. The dwelling has two gable-end chimneys and a lean-to porch over a central entrance.

20. D.S.W./Ridge & Furrow landscape, Govilon (SO 2650 1420)
Extensive drystone walled, ridge & furrow landscape located on land either side of the A465 between Rose Cottage and Hopyard Farm. These field boundaries are cut by the A465.

21. Farm cottages, Maes y Berllan, Govilon (SO 2698 1424)
A small farmstead complex north of the A465 including a one and half storey cottage and single-storey outbuildings.

22. Ty Clyd, Govilon (SO 2691 1404)
A house of 'special architectural interest' with listing under consideration. Described as a 'sheltered house' and 'much improved' in 1906 by the then owner.

23. Farm complex, Govilon (SO 2673 1415)
A series of three buildings forming part of the remains of an L-shaped courtyard farm. The buildings are built of uncoursed masonry with well-cut quoins which were probably used as outbuildings; they have now been converted, mainly to garages. The eastern gable of building No.1 has an elaborate window surround, and many of the buildings have blocked windows and/or entrances indicating several phases of use.

24. Ridge and furrow landscape, Cadfor Farm (SO 2750 1400)
A series of poorly defined Post-Medieval ridge & furrow marks on a north/south alignment. Located west and east of the service bridge to Cadfor Farm, south of the A465.

25. Hopyard Farm, Glanbaiden (SO 2620 1440)
A late 17th/early 18th century farmhouse with cross-passage way (now blocked), stop-chamfered ceiling joists and western gable fireplace and baking oven. The remains of a cellared house platform was found beneath the floor of the associated farm outbuildings whilst under conversion to domestic use (No.18).

26. Remains of a walled garden, Hopyard Farm, Glanbaiden (SO 2622 1435)
The remnants of an extensive walled garden probably connected to the Glanbaiden House estate. The wall is constructed of masonry, but is now in a ruinous state.

27. Glanbaiden House, Glanbaiden (SO 2614 1438)
The early eighteenth century house takes its name from the brook which forms the parish and county boundary. It is a large detached Georgian manor house with a conservatory and servants quarters to the rear. Built of ashlar with a hipped-roof and classical portico with ionic columns. The fenestration consists of sixteen pane sash windows with a tall round-headed window lighting the stairs to the rear. A few metres to the east are a series of estate cottages. To the south, and beyond the present line of the A465 there are the remnants of an ornamental parkland (No. 30) and the associated driveway to Glanbaiden Lodge.

28. Glanbaiden Farm, Glanbaiden (SO 2615 1442)

A 17th century farmhouse and outbuildings which probably predates Glanbaiden House as the center of the estate.

29. Glanbaiden Lodge, Glanbaiden (SO 2613 1422)
A picturesque gatehouse serving Glanbaiden House with a high pitched roof, scalloped barge-boards, dormer windows, well-cut rusticated quoins and a large central chimney. Externally, the building has a later porch and lean-to building. The adjoining cast-iron entrance gate to the estate consists of five ashlar sandstone pillars and iron railings with fleur-de-leys and urn motifs. The remnants of a north-south track leading to the estate house from the lodge is still visible. The cottage may, originally, have been thatched and an example of a 'cottage orne'.

30. Parkland, Glanbaiden House, Glanbaiden (SO 2610 1435)
East of Aberbaiden lodge is the remnants of a parkland landscape indicated by several mature taxa including sweet chestnut and yew. The parkland is probably associated with the nearby Glanbaiden House.

31. Abergavenny/Merthyr Turnpike, Glanbaiden (SO 2599 1431)
A few metres north-east of the Govilon roundabout is the remains of the Abergavenny-Merthyr Turnpike road (B4246) road running SE-NW (also No.8) which was abandoned due to the re-alignment of the road for traffic calming measures.

32. Aberbaiden Lodge, Aberbaiden (SO 2582 1444)
A two-storey classically derived lodge with a low pitch roof, wide eaves, moulded string course, pilaster door surrounds and leaded windows. Attached to this building is an later extension with small round-headed windows. This building served as the gatehouse to Aberbaiden Farm to the north. To the east, next to the present garden layout are the remnants of parkland which is delineated by a low iron fence.

33. Little Chef Restaurant, Gilwern (SO 2572 1444)
A modern (1979) restaurant building constructed of red brick. This building is under direct impact from the road dualling.

34. Brecknock & Abergavenny Canal (SO 2540 1453 to SO 2568 1434)
The B. & A. Act was passed in 1793 and the canal was completed from Brecon as far as Gilwern in 1798. The canal was designed to provide links between the river Usk and Gilwern in order to transport coal from Brynmawr, thus providing a competitive route to the sea. The canal falls within the 50 metre corridor from Gilwern roundabout to the Gilwern embankment (No.42) (SO 2440 1446). From this point the canal turns north towards Brecon. Within the corridor are two associated, eccentric arched bridges (site nos. 35 & 36) which probably served local parish traffic.

In addition, there are a related number of canal buildings including canal cottages (site no. 37), the Navigation Inn (No.38) and the Bridge End public house (SO 2461 1455). To the west are associated features including a footbridge (No.45), a lean-to (No. 46), a sluice system (No. 47), an embankment (No.42), two aqueducts (No.43) and a series of tramroads. The tow-path is still visible although the canal seems to have been dredged and repaired in recent history. **GGAT/PRN CO6**

35. Canal bridge (eccentric arched), Gilwern (SO 2569 1434)
A small canal bridge, probably contemporary with the construction of the canal and probably used by local farm/parish traffic. Built of uncoursed sandstone with well-cut voussoirs it has a low flat arch which is eccentrically shaped due to the need to accommodate a tow-path on the northern side. The bridge is buttressed by four stone piers and has now been heavily re-pointed on the northern side.

36. Canal bridge (eccentric arched), Gilwern (SO 2537 1452)
Construction and date similar to site no. 35. This bridge however, has over time become unstable and iron rails (possibly tramrails) have been bolted underneath the arch to reinforce it. On the southern side, the buttress appears to have been incorporated into the fabric of the present A465. On the northern side the parapet wall splays onto the nearby path forming a wall. This wall must at one time have extended along this length of the canal since it incorporates a stone foot-stile indicating the need to protect livestock from the water. On either side of the canal, immediately to the west of the bridge, are two slots cut into the banks which were used to hold a temporary barrier.

37. Canal workers cottages, Gilwern (SO 2471 1454)
Two sets of small contemporary workers cottages facing onto the canal. The cottages consist of two-bay, two-storey dwellings, probably built of masonry, but now rendered externally. Both houses have asymmetrical front doors and chimneys.

38. Navigation Inn, Gilwern (SO 2458 1450)
A substantial two-storey purpose-built inn next to the Brecknock and Abergavenny Canal with at least three phases of construction. Constructed of coursed sandstone with front entrance porch and associated boundary walls, probably dating from the mid-nineteenth century and under consideration for listing.

39. D.S.W. landscape, Gilwern (SO 2520 1440)
South of the A465 at this point is a drystone walled landscape. Growing within these boundaries are a number of mature taxa including sweet chestnut and holly. The boundaries continue on the northern side of the A465, but are cut by the canal, therefore supplying a *terminus ante quem* of c.1798 for the boundaries.

40. Holloway/road, Gilwern (SO 2539 1447)
A holloway which is the remnant of a small county lane originally running southwards to cross the eccentric bridge (No.36) over the Brecknock and Abergavenny Canal. The holloway has been replaced by a traffic calming slip-road.

41. Leat below Gilwern Embankment (SO 2443 1450)
On the north side of the River Clydach is a substantial leat system with a weir just downstream form the aqueduct. The leat was built to serve Danybont woollen mill which is marked on the tithe map of 1847. The upper section of the leat has been replaced in brick.

42. Gilwern embankment-Brecknock & Abergavenny Canal (SO 2446 1446)
Built in 1797, the embankment was started in one of the first phases of construction for the canal. This substantial (size 84ft high x 90 yards long) embankment for the Brecknock & Abergavenny Canal, incorprorates two masonry aqueducts (No.43), the smaller of which carries the canal over the Clydach Railroad. There is also a small overflow with a masonry footbridge at its southern end (Nos. 47 & 45). Under consideration for Scheduling by Cadw.
GGAT/PRN 3199 G

43. Canal aqueduct over Clydach Railroad, Gilwern (SO 2439 1451)
At this point the canal veers north and is carried over the River Clydach in the gorge below by an large masonry aqueduct and over the Clydach Railroad to the north by a smaller aqueduct.
GGAT/PRN 3199 G

44. Clydach Railroad, Gilwern to Cheltenham (SO 2450 1470 to SO 2230 1275)
Built by the Brecknock & Abergavenny Canal Company and designed by John Dadford, the Clydach Railroad linked the collieries at Brynmawr to the iron forge at Glangrwyne on the Usk and was opened in 1794. The line followed the north bank of the Clydach past Blackrock and Cheltenham to Gilwern and beyond, to the Usk. The main line and all the branches were built of edge rail in 4 ft. sections and extended for seven miles and two furlongs at a cost of £26,890.

The route of the Clydach Railroad between these coordinates runs below the Gilwern embankment through a substantial masonry tunnel to the canal side wharves at Gilwern (SO 2435 1450). A branch line was laid out by 1798 to a wharf on the Brecknock & Abergavenny Canal to the north of the Gilwern embankment. Further east the main Railroad is joined by another branch of the Clydach Railroad from the north at SO 2420 1414 and at this point the weigh house (No.52, now known as 'Machine House') still stands. It then continues eastward (roughly parallel to the A465) along what is now the road through Maes y Gwartha (see also No.78).
GGAT/PRN B30

45. Pack-horse bridge, Gilwern (SO 2441 1442)
Small bridge over a sluice system (No.47) running off the Brecknock and Abergavenny Canal. It is described by van Laun (1979) as a pack-horse bridge, and was possibly linked to the Old Trap road which runs from near the end of the Forge Hammer branch of the Llam-March Tramroad (No.55) towards the Gilwern embankment.

46. Lean-to building and D.S.W, Gilwern (SO 2440 1442)
A small masonry lean-to attached to a wall, within the curtillage of a house which originally stood nearby (van Laun).

47. Overflow system, B & A Canal, Gilwern (SO 2442 1443)
An overflow system used to control water levels in the canal, and probably monitored from the nearby (now demolished) house.

48. Lion Hotel, Gilwern (SO 2437 1438)
A much altered building with successive extensions built between the OS mapping of the area in 1840 and 1880. The building has decorative lintels and window surrounds, but has been rendered externally. This style of construction is repeated in three cottages to west (No.49). An earlier two-storey, four bay building is attached to western gable of the main hotel and exhibits stone construction internally.

49. Terrace cottages, Gilwern (SO 2433 1436)
Three terraced worker's cottages (far western extent) similar in design to the main building of the Lion Hotel (and probably contemporary), with central entrances, large sash windows and end-chimneys. Two small earlier cottages stand to the east with mirror image facades and a shared central chimney. The eastern end cottage, which is probably the earliest building in the row, is of uncoursed masonry with later stone and brick repairs, inserted brick window surrounds and blocked windows and a door in east gable.

50. Primitive Methodist Chapel and grave yard, Gilwern (SO 2427 1429)
A former chapel shown on the OS map in 1880, and built in 1838, with five associated graves (earliest 1846). It is of the rectangular 'barn-like' design and is built of coursed masonry with a gabled, slate-clad roof. Externally there are south-facing double doors with a semi-circular light above and also west facing double doors with two sets of rectangular windows above (now blocked). The date-stone in west facing elevation is missing. There is a tall rectangular stair-light with a round-head in northern elevation. The revised O.S. map of 1900 simply marks this as a building with no specific purpose, probably indicating that it was already out of use by then. The building has had various changes of use and is now used for storage therefore removing the likelihood of internal fittings surviving. The cemetery was partially removed and relocated during the 1960s construction of the A465

51. Llam-March Tramroad, Gilwern (SO 2440 143 9 to SO 2328 1379)
Built at the request of the owner's of the Clydach Ironworks to connect the works to the collieries and ironstone mines on the hillside to the south. Opened in 1795, it was designed by John Dadford and laid with edge rail. The tramroad was extended from the ironworks to the canal at Gilwern in 1809. From the canal side wharves at Gilwern the Llam-March Tramroad ran eastwards through the Clydach Iron Co.'s forge (No.58) and tin-plate works (No.60). At this point it was joined by a branch of the tramroad from a roadside wharf near the Forge Hammer Inn (No.55) which crossed the River Clydach on the Llanelly bridge (No.61). The main line continued east past Forge Row and along what is now a minor road. The tramroad then ran in front of the Saleyard across the present A465 over a masonry bridge (No.68) that crosses River Clydach, and along the line of the minor road to Danycoed. Before reaching this settlement, the tramroad crosses the Nant Dyar river into the Clydach Ironworks. Above the ironworks the edge railway of 1795 was rebuilt as a plateway and partly realigned in 1811.

52. Machine House (weighbridge), Clydach Railroad (SO 2419 1439)
The Machine House was built by 1798 as a toll house for the Clydach Railroad and associated with a weighbridge. Although well outside the 50m corridor, this building is nevertheless important to the group value of the Clydach Railroad.

53. Forge Hammer Inn, Gilwern (SO 2378 1408)
A two-storey building of coursed masonry built around the middle of the nineteenth century as an inn serving the iron-making community in the gorge below. A branch of the Llam-March Tramroad ran past this site, apparently serving the works offices and then providing transport to a road-side wharf near the inn.

54. Pwll Rhys waterfall footbridge (SO 2375 1410)
A cast-iron footbridge over the River Clydach with masonry abutments. Possibly built of locally produced iron.

55. Branch of the Llam-March Tramroad, Maes y Gwartha (SO 2355 1396 to SO 2378 1408).
A branch tramroad over the Llanelly bridge (No.61) and along what is now a private track. Rattenbury (1980) suggests this branch served a roadside wharf near the Forge Hammer Inn, whereas Van Laun (1979:19) believes this branch served tramroad offices nearby. These offices may have been situated at the site presently occupied by Riverside House which is along this route. This branch line is aligned with the Old Trap Road to the south opposite the Forge Hammer Inn, (now a minor road) which loops around to the north and heads towards the small footbridge (No. 45) and the embankment portion of the Brecknock & Abergavenny canal. This may have been part of an earlier transport link. The branch to the Forge Hammer Inn is shown on the tithe map but had gone by the time of the 1880 OS.

56. A465 concrete revetting, Gilwern (SO 2420 1423)
Just west of the Primitive Methodist Chapel (No.50), and on a north section of the present A465 are the remnants of concrete revetting which stands in places up to 3-4 metres in height.

57. Culvert/buttress, River Clydach, Maes y Gwartha (SO 2365 1410)
At several points along the River Clydach on the northern bank (opposite Barnheld and Riverside houses) there are the remains of two, arched masonry culverts and a semi-circular masonry buttress between them. It is believed locally that from the size of the latter structure it once acted as part of a bridge across the River Clydach.

58. Llanelly Forge, Maelog Bungalow, Maes y Gwartha (SO 2355 1405)
The site of a forge once owned by the Clydach Ironworks and now occupied by a bungalow on the northern bank of the River Clydach. The site was powered it by the water from a leat, originating from the Nant Dyar and skirting Clydach house on the left, the tithe map shows that a weir on the leat fed the west end of a pond before continuing along the north side to end near the pond's dam wall (No.59). There seems no reason to doubt that this was the leat mentioned in an agreement of 1663 to divert water to the 'ironworks' (Riden) which together with the pond is still visible today

.
The forge continued to work alongside the charcoal-fired Llanelly Furnace (No.66) and when this site was abandoned it was later leased to the proprietors of the Clydach Ironworks. It stands alongside the line of the Llam-March tramroad which was built in 1809 from the blast furnaces to the canal via the forge and once supplied it with pig-iron. Even after the closure of the Clydach Ironworks in 1861 the forge was leased separately to John Mills, a tin-plate maker of Pontymister, in 1864. It seems that it was only from this period that the forge together with Forge House (No.60) were used to make tin-plate. The site continued in use until it was closed in 1884.
GGAT/PRN 2480 G

59. Dam and parallel leat, Llanelly Forge, Maes y Gwartha (SO 2351 1402)
The dam at this point served to store the massive quantities of water required by the Llanelly forge (No.58) in a pond. A weir on the leat from Nant Dyar served the west end of the pond and then continued to end at a point level with the ponds dam wall. This seems to be the leat built under agreement of 1663.

60. Forge House, Tin Plate works, Maes y Gwartha (SO 2352 1399)
The site of Llanelly tinplate works in the late 1870's where sheets of wrought iron were brought to be dipped into molten tin. The tithe map marks this as the site of 'Forge Buildings' suggesting that they were initially part of the Llanelly Forge (No.58) until its lease to John Mills, a tin-plate maker of Pontymister, in 1864
GGAT/PRN 2481 G

61. Llanelly Bridge, Maes y Gwartha (SO 2353 1396)
This masonry bridge over the River Clydach, is built of a low, fairly flat arch with narrow voussoirs sprung from abutments built of large boulders. It consists of at least two phases of construction with a 'straight joint' between the two which is visible underneath the bridge. This appears to be a bridge that was either adapted to tramroad traffic or was adapted to a greater traffic flow. The bridge carried the Llam-march tramroad to the road side wharf near to the Forge Hammer Inn (No.55) although it may not have been specifically constructed for this purpose.

62. Forge Row, Maes y Gwartha (SO 2345 1392)
Described by Van Laun as being 'twenty workmen's houses' in 1813 when they were mentioned as part of the sale of the Llanelly forge and associated plant. The central row have steeper pitched roofs and may well originally have been thatched, possibly dating from the period of the 17th century charcoal fired Llanelly blast-furnace (No.66).
GGAT/PRN 2486 G

63. Culvert, River Clydach, Saleyard (SO 2339 1383)
At this point there are drystone revetments and a well-built arched culvert with masonry above it standing to c.2.5 metres. The culvert served a leat to Llanelly forge and ponds.

64. Clydach House, Saleyard (SO 2325 1382)
This three-storey grade II listed building is constructed of large coursed masonry with a later outhouse and additions to the west gable. Built for the Clerk of the Clydach Ironworks with two large gable-end chimneys, twelve pane sash windows in the ground floor and first-floors, six pane windows in the third storey and no windows into the basement. A coat of arms and a date stone of 'A.D.1693' are found over French doors at the rear. The garden contains an ornamental fountain and a watercourse.
GGAT/PRN 2484 G

65. Industrial buildings, Clydach House, Saleyard (SO 2331 1392)
A series of partly demolished buildings to the north of Clydach House and across the Maes y Gwartha road. The buildings probably have an industrial use associated with the Llanelly furnace site to the south-west.

66. Llanelly Furnace, Saleyard (SO 2323 1386)
The archaeological remains of a charcoal-fired blast-furnace site, the earliest documented reference to which may date from 1663 when an agreement to build a weir to divert water to an 'ironworks at Llanelly' was made for Capel Hanbury (the owner of an ironworks at Pontypool). However, although it appears more likely that this document refers to the Llanelly Forge, since the furnaces were not powered by water from the Clydach, it does suggest an early date for iron-making in Llanelly.

The resultant pig-iron from the furnace was transported to the Llanelly Forge further downstream which was probably built at around the same time. The earliest definite documented reference to the blast furnace is in 1684 and again 1717 it is mentioned as having an output of 400 tons per year. The furnace is known to have closed during the late 1790's when the coke-fired Clydach Ironworks was built higher up the gorge and a list of sites from between 1750 and 1788 describes Llanelly furnace as 'down'.

The site of the charcoal furnace can be seen on John Aram's plan of c.1795 and was still identified as the 'Old Furnace' on the tithe map half a century later. It consisted of a square masonry furnace in front of a stone bank, with a bridge linking the charging bank to the furnace. The blowing-house stood on the opposite bank of the river to the furnace, and contained bellows which powered the furnace with the water-wheel at its west end.
The site is now a Scheduled Ancient Monument.
CADW/SAM BR160
GGAT/PRN 2485 G

67. Terraces, arches and ponds, Llanelly Furnace, Saleyard (SO 2318 1377)
To the west of Saleyard are a series of terraces, arches and ponds used to supply the water necessary for iron smelting at the Llanelly Furnace. These features are not marked on the Tithe map, but date from around the late 17th and 18th centuries.

68. Former road bridge, Saleyard (SO 2330 1375)
The abutments of a former road bridge that predates the 1960's A465 scheme and has been incorporated into the modern construction. The abutments of the bridge are constructed of sandstone masonry and now support a reinforced concrete section that spans the River Clydach.

69. Llam-march Tramroad bridge, Saleyard (SO 2329 1373)
Masonry bridge with parapet wall built to carry the Llam-march Tramroad over the River Clydach to the Clydach Ironworks. Probably contemporary with a masonry culvert under the adjacent road and revetments along which water was diverted to a watercourse on the southern bank.
GGAT/PRN 2482 G

70. Llam-march Tramroad, Saleyard (SO 2327 1367)
This tramroad was originally built to transport raw materials from the collieries and ironstone mines on the hillsides south of the gorge to the Clydach Ironworks. It was designed by John Dadford and opened in 1795 with an edge-rail, but was later rebuilt as a plateway. Furthermore, a plateway was built from the ironworks to the Brecknock and Abergavenny Canal at Gilwern in 1809 via masonry bridge over the Nant Dyar, following the right bank of the River Clydach then crossing the Clydach again to the left bank via bridge No.69 to Sale Yard. From there, the tramroad passed through the Llanelly Forge (No.58) and tin-plate works (No.60) before terminating at a canal-side wharf at Gilwern. A large section of the tramroad, within the 50m corridor, was destroyed by the construction of the A465.

A branch of the tramroad (No.55) diverted from the main line near the forge to a road-side wharf near the Forge Hammer Inn.

71. Farmstead, Burnant (SO 2375 1394)
A farmstead on the hillside to the south of the A465 with a masonry farmhouse (now partly rendered on the exterior), with evidence of a flagstone roof (now replaced) and many later additions. Associated farm buildings consist of a ventilated barn, a cowshed, an unroofed barn and a coal house; all built of uncoursed masonry with wooden lintels.

72. Clydach Villa, Cheltenham (SO 2291 1348)
A substantial detached mid.-Victorian gentry house built of sandstone with limestone quoins and brick window detailing with 12 pane sash windows. Low pitched roof of slate with red tiles at the angles and central multi-flued chimney.

73. Lamb House and industrial unit, Cheltenham (SO 2282 1333)
A group of associated buildings built above Main Rd. and served by a masonry ramp. Consisting of a 19th century cottage (Lamb House) and single-storey extension, a three-storey uncoursed sandstone building and a small stone and brick utility room between the two. The three-storey building has nine pane sash windows and a central door with a stone arched lintel. It is possible that this building had an industrial function, although it may belong to the same typological group of three-storey worker's housing exhibited at Haman's cottages, Clydach (No.92).

74. Sunnyside - Terrace cottages, Cheltenham (SO 2279 1332)
A row of four worker's cottages built of uncoursed limestone of one and a half storeys high with arched window heads. The windows, doors, chimneys and roof have been heavily modernised and there are inserted dormer windows in the roof.

75. Craig Amy - Terrace cottages, Cheltenham (SO 2273 1323)
A terrace of three worker's cottages built of uncoursed limestone. Probably originally of one and a half storeys in height, but now raised to a full two-storeys. The cottages have been heavily modernised, especially the windows, doors, chimneys and roof with evidence of several blocked openings.

76. Workers cottages incl. Oak Cottage, Cheltenham (SO 2267 1313)
A row of four workers cottages adjacent to the line of the earlier Clydach Railroad. 'Oak Cottage' is a detached house built of uncoursed limestone with a central entrance. All windows, doors and the roof have been modernised. The adjacent property, to the west, is a semi-detached sandstone cottage of two-units, with a central entrance and stone arched lintels, now much re-pointed (Next door is 'Pentusan'- a modern rendered cottage.). Further to the west is 'Mill View' a 19th century two-unit sandstone cottage built on a masonry plinth with central entrance, stone arched windows, and a later extension and lean-to to the west.

77. G.W.R notice, Cheltenham (SO 2270 1318)
Located on a minor road to the north side of Main Road and along the route followed by the Clydach Railroad, it was erected by the Great Western Railway Company after c.1920. The inscription reads 'LOCOMOTIVES, HEAVY MOTOR CARS AND ALL MOTOR VEHICLES WITH SEATS MORE THAN 15 PERSONS PROHIBITED.'

78. Clydach Railroad, Cheltenham (SO 2195 1274 to SO 2300 1369)
Built by the Brecknock and Abergavenny Canal Company after it was incorporated in 1793 from the collieries at Brynmawr to the iron-forge at Glangrwyne on the Usk.
This section of the Clydach Railroad runs from east of Church Road (SO 2300 1369) where a branch-line ran south-west to the Clydach Ironworks (No.94) (see below). The mainline continued westwards and until it crossed the Cheltenham Main Road (erstwhile Turnpike Road, No.86) and continues as a unmetalled track. It was eventually truncated by the A465 c. 70m south-west of the Rock and Fountain Inn. The railroad had ceased to carry traffic by 1908.

The branch line between the Clydach Ironworks and the Clydach Railroad, was built by the owners in 1817. Rattenbury (1980) suggests this took the form of a stone road from Smart's bridge along the river bank, and up an incline to a junction with the Railroad. This is reinforced by the existence of a cobbled road adjacent to Smart's bridge and a partly revetted embankment along the course of the present footpath between Pant-Glas and the main line of the Clydach Railroad where both lines converge at SO 2296 1364.
GGAT/PRN B30

79. Oak House, Cheltenham (SO 2258 1302)
Oak House forms part of a row of three houses which date from the late 18th/early 19th centuries. Dr.Wakelin (Cadw) suggests that due to the 'unusual depth and scale of the row' the function of Oak House may have been as a store or truckshop which would have been run by the owners of the Clydach Ironworks.

80. Ebenezer Welsh Chapel, Cheltenham (SO 2255 1397)
A nineteenth century chapel located to the south of Main Road and one of a number of religious meeting houses within the settlement of Cheltenham.
GGAT/PRN 2473 G

81. English Wesleyan Chapel, Cheltenham (SO 2250 1292)
A chapel built in 1829 and rebuilt in 1891 with an attached school, approximately 50 metres west of the Ebenezer Welsh Chapel.
GGAT/PRN 2472 G

82. James Terrace cottages, Cheltenham (SO 2246 1290)
A group of six terraced cottages known as James Terrace located north of Main Road, Cheltenham. They possibly served as workers cottages for the Clydach Ironworks.

83. Siloam Chapel Graveyard, Cheltenham (SO 2247 1281)
A walled cemetery with gravestones dating from the mid-19th century to 1968. Some stones are highly decorated and bear inscriptions in Welsh. The associated chapel, now demolished, once stood nearby to the north. To the north-east part of the cemetery has been infilled and is now used as a car-park and the site is now very dilapidated.

84. Spring, gully and D.S.W., Cheltenham (SO 2239 1283)
North of the graveyard (No.83), are a series of gullies, a spring and an extensive drystone wall. These features are contemporary with the buildings along Main Road, Cheltenham; which date to the mid 19th century.

85. Penrheol Las and Big House, Cheltenham (SO 2223 1281)
An early to mid 19th century farm cottage, possibly attached to Penrheol Las, a well preserved 19th century farmstead. Both dwellings are located either side of Main Road, west of the settlement of Cheltenham. Big House, a two-storey worker's cottage to the south of the Main Road, is now derelict.

86. Merthyr-Govilon Turnpike Road (Main Road) (SO 1964 1213 to SO 2323 1437)
The route of the Turnpike road which became the Main Road through Black Rock and Cheltenham, was built between 1811-12. However, Rattenbury (1980:78) believes the Merthyr/Abergavenny section of the Turnpike was built around 1809 and was paid for by subscription with tolls for its use. In the western section, at head of the Clydach gorge, the road crossed Clydach bridge, which now stands in the middle of the A465 roundabout, east of Brynmawr. To the east it exists up to Saleyard as the present Maes-y-Gwartha Main Road. At this point it would have crossed the Clydach over a bridge at Saleyard (No.69) and then continuing further east toward Govilon.

87. Derelict cottage, Rock & Fountain Inn, Main Road (SO 2199 1278)
A small late 18th century, coursed masonry cottage, located south of Main Road, opposite the Rock and Fountain Inn. This building was probably built in two main phases although the western gable-end exhibits three types of construction. Originally a single-storey dwelling, of which the first phase of building clearly shows uncoursed rubble stonework. Later, squared and coursed masonary was added in order to raise the level of the eaves. Towards the top of this gable there have also been later repairs in red brick. The front elevation has a small crude doorway and windows with wooden lintels. There are later additions including a lean-to (now demolished) and a chimney on the western gable end. A set of outside stairs were added to eastern gable end to serve the first floor.

88. Masonry culvert, Main Road (SO 2193 1277)
Masonry arched culvert probably nineteenth century in date. Located approximately 10m. south of Main Road, the culvert possibly continues underneath the road and probably marks the southern extent of an earlier track/road.

89(i). Tramroad, Darren Ddu Limestone Quarry to Blackrock (SO 2154 1262 to SO 2190 1294)
Identified to the west and east of Darren Ddu quarries, and north and south of the Blackrock limekilns are two tramroads. (labeled as 89(i) & 89(ii). Tramroad 89(i) starts from east of Myrll cottage (now a footpath), and travels behind the Blackrock settlement for c.450m. This tramroad would have fed the limekilns with limestone from the quarries behind. The gradients for this tramroad are relatively shallow. This line may have supplied the final product to Llangattock Tramroad to the north and the Clydach Railroad to the south.

89(ii). Tramroad, Darren Ddu Limestone Quarry to Limekilns (SO 2185 1275 to SO 2205 1287)
This tramroad starts at the south-eastern end of the Blackrock limekilns and runs due east for c.320m up a sharp incline. Again this tramroad would have supplied limestone to the kilns and is believed to have had a self-acting incline mechanism (Van Laun 1979:23). A railroad entrance to the Darren Ddu Quarry existed at SO 2176 1268 and passed under the former Turnpike road (now Main Road) by a tunnel about 20 metres long (Rattenbury 1980:79).

90. Blackrock Lime Kilns, Main Road (SO 2181 1275)
South of the Darren Ddu quarries, adjacent to Main Road, are the substantial Blackrock lime kilns. This site consists of three kilns (one is in a poor state of repair) which have a red-brick lining and are encased by a substantial coursed limestone revetment/ramp which extends back to the quarried cliff-face. This allowed access to the top of the kilns by men and trams in order to charge them. Between kilns the western and central kiln and above the eastern kiln are two date plaques one of which is clearly dated 1889. Around the outside of the kilns are the remains of the doorway furniture, and at the rear of the kilns are iron lintels which support the shafts between the main body and the charging shaft. Above the shafts are three kettle-holes from which the kilns were charged. Immediately in front of the kilns was a turnpike road (now Main Road) as well as the Clydach Railroad which continued to serve the kilns until 1908. Van Laun (1979) suggests that lime kilns dating from 1795 preceded these kilns in this area although nothing is shown on the tithe map of c.1840.
GGAT/PRN 2475 G

91. Track/road between Blackrock & Cheltenham (SO 2153 1255 to SO 2188 1274)
Intermittently dispersed between Cheltenham and Blackrock is a linear feature probably used as an agricultural track which pre-dates the Main Road. The best sections of this road are between the derelict cottage (No.87) and the culvert (No.88).

92. Haman's Cottages, Clydach (SO 2282 1319)
These cottages are associated with the nearby Clydach Ironworks and consists of a building cut into a hillside to the rear producing two-storeys with a basement level. The ground floor is built of coursed limestone blocks whereas the upper courses are of sandstone, possibly for structural reasons. The cellars are barrel-vaulted and inter-connected with internal doorways. Access from the cellar to the outside was from doors in the south elevation (which were replaced by windows). Part of the cellared area are believed to have been used as a communal workspace with wash-room/laundry facilities. This arrangement seems almost identical to a type of worker's housing known as 'dual rows' which was developed at this time in South Wales and in one range of houses formed the basement of an entirely separate row above (Lowe 1994:17). Indeed, there is evidence of small wall larders within the basement level similar to those found at the oldest such houses, Office Row, near Nantyglo Ironworks, built between 1793 and 1795. This building has been extensively altered, including the removal of seven multi-flued chimney stacks (three have since been rebuilt). The arrangement of the stacks and windows on the southern elevation suggests that there were around 14 self-contained dwellings units within this row of houses.
GGAT/PRN 3648 G

93. Smart's bridge, Clydach (SO 2287 1327)
This bridge inscribed with a date of 1824 is constructed of cast-iron members spanning the Clydach river. Either side of the bridge is evidence of a cobbled roadway which Rattenbury suggests formed a branch linking the Ironworks to the Clydach Railroad (No. 78). During the productive years of the Clydach Ironworks, the bridge was used to transport raw materials and the finished products to the Clydach Railroad via an incline.
GGAT/PRN 3204 G

94. Clydach Ironworks, Clydach (SO 2290 1320)
The ironworks was located close to sources of iron ore, coal and limestone as well as water from the River Clydach. The coke-fired Clydach Ironworks was in operation by 1797 superseding the charcoal-fired Llanelly Furnace (No.66) further down the gorge. It remained in production for a further 64 years during which time it became the main employer within the Clydach Gorge. By 1841, 1350 people were directly employed including 133 children under the age of thirteen (van Laun 1979). Besides taking over control of the Llanelly forge (No.58) to the east of the ironworks, the company also built a rolling mill further to the west along the River Clydach in order to roll pig-iron. The Llam-march Tramroad (No.70) supplied the furnaces with raw materials brought from the hillsides above the ironworks. Unfortunately the ironworks were poorly located and this meant that pig iron had to take a highly circuitous route. From the furnaces the pig-iron traveled down to the forge, back up to the rolling mills as bar iron and then returned back down to the canal at Gilwern. Before 1811 when the Llam-march Tramroad was extended to Gilwern, these journeys were made largely on wagons and pack-horses. In 1861 the Clydach ironworks were closed and by 1873 the ironworks had been sold for £220,000 to the Brynmawr Coal & Iron Co. Over-valued at the time, the company went into voluntary liquidation in 1877. There were four blast furnaces on the site and a water wheel, probably powered by water from a launder. The site was excavated in 1986-8 and the ironworks became a Scheduled Ancient Monument.
CADW/SAM BR161
GGAT/PRN 2476 G

95. Section of (branch) tramroad, Clydach Ironworks (SO 2289 1305 to SO 2230 1250)
Part of a tramroad system between the Clydach Ironworks and the companies' rolling mills existed to the west, and south of the A465. Located outside 50 metre corridor, but within the 'impact' zone.

96. Site office and dwellings, Clydach (SO 2287 1332)
The remains of a Works Office and cottages existed on the north bank of the River Clydach opposite the ironworks for which there is pre-A465 photographic evidence. These buildings were demolished in the 1960's for the construction of the A465 although some remains probably still survive below the road.

97. Pant-Glas Bridge, Clydach (SO 2293 1333)
A sandstone masonry bridge of roughly coursed stone with a double row of voussoirs over a low flat arch. The bridge was extended at some stage for additional tramroad traffic and this is still visible in the form of a 'straight joint' in the masonry underneath the arch.
GGAT/PRN 3200 G

98. Kilns (?) within Clydach river bank (SO 2297 1339)
The remains of a semi-circular masonry feature is visible in the north bank of the River Clydach and possibly charged from above. The deposits of ash nearby suggest the masonry served an industrial purpose rather than merely as revetments for the river bank. However, the site is currently very close to the course of the River Clydach below, which would have impeded its use. Revetments are also found along this riverbank and a furnace slag has also been deposited nearby in order to consolidate the bank.

99. Leat keeper's cottage & outbuildings, Clydach (SO 2299 1344)
A one-storey building over 17m in length with a central doorway and three partly blocked windows in the front elevation, a blocked door on the east gable and a blocked door and window in the west gable. Built of sandstone with lime mortar and wooden lintels, it had a Welsh slate roof at some point, but this has now been removed. The foundations of a further extension to the east gable can be seen as well as a possible extension to the west gable. The footings for a separate small outbuilding are still visible to the west. The building is unusual in being built on a river bank with a basement level exiting on to the Clydach River. Its proximity to the weir and sluice system suggest that the building was used by the occupant to regulate and monitor the flow of water to the leat, which leaves the river at this point. However, the building appears to have gone through many phases of usage and is known to have been, at one point, a soap-factory, making use of power from a water-wheel encased within the masonry piers in the river. Later on in its history the building was turned over to agricultural use during which time the demolished building on the east gable was known to have housed a hand powered 'chaffing' machine. The building is at present partly ruinous, although the west end is still used for agricultural storage.

100. Weir, sluice system and leat, Clydach (SO 2301 1344 to SO 2315 1358)
An agreement of 1663 granted Capel Hanbury (the owner of another ironworks at Pontypool) the liberty to build a weir to divert water from the River Clydach to his 'ironworks at Llanelly' (Riden 1993:23). This probably refers to the Llanelly forge (No.58) rather than the charcoal-fired blast furnaces (No.66), which were not powered by the River Clydach. The weir which forms a barrier across the river at this point consisted originally of a fixed iron plate from the north to the south bank across a natural waterfall. The weir was secured on both ends to the masonry abutments/piers, but this has now been removed although the iron fixing points are still visible in the masonry and rock in certain places. The masonry piers which are built upon the natural bedrock, extend into the River Clydach from the north bank. These form the sluice system, and are built of a central core of rubble masonry surrounded by substantial squared limestone blocks although many have now been removed. This sluice helped to channel water from the Clydach into a leat serving the Llanelly forge and its course can still be followed much of the way. Another smaller channel within a masonry pier allowed water to return to the course of the river via a water-wheel (now removed) and possibly allowed run-off during periods when the river level was too high. The leat, which leaves the river at this point to head NE towards Llanelly, no longer flows and has been partly eroded by the river. In places along its length, especially at bends it is also revetted with drystone walling. About 40m along, it is apparently joined by a second small leat which returns to the Clydach and may have acted as a water run-off. The leat and weir are now under consideration for Scheduling by Cadw (See diagram).

101. Hafod Inn, Blackrock (SO 2158 1261)
The Hafod Inn is shown on the O.S. 1891 map although the present building appears to date from c.1920-30. Built of red brick, it is now a residential building retaining 'Hafod Inn' which is cast in concrete above door. There is also a sign holder above the door and 'Rhymney & Crosswells (Brewery)' painted on both gable ends.

102. Drum & Monkey Inn, Blackrock (SO 2155 1257)
A two-storey building heavily altered in recent years though the remains of earlier masonry fabric is visible in the cellar below the western building. Possibly a building with an out-shut to the south, suggested by the pitch of the roofs. The alignment of the Clydach Railroad through the property respects the layout of the building, which suggests that it was already in existence by 1797 and that the railroad was following an earlier track/road through the property. A small outbuilding to the rear (now public house toilets) is built of roughly coursed rubble with wooden lintels, and has a roofline which has been raised above the eaves. Attached to this building is a later, barrel-vaulted coal-house to one side. The site of a further range of outbuildings, to the east of the Drum & Monkey, which are now demolished, lie below the current car-park. The Drum and Monkey was formally known as the Prince Albert.

103. Craig Cottage, Blackrock (SO 2149 1258)
A two-unit mid 19th century cottage built of well-coursed limestone and located on a south facing slope. The building is probably contemporary with the period of quarrying as with other buildings both east and west along Main Road.

104. Cottages, Blackrock (SO 2145 1252)
A row of cottages to the north of Main Road named Rose Cottage, Gelli View and Old Crown. All three have been substantially altered. Rose Cottage, a detached house to the west, was originally two dwellings and has now been converted to a single unit. Next door, to the east is Gelli View, originally known as the Old Blackrock Inn. The house furthest to the east is still known as the Old Crown (shown as the Crown Inn - O.S. 1891). Quarry Cottage which originally stood further to the west has been demolished. The three remaining buildings appear to be purpose built around the quarry industry. Prior to construction of the A465 (1963), further dwellings to the south formed part of an industrial-centered settlement and these public houses would have been an important foci for the community.

105. Blackrock Quarry, Blackrock (SO 2129 1250)
A large limestone quarry now used as a landfill site. Established during the early industrial period of the gorge (Van Laun 1979). An arch under the 1812 Turnpike road was built to accommodate a branch line from the Clydach Railroad to the quarry, but was destroyed during construction of the A465.

106. Road and foot bridges, Blackrock (SO 2114 1249)
A masonry road bridge along the line of the Turnpike road (now Main Road), and the remains of a parallel wooden footbridge supported on masonry piers below, spans the Nant Gwyn. The river is channeled below the road by a culvert. The road bridge possibly dates from 1809-1812.

107. Squatter's settlement/industrial site, Nant Gwyn (SO 2114 1248)
Below the bridge (No.106) there is uncoursed drystone masonry revetment along the banks of the Nant Gwyn associated with the remains of lime mortared walls on both sides of the of the stream. Their location next to a stream suggests that these buildings may have had an industrial use which made use of water during processing. At present the level of the Nant Gwyn appears to fluctuate, but would have originally have flowed more freely.

108. Track and D.S.W. landscape, Main Road (SO 2108 1249)
A substantial revetted track running east/west between the Main Road and the A465, associated with various drystone walled field boundaries down the slope of the hill. The track is truncated by drystone walling aligned north/south.

109. Milestone, Nr. Pont Gam (SO 2096 1260)
A milestone along the line of the old Turnpike Road built 1811-12 inscribed 'Abergavenny 7'. Rattenbury (1980) suggests that the Turnpike Road was built in 1809. This milestone is part of a mileage system along what was then the main road between Abergavenny and Brynmawr. No other milestones are recorded along this road.

110. D.S.W. landscape, Water Works, Pont Gam (SO 2077 1250)
A drystone walled field boundary running north/south. The boundary consists of a rough linear two-coursed stone bank. Either side is evidence of toppled stonework.

111. Llangattock-Brynmawr Tramroad, Brynmawr (SO 1945 1236 to SO 2209 1310)
At this point the A465 severs the line of a tramroad built in the early 1830's by J. & C. Bailey to link their ironworks at Nantyglo and Beaufort to the Brecon & Abergavenny Canal at Llangattock, passing the Darren Disgwylfa limestone quarries en route. From the 1840's locomotives were used on this route. This line was re-built as a standard gauge tramway and linked to the LNWR through Brynmawr in the 1870's.
GGAT/PRN B29

112. Clydach Railroad & bridge, Cwm Nantmelyn (SO 2022 1226)
This is a well preserved stretch of the Clydach Railroad running along the north face of the gorge and includes a masonry causeway with earthen backfill behind impressive revetting. A masonry bridge with iron cross-girders carried the tramroad over the Nantmelyn still survives. The Railroad dates from 1794 and linked the collieries at Brynmawr to the iron forge at Glangrwyne on the Usk.
GGAT/PRN B30

113. Branch line of the Clydach Railroad & colliery level (SO 2008 1218)
Masonry revetments and two coal adits (east and west) survive in the face of the cliff above the coal measures. These workings were served by early branch line tramroads which were related to the Clydach Railroad. On a cliff face, north-east of adit 'East' is an area of revetted masonry that marks the edge of a low gradient branch line.

114. Merthyr, Tredegar & Abergavenny Railway (SO 1968 1207 to SO 2190 1248)
The line of the MT & A was opened as far Brynmawr by 1862 (by 1866 this line had been taken over by the London & North Western Railway). From Abergavenny to Govilon the railway followed the alignment of the southern portion of the Llanvihangel Railway while much of the stretch from Govilon followed the route of the Bailey's tramroad which the company had acquired. The line eventually reached Merthyr Tydfil by the 1870's. The route through the Clydach gorge section is carried upon a substantial cutting into the cliff-face, to the south of the present A465. Towards the Brynmawr roundabout section of the A465 the MT & A is crossed by the remains of a skew bridge (No.119) built of large coursed masonry with a rubble core. At various places along this section of the line, on the cliffs both above and below the line, are substantial limestone revetments of a similar construction to this bridge suggesting that these were built at the same time by the MT & A Railway.

115. Ffynnon Gistfaen religious waterfall, River Clydach (SO 2068 1238)
A waterfall in the gorge below the level of the present A465, with possible religious associations.

116. Devil's Bridge, Cheltenham (SO 2154 1249)
A substantial masonry footbridge spanning the River Clydach probably dating from the eighteenth century for the transportation of minerals on pack-horses. Built of well-coursed masonry graded to smaller uncoursed stone at the upper levels. The arch is tall and regular with well-cut voussoirs, but there is evidence of collapse and re-building over the centre of the arch.

117. Clydach Bridge Cottages, Brynmawr (SO 1955 1212)
A row of four worker's cottages known as 'Clydach Bridge' cottages with a modern inscription dating them to 1836. These houses are all rendered on the outside and are covered by slate roofs. A masonry chimney is evident on the third building (from east) which may be the oldest.

118. Clydach Bridge, Brynmawr (SO 1964 1213)
A single-arched bridge incorporated within the A465 roundabout, all that remains of the original four-arched structure which carried the (1811-12) east/west Turnpike Road across the River Clydach at this point. Built of coursed limestone with evenly cut voussoirs the bridge is now partly reinforced on either side with concrete.

119. Skew bridge, Brynmawr (SO 1979 1211)
The partial remains of a coursed masonry bridge with a rubble core. The sharp dog-leg in the course of the pathway over the bridge on both sides suggests that this was built by the railway to maintain the course of an earlier tramroad or Rights of Way from the hillside above the MT & A.

120. 'Squatter' settlement & water courses, Clydach Dingle (SO 1922 1287)
A squatter settlement to the north of the A465 consisting of several small buildings built of limestone with a lime mortar bonding. Possibly related to localised open drift quarrying and coal outcroppings to the south. The main remaining dwelling, now partly demolished, is a masonry cottage built into the slope of the hillside above, and was probably originally one-storey high with an external chimney-breast and south-facing entrance. The remains of further outbuildings/cottages can be found nearby and lower down the dingle. The area is largely enclosed by drystone walling, and masonry revetments. The dried-up remains of a two culverts can be found further down the dingle adjacent to the A465. Above the dingle, to the east is an inclined linear platform which is considered to be a tramroad branch line (No.265). The culverts channel watercourses below the route of the tramroad (No.265).

121. Local open-cast coal workings & terraces, Brynmawr (SO 1847 1288)
To the south of the A465, and opposite site No.120, are a series of platforms and quarry holes which cut into the exposed coal-seams. The platforms have been interpreted as being local tramroads leading to open-cast workings. The outcrops were worked intermittently up to the 1930's (pers.com).

122. Bailey's Disgwylfa Tramroad, Clydach Dingle (SO 1905 1215 to SO 1935 1287)
Above the open-cast workings and terraces (No.121) and within the 50m corridor is a section of the Bailey's Disgwylfa Tramroad preserved on the hillside above the A465. In use by 1818, it brought limestone from the quarries at Daren Disgwylfa to Bailey's Nantyglo Ironworks. It also transported coal and ironstone which was mined either side of Clydach dingle at sites such as No.121 and No.120. The line was laid with an unusually narrow plate rail of 2ft 4in.. By the 1870's, when the O.S. surveyed the area, the section from Nantyglo to Clydach Dingle had been re-built as a standard gauge tramway and linked to the Llangattock Tramroad (No.111) whilst the remainder had been abandoned in favour of the Llangattock line.

123. Tramroad, Garn Lydan (SO 1753 1275 to SO 1756 1361)
The line of a north/south aligned tramroad crossing the course of the Preferred Route. It forms part of a localised network of tramroads either side of the A465. The function of the tramroad may have been to serve coal seams at Garn Lydan to the west. The tithe map of the area does not mark any tramroads, but only records land usage in a perfunctory manner. The 1880 O.S. does mark short lengths of tramroad in the area which appear to have been rebuilt as standard gauge railways and were connected to the main line.

124. Farm house and outbuildings, Garn Lydan (SO 1747 1242)
Remains of two dwellings and outbuildings one of which acted as a farmhouse with garden layout, drive and drystone walled boundaries. The farmhouse is brick built (probably Victorian) and was apparently unoccupied for c.40 years (pers.com). The cottage and outbuildings in the plot adjacent are built partly of uncoursed masonry with more recent additions.

125. Tramroad, Garn Lydan (SO 1803 1271 to SO 1703 1258)
Tramroad running west/east, parallel to, and south of, the A465. This tramroad was connected to the Garn Lydan Tramroad (No.123) at SO 1763 1257 and appears to serve extensive open-cast workings to the east at SO 178 126 to 193 125 (No. 121).

126. Coal workings and quarrying, Brynmawr (SO 1800 1270)
From Garn Lydan to Clydach Bridge there are extensive areas of disused coal and ironstone workings. The O.S. of the 1880's records this area as a unbroken mass of industrial activity.

127. Cwm Gwybedog patches and leats, Garn Lydan (SO 1694 1240)
An open expanse of early 19th century patch workings used for the localised extraction of outcropped iron ore and coal which served the Ebbw Vale and Beaufort Ironworks. Scratched into the surface are a number of watercourses and earthworks. To the east are a series of tramroads (Nos. 123 and 125) which provided transport for the industry.

128. Drift mines, Garn Lydan (SO 1702 1230)
To the south of the A465 and opposite a modern housing estate are at least three linear platforms extending at least 80 metres, which cut into a north facing slope. These are considered to be local coal terraces, possibly dating to this century.

129. Farmhouse & D.S.W., Afon Ebbw (SO 1646 1219)
A farmhouse located to the north of the A465, built of coursed masonry with brick window detailing, two brick gable-end chimneys and a later brick extension to the northern elevation. Behind the building is associated drystone walling.

130. Tramroad, Afon Ebbw (SO 1643 1209)
Line of a possible north/south tramroad running parallel to the Ebbw river, south of A465, not on the Preferred Route.

131. Primrose Cottage, Rassau Brook (SO 1538 1173)
A mid-19th century, two-storey, three-unit dwelling built of rubble masonry with a slate roof, two gable-end chimneys and a later porch and flat-roofed extension. The small sash windows of the first floor survive, but the others have been replaced. The building, which is enclosed within drystone walling, is bordered by a brook to the east.

132. D.S.W landscape, Nant y Croft (SO 1400 1100)
An extensive drystone walled landscape south and north of the A465 and probably associated with the two farmsteads to the south of the road (No.140).

133. Trefil Tramroad, Nant y Croft (SO 1407 1160 to SO 1458 1158)
The Trefil Tramroad was built in 1797 to carry limestone from the extensive quarries at Trefil on the eastern bank of the Sirhowy River on Mynydd Llangynidr to a connection with the Rassau tramroad at Beaufort. Today, the route of the tramroad is represented by the road leaving the A465 east of Wells Farm, passing south of the farm and continuing west and then north-east onto the mountain. In places, the tramroad is well preserved with substantial revetting either side to form a raised platform.

134. Lamp-stand and manhole cover, Nant y Croft (SO 1478 1158)
An early twentieth-century lamp-stand and man-hole cover opposite Station House, Trefil along the line of the Trefil Tramroad. Man-hole cover inscribed 'Ebbw Vale'.

135. Quarry and D.S.W., Nant y Croft (SO 1500 1160)
A limestone quarry partially enclosed by drystone walling. Part of the walling has been removed to the NE through quarrying activities suggesting that the quarrying is later than the drystone walling.

136. Craig House, Nant y Croft (SO 1493 1159)
An early 19th century cottage forming part of a row of houses along the Trefil Tramroad (the present Rassau Road) settlement of Nant y Croft. Prior to the A465's truncation of the settlement, the row of houses extended south, forming an early ribbon development.

137. Hirgan Farmstead and outbuildings (SO 1433 1134)
A farmstead with the remains of an early masonry rubble-built barn/cowshed with squared quoins forming the outshut of barn which has now been replaced in corrugated iron. A drystone wall landscape associated with this farmstead includes a sheep-fold c. 19th century surviving to c.1.5m high.

138. Rassau Tramroad, Nant y Croft (SO 1470 1155 to SO 1569 1154)
A section of the Rassau Tramroad is located south of the settlement of Nant y Croft and may link up with the Trefil Tramroad (No. 133) and Mineral Line (No. 139). The Ordnance Survey suggests that the route is a dismantled railway which possibly terminates at SO 1475 1150.

139. Mineral Line, Nant y Croft (SO 1475 1150 to SO 1500 1152)
The Mineral line to Ebbw Vale is possibly an extension of the Rassau Tramroad (No.138). Later, it is suggested that it becomes a branch-line of the London and North-Western Railway. It must be stressed that all three tramroads at the point south of Nant y Croft require further research.

140. Farmstead and outbuildings, Nant y Croft (SO 1517 1152)
Two tofts and associated dwellings. To the west is a derelict two-storey 19th century farmhouse, built of masonry but partly rendered on the outside. To the east is a small coursed masonry cottage and barns with gable-end chimney, tin roof and outshut, possibly a mid-19th century squatter's cottage.

141. Old Hargan Fach and D.S.W. landscape (SO 1372 1099)
A small, one-storey building with brick lintels over windows and door. Internally, the front room has a blocked fireplace, and externally there is a window into the loft-space above. To the rear there is an outshut with catslide roof. To the east is a two-storey extension with brick detailing around the windows, a slate roof and a brick chimney in the eastern gable. The farmstead dates from the early to mid 19th century.

142. Merthyr, Tredegar & Abergavenny Railway, Dukestown (SO 1363 1083 to SO 1334 1092)
Between Nantybwch and Dukestown, the A465 deviates from the line of the LNWR branch which it otherwise follows from Dowlais to Rassau, leaving an isolated stretch of railway track-bed to the north. This section crosses the Sirhowy River on a curved embankment and viaduct which was built for the second section of the Merthyr, Tredegar & Abergavenny line (opened between Brynmawr and Nantybach in 1864). The line cuts through the southern extent of Dukestown cemetery before being rejoined by the route of the A465. The line was closed in 1958.

143. Railway viaduct, Dukestown (SO 1329 1093)
A viaduct of nine arches, c.90 metres long, which is built of squared masonry with a four brick thickness of voussoirs over the arches and a stone parapet wall. The remains of a parallel cast-iron structure (a bridge or buttress) to the south, standing to 0.5m high in places is visible. The viaduct was built for the second section of the MT & A line which opened between Brynmawr and Nantybwch in 1864.
GGAT/PRN 3624 G

144. Earthworks and D.S.W., Dukestown (SO 1323 1083)
A series of earthworks/platforms visible including a drystone walled remains of a sheepfold; the latter is now partly truncated by a modern housing estate.

145. Cast-iron weir, Dukestown (SO 1342 1077)
A weir built of cast-iron plates across the Afon Sirhowy with intermediate area filled with squared masonry. On the down-slope end of the weir are further masonry revetments. At the top are further cast-iron plates. A possible leat runs NE above the weir to serve the Sirhowy Ironworks.

146. Trefil Tramroad, Nant y Bwch (SO 1295 1111 to SO 1313 1076)
The Trefil tramroad, Tredegar Branch was built to carry limestone from the extensive quarries at Trefil on the eastern bank of the Sirhowy River to a junction with the Rassau Road at Trefil Machine. It was approximately 4.2 km and built by T. Dadford Jr. The tramroad was in operation between 1797 and 1860.

147. Merthyr, Tredegar & Abergavenny Railway, Waundeg (SO 1325 1093 to SO 1274 1064)
A section of the MT & A Railway approximately 250 metres in length south of the settlement of Waundeg. At this point, there was probably a railway station. North of the line is a row of cottages known as 'Station Terrace' (SO 1295 1074).

148. Siloam Chapel, Tafarnaubach (SO 1204 1047)
A chapel with date plaques of 1844 & 1877, and an inscription in Welsh. The architecture of the building is typical of other chapels of this denomination and date within the region.
GGAT/PRN 4095 G

149. Welfare Hall, Tafarnaubach (SO 1188 1036)
A substantial brick building, built in 1937, and rendered externally. The date suggests that the hall was built in honour of the coronation of George VI.

150. Bronze Age find spot, Tafarnaubach (SO 1170 1010)
A findspot discovered during the course of the construction of the A465 in 1964 consisting of two damaged socketed palstaves found in what appeared to be a log-lined pit, within peat deposits. Finds now in National Museum of Wales.
GGAT/PRN 2316 G

151. Farmstead, Bryn Bach (SO 1253 1052)
The remains of a demolished farmstead with brick and masonry rubble surviving together with brick gate pillars, probably dating from the late 19th century.

152. Leat system and 'kettle-hole' quarries, Princetown (SO 1134 0982)
An extensive early to mid 19th century industrial landscape comprising of a leat system, 'kettle-hole' quarries and crowsfoot tips south of an early Turnpike road (now the B 4257). It would appear that the leat system predates these other industrial features. The coal tippings are located either side of the A465 and are probably incorporated into its foundations. The 1880 O.S. map marks a number of small tips in the locality on either side of the L.N.W.R. (the present route of the A465). To the north-east and parallel with the A465 is a leat system which served the Union Furnace at Llechryd established in 1801. This leat system has been truncated by the present A465 and was fed by the Mynydd Llangynidr.

153. Mining tips and quarry, Princetown (SO 111 096 to 112 096)
Either side of the A465 is a series of coal tips and earlier quarrying levels. These features are associated with the industrial landscape to the north and possibly date from the mid-19th century. Beneath these features and to the east is an earlier drystone walled landscape. Further to the west is a substantial gully orientated north/south (SO 1110 0965) (No. 171) and located between the A465 and a branch road of the B4257.

154. Industrial building, Princetown (SO 1110 0970)
A substantial red brick building (associated with No.155) with concrete slabbed roofing standing alongside the old Turnpike road (now the B 4257) and to the north of the A465. It was probably related to a railway/industrial since the route of the LNWR ran close by, but is now used as stables.

155. Earthworks (demolished building), Princetown (SO 1111 0970)
Attached to the above building (No.154), and pre-dating it, are the remains of a partly demolished masonry building with an internal fireplace.

156. D.S.W. landscape, Blaen Rhymney (SO 107 097 to 113 096)
Surrounding and incorporated within the early industrial landscape at Princetown is an earlier drystone walled field-system running either side of the A465.

157. Railway bridge and tunnel, Llechryd (SO 1057 0961)
A large and impressive tunnel and embankment to carry the line of the Merthyr, Tredegar & Abergavenny Railway over the Afon Rhymney. The tunnel is built in two phases with the section behind the north facade consisting of a brick arch on top of a masonry plinth. Between this section and the remainder of the tunnel to the south there is a 'straight joint' and the construction changes to large coursed limestone blocks. This indicates two separate phases of construction, with the larger section to the south probably being the earliest. The southern portion is built in two sections punctuated by 'building-breaks' at which point the height of the tunnel changes; the section furthest to the north of tunnel having the tallest, narrowest arch. The northern facade of the tunnel and the retaining walls are built of rusticated limestone and form a two metre high plinth along the length of the tunnel upon which the yellow brickwork is laid to form the construction of the arch. The masonry retains putlog holes in the stonework from the original internal formwork/scaffolding used during construction. The second section of tunnel, further to the south (the earliest phase), has a more rounded arch and is composed of rusticated masonry blocks.

158. D.S.W. landscape, Blaen Rhymney (SO 1054 0964)
An area of land to the north of the A465 and adjacent to the Afon Rhymney which is separated from the river by drystone walling. The walling is found along the stretches of low lying flood-plain land along the western bank of the river

159. D.S.W. landscape and building platforms, Afon Rhymney (SO 1050 0978)
An northern extension of the drystone walled landscape of No.158 along the flood-plain of the western bank of the Afon Rhymni. It is at this point that the boundaries are associated with the remains of a demolished masonry building, probably with an agricultural function.

160. Northern section of leat system, Blaen Rhymney (SO 1045 0994 to SO 1052 0960)
A north/south aligned leat on the hillside to the west of the course of Afon Rhymni consisting of a ditch intermittently reinforced by stone revetting along the sides, with a turf bank on the downslope (eastern) side. The leat, which no longer flows, carried water from the river to the Bute Town Reservoir, south of the A465. Bute Town Reservoir was built to serve the Rhymney Ironworks. The leat is channeled below the course of the road in a stone-lined culvert, probably built for the MT & A railway, and is still visible on the southern side of the A465. This leat is marked on the O.S. of the 1880's and appears to be the main feeder for Bute Town Reservoir; other feeders are also recorded to the west (No.165). The 1971 O.S. also records this leat as a watercourse, suggesting that it was still functioning until quite recently.

161. Road platform, Pleasant View, Llechryd (SO 1039 0956 to SO 1033 0953)
This is a road which is still visible as a linear track across a field was the original alignment of the 'B' class Merthyr common road which still survives to the west.

162. D.S.W & T.S.W system, Bute Town (SO 1010 0930)
South of the A465 and north of the Bute Town Reservoir are a complex series of drystone and turfstone walling. Both features have been truncated by later railway fencing (MT & A) and a leat system (No.165), orientated east/west. The drystone and turfstone walling is also truncated by the Bute Town Reservoir, thus pre-dating it. North of the A465, there is no evidence of any continuation of the field-boundary system therefore confirming it's status as common land.

163. Railway furniture, Bute Town (SO 0960 0910)
A line of concrete posts originally set by the MT & A railway are located approximately 5 metres to the south of the A465, on a linear platform. The line of posts extend for about 60 metres aligned east/west.

164. D.S.W landscape, Bute Town Reservoir (SO 0940 0900)
South of the A465, and incorporated around two small farmsteads known as 'Gypsy Castle', are a series of early drystone walled boundaries. Both these, and the field boundaries around Blaencarno Farm and Nant yr Helyg, would originally have been continuous.

165. Leat system, Bute Town Reservoir (SO 0980 0927)
The remains of an east/west leat consisting of a ditch with stone and turf banks extending for some 200 metres, and related to the Bute Town reservoir (which was built to serve the Rhymney Ironworks) to the south. To the north of the leat are a number of streams that feed into the leat from Blaencarno common, north of the A465. Interspersed along the leat are feeder gullies that run into Bute Town reservoir. The leat system cuts into earlier drystone walling (pre-mid nineteenth century) (No.164). The 1886 O.S. marks an arc of five leats feeding Bute Town Reservoir on its northern side, four of them originating in springs on the hillside above and the fifth leading off the Carno Brook to the west.

166. Masonary bridge, Graig Lwyd (SO 1019 0929)
A small road bridge with a masonry facade and brick interior arch over a minor stream flowing to Bute Town Reservoir. The bridge forms part of a farm track to Nant yr Helyg Farm.

167. Gullies and earthworks, Bute Town (SO 1020 0934)
South of the A465, close to Bute Town reservoir are a series of gullies and Post-Medieval (industrial) earthworks, which may be related to the nearby leat-system. The earthworks, linear in form, are orientated roughly north-south.

168. Skew bridge, Llechryd (SO 1042 0944)
A concrete bridge, built to carry the road over the cutting for the Merthyr, Tredegar & Abergavenny Railway, but now disused. Part of the iron reinforcing fabric is visible on the southern parapet wall. It is believed locally that the cutting below this bridge exceeds 6 metres in depth (pers.com.).

169. Station House, Llechryd (SO 1046 0951)
The Rhymney Bridge Station House at Llechryd on the Merthyr, Tredegar & Abergavenny Railway, now re-used as a domestic building of the same name. Situated on a bank above the present A465, the station and platforms were originally served by the railway in a cutting below the level of the present road (No.168) approaching from the south and exiting north-east following the course of the A465. The building displays no features of special architectural interest and the exterior is heavily obscured by render.

170. Southern section of leat system, Llechryd (SO 1052 0953 to SO 1053 0950)
This section of the main leat (No.160) extends under the A465 through a culvert and can be followed for approximately eight metres to the south of the road, until it terminates half way up a gradual north-facing slope. The gradient of the watercourse is slight, but it runs in a north to south direction toward Bute Town Reservoir.

171. Gullies and tips, Princetown (SO 1110 0969 to SO 1111 0963)
Orientated roughly north/south and south of the A465 is a deep gully which runs from a high embankment above the road to a side road of the B 4257. Possibly associated with quarrying to the east.

172. D.S.W. landscape, Princetown (SO 1120 0965)
Underlying, and in places overlying, coal tips are the remnants of an early drystone wall landscape which probably pre-date the industrial phase of this area.

173. D.S.W & T.S.W landscape, Blaencarno Common (SO 0860 0890)
Within the 'impact zone', north of a series of (industrial) linear scratches are the remnants of an early drystone and turfstone landscape that extends further north and east beyond the Merthyr Common road. Traces of turfstone walling can also be seen on the Blaencarno Common.

174. Ventilation/water shafts, Blaencarno Common (SO 0883 0891)
Located along the intermediate slopes of Blaencarno Common between the A465 and the Merthyr Common road are a number of circular features that are associated with the mining industry, two of which are ventilation/water-drainage holes that are located 25 metres east of the Bronze Age cairn (No.175).

175. Bronze Age Cairn, Blaencarno Common (SO 0887 0890)
Remnants of a small a dough-nut shaped cairn c.3-4 metres in diameter and about 1 metre high built of medium sized rubble probably Bronze Age in date. Although there is later material surrounding, including brick and slag, this structure does not appear to have had any industrial function. Aerial photographs show further similar features to the north and east, but outside the 50m corridor; this landscape may therefore represent the remnants of a Bronze Age cairn field.

176. Industrial earthworks, Merthyr Common (SO 0851 0890)
Located to the north of the A465, and west of Blaencarno Common are a number of heavy scratches which extend over 150 square metres. Linear in form, these features overlie earlier coal-tips. To the south, and incorporated into the A465, are extensive coal-tips (No.178). Between the scratches and the coal-tips is a small stream that feeds onto Blaencarno Common. Iron-ore deposits are visible within the bank section.

177. Railway furniture, Merthyr Common (SO 0842 0862)
A line of concrete posts delineates the northern extent of the Abergavenny, Tredegar & Merthyr Railway. Approximately two metres south the route has been infilled by later coal tips.

178. Coal tippings, Blaencarno Farm (SO 0890 0876)
These spoil-tips, which are still visible, are marked on the O.S. of 1880 and are partly incorporated into the foundations of the A465.

179. 'Dig for Victory' allotments, Blaencarno Farm (SO 0892 0884)
A series of four allotment gardens dating from the W.W.II 'Dig for Victory' campaign and originally belonging to the occupants of seven cottages (shown on tithe of 1842 and O.S. of 1880) which stood adjacent to Blaencarno Farm, but which have now been demolished. The features consist of low drystone walls which delineated the extent of the various allotments.

180. Culvert, Blaencarno (SO 0899 0890)
A culvert below the line of the present A465, constructed of well-coursed masonry and built when the Merthyr, Tredegar & Abergavenny Railway followed this route.

181. D.S.W., Blaencarno (SO 0975 0910)
To the south of the A465, and east of Gypsy Castle are the remnants of a drystone walled landscape which incorporates an 'L'-shaped feature (SO 0958 0910) which is constructed of turf and stone. To the south, the area is well-drained by several streams and artificial watercourses. To the north, the field system is truncated by the boundary of the MT & A Railway. Aerial photographic evidence also highlights a possible ringed feature nearby (SO 0968 0914), approximately 8-10 metres in diameter.

182. Railway furniture, Blaencarno (SO 0920 0930)
To the north of the A465 is a line of concrete railway posts. These delineate the northern width of the MT & A Railway. To the south of the posts are the remnants of a raised platform which marks the limit of a double track width.

183. Station House, Dowlais Top (SO 0800 0845)
Built adjacent to the Brecon & Merthyr Railway (B. & M.), close to a junction with the LNWR Dowlais Extension of 1873, which linked the Merthyr, Tredegar & Abergavenny Railway at Dowlais Top and the Brecon & Merthyr Dowlais Branch at Ivor Junction. The B. & M. line to Dowlais Top was opened in 1863 although the two-storey station house, which is constructed of rusticated coursed masonry, may be later. The building is typical of 19th century railway architectural. The platform area to the west of the station house has now been landscaped.

184. Brecon-Merthyr Railway (Dowlais Top) (SO 0804 0849 to SO 0839 0863)
The main line of the Brecon & Merthyr Railway opened in 1869 and ran from Dowlais Central to Pant, parallel for most of the way with the present road between these places. At Pant it was joined by the earlier B. & M. main line to Brecon via Pontsticill opened in 1863.

185. Brecon-Merthyr Railway embankment, Dowlais (SO 0750 0836)
A large section of embankment belonging to the Brecon & Merthyr Railway exists west of the Dowlais Top roundabout, close to the easterly section of the Upper Reservoir leat system (No.186). The route of the railway at SO 0729 0849 veers north alongside the northern bank of the Upper Reservoir towards Brecon. The original line between Dowlais Top station and SO 0750 0840 roughly follows the northern limit of the present A465.

186. Eastern leat system, Upper Reservoir, Dowlais (SO 0750 0834 to SO 0729 0848)

A well preserved leat running for approximately 300 metres and incorporating two aqueducts (No. 187) is located within a narrow piece of land belonging to Welsh Water. Orientated east/west, traces of original brick-work are visible along its entire length. This leat feeds water into the Upper Reservoir

187. Aqueducts under leat, Upper Reservoir, Dowlais (SO 0733 0842)
Two nineteenth century aqueducts constructed of unmortared sandstone masonry are located approximately 15 metres north of the A465, close to the perimeter fence of the Asda superstore (Dowlais Top). The upper lining, which is constructed of Victorian yellow-brick and in places repaired with concrete, is exposed on both aqueducts.

188. Upper Reservoir, Dowlais (SO 0720 0850)
Two reservoirs (Upper and Lower) (No.195) are located either of the A465. Upper Reservoir is the larger of the two and has two leat systems (Nos. 186 & 191) feeding into and out of it. The southern embankment is raised approximately five metres in order to overcome the natural contours of the landscape. Below the embankment to the south-west is an associated water pumping/release station (No. 189). This reservoir is the more modern of the two, and was built by the time of the preparation of the first edition of the O.S. 1:2500 map in 1872-85.

189. Pumping station, Upper Reservoir, Dowlais (SO 0705 0851)
Below the Upper Reservoir is a 19th century pumping station constructed of red brick with a later low concrete slab roof.

190. Inspection road, Upper Reservoir, Dowlais (SO 0728 0846 to SO 0692 0868)
Surrounding the Upper Reservoir is a concrete inspection road, approximately three metres in width. It appears to be equi-distant between both the Upper and Lower Reservoir as well as the leat system to the west. A smaller road links the Upper and Lower (No. 195) Reservoir via the pumping station (No. 189).

191. Western leat system, Upper Reservoir, Dowlais (SO 0688 0867 to SO 0692 0849)
To the west of the Upper Reservoir is a north/south orientated leat with an extensive brick and stone masonry lining visible. Flowing north to south, the leat is 1 metre in depth by 1.5 metres wide and runs approximately 200 metres north of the A465. The leat south of the road feeds into Lower Reservoir.

192. Branch line of Brecon & Merthyr Railway, Dowlais (SO 0668 0887 to SO 0733 0804)
To either side of, and below, the A465 is the remains of a substantial north/south cutting originally part of the branch line of the Merthyr & Brecon Railway. Opened in 1869, the branch line ran from Dowlais Central (south of A465) to Pant in the north. At Pant, the branch line converges with the main earlier Brecon & Merthyr Railway (to Brecon via Pontsticill) opened in 1863.

193. Branch line of Brecon & Merthyr Railway, Dowlais (SO 0675 0856 to SO 0666 0859)
To the north of the A465 is the course of an east/west connecting line between the main line of the Brecon & Merthyr Railway to Brecon (via Pontsicill) in the west (No.194), and the branch line of the Brecon & Merthyr Railway to the east (No.192). The route has now been substantially disturbed by development, but is still indicated by the presence of railway posts.

194. Brecon & Merthyr Railway (to Pontsticill), Dowlais (SO 0664 0884 to SO 0651 0840)
Below the A465 and to the west of the Brecon & Merthyr Dowlais Branch is the Brecon & Merthyr Railway main line to Brecon via Pontsticill - opened in 1863. At Pant, this line converges with the later Dowlais Branch of the Brecon & Merthyr Railway - opened in 1869 (No. 192). Directly below the A465 fly-over along the course of this line a set of railway signals are still visible.

195. Lower Reservoir, Dowlais (SO 0730 0830)
The smaller and more southerly of two inter-linked reservoirs, the Lower Reservoir was built prior to the completion of the Merthyr Tydfil tithe map of 1850, whereas the Upper Reservoir was added later in the century (No.188). Constructed to supply water to the Dowlais Ironworks.

196. MacDonald's Restaurant, Dowlais Top (SO 0783 0822)
Constructed during the early 1990s, this Post-Modernist fast-food restaurant is one of only a few 'Drive-thrus' situated within this part of Wales. Constructed of red brick to a 'MacDonalds' standardised design, this building will be directly impacted by the dualling.

197. DSW. landscape, Gurnos (SO 0485 0870)
To the north of the A465, east of the Castle Morlais Tramroad (No.200) is the remnants of a drystone walled landscape.

198. Lime kilns, Castle Morlais Tramroad, Gurnos (SO 0471 0872)
The remains of at least three circular, corbelled lime-kilns constructed of unmortared, uncoursed rubble stonework (standing to a height of c.1.5m) are located on the eastern edge of a large coppiced woodland, next to the Castle Morlais Tramroad (No. 199). This tramroad would have supplied the raw materials used to charge the kilns, the resultant lime was probably being used for agricultural improvement of the land surrounding Gurnos Farm (No.204).

199. Coppice and D.S.W. landscape, Gurnos (SO 0470 0870)
West of the Castle Morlais Tramroad is a large coppice area which incorporates three lime kilns (No. 198). It is possible that the coppice supplied fuel for the kilns as well for the farm.

200. Castle Morlais Quarries Tramroad, Gurnos (SO 0473 0892 to SO 0473 0867)
The course of the tramroad which was built in 1803 crosses the A465 at this point. It brought lime and limestone from Castle Morlais quarries down to the Dowlais Ironworks. The line was constructed of a plateway with mixed 2ft.9in. and 4ft. 2in. gauge track and the route is marked on the tithe map and OS of 1880.

201. Possible quern stone, Gurnos (SO 0455 0866)
Within a field (No.197), around 150 metres east of Gurnos Farm, a possible quern-stone (with acute bowling on one face) was identified, which is probably of prehistoric date.

202. D.S.W. landscape and sheep pen, Gurnos (SO 0450 0865)
Approximately 110 metres to the east of Gurnos Farm is a semi-circular drystone walled enclosure which appears to have been truncated to the south by the construction of the A465. Inside the semi-circular feature there is evidence of stone clearance, whilst externally the surrounding fields are littered with limestone outcrops and possible quarrying. Following the external circumference of the walling is a stream linked to other watercourses to the north.

203. Gurnos Farm workers cottages, Gurnos Farm (SO 0435 0863)
Three farm worker's cottages of 2 bays, and 2 storeys high with painted brick window & door detailing and coursed, rusticated masonry. Architecturally very similar to Gurnos Farm the buildings probably acted as tied cottages for agricultural laborers.

204. Gurnos 'model' Farm, Gurnos (SO 0430 0864)
Gurnos 'model' Farm was occupied, but not owned, by William Crawshay. A tithe award was prepared in 1846 and then encompassed to 209 acres. Consisting of a farmhouse covered by striated render imitating ashlar masonry, painted windows and door detailing, with a front porch and decorative barge boards. The main body is of 3 bays in length with a hipped roof. To the side is an extension with a pitched roof of Welsh slate. Either side of house are single-storey stable blocks (the western wing forming a 'c' shaped layout) built of uncoursed stone with brick detailing. At the centre of the courtyard is a lofted barn built of coursed stone. The farm is unusual in being a planned courtyard farm, and the layout dates from before 1880 O.S. It may have been erected by William Crawshay II as part of his development of the Cyfartha estate, which included a large amount of ornamental planting between Gurnos and his seat at Cyfartha Castle.

205. D.S.W. landscape, Gurnos Farm (SO 0423 0860)
Directly to the west of Gurnos Farm and incorporated into the outer walls of the farm complex is a series of drystone walling, part of which encloses a small coppice. Drystone walling also forms part of a side entrance to the farm complex.

206. Viaduct A, Taf Fechan, Cefn-coed-y-cymmer (SO 0335 0815)
One of the bridges designed by road engineers Rendel, Palmer & Tritton with Alex Gordon and Partners as consultant architects it employs twin parabolic arch ribs to carry the road above over the gorge.

207. Gurnos Leat system, Cefn-coed-y-cymmer (SO 0342 0829 to SO 0373 0767)
A leat below the present A465, and parallel to the Taf Fechan and Gurnos tramroad. Built in 1792 it is constructed of red brick with masonry coping stones. It was used to supply Cyfartha Ironworks with water and still flows to this day.
CADW/SAM GM478

208. Gurnos Tramroad, Cefn-coed-y-cymmer (SO 0341 0830 to SO 0372 0767)
The course of the Gurnos Tramroad below the present A465, and parallel to the Taf Fechan and the Gurnos leat. Built to supply limestone to the Cyfartha Ironworks.
CADW/SAM GM478

209. Footbridge over Brecon-Merthyr Railway, Cefn-coed-y-cymmer (SO 0327 0821)
Thirty metres northeast of the a railway bridge (No.211) spanning the present A465 is a four-girder iron footbridge with cross concrete plinths. The adjoining bank is revetted with rusticated ashlar masonry.

210. Gurnos Limestone Quarry, Gurnos (SO 0355 0828)
A well-preserved late eighteenth century quarry excavated to supply Cyfartha Ironworks with limestone. Described as 'Quarry and Pasture' on the tithe map and associated with a network of tramways on the quarry floor which were shown on the 1880 O.S.

211. Railway bridge, Brecon & Merthyr line, Cefn-coed-y-cymmer (SO 0324 0814)
A bridge once carrying the Brecon & Merthyr Railway across the line of the Merthyr/Abergavenny Railway (now the A465). It appears to have been replaced during construction of the A465 in 1964. The bridge is constructed iron riveted plates supported by iron girders.

212. Capel Tabor and cemetery, Cefn-coed-y-cymmer (SO 0297 0808)
Tabor chapel was built in c.1850, and rebuilt in 1904 in a Neo-classical style, as a 2 storey building with a basement. The first floor has decorative keystones and mouldings to windows on front elevation. The ground floor has decorative long/short work around the windows and corners, the side door and porch. At the basement level there is a side entrance and porch. The associated graveyard dates from c.1850 and has a number of decorated headstones, some written in Welsh. The chapel was restored in 1989.

213. Prehistoric hut circle, Cefn-coed-y-cymmer (SO 0297 0804)
An area of possible Iron Age activity west of Cefn-Coed-y-Cymmer described as a 'Celtic hut circle' (GGAT) consisting of a simple earth mound and a single broken quern stone. The area indicated by the SMR grid reference is now within a large cutting made for the A465 and has therefore been destroyed.
GGAT/PRN 1104 M

214. St. John's Church, Cefn-coed-y-cymmer (SO 0329 0806)
Designed by Cardiff architect George Edward Robinson in 1880 and typical of 'High Church' architecture of the period. The church is built in a 'Gothic' style with a tower in the north aisle, a porch over the south-eastern entrance, decorative stain-glass windows and is buttressed on all sides. The windows in the nave are decorated with gothicised tracery. The whole church is built of uncoursed masonry, except for the window ornament and the well-cut, rusticated quoins, and covered by a Welsh slate roof. Associated with a stone & brick chapel opposite.

215. Medieval coin hoard, Cefn-coed-y-cymmer (SO 0328 0805)
Close to St. John's Church, Cefn-coed-y-cymmer was discovered a hoard of 31 silver coins, all dating before A.D.1325.
GGAT/PRN 1887 M

216. Stone structure, Cefn-coed-y-cymmer (SO 0372 0430)
South of present A465, and situated at the bottom of a scree slope (south-west facing) are two large slab-stones (limestone) that are positioned over what is possibly a series of orthostats. At the southern end the larger of the two slabs is embedded into the soil; a so-called 'earth-fast monument.'
217. D.S.W. landscape, Gurnos (SO 0408 0840)
A substantial drystone wall which is partly revetted on the west side, runs for approximately 150 metres, south of the A465. It stands in places at 1.5 metres high and may have supported a trackway behind to the south.

218. Grawen Cottages, Cefn-coed-y-cymmer (SO 0285 0814)
A terrace of two-storey, two bay worker's cottages with a central entrance and a lean-to at back although many have now been altered. Built of uncoursed masonry with brick arched lintels over doors and windows, these were shown on the O.S. of 1880 and probably date from the mid-nineteenth century.

219. D.S.W. landscape, Coed Meurig (SO 0238 0748)
To the north-east of Coed Meurig farm is a drystone walled field-system which extends approximately 60 metres to the east. Associated with the lofted cow shed (No.222).

220. Buttressing under Nant Ffrwd Viaduct (SO 0248 0752)
The remains of earlier masonry abutments incorporated within the structure of the Nant Ffrwd concrete viaduct (No.221 C) (1964).

221. Viaducts (A465), Cefn-coed-y-cymmer (B=SO 0282 0789, C=SO 0250 0750)
A further two 1960's concrete viaducts are located further west of the Taf Fechan viaduct; all three won Civic Trust Awards in 1968. The road is supported by two single-span elliptical arches with vertical struts. The bridges were designed by road engineers Rendel, Palmer & Tritton with Alex Gordon and Partners as consultant architects. Those over the Taff Fechan and Nant Ffrwd employ twin parabolic arch ribs to carry the road above and the central bridge over the Taff Fawr has three spans cantilevered from two piers. No.221 A (No. 221 B (SO 0282 0789) - over Taf Fawr; No. 221 C (SO 0250 0750) - over Nant Ffrwd.

222. Lofted cow shed, Coed Meurig Farm (SO 0226 0745)
Coed Meurig lofted cowshed of six or seven bays in length with external stone staircase at the eastern end to the hayloft above. Built of uncoursed masonry with brick detailing, wooden lintels. The roof trusses have been entirely replaced and covered with a Welsh slate roof. There are the remains of full-length double doors at the rear (northern elevation), mirrored by a similar blocked entrance to the front, which appear to have been used as threshing doors. Ventilation slits either side of these entrances also suggest that fodder was stored in this building. Internally the stalls and hay racks are still present. Externally, there are associated sheep pens, a sheep dip and a cobbled yard which surrounds the cowshed. These farm-buildings are clearly marked on the Merthyr tithe map of 1850 and the schedule of 1846. The latter, lists Coed Meurig as a farm of 37 acres.

223. D.S.W. landscape, Nant Ffrwd (SO 0240 0745)
Remnants of drystone walling located south-east of Coed Meurig Farm which represents part of the associated field-system enclosing the farmstead.

224. Coal tippings, Baverstock (SO 0260 0720 to SO 0100 0720)
To the east of the Baverstock settlement and parallel to the present A465 to Cyfarthfa are sequence of coal tips. These tips are related to either the Cyfarthfa or Llwydcoed Ironworks. To the east of the settlement, are a number of horizontal mine-shafts which cut into a north facing slope of Bedd y Gwyddel, from which the waste is formed into a series of crow-foot tips to the north (See diagram).

225. D.S.W. landscape and sheep pen, Coed Meurig (SO 0220 0735)
A substantial drystone walled landscape which incorporates a sheep fold, both are at present related to Coed Meurig Farm. The walling on the southern side of the A465 is arranged in order to funnel livestock towards the lofted cow shed (No.222) at Coed Meurig Farm (north of A465).

226. Stone rubble-demolished cottage, Baverstock (SO 0110 0740)
Area of stone rubble spread suggesting the site of a cottage that was demolished 30 years ago (pers. com.). The cottage would have been part of the Baverstock settlement (No.232). Drystone walling either side of the A465 links the two sites.

227. D.S.W. landscape, Baverstock (SO 9970 0717)
Drystone wall field system running either side of A465, possibly related to drystone walling, approximately 150 metres to the west (No.228).

228. D.S.W. & T.S.W., Lech Sychrhyd (SO 9947 0700)
Remnants of a drystone walled and turf boundary landscape now bisected by A465. To the north, landscape has been much altered due to extensive forestry plantations.

229. Track, Lech Sychrhyd (SO 9960 0704 to SO 9958 0680)
A track to the south of the A465 which is visible at ground level. It has a slightly raised platform running north/south. It is possible that this track once continued further to the north of the A465, but forestry planting in this area has now destroyed any possible evidence.

230. Dam and possible sluice system, Lech Sychrhyd (SO 9969 0690)
South of A465 is a probable damming system that incorporates a substantial oval-shaped series of banks and a sluice. The banks have been cut and enlarged around a small stream

231. Fairfield House (Giant's Head Inn), Baverstock (SO 0055 0728)
Cottage adjacent site No.232, is believed by the owner to be a masonry-built public-house of at least the Victorian era, originally known as the 'Giant's Head' after the 'Giant's Grave' pillow mound on the hill to the south. The house is of two-storeys and three bay design with two gable-end chimneys and buttressing to the north gable wall, which was rebuilt in the 1970's after severe subsidence. Externally the building has concrete roof tiles and inserted double glazed windows as well as been rendered outside walls.

232. Settlement and field system, Baverstock (SO 0073 0730)
Located SE of Baverstock Hotel is a complex series of field systems of substantial turf and drystone walling representing gardens, enclosures and drainage systems. Areas of rubble concentrations seem to indicate house platforms and the associated banks may be the remains of post-medieval tofts. The surface finds of pottery and glass indicate continuing usage and the tipping of domestic refuse throughout the nineteenth century. On the hillside above the site is a multi-period landscape with a number of features including several Bronze Age ring cairns and an unusual raised turf cross described as a 'pillow mound', known locally as the 'Giant's Grave'. This latter feature, although with no supporting evidence, is indicated by the SMR as the possible site of a medieval windmill (GGAT). This, however, seems to be a somewhat unlikely inference as the surrounding landscape supplies ample opportunity for the harnessing of water-power. The Merthyr tithe map of 1850 marks two cottages, now demolished, close to the site of the Dynevor Arms, one of which is likely to be directly impacted by the dualling, whereas the other is on the edge of the 50m corridor. These may have been built by miners working the outcrops of coal and iron up slope (See diagram).

233. Coal workings and tips, Baverstock (SO 0069 0727)
The remains of early open-cast workings possibly aided by water extraction located behind the Post-Medieval settlement of Baverstock (No.232). The tippings have been purposely dumped in order not to extend beyond field boundaries close to the settlement. They stretch for approximately 110 metres and merge into substantial coal tippings running east to the settlement of Cyfarthfa.

234. Nant Hir Reservoir (SO 9890 0690)
The Nant Hir Reservoir, of mid-19th century date, was built by the Aberdare Water Works Co. The reservoir which is now bisected by the A465 is not found on the tithe map, but is shown on the O.S. of 1880. It is circumvented by a substantial mortared wall and a dam, sluice and bridge are found in the southern extent of the reservoir.

235. Holloway, Nant Hir (SO 9885 0690)
A small holloway running NE/SW and is parallel to the walls of the Nant Hir Reservoir. It merges into a more substantial holloway from the west (No.238) at a field shelter (No.237).

236. D.S.W. landscape, Nant Hir (SO 9875 0684)
An extensive drystone walled landscape which is located either side of A465, is probably contemporary with two holloways to the east (No. 238). The present road truncates the linearity of at least two walled boundaries which define an historic pastoral field system.

237. Field barn and stable, Nant Hir (SO 9885 0686)
An unusual arrangement of farm buildings constructed adjacent to Nant Hir reservoir and associated with a drystone walled landscape (No.236), the intersections of two holloways (235 & 238) and reservoir perimeter wall (No.234). To the north is the remains of a substantial building (c.4m x 6m) of coursed masonry, standing to c.2m high. The stonework is uniform with quoinstones and a cross-passage way, but no evidence of the roofing material. Attached to the eastern elevation is a later lean-to rubble masonry building. To the south of the mortared building is a drystone walled structure with a rough internal corrugated iron shack separated by a straight joint. It was probably built from the demolition material from the northern building re-used as drystone walling and acted as a stable/field-barn. The whole site is bordered on one side by the reservoirs perimeter wall which curves round to a nearby entrance gate and the intersection of two holloways which are truncated by the A465 to the north.

238. Holloway/sheep pen, Nant Hir (SO 9983 0687 to SO 9875 0698)
An extensive holloway (2-3m deep) running north/south, either side of the A465. On both sides of the holloway is a series of mature taxa possibly indicating an early date for the holloway. To the north, approximately 50 metres from the road, the holloway merges into an extensive corralling area (sheep or cattle) which is delineated by low dry-stone walling. To the south, a second holloway converges at a small field shelter (No.237), west of Nant Hir Reservoir.

239. D.S.W. landscape, Nant Melyn (SO 9798 0625)
An extensive drystone wall landscape either side of A465. Both the walled landscape and holloway are probably integrated.

240. Holloway, Nant Melyn (SO 9770 0622 to SO 9789 0623)
An east/west aligned holloway (north of A465), is at present, connected to a farm track leading to Nantmoel Farm. The present A465 has destroyed any possible indication of its southern route. However, the route probably crossed the Nant Melyn at the point now traversed by a road bridge (SO 9792 0624).

241. Holloway, Llycoch (SO 9768 0592 to SO 9785 0585)
A Holloway aligned north/south and perpendicular to A465, with substantial rubble drystone walls (c.1m high) and indicator species of birch, hazel and holly. The track appears to extend north to Llyncoch Farm and beyond. To the south, the track terminates at the southern most point of a birch coppice.

242. Holloway, Court Farm (SO 9734 0564 to SO 9735 0547)
Remnants of a holloway/track running either side of the A465 which is perpendicular to the B 4018 (an extension of the old A465). It appears to have once served Court Farm (SO 9718 0584). The holloway/track predates the Vale of Neath Mineral Railway - the railway truncates the holloway (pre 1851). It may also be contemporary with coppicing and drystone walling to the south.

243. Skew bridge over Vale of Neath Railway (SO 9727 0552)
A skew bridge which was built to carry a road over the Vale of Neath Mineral (later G.W.R. branch) Railway (Nos. 258 and 272). It is constructed of large to medium sized, coursed, rusticated, limestone blocks. Within the tunnel there is a masonry pier with angled stonework, which form the curve of the arch. The bridge has masonry abutments on all four sides.

244. Rectangular platform and earthworks, Hirwaun (SO 9674 0544)
Approximately 80 metres north of A465 is a substantial rectangular building platform, probably industrial in form and may be contemporary with a track which runs N/S towards the Afon Cynon. The layout of the masonry brick suggests a building with at least three rooms and an outer platform, possibly for loading.

245. D.S.W. landscape, Parc Hensol Farm (SO 9675 0528)
An extensive drystone walled system around the now derelict farmstead of Parc-Hensol Farm. Much of the walling, which is in reasonable state of preservation, extends to the A465, 80m to the north. Walling includes a small enclosure, attached to the farmstead and revetting of a near-by stream, a tributary of the Afon Cynon.

246. Farmstead, Parc Hensol (SO 9677 0526)
Between the Afon Cynon and a brook to the west is a small, partly demolished, farmstead in the lea of a small hillock, associated with dry-stone wall field boundaries probably of the early nineteenth century. It was probably a single-storey cottage divided into two bays with a western gable-end chimney. Attached to the northern elevation is a lean-to structure with further separate outbuildings to the east, currently represented by the remains of a flagstone floor. The building is constructed of uncoursed limestone bonded with lime mortar, but with some repairs in Portland cement and red-brick. To the west, is an area of gardens and a masonry revetment along the nearby stream .

247. Bridge remains, Afon Cynon (SO 9682 0529)
To the east of the Parc-Hensol farmstead (No.246) and along the bank of the Afon Cynon is a wrought-iron tension bar indicating the remains of a rope/wire footbridge. On the opposite side of the river is the remains of a slabbed platform relating to the crossing.

248. Track, Afon Cynon, Hirwaun (SO 9697 0529)
A small metalled track running alongside the Afon Cyon and following east around the lower contour of a small hill, adjacent to the A465. Possibly contemporary with Nos. 244 and 247. Width of track is approximately 2.5-3.0 metres.

249. Cynon farm, Hirwaun (SO 9640 0526)
Mid-Victorian cottage with at least three phases of construction close to the banks of the Afon Cynon. Built of stone rubble with brick detailing around the windows and doors, quoin stones and a central doorway. The roof has modern concrete roof tiles and there is a later western gable-end chimney, and lean-to. Now derelict, but under renovation.

250. Hirwaun-Aberdare Tramroad, Hirwaun (SO 9620 0530 to SO 9667 0513)
Built for the Hirwaun Ironworks to the canal at Aberdare in the 1790's, it is now represented by a minor road and a footpath. The line was still in operation during the mapping of the second O.S. in the 1870's, by which time it had been rebuilt and integrated with the main line railways serving Hirwaun Ironworks and its associated mines and collieries. Drystone masonry revetting and rut marks in the stone are visible along the course of the tramway. It was later re-built as a locomotive railway.
GGAT/PRN B48

251. Pig-Pens, Hirwaun (SO 9544 0535)
Uncoursed masonry pig-pens belonging to a farmstead between the river Nant-y-Bwlch and Tower road, probably dating from the mid-nineteenth. Associated with this farmstead is the remains of a demolished masonry building on the bank of the river which probably pre-dates the current bungalow as the farmhouse.

252. Bute Colliery Road (Tower Road) (SO 9534 0527 to SO 9506 0500)
Course of the dismantled Bute Colliery to Hirwaun Tramway intersects with the preferred route south of A465 and has now been replaced by the Tower Road. To the south at SO 9506 0501 the Bute colliery tramway and the Aberdare to Rhondda Railway appear to converge near an area of open-cast workings.
GGAT/PRN B 62

253. T.S.W. landscape, Hirwaun (SO 9525 0533)
Either side of the A465 are the remnants of a turfstone walled landscape which probably predates industrial activity in the area

254. Coal tips, Bryngelli Estate, Hirwaun (SO 9520 0534)
South of the A465, and close to the second roundabout west of Hirwaun, are extensive coal-tippings that date from the nineteenth/twentieth centuries. Standing around 25 metres high and running for 300 metres the tips originate from nearby collieries to the south. A number of tramroads are located close-by and may have served the southern extent of the tips.

255 Railway A. Aberdare & Rhondda Railway (SO 9578 0514 to SO 9506 0501)
The course of the Aberdare & Rhondda Railway running roughly west/east, and crossing the proposed line of the A465 near to the crossing over the Nant-y- Bwlch. It is marked on the OS of 1880 as the Aberdare & Rhondda 'main line'. From a bridge over the stream at SO 9531 0508 the line continues east, running to the south of the tennis courts to another bridge where a tramroad crossed the main line (SO 9560 0503).

255 B. Tramroad B - Branch of the Aberdare & Rhondda Tramroad (SO 9581 0512 to SO 9589 0476)
Shown on the OS map of 1880 as an abandoned branch of the Aberdare & Rhondda tramroad, continuing SSW, presumably to pits, which had vanished by the time of the OS in 1880. The tramroad is built upon an earth bank over 1.5m high which has been truncated by the later construction of Tramway C and crosses a stream above a culvert (No.256).

255 C. Tramroad C, Hirwaun (SO 9587 0510 to SO 9567 0471)
The course of a tramway running SSW, but not shown on the OS of 1880. The tramroad intersects with Tramroad B. causing the partial destruction of its earth bank, and indicating its later construction date.

256. Culvert, Aberdare-Rhondda Tramroad, Hirwaun (SO 9582 0506)
A small culvert below the course of tramroad B. (No.255), of drystone construction now partly collapsed on the eastern side. Built from sandstone blocks, the culvert is contemporary with the initial construction of the tramroad.

257. Culvert, Hirwaun to Aberdare Tramroad, Hirwaun (SO 9648 0519)
A small culvert below the line of the tramroad for the course of a brook built of drystone masonry. The culvert has been repaired using an iron girder and concrete.

258. Vale of Neath Mineral Railway (western section) (SO 9530 0617 to SO 9413 0641)
The Vale of Neath Railway was opened in 1851 as a broad gauge line, later re-built as a standard gauge Great Western branch, and survives as a single track mineral line. The western section of line circumvents Hirwaun to the north, eventually crossing the A465 in the east (No.258) under a contemporary skew bridge (No. 243). The Hirwaun Common Mineral Railway (No. 259) linked the western section of the Vale of Neath Railway to the Bute colliery.
GGAT/PRN D 29

259. Branch of the Hirwaun-Aberdare Tramroad (SO 9408 0591 to SO 9525 0556)
A branch of the Hirwaun-Aberdare Tramroad exists to the west of Hirwaun and follows the present route of the Rhigos Road (A 4059). Orientated roughly east/west, the route approaches Hirwaun from the south-west, and then heads north-east through the town towards the main Hirwaun-Aberdare Tramroad (250i.) and a series of (scheduled) viaducts (SO 9584 0572) to the north.

260. Walled enclosure, Pen-Twyn, Gilwern (SO 2457 1442)
An enclosure on the slope of a north facing hillside representing a walled garden area probably for a private orchard is situated close to an embankment, south of the A465, directly opposite the Navigation Inn, Gilwern.

261. Walled road, Govilon (SO 2620 1437 to SO 2710 1433)
North of the A465 from Hopyard Farm (No.25) to the Boat Farm (SO 2709 1435) is a country lane, intermittently walled on either side, which crosses the Cwm-Shenkin Brook over a single arched masonry bridge close to the worker's cottage (No.14).

262. Building foundations, Pant Glas (SO 2298 1343)
Approximately 15 metres north of leat keeper's cottage, and under the present A465 was a school of which there are no visible remains. This school was once part of a thriving local community along the banks of the Clydach. Photographic evidence indicates that a number of cottages were located along the northern banks of the Afon Clydach, facing the Clydach Ironworks. Both these cottages, the school and Haman's Cottages (a large worker's cottage terrace) were purpose-built for the Ironworks.

263. Southern section of Clydach Railroad, Pont Harri Issac (SO 2043 1233 to SO 2130 1212)
To the south of the A465 is a small section of the Clydach Tramroad, in existence by 1798, which ran south-east over the River Clydach (Rattenbury 1980). The branch line to the collieries at Gelli Felen left the main line at Pont Harri Issac (a now demolished bridge). Further east (270 metres), the Clydach Tramroad crosses the line of M.T. & A. The route now survives as a footpath on the south side of the A465.

264. Western section of Clydach Railroad, Brynmawr (SO 1949 1202 to SO 1920 1220)
To the north of the A465, the tramway follows the northern banks of the Afon Clydach to the roundabout, east of Brynmawr. The route survives as a footpath to the Brynmawr roundabout, before running parallel (south) to the Clydach Bridge (No.118). After this, the route veers to the south-west into Brynmawr. To the east, the tramway crosses over the bridge at Nantmelyn (c.1793) (No. 112).

265. Branch of Disgwylfa Tramroad, Clydach Dingle (SO 1923 1283 to SO 1933 1277)
To south of the 'squatter's settlement (No.120), and next to quarrying within Clydach Dingle is a shallow incline which is a well persevered section of the Disgwylfa Tramroad. The area had a high concentration of quarrying (to the north) and coal extraction (to the south of the Dingle). This branch would have eventually converged with the Llangattock Tramroad at Brynmawr. It is probable that this branch supplied limestone from a small quarry within the Dingle (SO 1923 1284).

266. Reservoir, Garn Lydan (SO 1766 1279)
A small pond, north of the Preferred Route at Garn Lydan which is the remnant of a slightly larger reservoir marked on the OS of 1880 described as belonging to Nantyglo Ironworks. This pond was linked the larger Baen y Cwm Reservoir (No. 267) to the north-east and two others further south near Beaufort Hill, which also belonged to the ironworks. All four were part of a system of water-supply to the ironworks at Nantyglo and possibly Beaufort.

267. Blaen y Cwm Reservoir, Garn Lydan (SO 175 129)
North of the preferred route at Garn Lydan is the Blaen y Cwm Reservoir. This is the post-1880 successor to the a much smaller reservoir on the same site which was part of a network of ponds (No. 266) and supplied the Nantyglo Ironworks near the head of the Ebbw Vale.

268. Carno Reservoir and filter-beds, Afon Ebbw (SO 164 170)
The reservoir at Carno was built after the completion of the 1880 OS map, and is constructed of masonry blocks. It is associated with a sequence of twentieth century circular filter beds below the level of the reservoir which incorporate concrete and masonry walls.

269. Merthyr, Tredegar & Abergavenny Railway, Llechryd (SO 1033 0920 to SO 1070 0962)
The course of the MT & A Railway originally ran along the present route of the A465, across the Afon Rhymni over a masonry and brick bridge (No.157) and a leat (No.160 and 165), south of Llechryd station house (No.169), below a now infilled concrete skew bridge (No.168) before veering south-west towards Bute Town Reservoir.

270. Brecon & Merthyr Railway, Taf Fechan (SO 0343 0853 to SO 0325 0816)
On the western bank of the Taf Fechan, either side of the A465 is the route of the Brecon & Merthyr Railway, opened in 1863. A Bridge (No. 211) crosses the A465 at SO 0324 0814). Approximately thirty metres north-east of the railway bridge is a small footbridge (No.209). Between both bridges, the embankment is heavily revetted.

271. Coed Meurig Farm (SO 0234 0742)
The homestead associated with the lofted cowshed (No.222) at Coed Meurig is shown on the Merthyr tithe map of 1850 and described in the schedule of 1846 as being a farm of 37 acres belonging to Lord Dynevor. It consists of a two-story cottage with an outshut to the rear. Constructed of a coursed masonry with front and rear porches, two gable-end chimneys, a Welsh slate roof and a small lean-to.

272. Vale of Neath Mineral Railway (eastern section), Hirwaun (SO 9700 0559 to SO 9760 0543)
The Vale of Neath mineral railway survives to the east of Hirwaun below contemporary masonry road bridge on the A465. The railway, which was built in c.1851 as a broad-gauge single track, has a bridge & revetments built of well-coursed rusticated limestone set askew to the railway.
GGAT/PRN D29

273. Tramway, Hirwaun (SO 9566 0520 to SO 9559 0491)
A local tramroad, surviving as a track, which transported ironstone from the Knobby Drift Ironstone pit (No.274) to the Hirwaun Ironworks during the mid 19th century.

274. Knobby Drift Ironstone Pit, Johnson Park, Hirwaun (SO 9559 0491)
This ironstone pit was served by a tramway which fell into disuse before it was surveyed for the O.S. in the 1870s (No. 273). The quarry supplied ironstone to the Hirwaun Ironworks during the mid 19th century.

275. Tramway branch-Hirwaun Common Railway (SO 9597 0500 to SO 9598 0470)
This tramway survives as a north/south track and is marked on the O.S.map of 1880. It was a branch line of the Hirwaun Common Railway and would have carried coal from collieries to the south.

276. The Hirwaun Common Mineral Railway (SO 9495 0618 to SO 9862 0481)
The Hirwaun Common Mineral Railway was marked as a tramroad on the tithe map of c.1840 and a conventional locomotive-operated railway on the O.S. map of c.1880. The line can be followed to the west of Hirwaun at SO 9495 0618 where it converges with the Vale of Neath Railway (No.258). To the east, the line of the railway follows along Longfield Court to SO 9612 0505 where it is crossed by the A465. The 1880 O.S. shows that the line continues further on to the south-east and a branch line diverges to south, currently a footpath (No.276). The main line eventually crosses the Hirwaun Road (A 4059) at SO 9664 0581.

277. Branch line of the Hirwaun Common Railway (SO 9617 0500 to SO 9634 0478)
At the point where the Hirwaun Common Mineral Railway crosses the A465, a branch line diverges to the south and currently survives as a footpath. This branch line is marked on the 1880 O.S. (but not on the tithe map).

1 Introduction

1.1 In 1995 the Secretary of State for Wales announced the Preferred Route for the proposed A465 dualling (Figure 1). Babtie Group was commissioned by the Transport Directorate of the National Assembly for Wales to carry out an archaeological assessment of the A465 in accordance with a brief prepared by Cadw: Welsh Historic Monuments (CO15L986 PP).

1.2 The archaeological assessment was divided into three stages in accordance with the guidelines set out in the Cultural Heritage section of the 'Design Manual for Roads and Bridges' (DMRB) (Vo.11, Highways Agency *et al*, 1992). The results of Stages 1 and 2 of the Cultural Heritage Assessment were published in 'A465 Abergavenny to Hirwaun Archaeological Survey: Phase 1 Report' (Babtie, 1996).

1.3 The length of road proposed for dualling extends for a distance of 41.5kms, between Abergavenny and Hirwaun; the road has been divided into 7 distinct sections. This report covers the archaeological sites within Section 5 of the road scheme which extends for 5.4kms from Dowlais Top to the A470 Junction.

2 Background to the study

2.1 The Stage 1 report was completed by Glamorgan-Gwent Archaeological Trust (GGAT,1994). These reports were based primarily on information contained in the Regional Sites and Monuments which is maintained by Glamorgan-Gwent Archaeological Trust (Curatorial Section).

2.2 This information was supplemented by a walkover survey carried out by Cadw (Cadw, 1995). Further to this Cadw prepared an archaeological brief requiring two further phases of work, which equated with Stages 2 and 3 of the Cultural Heritage assessment outlined in Vol.11 of the DMRB. These further stages were carried out by Babtie Group's archaeologists in accordance with this brief.

2.3 Stage 2 involved a re-interrogation of the Regional SMR to include any data added since the Stage 1 study. In addition a detailed desk-top study, further historic and cartographic background research and a walk-over survey with a photographic record was carried out.

2.4 During the Stage 2 assessment an archaeological value was assigned to each site based on the Secretary of State's non-statutory criteria for the Scheduling of Ancient Monuments, published in Planning and the Historic Environment: Archaeology Welsh Office Circular 60/96. Each site was then provisionally graded into five categories of site, as follows:

- Category A: Sites of National Importance;
- Category B: Sites of Regional or County Importance;
- Category C: Sites of District or Local Importance;
- Category D: Minor or Damaged Sites;
- Category E: Sites Requiring Further Investigation.

2.5 The results of Stage 2 were reported in the Cultural Heritage Assessment of Vol. 2.2 of the Environmental Statement, which identified a total of 282 archaeological sites between Abergavenny and Hirwaun (Welsh Office, 1997). The Stage 2 assessment identified a total of 33 sites in Section 5 (See Appendix 2).

2.6 The Stage 3 evaluation programme involved trial-trenching, geophysical survey, test-pitting and an assessment of the palaeoenvironmental potential. During Stage 3 a total of 41 Category E sites within the scheme were evaluated through trial-trenching of which 3 sites were within Section 5. This enabled the nature, importance and preservation of any surviving archaeological remains to be determined and the impact of the proposals on them.

3 Background to the Stage 3 Evaluation Programme

3.1 This report incorporates the Stage 2 background research and assessment with the results of the Stage 3 archaeological evaluation fieldwork programme. Most of the sites identified in Section 5 were of post-medieval date, largely consisting of industrial features such as tramroads, railways and coal and iron workings, chapels and farmsteads and drystone walled landscapes.

4 Statutory and Non-Statutory Designations

4.1 Within Section 5 there is one archaeological site which has statutory protection. This is:

- the Gurnos Tramroad (Site 207) and Leat (Site 208) form a Scheduled Monument (GM 487).

4.2 In addition there is one landscape which is recorded within the non-statutory Register of Landscapes of Outstanding Historic Interest:

- the Merthyr Landscape of Outstanding Historic Interest HLW (MG I) 2

5 Geographic and Topographic Overview of Section 2

5.1 Section 5 is situated within a narrow strip of coal-bearing land which forms the South Wales coalfield. The solid geology of the area consists of productive Coal Measures, Millstone Grit, Culm and Carboniferous Limestone with drift geology of mainly poor shaley soils.

5.2 In general the A465, between Dowlais and Brynmawr, follows an alignment that skirts the northern edge of a succession of historically important settlements at the heads of each valley it crosses. Section 5, from Dowlais Top and the A470 Junction near Cefn-coed-y-cymmer, is mainly located within open moorland. Only to the west of Dowlais and to the east of Brynmawr, was the A465 built through mainly enclosed land.

5.3 The principal settlement in Section 5 is Merthyr Tydfil, which occupies a natural basin at the head of the Taff valley. The high hills and ridges around the area reach 450m above ordnance datum, so development is largely constrained to the basin floor and smaller tributary valleys of the Taff. The Taff provides the only natural route out of the basin to the south east. The Taff Fawr forms the

boundary between Penderyn and Vaynor parishes and the Taff Fechan the boundary between Vaynor and Merthyr.

6 General Background to Section 5

6.1 The section of the A465 between Dowlais Top and Brynmawr is one of the most exposed of the entire road as much of it lies above the 300m contour and was, therefore, with possible exceptions during the Bronze Age, largely devoid of settlement prior to the post-medieval period.

6.2 During the 1960s the A465 road engineers faced considerable problems in building a trunk road to modern standards over difficult terrain. The A465, therefore, partly re-used the abandoned trackbed of the London and North Western Railway's (LNWR), which ran roughly parallel to the earlier Merthyr to Abergavenny turnpike road.

6.3 At Cefn-coed-y-cymmer, in Penderyn parish, the A465 road crossed the Taff Fawr, the Taff Fechan and the Nant Ffrwd on three major road viaducts that are generally regarded as outstanding engineering works of their type and period. The road viaducts, which were designed by the road engineers Rendel, Palmer & Tritton with Alex Gordon & Partners as consultant architects, employ twin parabolic arch ribs with the spans cantilevered from two piers.

6.4 The construction of the A465 in the 1960s severed a number of industrial era tramroads, originally built to bring raw materials, chiefly limestone, from quarries, like Castle Morlais, to the various ironworks. In addition the road crossed several leats which were built to bring water to power the furnaces and the forges. There are also some remains of ironstone pits and coal mines on both sides of the route of the A465 throughout Section 5.

6.5 Merthyr Tydfil is one of the few large settlements, located along the A465 road in Section 5. The mineral resources contained within its hinterland led to it becoming the largest iron-making town in the world between the early and mid-19th century. The town, and its associated landscape, was rapidly transformed from a village in the 1750s to the largest town in Wales by the early 1800s.

6.6 The greater portion of the metal from the ironworks in the Merthyr vicinity was converted into bar iron and other malleable iron. The production of manufactured goods made of iron centred on Sheffield and Birmingham and was little practised in Wales. However, besides iron working, there were other trades of some consequence In Merthyr, including the manufacture of woollen cloth and brewing. In addition the town was a significant economic, religious, literary and political centre in Wales.

6.7 Merthyr retains a relict industrial landscape whose character was formed when it was the most significant Welsh town of the Industrial Revolution. The landscape retains numerous elements from the late 18th and 19th centuries, such as the remains of large ironworks, remnants of the associated coal mining industry, leats for water power, an early iron bridge, early tramroads, tips, industrial terraced worker's housing and the Ironmasters' house at Cyfarthfa Castle.

7 General Historical Background to the Iron Industry

7.1 Section 5 comprises the parishes of Merthyr Tydfil, Penderyn and Vaynor. The parish of Merthyr Tydfil comprises the hamlets of Forest, Garth, Gellideg, Heolwermood, Taff and Cynon. Merthyr grew from a population of 7,700 in 1801 to a figure of 22,000 in 1831, to 34,978 in 1841 and 46,378 in 1851, making Merthyr by far the largest town in Wales.

7.2 The tithe map for Merthyr Tydfil (1850) (Figure 5) shows that, outside of the iron-producing areas, the landscape remained largely rural and enclosed. In addition, the 1891 Ordnance Survey (OS) map shows the area around Dowlais as a series of railway lines, tips, ironworkings and industrial housing.

7.3 The area's iron industry centred on Merthyr Tydfil, where the Dowlais Ironworks was opened in 1759 and became probably the first works to use coke for iron smelting in South Wales. It was followed by the foundation of other ironworks such as Plymouth in 1763, Cyfarthfa in 1765 (linked to the Hirwaun Ironworks) and Penydarren in 1784. Further subsidiary works were created in the early 19th century: at Ynysfach by Cyfarthfa; Ivor by Dowlais; Dyffryn by Plymouth; with further forges at Pentrebach. Surviving remains include the renowned blast furnace bank at the Cyfarthfa Ironworks, Dowlais Ironworks and the remains of the Ynysfach Ironworks.

7.4 In the first year of production the primitive Dowlais furnace produced over 500 tons of iron. The site was extended in 1763 and further furnaces, mills, forges and workers houses were built. It is characteristic of Welsh ironworks that they were integrated businesses since, due to the fortunate geological arrangement of the Coal Measures, the iron-ore and coal lay together with coarse pennant sandstone for building, Carboniferous limestone for use as flux in smelting, clay for bricks and water for power.

7.5 The South Wales ironworks operated on a vast scale and by 1801 the population had grown to nearly 8,000 people making Merthyr Tydfil the largest town in Wales. The Dowlais Ironworks, which had 5000 employees in the 1840s, was then the largest manufacturing enterprise in the world. By 1845 the Dowlais works had seventeen furnaces, and made 74,880 tons of iron. At the same time the Cyfarthfa works had eleven furnaces and made 45,760 tons of iron, employing founders, colliers, miners and labourers.

7.6 The iron industry built dynasties of ironmasters like the Guest family, who managed the Dowlais works, and the Crawshay family, who managed the Cyfarthfa Ironworks. William Crawshay II became one of Britain's first millionaires and built Cyfarthfa Castle with its landscaped gardens as part of his estate.

7.7 By the 1780s the ironmasters of Merthyr's iron industry had adopted Cort's puddling process, which vastly speeded up the rate of iron production and became known as the 'Welsh method'. By the 1820s, Merthyr was the source of 40 per cent of Britain's iron exports and remained the foremost ironmaking town until its decline in the 1850s when new manufacturing processes demanded purer iron ore. The population of Merthyr decreased in the 1870s until greater demand for coal led to further growth. The eventual the collapse in the demand for coal in the 1920s led to the economic failure of Merthyr.

7.8 The iron industry also invested in infrastructure in order to speed up the process of marketing their goods. Early transport systems included: · the Glamorganshire Canal from Merthyr to Cardiff, opened in 1794; the horse-drawn Penydarren tramroad built in 1802 to link Merthyr to Abercynon and significant as the route of the first steam-locomotive railway journey by Richard Trevithick's 1804; the Gurnos tramroad, built in 1793, carrying limestone from the Gurnos quarries to Cyfarthfa Ironworks; the Pontycafnau bridge, the first ever iron railway bridge to be built; and the Taff Vale Railway from Merthyr to Cardiff, which opened in 1840-1.

8 Archaeological Background to Section 5

8.1 Prehistoric

8.1.1 Within Section 5 there is only fragmentary evidence of prehistoric activity and the potential for prehistoric features is restricted by the later industrialisation of the area. There are no positively identified prehistoric features within the Section 5 road corridor, although Bronze Age cairns, round barrows and standing-stones are known to survive in the upland areas to the north the A465. Outside of Section 5, either side of the A465 near to the Baverstock Hotel, are a number of Bronze Age barrows and cairns, clustered into cemeteries. Outside the road corridor, to the north of Merthyr Tydfil, the early medieval site of Castle Morlais was built within an existing Iron Age hillfort on a limestone ridge above the Taff Gorge. The relative lack of prehistoric activity within the Section 5 of the road corridor possibly means that much of the area was only relatively sparsely occupied, possibly by semi-nomadic pastoralists practising transhumance, prior to the post-medieval period.

8.1.2 During construction of the A465, in the 1960s, a series of hut circles were uncovered at Grawen Cottages (Site No.218). The huts circles were not fully recorded, but were considered to date from the early medieval period. However, from the scanty details recorded, these could equally have been evidence of prehistoric settlement.

8.1.3 The walkover survey recorded a number of undated sites in Section 5, some of which were postulated to have a prehistoric origin. A large single stone with an acute smooth-bowled surface on one edge (Site No. 201) was identified in a field just east of Gurnos Farm. The stone appeared to be a simple hand quernstone, which could have been prehistoric in origin.

8.1.4 A small a dough-nut shaped cairn (Site No.175) was found on a south facing slope, north of the A465 on Merthyr Common. The cairn, which was c.3-4m in diameter and about 1m high, was built of medium-sized stone rubble. It is possible the site dated from the Bronze Age, although there is later material surrounding it, including brick and slag, which may suggest an industrial function as a ventilation shaft. Aerial photographs showed further similar features, outside the study area, throughout the common.

8.1.5 In addition two large slabs of limestone partially embedded into a west facing slope were identified on the south side of the road, east of Cefn-coed-y-cymmer, away from the areas of commercial quarrying. The slabs appeared to be supported from underneath by small upright stones. At the southern end, the slabs are submerged into disturbed earth and stone. This site was originally believed to be a chambered structure of an 'earth-fast' type, possibly dating from the Neolithic period.

8.1.6 The medieval castle of Castle Morlais, on a limestone ridge above the Taff Gorge, was built on the site of an Iron Age hillfort, suggesting that this site was an important strategic route prior to Roman occupation.

8.2 Roman (55 BC - AD 450)

8.2.1 There are no positively identified Roman period sites within the Section 5 road corridor, although a north/south aligned track, adjacent to the A465 at Gurnos Farm is labelled as `Roman Road' on the 1891 OS map. The possible Roman road runs towards Pont Sarn, where there is a crossing of the Taff Fechan.

8.2.2 The site may have formed part of Margary's Route 621, which was a road which connected the military sites. The exact line of this road is unknown but it did run to the nearby Penydarren Fort, connecting it to the forts at Gelligaer, Brecon, Caerleon (Isca), Caerphilly and Cardiff (Tamium).

8.2.3 Alternatively the track may merely have been yet another stretch of straight footpath which the OS surveyors interpreted as a 'Roman Road'. There is no conclusive proof supporting the hypothesis of a Roman origin for this track and the site is not recorded on the SMR.

8.2.4 The Iron Age hillfort, at Castle Morlais, was possibly abandoned during the Roman period after the beginnings of military incursions in the area. The nearby Roman auxiliary fort of Penydarren is know to have been built between the 1st and early 2nd centuries, and was occupied up to c.40 AD. It is possible its construction led to the end of occupation of the Castle Morlais hillfort. The Penydarren Fort was built on a strategic spur of ground overlooking the Morlais Valley, in what is now Penydarren Park (SO05030678).

8.2.5 Penydarren fort was originally built in timber but this was replaced in stone around the turn of the second century. The site included a bath-house, a mosaic pavement and cremation burials.

8.3 Medieval

8.3.1 It is likely that these uplands would have been exploited for agriculture in some form during the medieval period, possibly based on transhumance farming. Evidence for such farming and temporary settlement is likely to have been largely destroyed by post-medieval industrial workings and settlements. However, some evidence may survive in the form of dry-stone walled field patterns and sheep enclosures. It is possible that much of the drystone and turfstone walling along the entire route of the A465 could date from either the late medieval or early post-medieval periods.

8.3.2 The main medieval monument in this area is Castle Morlais, although this is located some distance to the north of the A465 road corridor. The castle was built within an Iron Age hillfort on a limestone ridge above the Taff Gorge. The surviving ruins represent the last vestiges of a well-fortified castle begun in AD 1287 by Gilbert de Clare, earl of Gloucester, on land claimed by Humphrey de Bohun, earl of Hereford. When warfare broke out between the earls in 1290, Edward I was forced to march down from north Wales to intervene in the dispute.

8.3.3 The castle comprised a triangular inner ward with sides about 45m long and an inner bailey 60m wide. The inner ward had a round keep 17m in diameter at the north corner, a D-shaped tower with a staircase at the southeast corner, and a similar tower projected from the south wall. Between these was the

gateway. The outer ward has no towers on the west side, but there is a D-shaped tower at the southeast corner.

8.3.4 In 1880, an early medieval coin hoard (No.215) dated to AD 1340, was discovered close to the present A465, during construction of St. John's Church in Cefn-coed-y-cymmer. In addition, close to Grawen Cottages (No.218), a series of hut circles were discovered during the 1960s construction of the A465. These were considered to be of early medieval date, but could have dated from the prehistoric era.

8.4 Post-medieval

8.4.1 A large part of the industrial landscape was lost when the A465 was built in the 1960s and other portions have disappeared as a result of modern opencast working and land reclamation. The industrial activity of this relatively isolated area depended on a well-developed communications infrastructure designed to transport raw materials and the finished products. During the early stages of ironworking in the South Wales valleys, raw materials and pig-iron were probably initially moved around the area using pack animals and localised tramroads. However, by the end of the 18th century industrial expansion led to the creation of a number of integrated communications links such turnpike roads, tramroads and later railways, to move products and materials between the limekilns, coalmines, the iron-works and the consumer markets.

8.4.2 One of the areas first communication links was the Merthyr to Cardiff turnpike road which was built as the result funds raised in 1767. Following on from this in 1812 a turnpike road was built from Merthyr to Abergavenny on much the same route as that now followed by the A465 and this remained the only main road between these towns until the opening of the A465. The road followed a circuitous route from Merthyr, passing close to the various ironworks which, by this date, had been established near the heads of each of the intermediate valleys, to the mountain top at Brynmawr and down the Clydach gorge to Gilwern. During the 19th century the road between Brynmawr and Merthyr served as a focus for a number of settlements.

8.4.3 One of the most successful transport systems was the Glamorgan Canal between Merthyr and Cardiff. After some preliminary failures the Glamorgan Canal Navigation Act obtained the Royal Assent in 1790. The first stretch of the canal, between Abercynon and Cardiff, was known as "The Navigation", or "The Basin", and was completed by 1794, but it took another 4 years to complete the 9 miles between Abercynon and Merthyr. The Glamorganshire Canal itself was a considerable engineering feat, having a total rise of 568 ft. in the 25¼ miles between the Cardiff Sea Lock; the head of the canal at Merthyr required 50 locks and cost of over £100,000.

8.4.4 The Glamorgan Canal Navigation Act, as with other measures sanctioning canals in South Wales and Monmouthshire, provided for the construction of Penydarren Tramroad and connecting tramroads from collieries and ironworks situated not more than 4 miles from the canal.

8.4.5 The 19th century landscape was covered by tramroads, which were laid from the ironworks in each valley running north to a series of collieries, ironstone pits and limestone quarries. In addition some tramroads were linked together to create a rudimentary west-east route, giving the ironworks concerned access to wider markets.

8.4.6 In 1799 a Bill was promoted in Parliament for a Cardiff & Merthyr Railway. This was originally a tramroad which was intended to run from Cardiff Sea Lock up the valley of the Taff to Navigation House at Abercynon. From there one arm was to have turned westward towards Aberdare, with the main line continuing for 9 miles along the bank of the Taff and then bearing further east to a terminus at Carno Mill, near Rhymney. A further branch was to have served the limestone quarries north of Merthyr, which figure as the objective of many later railway schemes.

8.4.7 The scheme for the Taff Vale railway to Cardiff faced powerful opposition from the Glamorgan Canal Company but despite this, the Taff Vale Railway Company's Act received the Royal Assent in 1836. It incorporated the first commercially significant public railway in Wales. The Taff Vale Railway was to run from Merthyr Tydfil to Cardiff, with a branch to communicate with the Tramroad leading to the Penydarren, Dowlais, and Plymouth Ironworks, and another branch to the collieries of Lancaiach. The first stretch of the railway was opened in 1840 and reached Merthyr by 1841.

8.4.8 The Heads of the Valleys Railway Company was first promoted in the late 1850s, following a route already adopted by earlier tramroads. Nevertheless, the building of a locomotive-operated railway was a formidable challenge and proved too much for the original company which was taken over by the London & North Western Railway (LNWR).

8.4.9 The first stretch of the LNWR's Merthyr, Tredegar & Abergavenny line was opened to Brynmawr in 1862. Further sections of LNWR line followed, built jointly with the Rhymney Railway and the Brecon & Merthyr, until a complete route to Merthyr was opened in 1879. The line was built principally to carry iron, and in later years coal, from the works along the heads of the valleys to the Midlands, and passenger traffic was probably always minimal. The railway route included some of the steepest gradients found anywhere on the main-line system in Britain and some of the tightest curves. The railway was a magnificent engineering achievement with several fine viaducts, tunnels and other features.

8.4.10 However, the LNWR line probably never paid its way, except perhaps for a few decades after it was first opened and, as the South Wales iron industry began its rapid late 19th-century decline, the revenue originally envisaged never materialised. After the Second World War it became a candidate for closure and was shut as a through route in 1958, although a few short lengths at either end remained in use for a little longer.

8.4.11 From Dowlais Top to the boundary with Gelligaer parish the A465 was built on the trackbed of the London & North Western Railway's Merthyr, Tredegar & Abergavenny Railway.

8.4.12 The Brecon & Merthyr Railway main line, which opened in 1869, ran from Dowlais Central to Pant, parallel for most of its length with the present road between the same places; the A465 is carried over both road and railway on the northern edge of Dowlais village. At Pant it joined the earlier B&M main line to Brecon via Pontsticill opened it 1863. To the northwest a tramway branched off the main line to serve Bryniau Quarry, of which no trace appears to have survived beneath a modern housing development and the Merthyr Industrial Estate.

8.4.13 The branch to the northeast was the London & North Western Railway's Dowlais Extension, opened in 1873, which linked the LNWR Merthyr, Tredegar

& Abergavenny section at Dowlais Top with the Brecon & Merthyr Dowlais Branch at Ivor Junction. This curved through 180^0 to return southeast to Dowlais Top where it is crossed by the A465.

8.4.14 The former Station House at Dowlais Top (Site No. 183) was built by the Brecon & Merthyr Railway (B&M), close to the junction with the LNWR's Dowlais Extension.

8.4.15 The Castle Morlais Quarries Tramroad (Site No. 200) was built in 1803 to bring lime and limestone from Morlais Quarries, which were far more extensive than Gurnos Quarry, down to the Dowlais Ironworks. The line, which was a plateway with mixed 2ft 9in and 4ft 2in gauge track, is marked on both the Tithe map and the 1891 OS. The trackbed branches off from the Gurnos housing estate, just south of the A465, and passes beneath the road where it continues north to the quarries. A small group of field limekilns were identified during the walk-over near the tramroad, probably for use in improving the adjacent pasture.

8.4.16 The Gurnos Limestone Quarry, which is a well-preserved late 18th-century quarry, was built to supply limestone and lime to Cyfarthfa Ironworks. The Merthyr Tithe map (1850) schedules the parcel in question as `Pasture and Quarry', while the 1891 OS map shows a network of tramways on the quarry floor connected to the main line described in the previous paragraph.

8.4.17 Gurnos Tramroad and Leat (Site no. 200) is a Scheduled as an Ancient Monument, built in 1792 to supply the Cyfarthfa Ironworks with limestone. A leat alongside the tramroad, and running parallel with the Taff Fechan, supplied water to the works.

8.4.18 At Cefn Coed y Cymmer, in Penderyn parish, the existing A465 crosses first the Taff Fawr and then the Taff Fechan on a series of three major road viaducts that are generally regarded as outstanding engineering works of their type and period. The viaducts on the A465 were erected in 1964 to carry the original road over the Taff Fawr, Taff Fechan and Nant Ffrwd. They were designed by the road engineers Rendel, Palmer & Tritton, with Alex Gordon & Partners as consultant architects. The viaducts over the Taff Fechan and Nant Ffrwd employ twin parabolic arch ribs to carry the roadway. The central bridge over the Taff Fawr has three spans cantilevered from two piers.

8.4.19 Gurnos Farm (Site No. 204) was occupied, but not owned, by William Crawshay when the Tithe award was prepared in 1846, and then extended to 209 acres. The buildings date from the late 19th century and the tithe map and the 1891 OS appear to mark exactly the same layout as the current OS. This consisted of three large blocks of buildings around an open quadrangle, approached from the south by a straight driveway which enters the farmyard in the centre of its south side. The farm was an early 19th-century 'model farm' built by an `improving' landlord or a substantial tenant and may originally have been erected by William Crawshay II as part of his development of the Cyfarthfa estate.

8.4.20 The Merthyr Tydfil tithe map (1850) (Figure 5) marks only the more southerly of the Reservoirs at Dowlais; the larger reservoir to the north of the A465 was added sometime prior to the preparation of the first edition of the OS map in 1872-85. The storage pond marked on the current OS map and labelled `Roadside Pond Reservoir' on the print supplied for this survey is marked on the OS of 1891 at more or less its present size. The present pond lies entirely in Merthyr but both the tithe map for this parish (1850) and that for Gelligaer (1842) marks another, much larger pond adjoining to the east, most of which

lay in Gelligaer. These ponds were evidently supplied from two larger ponds to the north of the A465 on Merthyr Common (Pitwellt Pond and Jepson's Pond), and a leat continues from the Roadside Pond (and from its larger neighbour to the east, according to Gelligaer tithe map) to run southeast to a fourth pond near Pant-y-waun Pit, which seems to have disappeared from the modern map. The map evidence for this group of ponds and associated leats suggest they were built to supply water to the ironstone pits at the northern end of Gelligaer Common, rather than an ironworks.

8.4.21 The worker's cottages near Grawen House (Site No. 218) are marked on the 1891 OS and probably date from the early to mid-19th-century. St John's Church (Site No. 218), which was designed by the Cardiff architect George Edward Robinson, dates from 1880. It was described by John Newman (Architecture in Wales) as `rather coarse and artless', but as an important Victorian church and churchyard, it has significant landscape value.

9 Section 3: Evaluations Methodology

9.1 Each evaluation followed a methodology including combinations of machine excavation and hand excavation and recording. Excavation of the topsoil and non-archaeological layers was carried out using a machine fitted with a ditching bucket under archaeological supervision. Detailed excavation of stratified deposits was carried out by hand. The archaeological contexts were recorded on pro forma sheets following the site specification and the methods set out in the Babtie site manual.

9.2 A feno station was established next to each site, which was tied-in to the National Grid reference and had a known height above ordnance datum, accurate to a lateral tolerance of +/-50mm on soft surfaces and a height tolerance of +/-10mm. The exact location of the individual trenches was measured from known points and plotted onto Ordnance Survey digital base maps. Levels were taken using an automatic dumpy level.

9.3 The archaeological research objectives for each site are outlined on a site-by-site basis in Appendix 1, but the overall objectives were to evaluate the potential survival and relative importance of sites related to the industrial period in Section 3.

10 Site No. 192: Brecon & Merthyr Railway, Dowlais Branch (SMR 03170m) (SO 0668 0887 to SO 0733 0844)

10.1 Description

10.1.1 The profusion of different railways and their junctions around Dowlais make this a complex area of industrial archaeology. The B&M Dowlais Extension (Site 192) represents a north/south orientated branch line of the Brecon & Merthyr (B&M) main line. The branch line linked Dowlais Central Station to the B&M main line and the B&M & LNWR Joint Railway, at a junction to the north of Castle Morlais Quarries.

10.1.2 A large section of embankment (Site 185) belonging to the Brecon & Merthyr Railway main line (Site 184) survives west of the Dowlais Top roundabout, close to the easterly section of the Upper Reservoir leat system (No.186). The route of the B&M main line railway (Site 184) at SO 0729 0849 veers north alongside the northern bank of the Upper Reservoir towards Brecon.

10.1.3 Dowlais Top station house (Site 183), which was constructed to serve the B&M main line railway (Site 184) and the London and North Western Railway (Dowlais Extension) is built of rusticated coursed masonry and probably dates from circa 1873. The station house retains its typical of Victorian railway architectural style, although the platform area to the west of the station house has now been landscaped.

10.2 Cartographic Evidence

10.2.1 The Tithe map of 1859 does not show this railway as it was not built until later in the 19th century. The OS 1891 map shows that much of the branch line section of the Brecon and Merthyr Railway (Site 192(has been supplanted by the existing housing estates north and south of the A465.

10.3 Documentary Research

10.3.1 The Brecon & Merthyr Railway (Site 184) main line was opened in 1869 and ran from Dowlais Top Station to Pant. At Dowlais Top Station the line forms a junction with the London and North Western Railway (Dowlais Extension) which was built in 1873. The LNWR Dowlais Extension formed the link between the LNWR Merthyr, Tredegar & Abergavenny section and the B&M Dowlais Branch at Ivor Junction. From Dowlais Top to Pant the main line runs parallel for most of the way with the present road between these places. At Pant it was joined by the earlier B&M branch line to Brecon via Pontsticill opened in 1863.

10.3.2 The B&M Dowlais Extension (Site 192), which was opened in circa 1873, is a branch line of the Brecon & Merthyr (B&M) main line. The branch line linked Dowlais Central Station to the B&M main line and the B&M & LNWR Joint Railway, at a junction to the north of Castle Morlais Quarries.

10.4 Evaluation Results

10.4.1 A trench 4m x 1m was excavated to a depth of 1.2m across the probable line of the B&M branch line. The site of the evaluation trench was excavated in an area of open green space, north of the A465.

10.4.2 The first layer (001) consisted of a loose blue grey fill with shale and blue grey clay material and building rubble. The, which had been truncated by cuts [002] & [003], possibly for the extraction of material for the road embankment. Cut [002] was u-shaped and 1.15m deep by 3.5m EW, with sides sloping at about 1:1.

10.4.3 Cut [003] was also u-shaped and about 0.8m deep x 0.55m EW with sloping sides of 1:1. It was considered to be a cut for the removal of the material for construction of adjacent road.

10.4.4 Layer (004) loose mottled brown dark grey mixed sandy soil and clay containing general modern rubbish and was cut through by [002] & [003].

10.5 Conclusions

10.5.1 The site had obviously been levelled and reclaimed at some point as the first layer removed contained a lot of building rubble. It was considered that the cuts into these layers probably represented the removal of the material for construction of 1963 road embankment.

10.5.2 No evidence of the Brecon and Merthyr Railway was found during this evaluation. It was concluded that any evidence for the Brecon and Merthyr Railway at this point had been removed by the construction of the A465 in the 1960s and additional disturbance had been caused by the excavation of material for construction of the road itself, haul roads and specifically the adjacent embankment.

11 Site No. 202: Drystone walled landscape and sheep fold, Gurnos (SMR 03197m)SO 0450 0865

11.1 Description

11.1.1 Approximately 110m to the east of Gurnos Farm is a semi-circular drystone walled enclosure which appears to have been truncated to the south by the construction of the A465. Inside the semi-circular feature there is evidence of stone clearance, whilst externally the surrounding fields are littered with limestone outcrops and evidence of possible quarrying. Following the external circumference of the walling is a stream linked to other watercourses to the north.

11.1.2 The antiquity of the field system was further suggested by the proximity of a possible Roman road (Site 205) and a possible quern stone (Site 201).

11.2 Cartographic Evidence

11.2.1 The area of the wall is shown on the Tithe of 1850 and the OS of 1891 maps (Figures 5 & 7) as forming part of an unusually-shaped field which originally extended to the north and south of the present A465. The southern area of the field has largely been truncated by the A465. The surrounding area consisted largely of woodland.

11.3 Documentary Research

11.3.1 The track way (Site 205) to the west of the field system, may have formed part of a Roman road (Margary's Route 621), which connected the military sites at Cardiff, Caerphilly, Gelligaer, Penydarren and Brecon.

11.3.2 The field in question was almost certainly formed part of the 206 acres owned by the adjacent Gurnos Farm (Ste 204), which was a model farm, built in 1846. The farm is unusual in being a planned rectangular courtyard farm. The farm would have improved much of the surrounding farm land for pasture, as the adjacent field lime kilns (Site 198) testify.

11.3.3 The farm may have been erected by William Crawshay II as part of his development of the Cyfartha estate, which included a large amount of ornamental planting between Gurnos and his seat at Cyfartha Castle.

11.4 Evaluation Results

11.4.1 Two trenches 1m x 1m were excavated either side of a small section of the field wall in order to determine the possible date for the walls and methods of construction.

11.4.2 Below the topsoil (001) was a moderate to firm mid-brown grey mottled layer (002) of silty loam with some iron-pan, with occasional angular stones approximately 0.2m-0.3m thick. Below this was moderate to firm reddy brown sandy clay layer (003) of re-deposited natural clay, probably dating from the

construction of the wall. This layer seemed to have been formed in a cut, but no clear edge for the cut was visible during excavation; this probably represented the back-filled material of the construction trench for the wall.

11.4.3 The wall itself (004) was of dry-stone construction and stood, on average, 0.5m above ground level. The wall was built of roughly squared limestone blocks of between 0.5m x 0.15m and 0.15m x 0.15m in size, largely uncoursed, with no foundations.

11.4.4 The lower section of the wall extended approximately 0.30m below the present ground surface, close to the interface between recent shallow dark humic soils and light orange clays.

11.5 Conclusion

11.5.1 No foundations for the wall were revealed since the wall was built off the existing clay, suggesting that this wall was constructed purely for agricultural use. The unusual sub-circular shape may be explained by the need for a corralling area for cattle or use as a sheep-fold. No dating evidence for this wall was found, and it remains possible that these drystone walls have a medieval or earlier origin.

12 Site No. 216: Stone structure, Cefn-coed-y-cymmer (SO03730803)

12.1 Description

12.1.1 The site is situated south of the present A465 at the bottom of a south-west facing scree-slope and consists of two large, self-supporting limestone slabs. Initial assessment concluded that these stones may have formed a man-made structure, possibly of prehistoric origin.

12.2 Cartographic Evidence

12.2.1 The site is located close to an area annotated on the OS 1880 map as the 'Gurnos Quarry' and served by a series of minor tramways linked to the Gurnos Tramway (Site 208). The adjacent area is shown as an area of rough, unenclosed scrub and heathland.

12.3 Evaluation Results

12.3.1 Below the topsoil (001) of black peaty soil with small quartz pebbles was a layer (002) of light brown sandy silt with high organic content and large angular quartz and limestone conglomerate. No archaeological features or finds were made within this layer (002) and it was interpreted as the natural subsoil.

12.4 Conclusion

12.4.1 The Stage 3 evaluation revealed no dating evidence or features suggesting that prehistoric activity caused the unusual appearance of the stones. The lack of archaeological evidence around the stones suggested that these blocks were, in fact, natural limestone outcrops. Alternatively, they may be explained as resulting from extensive quarrying activity within the adjacent Gurnos Quarry, although this does not explain why such prominent slabs were left un-worked.

APPENDIX 1

Appendix 1: Sites evaluated in Section 5

Site No.	Name of Site	Evaluation Method	Period	Type
192	Branch line of Brecon & Merthyr Railway SO 0678 0856	*Method of excavation: Hand excavation followed by machine trenching.*	Post-medieval 1896	The north/south cutting for the Brecon & Merthyr railway line.
202	Drystone walled landscape and sheep pen, Gurnos	*Method of excavation: hand excavation.*	Post-medieval	An extensive drystone walled landscape including a sheepfold.
216	Stone structure, Cefn-coed-y-cymmer	*Method of excavation: Hand clearance and excavation where necessary.*	Post-medieval	Stone structure, initially considered to be of prehistoric provenance. Evaluation however, suggested it forms part of a quarry area.

APPENDIX 2

Sites in Section 5 - Dowlais Top to A470 Junction

Site no.	Site name	Grid ref.	Form	Type	Period	Date	Description
188	Upper Reservoir, Dowlais	SO 0720 0850	Structure	Reservoir	Post-Medieval		Upper Reservoir, which is related to Lower Reservoir, is larger of the two and has leat systems feeding into and out of it.
189	Pumping station, Upper Reservoir, Dowlais	SO 0705 0851	Building	Industrial building	Post-Medieval	post-1850	A brick-built pumping station related to Upper Reservoir.
190	Inspection road, Upper Reservoir, Dowlais	SO 0728 0846 to SO 0692 0868	Linear Feature	Road	Post-Medieval		A inspection road for the Upper Reservoir.
191	Western leat system, Upper Reservoir, Dowlais	SO 0688 0867 to SO 0692 0849	Linear Feature	Leat	Post-Medieval		A north/south orientated leat with extensive brick and masonry lining.
192	Branch line of Brecon & Merthyr Railway, Dowlais	SO 0668 0887 to SO 0733 0844	Linear Feature	Railway	Post-Medieval	1869	The north/south cutting for the Brecon & Merthyr railway line.
193	Branch line of Brecon & Merthyr Railway, Dowlais	SO 0675 0856 to SO 0666 0859	Linear Feature	Railway	Post-Medieval	1869	An east/west line between the Brecon & Merthyr railway and a branch line of the Brecon & Merthyr railway.
194	Brecon & Merthyr Railway (to Pontsticill), Dowlais	SO 0664 0884 to SO 0651 0840	Linear Feature	Railway	Post-Medieval	1863	The Brecon & Merthyr railway main line.
197	D.S.W. landscape, Gurnos	SO 0485 0870	Field System	Drystone walled field boundaries	Post-Medieval		A drystone walled landscape.
198	Lime Kilns, Castle Morlais Tramroad, Gurnos	SO 0471 0872	Structure	Lime kilns	Post-Medieval		Three circular limekilns constructed of drystone walling adjacent to the Castle Morlais tramroad related to Gurnos Farm.
199	Coppice and D.S.W. landscape, Gurnos	SO 0470 0870	Landscape Feature & Field System	Woodland and drystone walled field boundaries	Post-Medieval		An area of coppiced land.
200	Castle Morlais Quarries Tramroad, Gurnos	SO 0473 0892 to SO 0473	Linear Feature	Mineral extraction	Post-Medieval	1803	The course of the Castle Morlais tramroad used to

Site no.	Site name	Grid ref.	Form	Type	Period	Date	Description
		0867					transport limestone to the Dowlais Ironworks.
201	Possible quern stone, Gurnos	SO 0455 0866	Findspot	Prehistoric quern stone	Neolithic		A possible quern-stone of prehistoric date.
202	D.S.W. landscape and sheep fold, Gurnos	SO 0450 0865	Field System	Drystone walled field boundaries and sheep fold	Post-Medieval		Between Gurnos Farm and the Castle Morlais Tramroad on the northern side of the A465 is an extensive drysone walled landscape including a sheepfold.
203	Gurnos Farm workers cottages, Gurnos Farm	SO 0435 0863	Buildings	Domestic dwellings	Post-Medieval		Three farm worker's cottages similar in style to Gurnos Farm
204	Gurnos 'model' Farm, Gurnos	SO 0430 0864	Buildings	Farmhouse and outbuildings	Post-Medieval	pre-1880	A model farm laid-out around a courtyard related to improvement of worker's cottages and agricultural land.
205i)	D.S.W. landscape, Gurnos Farm	SO 0423 0860	Field System	Drystone walled filed boundaries.	Post-Medieval		A drystone walled landscape enclosing an area of coppice.
205ii)	Roman Road, Gurnos Farm	SO 0422 0860	Road	Farm road.	Romanl		A possible Roman Road from Brecon.
206	Viaduct, Taf Fechan, Cefn-coed-y-cymmer	SO 0335 0815	Structure	Road bridge	Post-Medieval	1963	One of the A465 road bridges designed by engineers Rendel, Palmer & Tritton with twin parabolic arch ribs.
207	Gurnos Leat system, Cefn-coed-y-cymmer	SO 0342 0829 to SO 0373 0767	Linear Feature	Leat	Post-Medieval	1792	A leat below the A465, built of brick and masonry it runs parallel to the Taf Fechan to Cyfartha Ironworks.
208	Gurnos Tramroad, Cefn-coed-y-cymmer	SO 0341 0830 to SO 0372 0767	Linear Feature	Tramroad	Post-Medieval		Gurnos tramroad below the present A465 built to supply Cyfartha Ironworks.
209	Footbridge over Brecon & Merthyr Railway, Cefn	SO 0327 0821	Structure	Footbridge	Post-Medieval		An iron-girder accommodation bridge over the course of the Brecon & Merthyr railway.
210	Gurnos Limestone Quarry, Gurnos	SO 0355 0828	Site	Mineral extraction	Post-Medieval		A quarry to supply Cyfartha Ironworks with limestone with tramwaysr.

Site no.	Site name	Grid ref.	Form	Type	Period	Date	Description
211	Railway bridge, Brecon & Merthyr line, Cefn	SO 0324 0814	Structure	Railway bridge	Post-Medieval	1863 rebuilt 1964?	A bridge to carry the Brecon & Merthyr railway across a cutting for the A465.
212	Capel Tabor and cemetery, Cefn-coed-y-cymmer	SO 0297 0808	Building and Earthworks	Chapel and cemetery	Post-Medieval	c.1850	Capel Tabor rebuilt in a Neo-classical style in 1904 with associated cemetery.
213	Medieval hut circles, Cefn-coed-y-cymmer	SO 0297 0804	Site	Medieval hut circles	Medieval		The site of a series of hut-circles, discovered during construction of the A465????
214	St. John's Church, Cefn-coed-y-cymmer	SO 0329 0806	Building	Church	Post-Medieval	1880	A 'Gothic' church designed by George Edward Robinson in 1880.
215	Medieval coin hoard, Cefn-coed-y-cymmer	SO 0328 0805	Findspot	Coin hoard	Medieval	*terminus post quem* 1325	The findspot of a hoard of Medieval coins.
216	Stone structure, Cefn-coed-y-cymmer	SO 0372 0430	Structure	Mineral extraction	Post-Medieval		Stone structure, initially considered to be of prehistoric provenance. Evaluation however, suggests that the large slabs form part of a scree slope/quarry area.
217	D.S.W. landscape, Gurnos	SO 0408 0840	Field System	Drystone walled field boundaries	Post-Medieval		A substantial drystone wall c.150m long.
218	Grawen Cottages, Cefn-coed-y-cymmer	SO 0285 0814	Buildings	Domestic dwellings	Post-Medieval		A two-storey terrace of worker's cottages
220	Buttressing under the Nant Ffrwd Viaduct	SO 0248 0752	Structure	Road bridge section	Post-Medieval	1963	The remains of earlier masonry abutments within the Nant Ffrwd concrete viaduct.
221	Viaducts (A465), Cefn-coed-y-cymmer	SO 0335 0815 (A); SO 0282 0789 (B); SO 0250 0750	Structure	Road bridges	Post-Medieval	1963	Two 1960's concrete viaducts designed by Rendel, Palmer & Tritton using twin parabolic arch ribs.
270	Brecon & Merthyr Railway, Taf Fechan	SO 0343 0853 to SO 0325 0816	Linear Feature	Railway	Post-Medieval	1863	On the western bank of the Taf Fechan, is the route of the Brecon & Merthyr Railway.

A Glossary of Archaeological Terms

Ashlar: decorative masonry formed from stone blocks which fit accurately together so that only fine mortar joints are required between them. The blocks are finely worked and the external faces are finished to form a uniform, flat surface.

Adit: a tunnel into a coal level, used either as an entrance to the mine or as a means of drainage.

Barrow: includes several types of earth covered funerary mounds with cremated or inhumed remains, primarily dating from the Neolithic (long barrows) and Early Bronze Age (round barrows) periods.

Cairn: a stone mound covering a cremation or inhumation found mainly in the Bronze Age periods.

Cropmark: a mark visible on aerial photographs caused by differential growth and colouration of field of crops over the archaeological features.

Crows-foot tips: a series of early spoil heaps formed from by tipping from a barrow or cart forming a distinctive star-shaped pattern.

Find-spot: the site of a random or isolated or stray find which may indicate further archaeological material is present nearby.

Holloway: an early farm or parish road consisting of an unmetalled surface surrounded by high banked hedges formed through the erosion away over time of the track.

Leat: an artificial watercourse made to channel water from source to an area for industrial usage.

Lithic scatter: a series of flint artefacts found on the surface and usually exposed by erosion or ploughing. Dating from the Palaeolithic to Early Bronze Age periods.

Motte and bailey castle: a defensive structure erected during the early stages of the Norman invasion consisting of a large artificial mound, or motte, surmounted by a wooden, and later a stone, keep (tower). The whole structure was surrounded by a large wooden bailey, often later replaced by a stone curtain wall.

Palaeoenviromental: the scientific technique of determining ancient landscapes and environment and climate characteristics from looking at macro fossils, pollen and faunal remains, often from within wetland sites

Relict palaeosols: an ancient soil surface which has survived, often by being completely buried (e.g. under barrows).

Rusticated masonry: stone that has been worked on the external face to produce a different effects from cyclopean (or rock-faced) to vermiculated (a worm-track effect).

Ridge & Furrow: the pattern formed by strip farming of land based on the medieval system of 'open' field agriculture. Medieval ridge and furrow tends to be form the soil into a larger series of troughs and banks than those found in post-medieval ridge and furrow.

Stratified deposits: the layers of natural/soils and man-made deposits which build-up over a long time-span on an archaeological site. The stratigraphy can be examined to determine the sequence and time-span of the site.

Tramroad: a rail or plateway carrying goods carts/trams and usually drawn by ponies.

Turfstone walling: boundary walls formed from an internal drystone core covered by a layer of earth and turves for added stability.

Quoins: the stones found at the corner of an external wall which support the greater stresses found there; usually of higher quality than ordinary stonework.

Voussoirs: the wedged-shaped blocks of stone which form the curve of an arch.

Dear Susan,

A465 Dualling Abergavenny to Hirwaun
Sections 6 & 7 Archaeological Evaluation Report

We have pleasure in enclosing a copy of the Archaeological Evaluation Report for Sections 6 and 7 of the above scheme for inclusion in the Regional Sites and Monuments Record.

If you require any further information please contact me on 029- 2035 3200.

Yours sincerely,

Jon Mullis
Principal Archaeologist

1 Introduction

1.1 In 1995 the Secretary of State for Wales announced the Preferred Route for the proposed A465 dualling between Abergavenny and Hirwaun (Figure 1). Jacobs Babtie was commissioned by Transport Wales of the Welsh Assembly Government to carry out an assessment of the Cultural Heritage of the A465 in accordance with a brief prepared by Cadw: Welsh Historic Monuments (CO15L986 PP).

1.2 Following the guidelines set out in the Cultural Heritage section of the 'Design Manual for Roads and Bridges' (DMRB) the archaeological assessment was divided into three stages (Vo.11, Highways Agency *et al*, 1992). The results of Stages 1 and 2 of the Cultural Heritage Assessment were published in 'A465 Abergavenny to Hirwaun Archaeological Survey: Phase 1 Report' (Babtie, 1996).

1.3 The A465 road proposed for dualling extends for a distance of 41.5kms, between Abergavenny and Hirwaun; the road has been divided into 7 distinct sections. This report covers the archaeological sites within Section 6 and 7 of the road scheme. Section 6 extends for approximately 2.5kms between A470 Junction and the Baverstock Hotel Junction and Section 7 extends for approximately 5kms between the Baverstock Hotel and Hirwaun. The desk-top study and walkover survey identified a total of six sites in Section 6 and 38 sites in Section 7.

2 Background to the study

2.1 The Stage 1 assessment for the A465 dualling was a desk-based report based primarily on information contained in the Regional Sites and Monuments which is maintained by Glamorgan-Gwent Archaeological Trust (Curatorial Section) (GGAT, 1994).

2.2 The GGAT report was supplemented by a survey carried out by Cadw (Cadw, 1995). Further to this report, Cadw prepared an archaeological brief, which specified the further archaeological work required for the A465. This consisted of two further phases of work, which equated with Stages 2 and 3 of the Cultural Heritage assessment as outlined in Vol.11 of the DMRB. These further stages were carried out by Jacobs Babtie archaeologists in accordance with this brief.

2.3 Stage 2 involved the re-interrogation of the Regional SMR to include any data added since the Stage 1 study. In addition a detailed desk-top study, further historic and cartographic background research and a walk-over survey with a photographic record was carried out together with some topographic survey.

2.4 During the Stage 2 assessment an archaeological value was assigned to each site based on the Secretary of State's non-statutory criteria for the Scheduling of Ancient Monuments, published in Planning and the Historic Environment: Archaeology Welsh Office Circular 60/96. Each site was then provisionally graded into five categories of site, as follows:

- Category A: Sites of National Importance;
- Category B: Sites of Regional or County Importance;
- Category C: Sites of District or Local Importance;
- Category D: Minor or Damaged Sites;
- Category E: Sites Requiring Further Investigation.

2.5 The results of Stage 2 were reported in the Cultural Heritage Assessment of Vol. 2.2 of the Environmental Statement, which identified a total of 282 archaeological sites, historic buildings and landscapes between Abergavenny and Hirwaun (Welsh Office, 1997). The Stage 2 assessment identified a total of 6 sites in Section 6 and 38 sites within Section 7 (See Appendix 2).

2.6 The Stage 3 evaluation programme involved trial-trenching, geophysical survey, test-pitting and an assessment for palaeoenvironmental potential. During Stage 3 a total of 41 Category E sites within the scheme were evaluated through trial-trenching of which one site was within Section 6 and seven sites were within Section 7. The evaluations enabled the nature, importance and preservation of any surviving archaeological remains to be determined and the impact of the proposals on them.

3 Background to the Stage 3 Evaluation Programme

3.1 This report incorporates the Stage 2 background research and assessment with the results of the Stage 3 archaeological evaluation fieldwork programme. Most of the sites identified in Section 6 and 7 were of post-medieval date, and primarily consisted of industrial features such as tramroads, railways and coal and iron workings, chapels and farmsteads and drystone walled landscapes.

3.2 Within Sections 6 and 7 route corridor there are no archaeological, historic buildings or landscapes sites which have statutory protection. However, the Section 6 does border the Merthyr Landscape of Outstanding Historic Interest HLW (MG I) which is recorded within the non-statutory Register of Landscapes of Outstanding Historic Interest.

3.3 The Pillow mound at Bryn-y-Gwyddel, outside the route corridor, known locally as the 'Giant's Grave', (located at grid reference: SO007070) is protected as a Scheduled Monument (SAM: GM517). This site is thought to have been a medieval pillow mound, possibly used for windmill or as a rabbit warren. It is more likely that this is a Post-Medieval rabbit warren used to provide meat for the occupants of the industrial settlement close to the Dynevor Arms (now the site of the Baverstock Hotel).

4 Geological and Geographic Overview of Sections 6 and 7

4.1 Section 6 of the A465 runs the short distance from the A470 Junction near Cefn-coed-y-cymmer to the site of the former post-medieval settlement near the Baverstock Hotel, and is mainly located within open moorland. At the start of Section 6, at Cefn-coed-y-cymmer in Penderyn parish, the A465 crosses the Taff Fawr and then the Taff Fechan and Nant Ffrwd. The Taff Fawr forms the boundary between the parishes of Penderyn and Vaynor and the Taff Fechan is the boundary between Vaynor and Merthyr parish.

4.2 Section 7 of the A465 road scheme begins in the parish of Penderyn at the Baverstock Hotel, originally the site of the Dynevor Arms Inn. From the Baverstock Hotel, the A465 runs westward mainly through enclosed land before entering the parish of Aberdare at a bridge over the Nant Hir and then crossing the Nant Melyn and the Hirwaun Common Railway (Site 276) at the edge of village of Hirwaun. On the outskirts of Hirwaun the A465 runs generally southwest across the river Cynon to its western terminus at the roundabout to the southwest of Hirwaun.

4.3 Geologically, Sections 6 and 7 of the A465 are situated within a narrow strip of coal-bearing land, which forms part of the South Wales coalfield. The solid geology of the area consists of the productive upper and middle Coal Measures including millstone grit, culm and Carboniferous limestone. The drift geology consists of mainly poor acidic, gley soils in a peat-forming moorland environment.

4.4 In the South Wales coalfield the seam of coal is bituminous in the eastern districts and becomes 'steam coal' in the central area and ultimately strong anthracite in the west. The best source of 'steam coal' in south Wales was the Aberdare 'Four Foot Coal' which was exported to commercial markets world-wide in the late 19th and early 20th century.

4.5 The 'steam coal' is an intermediate grade of coal somewhere in composition between bituminous and anthracite coal. The coal is dull black and ignites slowly to give off little smoke or flame, but with intense heat, and was mainly used for the production of steam. As the coal does not fuse or cake together it was also often called ' free burning'.

4.6 Although there are no detailed geological records for the area between Sections 6 and 7, there are records for the 'Rosser Ironstone' and the 'Four Foot Coal' at Dowlais (Hull, E. & Whitaker, W. 1861). The Lower Four-Foot coal, or 'Old Coal', was located about 210m south of the Rosser Ironstone (SO 0086 0693) and was stratigraphically above it. The 'Four Foot Coal', which appears to have been the 'Bottom Coal', was recorded as 4.35m in thickness and made up of eight seams.

4.7 The 'Bottom Rosser Vein' which was a layer of ironstone around 100mm thick was located around 35m below the 'Lower Four-Foot Coal'. The Rosser Ironstone, which outcrops to the east of Section 6, around Merthyr, is an ore with a 32.18% metallic content.

5 Historical Background to the Coal and Iron Industries

5.1 The initial impetus for the growth of industry in south Wales was its plentiful iron ore deposits. However, by the early 1870s, local iron ore production had virtually ceased altogether in South Wales as the introduction of the Bessemer steel system meant that the indigenous ore, which was rich in phosphorous and sulphur, was no longer suitable for the new process. Increasingly iron ore was being sourced from northern Spain instead.

5.2 From the 1850s onwards, coal began to supplant iron as the foundation of south Wales industry as the deep seams of the Cynon and Rhondda valleys were exploited. South Wales 'steam coal' was soon to become the main world industrial energy supply with annual exports reaching two million tonnes by 1862.

5.3 Mineral extraction in south Wales prior to the latter half of the 18th century was mainly exploited in the form of small levels and patch workings which focused on the obvious mineral outcrops of coal and iron-ore that had often been exposed by natural scouring in watercourses. These early workings rarely survive until the present day.

5.4 From the 18th century until the early 19th century the spoil was often removed from the workings without the aid of machinery, by the method known as 'scouring'. Scouring relied on the release of a stored reservoir of water onto the seam to remove the lighter waste material and expose the iron-ore or coal deposits.

5.5 By the late 18th century outcrop mining had usually grown into family businesses, where a section of the seam was sub-leased from a company. A temporary or semi-permanent miners' settlement often grew-up adjacent to these workings. These settlements were often established under squatter's rights as temporary 'tai-un-nos' communities on the borders of the open mountain and the enclosed agricultural land. Such settlements usually consisted of a number of single or semi-detached dwellings within their own 'close', which was used to grow vegetables.

5.6 During the mid 19th century the coal and ironstone workings increasingly came under the direct control of the main iron-producing companies, such as the Dowlais Iron Company, who had leased the mineral rights for these areas.

5.7 During a surge in coal mining activity during the last quarter of the 19th century the older, open quarrying or patch working methods continued, but with the expansion of level and shaft working.

5.8 In south Wales the method generally used for extracting coal was 'the single and double-stall systems', although the 'heading-and-stall' or 'post-and-stall' method was also common.

5.9 Using the 'pillar-and-stall' method the seam is cut up into square or oblong pillars, varying in size according to the thickness of the seam. The main levels or roadways are driven from the pit towards the boundary, connected to each other by further narrow roadways, slits or cross cuts for ventilation. The coal

was then removed as the stall roads are driven out at right angles forming pillars. In the early history of mining, these blocks or pillars were left unworked to prevent subsidence, but in later workings a wedge of coal from the bottom of the seam along the length of his stall was removed and short timber props inserted to prevent the roof from collapse. The props were eventually then removed to collapse the coal and free it up for removal. The coal was loaded into trams and pushed out on iron rails until it could be hauled out on horse-drawn trams to the stockyards. Extensive 'finger' or 'fan-tips' of waste material were also frequently associated with these shaft workings.

5.10 With the introduction of coal cutting machinery during the late 19th century the 'long-wall system' was adopted in which the whole of the seam was removed in one long 'face' or 'wall'. Initially a shaft could be sunk to depths of up to 780 metres and roadways were then dug outwards into the most profitable coal deposits. Using this method a series of 'faces' of considerable width, from 60m to 1000m, were opened out and worked. Winding houses at ground level were necessary to lower and raise the men and coal.

5.11 The main advantage of 'long-wall' system over the 'pillar-and-stall' system was that there was that a higher percentage of the coal was extracted. In addition there was better ventilation a safer working environment and more men were able to work in a given length of the face.

6 Archaeological Background to Sections 6 and 7

6.1 Introduction

6.1.1 As Sections 6 and 7 are relatively isolated areas, industrial activity depended on a well-developed infrastructure to transport the raw materials and the manufactured goods. The final example of the development of this infrastructure in the area was the construction of the A465 'Heads of the Valleys' road itself in the mid-1960s.

6.1.2 The construction of the road caused the engineers considerable problems in building the road to modern standards over difficult terrain. From Hirwaun in Section 7, to the west of the scheme, the A465 crosses the parishes of Aberdare and Penderyn and followed the route of the early 19th-century turnpike road past the historic site of the Dynevor Arms, now the site of the present-day Baverstock Hotel.

6.1.3 At the Baverstock Hotel the A465 enters Section 6 in the parish of Merthyr and here the route diverges from the older turnpike road and follows a new route to the northwest. At this point the A465 crosses to Cefn-coed-y-cymmer on concrete road viaducts across three valleys: the Taff Fechan, the Nant Ffrwd and Taff Fawr. These road viaducts were built in 1964 to a design by the road engineers Rendel, Palmer and Tritton, with Alex Gordon and Partners as consultant architects. The viaduct across the Taff Fechan and Nant Ffrwd has twin parabolic arched ribs, whereas the central viaduct over the Taff Fawr has three spans cantilevered from two piers. These road viaducts are outstanding works of engineering which are important cultural heritage features in their own right.

6.2 Prehistoric

6.2.1 There are no prehistoric features within the Sections 6 and 7 close to the road corridor, although Bronze Age cairns, round barrows and standing-stones are known to survive in the upland areas around it. The relative lack of prehistoric activity within this section of the road corridor probably indicates that much of the area was only relatively sparsely occupied. It is possible that the area was occupied throughout the Bronze Age and Iron Age by semi-nomadic pastoralists practising but it is believed to have been largely devoid of permanent settlement prior to the post-medieval period. Indeed, where there is some fragmentary evidence for prehistoric activity within these areas, surviving prehistoric features may have been removed by later industrialisation of the area.

6.2.2 At the junction of Sections 6 and 7, either side of the A465 around the Baverstock Hotel, there are a number of Bronze Age barrows and cairns clustered into cemeteries. These sites include the Bronze Age Bedd-y-Gwyddel ring cairn on the hillside above the Baverstock Hotel (Reference: 300977; SO00810691) which forms part of religious and funerary cairn field site (Reference: 00447m).

6.2.3 Outside the road corridor, to the north of Merthyr Tydfil, is the early medieval site of Castle Morlais (SAM Gm 28), which also has evidence of prehistoric activity. The later medieval castle was built within an existing Iron Age hillfort on a limestone ridge above the Taff gorge. The Iron Age hillfort, which is of the univallate type, comprising a sub-rectangular enclosure, overlooked the river

valleys of both the Taff Fechan and Taff Fawr, thereby controlling the traditional north-south and east-west communication routes.

6.3 Roman (55 BC - AD 450)

6.3.1 Indigenous settlement in the uplands of south Wales during the Romano-British period was probably sparse and principally based around hillforts such as that at Castle Morlais. There are no positively identified Roman era sites within the road corridor of Sections 6 or 7, although there is evidence for Roman military activity from the nearby fort at Penydarren. This fort was established in c. 75 AD and abandoned during the 2nd century AD and had an attached civilian extramural settlement, or *vicus*.

6.3.2 Historical and archaeological sources also record a Roman road from Gelligaer to Brecon which would have crossed the route of the A465 at some point to the east of Section 6, although the exact location is unknown.

6.4 Medieval

6.4.1 The pillow mound at Bryn-y-Gwyddel, (located at grid reference: SO007070) which is protected as a Scheduled Monument (SAM: GM517), has been postulated as having a Medieval date; possibly used as a rabbit warren or windmill. However, it is more likely that this site was a post-Medieval rabbit warren used to provide meat for the occupants of the industrial settlement close to the site of the Dynevor Arms.

6.4.2 The main later medieval monument in this area is Castle Morlais, although this is located some distance to the north of the A465 road corridor on a limestone ridge above the Taff Gorge. The surviving ruins represent the last vestiges of a well-fortified castle begun in AD 1287 by Gilbert de Clare, earl of Gloucester, on land claimed by Humphrey de Bohun, earl of Hereford. When warfare broke out between the earls in 1290, Edward I was forced to march down from north Wales to intervene in the dispute.

6.4.3 The castle comprised a triangular inner ward with sides about 45m long and an inner bailey 60m wide. The inner ward had a round keep 17m in diameter at the north corner, a D-shaped tower with a staircase at the southeast corner, and a similar tower projecting from the south wall. Between the towers was the gateway. The outer ward has no towers on the west side, but there is a D-shaped tower at the southeast corner.

6.4.4 During the medieval period it is likely that much of the region's uplands would have been exploited for summer pasture in some form, possibly based on transhumance farming. It has long been postulated that the Welsh uplands served as summer pastures for lowland communities, a relationship still mostly described in terms of the summer settlement (hafod) and home farm (hendre) system. Over the centuries some traditional 'hafodydd' became permanent farmsteads, while new settlements, the cottages of shepherds (lluestau), peat cutters, metal miners and landless labourers, also appeared in the uplands. However, surviving evidence for this temporary farming and settlement is likely to have been largely destroyed by post-medieval industrial development and distinguishing medieval sites from those of a later date is often problematic.

6.4.5 Although it has not been possible to accurately date the majority of field enclosures in the area, they are likely to have been partly established by the end of the medieval era and the beginning of the post-medieval period. These irregular, enclosed field boundaries mark the extent of late medieval and early

post-medieval encroachment on to, and enclosure of, the common and hillsides. These boundaries are mainly of dry stone walled construction, though hedgebanks (cloddiau) are also evident.

6.5 Post-medieval

6.5.1 A large part of the post-medieval industrial landscape in Sections 6 and 7 has been lost to later development, opencast workings and land reclamation schemes. The land in the area is a mixture of unenclosed upland or common land in Section 6 with more enclosed land along the valley bottom in Section 7. The distinction between field patterns in the upland and lowland areas seems to have developed with the change-over from cattle to sheep farming in Wales which is associated with the establishment of the large landed estates during the 15th-17th centuries.

6.5.2 Historically, Monmouthshire and Glamorganshire had several notable estates belonging to the Marquess of Bute, Lord Dynevor and the Dunraven Estate. The Merthyr tithe map of 1850 and the schedule of 1846 shows that the farm of Coed Meurig (SO 0226 0745) had 37 acres of land which belonged to Lord Dynevor. The associated homestead at Coed Meurig farm is situated to the south of the existing A465 and is shown in its present position on both the tithe map and the 1880 Ordnance Survey map (Figure 32).

6.5.3 Merthyr Tydfil, located east of Section 6, is one of the few large settlements along the A465 road. The mineral resources contained within its hinterland led to Merthyr becoming the largest iron-making town in the world between the early and mid-19th century. The town was rapidly transformed from a small village in the 1750s to the largest town in Wales by the early 1800s and became the most significant Welsh town of the Industrial Revolution.

6.5.4 The growth of Merthyr followed the establishment of the main four ironworks in the area, the Dowlais Ironworks established in 1759; the Plymouth Ironworks established in 1763; the Cyfarthfa Ironworks established in 1765; and the Penydarren Ironworks established in 1784.

6.5.5 Water became an important resource for the iron industry and the population as a whole. At the point at which the A465 crosses from Penderyn parish into Aberdare the Nant Hir was dammed in the mid-19th century to create the Nant Hir Reservoir. The reservoir supplied water for the Aberdare Water Works Company (Figure 33).

6.5.6 Although substantial amounts of iron ore were extracted from the south Wales coalfields and converted into bar iron and other malleable iron, most of the production of finished manufactured took place in Sheffield and Birmingham. However, besides iron-working, other important trades grew up in the vicinity of Merthyr, including the export of coal and limestone as well as the manufacture of woollen cloth and brewing. In addition Merthyr became a significant economic, religious, literary and political centre in south Wales.

6.5.7 At the western end of Section 7 of the A465 is the village of Hirwaun which developed to cater for workers at the Hirwaun Ironworks (Figures 36 & 37). The Hirwaun ironworks was established on the north bank of the river Cynon in 1757 by Thomas Mayberry and John Wilkins who leased land for mining and the establishment of the ironworks. This Hirwaun Ironworks appears to have been the first coke-fired blast furnace in south Wales.

6.5.8 The earliest settlement at Hirwaun was probably immediately adjacent to the ironworks, but by the time the area was surveyed for the second Marquess of

Bute, in 1818, an area to the south of the river, at the northernmost extremity of the Glamorgan parish of Aberdare, had been laid out for new streets and houses and was in the process of being developed(Figure 36).

6.5.9 In about 1820, Hirwaun Ironworks was rebuilt and enlarged by William Crawshay, but appears never to have been particularly successful. The furnaces were blown-out in 1859 and, although there was some sporadic later activity on the site, the works effectively closed about this date. Although coalmining and quarrying survived the closure of the ironworks there was, therefore, little further settlement growth at Hirwaun.

6.5.10 The industrial activity of the area depended on a well-developed infrastructure system. During the early stages of ironworking in the south Wales valleys, raw materials and pig-iron were probably initially moved around the area using pack animals and localised tramroads. However, by the end of the 18th century industrial expansion led to the creation of a number of integrated communications links such turnpike roads, tramroads and later railways, to move products and materials between the limekilns, coalmines, the iron-works and the consumer markets.

6.5.11 The most significant landowner in the region, the Marquess of Bute, controlled extensive tracts of mineral-rich land the income from which eventually made the family amongst the richest in the world. As a result the Marquess of Bute's influence had a significant impact on the development of the region's iron and coal industries since the Bute estate along with the area's iron-masters provided the investment for many infrastructure and other capital projects.

6.5.12 The 2nd Marquess of Bute financed and promoted the construction of the Glamorganshire Canal in 1794 from Cardiff to Abercynon; this part later became known as "The Navigation" or "The Basin". By 1798 the nine miles between Abercynon and Merthyr had also been completed.

6.5.13 The Glamorgan Canal Navigation Act also provided for the construction of the Penydarren tramroad and the connecting tramroads from collieries and ironworks situated less than four miles from the canal. Many of these localised tramways were built under this Act, such the horse-drawn Penydarren tramroad which was built from Merthyr to Abercynon in 1802. This tramroad was later used by Richard Trevithick's first steam-locomotive railway journey in 1804. In addition the Gurnos tramroad, built in 1793, was built to carry limestone from the Gurnos quarries to the Cyfarthfa Ironworks for use as flux in iron smelting.

6.5.14 In 1811 when the Aberdare Canal was constructed from the Glamorganshire Canal Navigation at Abercynon to Aberdare. The Aberdare Canal led to the construction of a number of further branch-lines and tramways to transport the finished iron from the ironworks to the canal at Aberdare and on to Cardiff docks.

6.5.15 However, by the 1820s the lack of proper dock facilities at Cardiff led the 2nd Marquess of Bute, to promote the construction of the West Bute Dock, which was opened in October 1839. This was followed by the West Bute Dock at Cardiff, opened in 1839, and the East Bute Dock opened in 1859. Cardiff further opened the Roath Dock in 1887 and the Queen Alexandra Dock in 1907.

6.5.16 The later construction of the Taff Vale railway to Cardiff faced opposition from the Glamorgan Canal Company but received the Royal Assent in 1836. It incorporated the first commercially significant public railway in Wales. The Taff

Vale Railway was to run from Cardiff to Merthyr Tydfil with a branch to communicate with the tramroad leading to the Penydarren, Dowlais, and Plymouth Ironworks, and another branch to the collieries of Lancaiach. The first stretch of the railway was opened in 1840 and reached Merthyr by 1841.

6.5.17 The Taff Vale Railway Hirwaun Junction Line was incorporated in 1867 as the Rhondda Valley and Junction Railway, and was opened in 1878 for mineral traffic only from the Blaenrhondda Branch junction to Blaenrhondda Colliery, with a spur to Blaencwm Colliery. Neither the original extension to Hirwaun, nor a later one, authorised in 1872, from Hirwaun to join the Aberdare Railway at Mill Street, Aberdare, was ever made. In 1889 the Taff Valley Railway absorbed the independent company.

6.5.18 The line of the A465 crosses several mid-19th-century tramways at Hirwaun. Most of these tramways were associated with the Aberdare and Rhondda Railway, which was laid out in the mid-19th century and ran from the top of the Rhondda Valleys to a junction with the broad-gauge Vale of Neath Railway near Hirwaun Ponds. The associated tramroads are the main features of industrial transport interest along the A465 route at Hirwaun. The tramroads connected the Hirwaun Ironworks with the collieries, ironstone mines and quarries from which it drew its raw materials or provided the means of dispatching finished iron to the canal at Aberdare.

6.5.19 At Hirwaun the other main rail feature was the Vale of Neath Railway (SN 9730 9550) which crossed the early road from Hirwaun to Merthyr Tydfil and was opened in 1851 as a broad-gauge line. The line was later rebuilt as a standard-gauge Great Western branch railway, which survives as a single-track mineral line (Riden, 1996).

6.5.20 After the coming of locomotive-operated railways to the area, during the period of rapid railway expansion between 1850 and 1870, a new generation of connecting tramways were built to feed the Vale of Neath Railway main line (Riden, 1996).

7 Sections 6 and 7: Evaluation Methodology

7.1 The methodology for evaluation of each site consisted of excavation of the topsoil and non-archaeological layers carried out using a machine fitted with a ditching bucket under archaeological supervision followed by detailed hand excavation of any stratified deposits. Where archaeological features were recorded on *pro forma* context sheets, and were drawn and photographed following the site specification and the methods set out in the Jacobs Babtie archaeological site manual.

7.2 In order to tie the site into the National Grid Reference system and to provide a height above Ordnance Datum, a base feno station was established next to each site to a lateral accuracy tolerance of +/-50mm on soft surfaces and a height tolerance of +/-10mm. The exact location of the individual trenches was measured from known points and plotted onto Ordnance Survey digital base maps. Levels were taken using an automatic dumpy level.

7.3 The archaeological research objectives for each site are outlined on a site-by-site basis in Appendix 1, but the overall objectives were to evaluate the potential survival and relative importance of each site.

8 Site No. 229: Track at Lech Sycrhydd(SO 9960 0704 to SO 9958 0680)

8.1 Description

8.2 This site represented the course of a buried track of unknown date at Lech Sycrhydd, located to the south of the A465 (Figure 4). The track is visible above ground-level as a slightly raised platform running north/south, although forestry planting to the north of the A465 has destroyed any possible evidence of the site in this area.

8.3 A trench was located across the track (Figure 8) which showed that around 0.08m of topsoil had accumulated over a layer (002) of well-compacted black glassy slag material which was 0.1m in depth (Figure 9). Below (002) was a layer (003) of well-compacted orangey-brown glass slag and clay between 0.07m and 0.01m thick. At approximately 0.3m below the surface was further black slag layer (004) which was similar in make-up to layer (002).

8.4 At approximately 0.55m below the present ground surface, the original topsoil layer (005) of the field level was encountered (Figure 9). This consisted of a black humic soil layer. The natural sub-soil (006) directly below (005) was a moderately compacted grey/orange boulder clay.

8.5 Conclusions

8.6 The layers observed in this trench did indeed represent a distinctive trackway which had been re-surfaced a number of times. However, the use of the highly vitrified slag materials suggested that the track had been constructed relatively recently, probably to consolidate and existing farm track.

9 Site No. 232: Baverstock Settlement and Mineral Workings (SO 0073 0730)

9.1 Description

9.2 The Baverstock settlement and mineral workings site is located on the open moorland of Mynydd Aberdare (Figure 3). The site consists of the remains of a number of a 'closes' and house platform associated with a series of tips, turfstone boundaries, tramroads and the remains of some possible scouring ponds or reservoirs (Figure 10). These earthworks can be clearly seen at ground level today from aerial photographs of the site (Plate 1).

9.3 Cartographic Evidence

9.4 The 1813 Ordnance Survey (OS) draft map of two inches to the mile shows that the area around Site 232, with its settlement and associated mineral workings, formed a single field running the length of the area. The 1813 draft OS map also shows that there were a number of iron ore levels worked from a tramroad which ran to Clwydy fagwyr where it was joined by two tramway branches annotated as 'Coal and Mine Works'. The line ran steeply on to Gelli-deg and from here to the old road to the furnaces. This alignment of the tramroad can also be seen on the later OS map of 1891 (Figure 32).

9.5 By the time the Merthyr Parish tithe map was surveyed in 1850 the Dynevor Arms Inn had been built at the site presently occupied by the Baverstock Hotel (Figure 3). The tithe map shows there are two cottages with 'closes' formed of banks near to the Dynevor Arms Inn. Although the tithe map of 1850 does not show the existing coal and ironstone workings this may reflect the limitations of the survey rather than the absence of workings at this date as the tithe maps were more concerned with productive agricultural land than mineral workings. The apportionment for the 1850 tithe map indicates that the two parcels of land which were later used as patch-workings and tips as shown on the later 1891 OS map were owned in 1850 by William Crawshay. William Crawshay was an important member of the family of who ran a number of ironworks in the area. The nearest Crawshay family ironworks was Cyfarthfa Ironworks, which was where the minerals from this area were probably used.

9.6 By the time the OS map of six inches to the mile was published in 1891 (Brecknockshire Sheet 50. NE) patches and tips to the south of the Merthyr to Aberdare road are annotated as a number of ironstone levels (Figure 32). The patches and tips shown on the 1891 OS continue to the south of the A465 east of the farmstead of Ty'n y Coed Cae (Figure 32). The 1891 OS indicates that there was one ironstone level still active at the Site 232 at this time which was located to the south of the A465 (Figure 32).

9.7 Further to the south, the whole area of open moorland of Mynydd Aberdare was littered by ironstone and coal workings with associated tramways (Figure 33). The 1891 Ordnance Survey map shows a series of coal and ironstone levels located some distance to the south of the Dynevor Arms and connected to it by a track; these patches are annotated as 'Fothergills Patches' and 'Bryn Defaid Patch' (Figure 33). The presence of an engine house at the latter patch-working indicates there was probably also deep mining requiring water pumps or winding gear at this time.

9.8 The field pattern of the enclosed area at the time of the 1891 OS map largely follows the line of the county boundary (Figure 32). It is likely that the Cynon and Taff valleys which form the county boundary and boundary between the parishes Penderyn, Vaynor and Merthyr parish may also have formed a division in mineral rights. The mineral rights to the western area probably belonged to Aberdare Ironworks and the rights to the eastern area to Cyfarthfa Ironworks (van Laun, 1997). The other three Merthyr Tydfil ironworks had mineral rights to lands located to the east of the Taff.

9.9 The two small cottages also appear on the later OS map of 1891 located close to the Dynevor Arms Inn (Figure 32). These cottages are located within defined field boundaries which would have formed their 'close' or garden area and relate to raised earthworks still visible on the ground today.

9.10 The only tramway shown linking the ironstone level at Site 232 on the OS of 1891 is located to the east of the cottages and runs towards Merthyr Tydfil (Figure 32). The shape of the workings and tips shown on the 1891 OS map (Figure 32) differ from those picked-up by the modern topographic survey (Figure 20). This indicates that the workings were further worked and enlarged after the publication of the OS map in 1891.

9.11 Documentary evidence

9.12 Historically many mineral workings made use of a technique called scouring which was described thus:

"After working several years on the 'pick and shovel' process, clearing the edge of the outcrops where convenient and practicable, the gradient of the strata was such that a considerable quantity of topping was to be cleared, and the minerals getting deeper into the earth, the miner was required to exercise his ingenuity and develop all his skill and energy. His next process was to drive small holes into the strata a certain distance, then to work the small pillars that separated the numerous holes, and suspending operations until the overlying strata would of their own weight fall in mass. In the meantime a small pond or reservoir was constructed and filled with water. The pond was situated in such a position that when its bank was broken the water rushed into the fallen mass, separating the mine and rubbish." (Extract from Evan Powell on the Local History of Blaenau Gwent).

9.13 A possible example of a scouring pond is still visible on the hillside above the cottages platforms, although no water now collects in it (Figure 20). Alternatively the large crater formed in the hillside may have been used to collect drinking water for the cottages below or have formed from the remains of mineral workings.

9.14 The 'pillow mound' (Scheduled Monument GM517) on the hillside above the cottages has been suggested as the site of a medieval rabbit warren or windmill site (Figure 3). However, there is no cartographic or documentary evidence to support the idea of a medieval or post-medieval windmill in this area. Windmills were never common in any part of south Wales and a mill in such an isolated spot, in a parish with relatively little land suitable for cereal production and ample water-power for water-mills, seems improbable (Riden, 1996). It is more likely the earthworks formed a post-medieval rabbit warren created by the occupiers of the cottages around the Dynevor Arms. Rabbits were often kept in industrial settlements to supplement meagre food supplies.

9.15 Evidence for Mineral Extraction

9.16 The workings in the vicinity of Site 232 were known as 'patches' and were formed from miners digging into the hillside to extract the easily accessible coal and iron ore which outcropped near to the surface. Each patch would be identified by the individual worker's name; for instance 'Fothergills Patches' (Figure 33).

9.17 In several places around the area the distinctive collapse of 'pillar-and-stall' workings is visible on the ground (SO 0101 0720) (van Laun, 1997). These workings would have been within the Rosser Ironstone (van Laun, 1997) and it is probable that the patches were exploiting outcrops of this ironstone as well as the Lower Four-Foot coal.

9.18 Ironstone working

9.18.1 From field walking it appears part of the workings in the area (SO 0089 0718) have been carried out by using the 'plank-and-barrow' method (SO 0108 0719) leading to 'crowsfoot' tips (van Laun, 1997). This method involved removing the overburden to expose the rock below. The face of the outcrop was then

worked down as far as practicable until the next section of overburden was reached. The spoil was barrowed across the newly formed gorge and deposited one step further on. In this way the 'face' advanced in a long strip with the waste moving a step at a time, always being roughly the same distance behind the 'face' (van Laun, 1997). This method left a characteristic waste tip roughly where quarrying began, sometimes radiating slightly outwards where gaps had been filled, with a final gorge where working stopped. The advantage of this method was that trams could be loaded with ore or coal directly from the 'face'.

9.18.2 In particular the area worked from SO 0045 0700 to SO 0073 0723 is characteristic of this method where a gully can be followed along the outcrop and waste dumped to the north with evidence of a cutting through the waste for a tramroad Figure 32). The tramroad would have been built at the final stage when waste disposal became a problem, possibly after the post-1829 enclosure of the area (SO 0063 0728). The mineral workings post-1829 and prior to 1867-72 can generally be attributed to the Aberdare Ironworks as all the western workings were abandoned after this date. The extent of the waste suggests this area was a major source for native iron ores.

9.19 Coal Workings

9.19.1 The general practice for mineral working in this area was to work the outcrop from the north, but because the coalfield dips seven degrees to the south, this created drainage problems (van Laun, 1997). However the topography of the land made it possible to drive levels up into the ore and coal. In order to work the seams downwards adits were also driven at a lower level still, with drainage taking place into established valley systems (van Laun, 1997). This would have allowed approximately 600m of southerly working before drainage would again have become a problem.

9.19.2 The coal levels were driven under the ironstone outcrop to meet the Lower Four-Foot below. Although some distance from the underground seams, the angle of the level driven upwards would have provided a good gradient for drainage and tramage (van Luan, 1997). By the 1870s, and probably well before, levels were being driven westwards into the outcrop between 100m to 170m lower down in the Taff valley giving more direct access to coal and ironstone. These levels were, therefore, generally all abandoned along with all the western workings by 1867-72.

9.20 From the cartographic and field-walking evidence it initially appears unusual that the coal levels, and the accompanying spoil tips, lie below the ironstone workings (van Laun, 1997). Using this method to reach the coal it would have been necessary to first pass through the iron. However, this method of working was necessary to obtain drainage and easy haulage and had the advantage that ironstone could also be won from the same levels.

9.21 Evaluation Results

Trench 1

9.21.1 The six evaluation trenches concentrated on what was assumed, from the historic mapping, to be a platform for a cottage closest to the original Dynevor Arms Inn (Figure 10). This house platform was enclosed by a series of embanked boundaries which probably formed the 'close' associated with each

house (Figure 11). The banks surrounding the house platform were between 0.5m and 0.8m high and covered by turf.

9.21.2 Trench 1 was opened up on an east-west orientation across the length of the 'close' and house platform earthworks and extended to 27m in length by 1.5m wide (Figure 11). The excavation revealed that across the area of the house platform there was a thin covering of humic material and demolition materials, such as stone and lime mortar (001) (Figure 12). Below this layer (002) was an active demolition layer with a high proportion of lime mortar with limestone and millstone grit, indicating the 'robbing' of stone for re-use. Stratigraphically earlier than this were two layers (003 and 004). The first layer (003) indicated a phase of building collapse, with only a few mortar fleks, and the second layer (004) represented a phase of stone removal with frequent lime mortar fragments, which were interpreted as the representing the removal of mortar from the stones prior to transportation and re-use.

9.21.3 The removal of these layers revealed the remains of a masonry wall with lime mortar. The wall was roughly orientated east/west and was recorded by dividing it into three main separate parts (005, 006, 007). The main length of wall (007) was located at the west end of the trench and was 7.05m long and 0.61m wide. This wall had a return wall at the west end, which was noticeably thicker, being 1.1m wide, with a further narrower return at its eastern end.

9.21.4 The eastern return end of wall (007) was separated from another short length of wall (006) which was 4.13m long by 0.57m wide. The wall (006) had evidence of a white lime render on its northern face, suggesting an exterior wall. This wall (006) was in turn separated from a stub wall (005) which was 1.02m long, but the width of which was hidden in the section and was not fully excavated.

9.21.5 The walls (005, 006 and 007) were formed from angular limestone and millstone grit rubble with main stones being on average 0.6m x 0.3m x 0.4m with smaller infill stones. The walls were similar in style and method of construction although separated by breaks in construction and doorways.

9.21.6 The thicker western end of wall (007) appeared to be a gable-end and was interpreted as being of increased size to accommodate a chimney. Wall (007) was, therefore, interpreted as encompassing the cottage's main living area. The eastern return wall (007) probably also defined an original gable-end of the cottage with the second wall (006) representing a later phase of construction forming and extension. This extension appeared to be separated from wall (007) by a doorway which would have provided a 'baffle-entry' into the main house. A further separate doorway into the extension was provided by a gap between the wall (006) and the stub wall (005). This extension was interpreted as being a utility of store room because it had a separate entrance to the main cottage.

9.21.7 Overall the cottage extended to a length of over 13m east-west. The rear wall was interpreted as the masonry structure revealed in Trench 2, making the cottage approximately 6.2m wide north-south.

9.21.8 Within the cottage living-area defined by wall (007) was a stone floor (008) which was 0.08m thick and built of flags on average 0.4m x 0.2m in size. There were also bricks set into the floor forming gullies or drains. Dispersed throughout the trench were large amounts of 19th century pottery including Staffordshire dark earthenware, china pottery and glazed biscuit wares. Within the utility area defined by wall (006) was a further flagstone floor (009).

9.21.9 Outside the west gable of wall (007) was a roughly north-south orientated limestone cobbles area over which were re-used slate and limestone roof tiles. The stones appeared to form a gully or drain 1.25m in length and 0.3m wide which was built sometime after the main house.

Trench 2

9.21.10 Trench 2 abutted Trench 1 to the south on a north-south orientation. Trench 2 was 26 long by 1.5m wide and crossed an east/west earthwork (Figure 13) which was presumed to be the rear wall of the cottage revealed in Trench 1 as well as a larger field boundary at its southern most end (Figure 14).

9.21.11 The excavation of the trench at the northern end through the bank at the rear of the cottage revealed a series of demolition and masonry collapse layers (006, 010 and 012) which had formed a bank (Figure 13). Removal of these layers revealed remains of a wall (011) standing to a height of approximately 0.4m which had well-defined north and south faces. The wall, built from limestone and millstone grit masonry with a lime mortar bonding, was 0.6m thick. The wall was largely similar to the wall (007) revealed in Trench 1 and was interpreted as the rear wall of the cottage revealed in Trench 1.

9.21.12 The excavation of the southern end of Trench 2 through the field boundary revealed a bank 0.8m wide constructed of a layer (014) of a mixture of re-deposited natural and field clearance stones (Figure 14) and covered by layers of clay.

Trench 3

9.21.13 Trench 3, 44m by 1.5m wide, was excavated to the north of Trench 1 on a north-south orientation across two earthwork boundaries (Figure 10). A section was excavated across the northernmost field boundary as this appeared to be the most substantial and complete of the two (Figure 15).

9.21.14 The stratigraphy of the section showed that there had originally been a low bank 0.6m high at this point made up of four main layers (009, 010, 011 and 012) (Figure 16). On the southern (uphill) side of the earthwork a ditch had been cut [006] which was 0.95m by 0.25m deep. The ditch had provided the layers of material for the make-up of the bank and to provide drainage.

9.21.15 The uppermost layer (009) of the bank was 0.15m thick consisting of a silty-clay with occasional large limestone and millstone grit stone blocks which appeared to have been a repair of the field boundary on the downhill side. Layer (011) below layer (009) was 0.31m thick consisting of a silty clay with frequent organic peaty elements. Layer (012) below (011) was a clay layer with some occasional medium to large limestone and millstone grit stones and was 0.27m thick; it appeared to be a re-deposited layer of subsoil used in the make-up of the field boundary. Layer (010) formed a layer of turf and topsoil laid over the ground surface (003) during construction of the boundary, it consisted of a silty organic clay material with small shale inclusions and was 0.16m thick.

9.21.16 The ditch [006] had later been filled by two layers (005 & 014) of silty clay material which represented silting-up of the ditch over time, 0.25m and 0.32m deep respectively.

9.21.17 In a later phase after the silting up of ditch [006] and the erosion and partial collapse of the bank, there had been a re-cut [013] to the north (downhill) side of the bank which had then been used to add a layer (008) of

material to the top of the bank. This final layer (008) was of mid-brown silty clay which was 0.55m thick and included large millstone grit and limestone blocks. This layer represented a repair to the bank on the southern side including material from further field clearance. This layer (008) had also eroded and the whole bank had been covered by a layer of topsoil (001) up to 0.05m thick.

Trench 4

9.21.18 Trench 4 was 3.5m long by 1.45m wide and was hand-dug across a across the easternmost bank surrounding the cottage 'close' which was north-south orientated (Figure 10). The section through the bank revealed a straightforward sequence of four layers that made-up the bank (001, 002, 003 and 004) (Figure 17). Layer (004) formed the natural sub-soil which was a yellowy-brown silty-clay with occasional lens of light-grey clay. Stratigraphically above this was a layer (003) of silty-clay material with fine gravel, 0.4m thick. This was overlain by a layer (002) 200mm thick of similar silty-clay material overlain by the topsoil (001), which was 100mm thick.

Trench 5

9.21.19 Trench 5 was 5m long by 0.8m wide and was excavated on a north-south orientation across a separate east-west linear boundary to the west of the cottage (Figure 10). This boundary was not directly related to main the cottage 'close' but represented an outer field boundary.

9.21.20 The trench was hand-dug to a depth of 1m with a 'sondage' cut through the western end and on the northern side (Figure 18). A sondage was dug on the western side to determine the relationships between the wall and the build-up layers and the sondage on the northern side was dug to determine the depth of the natural soils.

9.21.21 The field boundary had a central drystone wall (017) at its core which was 0.49m wide. The wall consisted of limestone blocks with average dimensions of 0.4m x 0.3m x 0.25m which were presumably field clearance stones.

9.21.22 A series of layers had built-up against the wall (Figure 19). The original ground surface upon which the wall (017) was built was layer (010). The deposits on the northern side (downhill) (005 to 009) seem to have built up over a long period of time through natural processes of the soil with leaching through the wall. The deposits on the southern side were less numerous and may well have been truncated through re-cutting of the bank, although no cut was visible in the section.

Trench 6

9.21.23 Trench 6 was 3.5m long by 1.5m wide and was hand-dug across an extensive north-south orientated field boundary which was over 120m long (Figure 10). This field boundary was not directly related to main the cottage 'close' but represented an outer field boundary possibly belonging to a further cottage platform site located to the north of the area (Figure 10).

9.21.24 The area was cleared to the height of the boundary wall stones (013) and a slot dug 0.4m wide dug through the stones to the natural (011) to record the structure in section (Figure 20).

9.21.25 The core wall was made-up of three layers (005, 006 and 009) (Figure 31). The stratigraphically earliest layer (009) was 0.3m thick and made-up of ironstone, limestone and quartz stones. Overlying this was layer (006) formed from large stones similar to layer (009). The final layer, layer (005) acted as a capping or bonding layer and contained few stones and was largely formed from clayey silt, 0.22m deep.

9.21.26 The material, apart from the field clearance stones at the core of the boundary, appear to have come from the ditch cut [012] along the eastern side, although it is possible there was a further ditch cut along the west side. The ditch cut [012] silted-up over time and was filled by (008) and later layers (007 and 003) and finally by (004) which also covered the whole bank.

9.22 Evaluations conclusions

9.22.1 Trenches 1 and 2 were located within a banked enclosure approximately 30m x 25m which incorporated the remains of a cottage. Within trench 1 were the external walls of a small dwelling with walling on average 0.5m thick. The cottage appears to have been a two-cell baffle-entry house made of local limestone and millstone grit with a stone and, possibly later, a slate roof with flagstone floors. The house appears to have had overall dimensions of 13m by 6.2m with a living area approximately 7m by 6.2m.

9.22.2 The prevalence of 19th century pottery associated with the cottage and its relative isolation means that it is unlikely to be any older than the 19th century. In this remote moorland area it is likely that this was a squatter settlement which was populated by miners and colliers. It is probable that the cottage was built by people who were working the nearby patches and mine workings exploiting the Rosser Ironstone outcrops and the Lower Four-Foot coal (Riden, 1996).

9.23 There is evidence that quarrying and mining was a seasonal job pursued by people who occupied dwellings with many similarities to the 'hafod' and 'hendre' dwellings common throughout upland Wales. However, the carefully organised field patterns with stone rubble walls and house platforms suggest at least a semi-permanent settlement at this site. The rectangular field patterns with houses situated in the middle are characteristic of the type of dwellings found following the growth in population in the early 1800s. This phasing is confirmed by the careful dumping of post-1829 ironstone waste short of the settlement.

9.23.1 Trenches 3, 4, 5 and 6 were located in order to provide sections of the raised turf and stone boundaries which surround the settlement. The construction methods for each boundary were similar consisting of a drystone walling covered over by an earthen bank principally using material taken from a ditch. Over the years the banks were eroded and then re-built. After their disuse, the earthen banks were colonised by mosses, sedges and grasses.

9.24 General Conclusions

9.25 The site covers an area of approximately 37 hectares and could be seen to rival Blaenavon as a rare survival of a relatively complete industrial landscape (van Laun, 1997). Although only preliminary fieldwork has been undertaken this area appears to contain near complete survivals of iron and coal workings from well before the 1870s, but not including deep mining. There survive a number of levels, pillar-and-stall workings and plank-and-barrow workings

combined with tramroads and surviving waste tips and the house platforms and boundaries of a squatter settlement which make this an important survival from the industrial era.

10 Site No. 252 Bute Colliery Tramway (SO 9534 0527 to SO 9506 0500)

10.1 Description

10.2 This site was presumed to be the route of the dismantled Bute Colliery to Hirwaun Tramway which had been replaced by the Tower Road in Hirwaun. The route, which intersects the existing A465 and to the south at SO 9506 0501, converges near an area of open-cast workings with the Aberdare to Rhondda Railway (Figure 7).

10.3 Evaluation Results

10.4 One evaluation trench was excavated in the area where the proposed road would impact the Bute Colliery Railway (Figures 22 and 23). Below the present road surface (001) was a compacted layer of industrial waste (002) including coal and slag material 400mm thick, which could have been the foundation material for the tramroad. Below this was a further layer (003) of well compacted sandy-gravel with large cobbles which either natural or re-deposited natural.

10.5 Conclusion

10.6 Although there was evidence of a metalled surface along the road there was no specific evidence relating to an earlier tramway surface at this site.

11 Site No. 255 Aberdare & Rhondda Railway and Tramroads (SO 9587 0510 to SO 9567 0417)

11.1 Description

11.2 The historic OS map shows that there were a number of mid-19th-century tramway lines at Hirwaun (Figure 24). Most of these were associated with the Aberdare and Rhondda Railway line, which ran south, from a junction with the Vale of Neath Railway branch of the Great Western Railway near Hirwaun Ponds, to the top of the Rhondda Valleys, marked on the OS of 1892 (Figure 35).

11.3 Whilst the Vale of Neath line ran north of Hirwaun, the Aberdare and Rhondda Railway ran to the south of Hirwaun running roughly west-east until it joined a series of lesser tramroads running to various ironstone mines such as Knobby Drift (Figure 35).

11.3.1 The three associated tramroads ran roughly from the ironworks, through Hirwaun village to an ironstone pit called Knobby Drift (Figure 22). It appears that this drift mine was certainly in use by 1892, although it lacked a tramway connection at this date, and it is possible that the level relied solely on road wagons to carry the iron away. Alternatively, it seems more likely that it was originally rail-connected and it is possible that the line was abandoned when the blast Hirwaun Ironworks furnaces closed down in 1859.

11.4 Route 255a: This is the course of the Aberdare & Rhondda 'main line' shown on the OS of 1892, near Knobby Drift running from a bridge over the stream at

SO 9531 0508 (Figure 35). The line continued east, running to the south of the present tennis courts to another bridge where the tramroad crossed the main line (SO 9560 0503) (Figure 12).

11.5 Route 255b: Shown on the OS map of 1892 (Figure 35) as an abandoned branch of the Aberdare & Rhondda tramroad, running SSW, presumably to pits, which had vanished by the time of the OS in 1892. The tramroad can be seen to have been built upon an earth bank over 1.5m high which has been truncated by the later construction of Tramway C. The tramway crossed the Nant y Bwlch stream on a culvert (Figure 12).

11.5.1 Route 255c: The course of a tramway running SSW, but not shown on the OS of 1892. The tramroad intersected Tramroad B causing the partial destruction of its earth embankment, and indicating that tramroad C has a later construction date (Figure 24).

11.6 Evaluation Results

11.6.1 Route 255a: A trench excavated across the Aberdare and Rhondda Railway main line showed that below an upper hoggin layer (001) of gravel and coal dust particles was a limestone layer (002), 0.2m deep which may have formed the track surface layer (Figure 25). Below this was a layer of hardcore (003), formed from shale, industrial waste materials and clay, which was 0.2m deep. A further foundation layer for the track bed (0004) consisted of large fragments of slate and shale on average 0.2m x 0.15m x 0.1m to a depth of 0.25m. Below this were natural layers of sandy-clay (005 and 006).

11.6.2 Route 255b: This was a poorly maintained track with many ruts within the upper layer (001), which consisted of a surface of orange/grey ironstone and leached shale (Figure 13). Below this were a number of layers of (002, 003, 004, and 005) which appear to have been attempts to repair the trackway with various materials from friable shales and ironstone to coal. At a maximum depth of 0.5m a layer (006) was uncovered which appeared to be the remains of the early tramway track bed. The layer was made up of frequent rounded stones of limestone and conglomerate stone with a clay matrix to a depth of 0.22m. Below this the natural (007) was a mottled orangey clay.

11.6.3 Route 255c: A trench was excavated across Tramroad C. However, due to heavy water-logging and past disturbance of the layers, no sub-surface remains recorded and the trench was abandoned at a depth of 1.2m.

11.7 Conclusions

11.7.1 The excavations revealed in section the remains of the railway and tramway track-bed layers respectively within Routes 255a and 255b. As one would expect the method of construction between the railway and tramway appeared vary. The track-bed of Route 255a used layers of rounded cobbles whereas the track in Route 255b was formed from mixtures of gravel and limestone.

11.7.2 The Aberdare and Rhondda railway and its tramways do not appear to be of any special interest and the lines do not appear to have had any engineering features of importance. The main surviving feature of note is the associated site of the ironstone pit at Knobby Drift. Although it is possible that excavation of the tramways may reveal some early rail artefacts, most material was probably removed when the lines were abandoned.

12 Site No. 273 Aberdare & Rhondda Railway Tramroad: (SO 9566 0520 to SO 9559 0491)

12.1 Description

12.2 This is the presumed site of a local tramroad, surviving as a trackway, which is believed to have been used to transport ironstone from the Knobby Drift Ironstone pit (No.274) to the Hirwaun Ironworks during the mid 19th century (Figure 7). This line is shown on the OS map of 1892 (Brecknockshire Sheet 50. NW), as a further off-shoot of the Aberdare and Rhondda railway (Figure 35).

12.3 Evaluation Results

12.4 A trench excavated across the course of the tramway line (Figure 26). The upper surface layer of the tramway incorporated frequent 19th and 20th pottery including bone china and earthen ware.

12.5 Below the upper layer were a series of truncated layers (002, 003, 004 and 005) which appear to represent attempts to infill the rutted surface of the track after the tramroad had fallen into disuse using brick, stone and slag (Figure 27).

12.6 Below these repair layers was a thin layer (006) (0.05m thick) constructed of a mixture of clay with small shale and ironstone fragments which may have been laid to receive the track bed directly. The main foundation for the track-bed, however, consisted of a layer (007) of medium to large shale and ironstone fragments at least 0.5m deep above an orangey clay natural.

12.7 Conclusions

12.7.1 A trench was excavated across the route of the tramway to assess the presence of possible track/sleeper level and to record in section the construction methods used for track bedding. The construction method used for the track bedding consisted of large shale and ironstone fragments and was similar to those identified at Site 255b, which was a related tramway.

13 Site No. 275: Tramway branch of the Hirwaun Common Railway (SO 9597 0500 to SO 9598 0470)

13.1 Description

13.2 This tramway is marked on the OS map of 1892 and survives as a north/south track (Figure 35). The tramway was a branch line of the Hirwaun Common Railway and would have carried coal from collieries to the south to the Hirwaun Ironworks.

13.3 The present route of the branch-line is marked on the ground by a modern concrete road running towards the uplands, south-east of Hirwaun (Figure 7). The route presently delineates the eastern boundary of land owned by the Bute Town Colliery Company.

13.4 Evaluation Results

13.5 A small trench 2m by 1m wide was excavated to the west side of the road in order not to disturb the metalled surface of the road (Figures 28 and 29). Layers 002, 003 and 005 represented a single layer of loose, clay-silt material with frequent coal inclusions which had been truncated by a cut (004). The cut, which may have represented a tramside drainage ditch, was filled by a well-compacted clay-silt.

13.6 Below these layers was a thick layer (006), approximately 0.6m deep, of loose grey shale with frequent coal inclusions. This seemed to represent a dumped layer of loose re-deposited natural shales, alongside the tramroad. Below this was a layer (007) approximately 0.17m thick of iron-rich material with large boulders. At a depth of 1.1m a peat layer (009) was encountered which was interpreted as the original surface layer prior to industrialisation.

13.7 Conclusions

13.8 There was no evidence of the original track bedding evident in section, possibly because, due to modern access along the route, the trench was not excavated directly on the track-bed route. Instead there was a series of shales dumped which were probably related to trackside activity. However, below this, at approximately 1.4m below the present ground surface was an organic rich sediment which probably indicates the original ground surface prior to industrial activity.

14 Site No. 276: The Hirwaun Common Mineral Railway (SO 9495 0618 to SO 9862 0481)

14.1 Description

14.2 The Hirwaun Common Mineral Railway was marked as a tramroad on the Aberdare tithe map of c.1840 and later as a conventional locomotive-operated railway on the OS map of 1892 (Figure 35). The route of the line can be followed to the west of Hirwaun at SO 9495 0618 where it converges with the Vale of Neath Railway (Site No.258) (Figure 7).

14.3 To the east, the line of the railway runs along Longfield Court to SO 9612 0505 where it is crossed by the A465 (Figure 7). The 1892 OS shows that the line continues further on to the south-east and a branch line diverges to south, currently a footpath.

14.4 Evaluation Results

14.4.1 The excavation of the trench across the track route (Figure 30) revealed two upper layers (001) consisting of loose, mid-grey silty-clay material with small to large angular pieces of shale 0.3m thick. Underneath this was a layer (002) of loose dark brown silty loam with a high proportion of coal dust, approximately 0.45m thick (Figure 19). Below these were (003, 004 and 005) which were two similar layers of orangey clay, shale and ironstone and industrial residues of gritty ash.

14.4.2 Located within layer (005) were the remains of an flat arched stone wall which had probably been built as a culvert beneath the railway (Figure 31). The wall was lime mortared and was formed from a number of individual voussoir stones. Only the top half of the wall was revealed, so it was not possible to determine its exact extent.

14.5 Conclusion

14.5.1 A series of hogging layers suggest that this was indeed the location of the Hirwaun Common Mineral railway track bed. The mortared wall below the track-bed was assumed to be culvert associated with the railway. The culvert would have been used to divert a small brook or drainage ditch below the railway to prevent erosion of the track-bed.

APPENDIX 1

Appendix 1: Sites evaluated in Sections 6 and 7

Site No.	Name of Site	Grid ref:	Evaluation Method	Period	Type
232	Settlement and field system, Baverstock	SO 0073 0730	*Method of excavation: Hand excavation followed by machine trenching.*	Post-Medieval	A complex of turfstone walled field boundaries representing gardens, enclosures and drainage systems. rubble concentrations indicate the sites of demolished cottages.
252	Bute Colliery Road (Tower Road), Hirwaun	SO 9534 0527 to SO 9506 0500	*Method of excavation: Hand clearance and excavation where necessary.*	Post-medieval	The course of the dismantled Bute Colliery to Hirwaun Tramway running along Tower Road..
255A	Railway A, Aberdare & Rhondda Railway	SO 9578 0514 to SO 9506 0501		Post-Medieval	The course of the Aberdare & Rhondda main line railway.
255B	Tramroad B, Branch of Aberdare & Rhondda	SO 9581 0512 to SO 9589 0476	Post-Medieval	abandoned by 1880	A tramroad from nearby pits to the Aberdare & Rhondda railway built on an earthen embankment.
255C	Tramroad C, Hirwaun	SO 9587 0510 to SO 9567 0471	Post-Medieval	post-1880	The course of a tramway intersects and truncates Tramroad B.
273	Tramroad, Hirwaun	SO 9566 0520 to SO 9559 0491	Post-Medieval		A local tramroad, surviving as a track, which transported ironstone from the Knobby Drift Ironstone pit to the Hirwaun Ironworks.
275	Tramway branch-Hirwaun Common Railway	SO 9597 0500 to SO 9598 0470	Post-Medieval	pre-1880	A tramway survives as a north/south track and is marked on the O.S. map of 1880 and was a branch line of the Hirwaun Common Railway.
276	The Hirwaun Common Railway, Hirwaun	SO 9495 0618 to SO 9662 0481	Post-Medieval	pre-1840	The Hirwaun Common Mineral Railway was marked as a tramroad on the tithe map of c.1840 and a conventional locomotive-operated railway on the O.S. map of c.1880.

APPENDIX 2

Sites in Section 6- Cefn-coed-y-cymmer Baverstock Hotel

Site no.	Site name	Grid ref.	Form	Type	Period	Date	Description
224	Coal tippings (S. of old A465), Baverstock	SO 0260 0720 to SO 0100 0720	Earthworks	Mineral workings	Post-Medieval		A sequence of coal tips related either to the Cyfartha or Llwydcoed Ironworks.
225	D.S.W. landscape and sheep fold, Coed Meurig	SO 0220 0735	Field System	Drystone walled field boundaries and sheep fold	Post-Medieval		A drystone walled complex incorporating a sheep fold, related to Coed Meurig Farm.
226	Stone rubble-demolished cottage, Baverstock	SO 0110 0740	Site	Demolished building	Post-Medieval		An area of masonry rubble indicating the site of a demolished cottage.
231	Fairfield House (Giants Head Inn), Baverstock	SO 0055 0728	Building	Public house	Post-Medieval		A modernised cottage once used as the 'Giant's Head Inn.'
232	Settlement and field system, Baverstock	SO 0073 0730	Earthworks & Field Systems	Settlement and enclosures	Medieval Post-Medieval ?		A complex of turfstone walled field boundaries representing gardens, enclosures and drainage systems. rubble concentrations indicate the sites of demolished cottages.
233	Coal workings and tips, Baverstock	SO 0069 0727	Earthworks	Mineral workings	Post-Medieval		The remains of early open-cast iron workings, possibly aided by water extraction located on the hill behind the Baverstock settlement.

Sites in Section 7- Baverstock Hotel to Hirwaun

Site no.	Site name	Grid ref.	Form	Type	Period	Date	Description
227	D.S.W. landscape, Baverstock	SO 9970 0717	Field System	Drystone walled field boundaries	Post-Medieval		A drystone walled field-system.
228	D.S.W. & T.S.W. , Lech Sychrhyd	SO 9947 0700	Field Systems	Drystone and turf-stone walled boundaries	Post-Medieval		The remnants of a drystone and turfstone walled field-system now bisected by the A465.
229	Track, Lech Sychrhyd	SO 9960 0704 to	Linear Feature	Farm track	Post-Medieval		A north/south track, visible as a slightly

		SO 9958 0680					raised platform.
230	Dam and possible sluice system, Lech Sychrhyd	SO 9969 0690	Earthworks	Water courses	Post-Medieval		A possible small-scale damming system incorporating banks and sluice along a stream.
234	Nant Hir Reservoir	SO 9890 0690	Structure	Reservoir	Post-Medieval		The Nant Hir Reservoir built by the Aberdare Water Works Co.
235	Holloway, Nant Hir	SO 9885 0690	Linear Feature	Farm track	Post-Medieval		A small holloway parallel to the Nant Hir Reservoir.
236	D.S.W. landscape, Nant Hir	SO 9875 0684	Field System	Drystone walled field boundaries	Post-Medieval		An extensive drystone walled landscape either side of the A465.
237	Field barn and stable, Nant Hir	SO 9885 0686	Buildings	Field barn	Post-Medieval		Masonry farm buildings adjacent to the Nant Hir Reservoir.
238	Holloway/sheep fold, Nant Hir	SO 9883 0687 to SO 9875 0698	Linear Feature	Farm track and sheep fold	Post-Medieval		An deep holloway running north/south across the A465 incorporating mature taxa and a coralling area.
239	D.S.W. landscape, Nant Melyn	SO 9798 0625	Field System	Drystone walled field boundaries	Post-Medieval		An extensive drystone walled landscape.
240	Holloway, Nant Melyn	SO 9770 0622 to SO 9789 0623	Linear Feature	Farm track	Post-Medieval		An east/west aligned holloway connecting to a farm track leading to Nant moel Farm.
241	Holloway, Llyncoch	SO 9768 0608 to SO 9785 0585	Linear Feature	Farm track	Post-Medieval		A north/south holloway lined with substantial rubble walls.
242	Holloway, Court Farm	SO 9734 0564 to SO 9735 0547	Linear Feature	Farm track	Post-Medieval	pre-1851	Remnants of the holloway/track running either side of the A465 and appears to have once served Court Farm. Truncated by the Vale of Neath Mineral railway.
243	Skew bridge over Vale of Neath Railway	SO 9727 0552	Structure	Road bridge	Post-Medieval	c.1851	A skew bridge built to carry the road over the Vale of Neath Mineral railway (later the GWR).
244	Rectangular platform, Hirwaun	SO 9674 0544	Site	Demolished industrial building	Post-Medieval		A rectangular building platform.
245	D.S.W. landscape, Parc-Hensol Farm	SO 9675 0528	Field System	Drystone walled field	Post-Medieval		An extensive drystone walled field

				boundaries			system around the derelict farmstead of Parc Hensol.
246	Farmstead, Parc-Hensol	SO 9677 0526	Buildings	Derelict farmhouse and outbuildings	Post-Medieval		A partly demolished farmstead on land along the banks of the Afon Cynon.
247	Bridge remains, Afon Cynon	SO 9682 0529	Structure	Footbridge	Post-Medieval		The remains of a wrought iron bridge across the Afon Cynon.
248	Track, Afon Cynon, Hirwaun	SO 9697 0529	Linear Feature	Track	Post-Medieval		A small metalled track running alongside the Afon Cynon.
249	Cynon farmhouse, Hirwaun	SO 9640 0526	Buildings	Farmhouse and outbuildings	Post-Medieval		A masonry cottage with modern alterations.
250	Hirwaun-Aberdare Tramroad, Hirwaun	SO 9590 0548 to SO 9667 0513	Linear Feature	Tramroad	Post-Medieval	c.1790-c.1870	The Hirwaun-Aberdare tramroad built for the Hirwaun Ironworks to the canal at Aberdare.
251	Pig-pens, Hirwaun	SO 9544 0535	Building	Pig-pens	Post-Medieval		Uncoursed masonry pig-pens.
252	Bute Colliery Road (Tower Road), Hirwaun	SO 9534 0527 to SO 9506 0500	Linear Feature	Tramroad	Post-Medieval		The course of the dismantled Bute Colliery to Hirwaun Tramway running along Tower Road..
253	T.S.W. landscape, Hirwaun	SO 9525 0533	Field System	Turf-stone wall boundaries	Post-Medieval		A turfstone walled landscape.
254	Coal tips, Bryngelli Estate, Hirwaun	SO 9520 0534	Earthworks	Mineral workings	Post-Medieval		Extensive coal tippings.
255A	Railway A, Aberdare & Rhondda Railway	SO 9578 0514 to SO 9506 0501	Linear Feature	Tramroad	Post-Medieval		The course of the Aberdare & Rhondda main line railway.
255B	Tramroad B, Branch of Aberdare & Rhondda	SO 9581 0512 to SO 9589 0476	Linear Feature	Tramroad	Post-Medieval	abandoned by 1880	A tramroad from nearby pits to the Aberdare & Rhondda railway built on an earthen embankment.
255C	Tramroad C, Hirwaun	SO 9587 0510 to SO 9567 0471	Linear Feature	Tramroad	Post-Medieval	post-1880	The course of a tramway intersects and truncates Tramroad B.
256	Culvert, Aberdare-Rhondda Tramroad, Hirwaun	SO 9582 0506	Structure	Culvert	Post-Medieval		A small culvert constructed of drystone walling beneath the course of the Aberdare-

							Rhondda Tramroad.
257	Culvert, Hirwaun to Aberdare Tramroad, Hirwaun	SO 9648 0519	Structure	Culvert	Post-Medieval		A culvert below the line of the Hirwaun-Aberdare Tramroad repaired with modern repairs.
258	Vale of Neath Mineral Railway (western section)	SO 9530 0617 to SO 9413 0641	Linear Feature	Railway	Post-Medieval	1851	The broad gauge Vale of Neath Mineral Railway, it was later re-built as a the standard gauge Great Western Railway.
259	Branch of the Hirwaun-Aberdare Tramroad	SO 9408 0591 to SO 9525 0556	Linear Feature	Tramroad	Post-Medieval		A branch of the Hirwaun-Aberdare Tramroad following the present-day Rhigos road (A 4059).
272	Neath Mineral Railway (eastern section), Hirwaun	SO 9700 0559 to SO 9760 0543	Linear Feature	Railway	Post-Medieval	c.1851	The Vale of Neath mineral railway survives to the east of Hirwaun below contemporary masonry road bridge on the A465.
273	Tramroad, Hirwaun	SO 9566 0520 to SO 9559 0491	Linear Feature	Tramroad	Post-Medieval		A local tramroad, surviving as a track, which transported ironstone from the Knobby Drift Ironstone pit to the Hirwaun Ironworks.
274	Knobby Drift Ironstone Pit, Johnson Park, Hirwaun	SO 9559 0491	Site	Mineral extraction	Post-Medieval	pre-1870	This ironstone pit was served by a tramway which fell into disuse before it was surveyed for the O.S. in the 1870s (No. 273).
275	Tramway branch-Hirwaun Common Railway	SO 9597 0500 to SO 9598 0470	Linear Feature	Tramroad	Post-Medieval	pre-1880	A tramway survives as a north/south track and is marked on the O.S. map of 1880 and was a branch line of the Hirwaun Common Railway.
276	The Hirwaun Common Railway, Hirwaun	SO 9495 0618 to SO 9662 0481	Linear Feature	Tramroad	Post-Medieval	pre-1840	The Hirwaun Common Mineral Railway was marked as a tramroad on the tithe map of c.1840 and a conventional locomotive-operated railway on the O.S. map of c.1880.

277	Branch-line of Hirwaun Common Railway, Hirwaun	SO 9617 0500 to SO 9634 0478	Linear Feature	Tramroad	Post-Medieval	pre-1880	At the point where the Hirwaun Common Mineral Railway crosses the A465, a branch line diverges to the south and currently survives as a footpath. This branch line is marked on the 1880 O.S.

A Glossary of Archaeological Terms

Ashlar: decorative masonry formed from stone blocks which fit accurately together so that only fine mortar joints are required between them. The blocks are finely worked and the external faces are finished to form a uniform, flat surface.

Adit: a tunnel into a coal level, used either as an entrance to the mine or as a means of drainage.

Barrow: includes several types of earth covered funerary mounds with cremated or inhumed remains, primarily dating from the Neolithic (long barrows) and Early Bronze Age (round barrows) periods.

Cairn: a stone mound covering a cremation or inhumation found mainly in the Bronze Age periods.

Cropmark: a mark visible on aerial photographs caused by differential growth and colouration of field of crops over the archaeological features.

Crows-foot tips: a series of early spoil heaps formed from by tipping from a barrow or cart forming a distinctive star-shaped pattern.

Find-spot: the site of a random or isolated or stray find which may indicate further archaeological material is present nearby.

Holloway: an early farm or parish road consisting of an unmetalled surface surrounded by high banked hedges formed through the erosion away over time of the track.

Leat: an artificial watercourse made to channel water from source to an area for industrial usage.

Lithic scatter: a series of flint artefacts found on the surface and usually exposed by erosion or ploughing. Dating from the Palaeolithic to Early Bronze Age periods.

Motte and bailey castle: a defensive structure erected during the early stages of the Norman invasion consisting of a large artificial mound, or motte, surmounted by a wooden, and later a stone, keep (tower). The whole structure was surrounded by a large wooden bailey, often later replaced by a stone curtain wall.

Palaeoenviromental: the scientific technique of determining ancient landscapes and environment and climate characteristics from looking at macro fossils, pollen and faunal remains, often from within wetland sites

Relict palaeosols: an ancient soil surface which has survived, often by being completely buried (e.g. under barrows).

Rusticated masonry: stone that has been worked on the external face to produce a different effects from cyclopean (or rock-faced) to vermiculated (a worm-track effect).

Ridge & Furrow: the pattern formed by strip farming of land based on the medieval system of 'open' field agriculture. Medieval ridge and furrow tends to be form the soil into a larger series of troughs and banks than those found in post-medieval ridge and furrow.

Stratified deposits: the layers of natural/soils and man-made deposits which build-up over a long time-span on an archaeological site. The stratigraphy can be examined to determine the sequence and time-span of the site.

Tramroad: a rail or plateway carrying goods carts/trams and usually drawn by ponies.

Turfstone walling: boundary walls formed from an internal drystone core covered by a layer of earth and turves for added stability.

Quoins: the stones found at the corner of an external wall which support the greater stresses found there; usually of higher quality than ordinary stonework.

Voussoirs: the wedged-shaped blocks of stone which form the curve of an arch.

Appendix 10A - Landscape and Visual Impact Assessment Criteria (IAN 135/10 W)

Table 10A.1: Magnitude of landscape impact and typical descriptors

Magnitude of impact	Criteria descriptors
Major adverse	Total loss or large scale damage to existing character or distinctive features and elements, and / or the addition of new but uncharacteristic conspicuous features and elements.
Moderate adverse	Partial loss or noticeable damage to existing character or distinctive features and elements, and / or the addition of new but uncharacteristic noticeable features and elements.
Minor adverse	Slight loss or damage to existing character or features and elements, and / or the addition of new but uncharacteristic features and elements.
Negligible adverse	Barely noticeable loss or damage to existing character or features and elements, and / or the addition of new but uncharacteristic features and elements.
No change	No noticeable loss, damage or alteration to character or features or elements.
Negligible beneficial	Barely noticeable improvement of character by the restoration of existing features and elements, and / or the removal of uncharacteristic features and elements, or by the addition of new characteristic elements.
Minor beneficial	Slight improvement of character by the restoration of existing features and elements, and / or the removal of uncharacteristic features and elements, or by the addition of new characteristic elements.
Moderate beneficial	Partial or noticeable improvement of character by the restoration of existing features and elements, and / or the removal of uncharacteristic and noticeable features and elements, or by the addition of new characteristic features.
Major beneficial	Large scale improvement of character by the restoration of features and elements, and / or the removal of uncharacteristic and conspicuous features and elements, or by the addition of new distinctive features.

Table 10A.2: Landscape sensitivity and typical examples

Sensitivity	Criteria descriptors and examples
High	Landscapes which by nature of their character would be unable to accommodate change of the type proposed. Typically these would be: • of high quality with distinctive elements and features making a positive contribution to character and sense of place; • likely to be designated, but the aspects which underpin such value may also be present outside designated areas, especially at the local scale; • areas of special recognised value through use, perception or historic and cultural associations; and • likely to contain features and elements that are rare and could not be replaced.
Moderate	Landscapes which by nature of their character would be able to partly accommodate change of the type proposed. Typically these would be: • comprised of commonplace elements and features creating generally unremarkable character but with some sense of place; • locally designated, or their value may be expressed through non-statutory local publications; • containing some features of value through use, perception or historic and cultural associations; and • likely to contain some features and elements that could not be replaced.
Low	Landscapes which by nature of their character would be able to accommodate change of the type proposed. Typically these would be: • comprised of some features and elements that are discordant, derelict or in decline, resulting in indistinct character with little or no sense of place; • not designated; • containing few, if any, features of value through use, perception or historic and cultural associations; and • likely to contain few, if any, features and elements that could not be replaced.

Table 10A.3: Significance of landscape effect categories

		Magnitude of landscape impact				
		No change	**Negligible**	**Minor**	**Moderate**	**Major**
Landscape sensitivity	**High**	Neutral	Slight	Slight / moderate	Moderate / large	Large / very large
	Moderate	Neutral	Neutral / slight	Slight	Moderate	Moderate / large
	Low	Neutral	Neutral / slight	Neutral / slight	Slight	Slight / moderate

Table 10A.4: Descriptors of significance of landscape effect categories

Significance category		Typical descriptors of effect
1	Very large beneficial (positive) effect	The project would: • greatly enhance the character (including quality and value) of the landscape; • create an iconic high quality feature and / or series of elements; and • enable a sense of place to be created or greatly enhanced.
2	Large beneficial (positive) effect	The project would: • enhance the character (including quality and value) of the landscape; • enable the restoration of characteristic features and elements lost as a result of changes from inappropriate management or development; and • enable a sense of place to be enhanced.
3	Moderate beneficial (positive) effect	The project would: • improve the character (including quality and value) of the landscape; • enable the restoration of characteristic features and elements partially lost or diminished as a result of changes from inappropriate management or development; and • enable a sense of place to be restored.
4	Slight beneficial (positive) effect	The project would: • complement the character (including quality and value) of the landscape; • maintain or enhance characteristic features and elements; and • enable some sense of place to be restored.
5	Neutral effect	The project would: • maintain the character (including quality and value) of the landscape; • blend in with characteristic features and elements; and • enable a sense of place to be retained.
6	Slight adverse (negative) effect	The project would: • not quite fit the character (including quality and value) of the landscape; • be at variance with characteristic features and elements; and • detract from a sense of place.
7	Moderate adverse (negative) effect	The project would: • conflict with the character (including quality and value) of the landscape; • have an adverse impact on characteristic features or elements; and • diminish a sense of place.
8	Large adverse (negative) effect	The project would: • be at considerable variance with the character (including quality and value) of the landscape; • degrade or diminish the integrity of a range of characteristic features and elements; and • damage a sense of place.
9	Very large adverse (negative) effect	The project would: • be at complete variance with the character (including quality and value) of the landscape; • cause the integrity of characteristic features and elements to be lost; and • cause a sense of place to be lost.

Table 10A.5: Magnitude of visual impact and typical descriptors

Magnitude of impact	Typical criteria descriptors
Major	The project, or a part of it, would become the dominant feature or focal point of the view.
Moderate	The project, or a part of it, would form a noticeable feature or element of the view which is readily apparent to the receptor.
Minor	The project, or a part of it, would be perceptible but not alter the overall balance of features and elements that comprise the existing view.
Negligible	Only a very small part of the project would be discernible, or it is at such a distance that it would form a barely noticeable feature or element of the view.
No Change	No part of the project, or work or activity associated with it, is discernible.

Table 10A.6: Visual receptor sensitivity and typical examples

Sensitivity	Criteria descriptors and examples
High	• Residential properties. • Users of Public Rights of Way or other recreational trails (for example, National Trails, footpaths, bridleways). • Users of recreational facilities where the purpose of that recreation is enjoyment of the countryside (for example, Country Parks, National Trust or other access land).
Moderate	• Outdoor workers. • Users of scenic roads, railways or waterways or users of designated tourist routes. • Schools and other institutional buildings, and their outdoor areas.
Low	• Indoor workers. • Users of main roads (for example, trunk roads) or passengers in public transport on main arterial routes. • Users of recreational facilities where the purpose of that recreation is not related to the view (for example, sports facilities).

Table 10A.7: Significance of visual effect categories

		Magnitude of visual impact				
		No change	**Negligible**	**Minor**	**Moderate**	**Major**
Visual receptor sensitivity	**High**	Neutral	Slight	Slight / moderate	Moderate / large	Large / very large
	Moderate	Neutral	Neutral / slight	Slight	Moderate	Moderate / large
	Low	Neutral	Neutral / slight	Neutral / slight	Slight	Slight / moderate

Table 10A.8: Typical descriptors of significance of visual effect categories

Typical descriptors of effect	
Very large beneficial (positive) effect	• The project would create an iconic new feature that would greatly enhance the view.
Large beneficial (positive) effect	• The project would lead to a major improvement in a view from a highly sensitive receptor.
Moderate beneficial (positive) effect	• The proposals would cause obvious improvement to a view from a moderately sensitive receptor, or perceptible improvement to a view from a more sensitive receptor.
Slight beneficial (positive) effect	• The project would cause limited improvement to a view from a receptor of medium sensitivity, or would cause greater improvement to a view from a receptor of low sensitivity.
Neutral effect	• No perceptible change in the view.
Slight adverse (negative) effect	• The project would cause limited deterioration to a view from a receptor of medium sensitivity, or cause greater deterioration to a view from a receptor of low sensitivity.
Moderate adverse (negative) effect	• The project would cause obvious deterioration to a view from a moderately sensitive receptor, or perceptible damage to a view from a more sensitive receptor.
Large adverse (negative) effect	• The project would cause major deterioration to a view from a highly sensitive receptor, and would constitute a major discordant element in the view.
Very large adverse (negative) effect	• The project would cause the loss of views from a highly sensitive receptor, and would constitute a dominant discordant feature in the view.

Page left intentionally blank.

Appendix 10B – Zone of Theoretical Visibility (ZTV) Methodology

Zone of Theoretical Visibility (ZTV) Methodology

Viewsheds

ZTVs have been generated in ArcGIS using the 'Viewshed' tool under the 'Surface' section of the Spatial Analyst software extension. Viewsheds are used to display where a designated point on the ground is visible from the surrounding topography.

Viewsheds have been generated based on an Ordnance Survey (OS) digital terrain model (DTM) dataset which extends 10 km from the proposed scheme. Two datasets have been used to generate viewsheds:

- a topography layer in raster format; and
- a point dataset of target points representing points along the existing road or the proposed scheme, as relevant to the applicable ZTV scenario.

Topography layer

The final output of the generation of the viewsheds is a raster image, indicating the ZTV.

Three viewshed / ZTV scenarios have been generated:

- existing road;
- winter year 1 without planting mitigation; and
- summer year 15 with planting mitigation.

For the existing road and winter year 1 scenarios, the OS DTM model has been used without any modifications, for example 'bare earth'. In the summer year 15 scenario, proposed mitigation planting has been extruded to the heights listed below and combined with the 'bare earth' OS DTM model, to form the topography base layer for this ZTV, which takes into account the screening effects of the proposed planting mitigation:

- 8 m – woodland, woodland edge and individual tree planting + ancient woodland transplantation;
- 5 m - shrubs with intermittent trees;
- 3 m – shrub ad scrub; and
- 2 m – hedgerow.

The above planting height is based upon a conservative estimate of growth over a period of fifteen years.

The potential screening effect of existing vegetation or surrounding buildings has not been included in the modelling of any of the three scenarios.

Point database / target points

The point database has been aligned to the design centreline, using the proposed scheme chainage data to identify target points at 100 m intervals. Target points 4.5 m above the level of the scenario carriageway have been used to represent the height of heavy goods vehicles (HGV) traffic using the roads. In addition, target points at 10 or 12 m above the level of the scenario carriageway have been used to represent the height of lighting columns in areas that are currently lit, or proposed to be lit, as applicable to the relevant scenario. The exact height of the target points for the lighting columns has been chosen based upon estimated height of existing lighting columns or indicative proposed height of lighting columns for the proposed scheme which is mostly 10 m, but 12 m in some locations.

Theoretical range of visibility

A theoretical range of visibility, from low to high (indicated by colour), has been used to illustrate the three scenarios examined in the assessment. Higher visibility indicates that a higher number of target points are theoretically visible along the existing road or within the proposed scheme, and lower visibility indicates that fewer target points are theoretically visible along the existing road or within the proposed scheme.

The resulting raster image generated contains value columns ranging from 0 to 15, where 0 is not visible. A symbology has been automatically applied to the raster dataset as it is loaded into ArcGIS, grouping 0 alone and the remaining values together (showing Not Visible and Visible extents).

Appendix 10C – National and County Borough Landscape Character Area Summary Descriptions

Extracts from Brecon Beacons and Black Mountains NLCA30 (NRW 31 March 2014)

Summary description

This is the highest range of mountains in southern Britain, rising to Pen y fan at 886 m. The vast swathes of smooth, unenclosed moorland rise up gentle ridges, between which run deeply cut valleys that terminate in high mountain passes. The Beacons themselves are made up of Old Red Sandstones, a relatively soft rock that has weathered and been sharpened by ice to create consistent, simple, smooth-sided slopes, falling abruptly and dramatically from ridges to provide the sharp outlines that are so characteristic, and which contrast with the lush, hedged, enclosed farmed landscapes of the deeper valleys.

Green to their summits in summer, these mountains are internationally renowned and provide an iconic image for rural upland South Wales akin to that of Snowdonia in the north. All of the area lies within Brecon Beacons National Park and is a popular destination for walkers and tourists to enjoy the dramatic upland scenery, the picturesque, lush green enclosed valleys, and generally the contrast to the adjacent lowland or industrial areas to the east and south.

The principle valley of the Usk separates the central Beacons from the Black Mountains to the east. Here, the high country runs in a series of lumbering north–south ridges, most emphatically along the Wales - England border, delineated by a section of the long-distance Offa's Dyke Footpath.

The character varies, with distinct open moorland, smooth ridge, valley and classic limestone areas. The latter includes an area famous as 'Waterfalls Country', centred around Ystradfellte, where a number of deep, wooded, river gorges issue down into the Neath Valley. There are show caves at Dan-yr-Ogof.

Key Characteristics

- **The highest mountains in South Wales** - distinctive flat-topped mountains and a prominent escarpment of Devonian Old Red Sandstone, with smaller bands of Carboniferous Limestone and Millstone Grit in the south.
- **Heavily glaciated** – classic upland cirque formations, ridges, glacial lakes and moraines, over-deepened and 'U' shaped valleys.
- **The source of a number of rivers** - Four major rivers, the Usk, Neath, Tawe and Aman, flow generally south through the landscape, fed by fast flowing streams and waterfalls from the surrounding uplands.
- **Numerous reservoirs** - have been created forming notable landscape features.
- **Rough moorland habitats** - open, exposed, mainly sheep grazed, some commons.
- **Classic limestone scenery** – to lower parts to the south including clints, grykes and caves, the best examples in South Wales, waterfalls, stone walls and buildings. However there are also a number of old limestone quarries and associated remnant infrastructure.
- **Strong field pattern with many small fields** - pasture enclosed by stone walls at higher altitudes and in limestone areas but thick hedgerows elsewhere and in the valley bottoms, with improved pasture fields found on the lower valley slopes.
- **Large conifer blocks** - cover some valley side slopes in certain areas.
- **Bio- and geodiversity** - large parts are designated. Features include arctic-alpine cliff flora and species-rich limestone grasslands.
- **Tourism** - the Brecon Beacons National Park symbolises the iconic beauty of South Wales and attracts thousands of visitors each year.
- **Scattered, small settlements** – confined to valleys; overall the area is sparsely settled.

- **Highly tranquil** - The windswept uplands display little intrusion of modern forms. High points afford panoramic views across the area and far beyond. The area is recognised for its dark skies.

Extracts from South Wales Valleys NLCA37 (NRW 31 March 2014)

Summary Description

Many deep, urbanised valleys dissect an extensive upland area. Combined with industrial heritage and the distinct identity of its people, the South Wales Valleys provide some of Wales' most widely known and iconic national images.

Extensive ribbon development fills many valley bottoms and lower slopes. Their urban and industrial character is juxtaposed with dramatic upland settings with steep hillsides, open moors or forests. Networks of railways and roads connect valley settlements. Topography constrains passage between valleys, and there are only a limited number of high passes between valleys. The noise and business of many valleys contrast with the relatively remote and wild qualities of adjacent hill plateaux.

Underlying geology and mineral deposits provided the resources that fuelled a rapid spread of industrial development in the C19th. Once rail transport became possible, new coal, steel and iron industries created an extensive infrastructure of large buildings, furnaces, towers, chimneys, viaducts, spoil heaps and levels. Housing for workers resulted in the extensive and iconic rows of terraced houses that run along hillsides. Their needs in turn brought chapels, shops, schools and other facilities to create new settlements with an urban character. The way of life and harsh environment resulted in the image of a tough, rugby playing and radically minded society. But the decline of industries in the late C20th resulted in the closure, removal, abandonment or redevelopment of many former industrial sites. These changes continue today, as do the consequential social changes to the way of life and community identity. The area is now seen as part of a wider, increasingly post-industrial, 'city region', the largest in Wales. A new iconic image is at times unclear, but heritage-based activities set within a softer, greener environment are emerging as part of this.

While greenness is returning to some former industrial landscapes many of the new woodlands are coniferous. Waterways are slowly welcoming back fish, and mammals such as otters. The importance of wildlife conservation being undertaken hand-in-hand with economic regeneration is being recognised as one of the keys to the sustained revitalisation of this most iconic Welsh 'bro', in the Heads of the Valleys and Valleys Regional Park initiatives.

Key Characteristics

- **Extensive Upland plateaux** – typically wild and windswept, often with unenclosed tracts, running roughly north-south as 'fingers' parallel between intervening deep valleys.
- **Numerous steep-sided valleys** - typically aligned in parallel, flowing in southerly directions, shaped by southward flowing glaciers, leaving behind distinctive corrie ('cwm') and crag features. Major rivers include the Tawe, Taff and Rhymney.
- **Ribbon urban and industrial areas in valleys** – in places extending up valley sides and to valley heads. The area is sometimes regarded as being part of a 'city region'. Middle and eastern valleys tend to be the most heavily and continuously developed, for example Rhondda Valley. The uplands by comparison have little or no settlement.
- **Extensive remains of heavy industry** – with a mix of derelict, preserved and largely redeveloped areas, notably for coal mining. Preserved as heritage (World heritage Site) at Blaenafon this typically includes old railway alignments, buildings and former tips.
- **Contrast of urban valley activity next to quiet uplands** – for example busy roads, new developments, traffic noise, night lighting, versus the adjacent wilder, remoter, quieter uplands.
- **Large blocks of coniferous plantation and deciduous woodland fringes** – covering many steep hillsides and hilltops, most notably in the middle to western portion of the area, providing a softer contemporary landscape where there was once industry.

- **Heather, rough grassland and steep bracken slopes** – dominate many plateaux and are grazed mainly by sheep. Much is common land.
- **Improved pastures on some lower valley sides** - grazed by sheep and some dairy cattle.
- **Field boundaries** - dry stone walls mark the boundary of common land while fields on lower slopes are bounded by dense hawthorn hedges, interspersed with swathes of broadleaved woodland.
- **Transport routes restricted to valleys** – the intervening topography makes valley to valley travel difficult, except at heads and bottoms of valleys. Occasionally there are roads that climb steeply over passes with dramatic views and 'hair pin' bends.
- **Iconic cultural identity** – many popular images of a tough, rugby-playing, religious, radically-minded society still remain associated with the South Wales Valleys, however today's post-industrial, internet-connected reality is somewhat different.

Extracts from Brecon Beacons National Park Landscape Character Assessment (2012)

3. Fforest Fawr

A bleak, upland moorland landscape, the character of which is locally influenced by its past use as a royal hunting ground and more recent estate ownership, apparent through the dry stone boundary walls, estate cottages, shelterbelts and former rabbit farms. Remains of prehistoric and medieval occupation, and later industrial archaeological sites, are visible in the landscape. Away from the occasional roads which run across the area, it feels tranquil, and with a sense of remoteness and relative wildness. Its distinctive flat-topped summits and steep northern escarpment are prominent in views from the north.

(Note: 'Special qualities' referred to in the landscape character assessment include high scenic quality, strong sense of place, high tranquillity and spectacular views).

4. Waterfall Country and Southern Valleys

"The predominantly limestone geology of this LCA creates its characteristic rough texture and grey colour, appearing in the crags, walls and buildings of this enclosed and relatively settled pastoral landscape. Ancient woodlands surround the streams and spectacular waterfalls which are found in the south of the LCA, flowing in deep, fern-filled gorges. Between the valleys are ridges of higher land with a more open quality and long views. The dark green of the extensive blocks of conifers in the south of the area contrasts with the surrounding grasslands.

(Note: 'Special qualities' referred to in the landscape character assessment include high scenic quality and strong sense of place due to features including rivers, waterfalls and rugged limestone backdrop, and strong sense of time depth).

8. Talybont and Taff Reservoir Valleys

"This LCA is characterised by its reservoirs, surrounded by steep sided, dark green forested valleys. Between the reservoir valleys are more open ridges of upland moorland which have long views across the reservoirs and their surrounding forests. This LCA is easily accessed from Merthyr Tydfil and the A470, and is a popular recreation destination.

(Note: 'Special qualities' referred to in the landscape character assessment include high scenic quality and strong sense of place due to features including waterbodies, forests and landform, geology, and tranquillity).

Extract from Brecon Beacons National Park Management Plan 2010 – 2015 Managing Change Together – Special Qualities of the Brecon Beacons National Park (Table 3.1 page 34)

Special Qualities

A National Park offering **peace and tranquillity** with opportunities for quiet enjoyment, inspiration, relaxation and spiritual renewal.

A feeling of **vitality and healthfulness** that comes from enjoying the Park's fresh air, clean water, rural setting, open land and locally produced foods.

A **sense of place and cultural identity** - "Welshness" - characterized by the indigenous Welsh language, religious and spiritual connections, unique customs and events, traditional foods and crafts, relatively unspoilt historic towns and villages, family farms and continued practices of traditional skills developed by local inhabitants to live and earn a living here, such as common land practices and grazing.

A **sense of discovery** where people explore the Park's hidden secrets and stories such as genealogical histories, prehistoric ritual sites, relic medieval rural settlements, early industrial sites, local myths and legends and geological treasures from time immemorial.

The Park's **sweeping grandeur and outstanding natural beauty** observed across a variety of harmoniously connected landscapes, including marvellous gorges and waterfalls, classic karst geology with caves and sink holes, contrasting glacial landforms such as cliffs and broad valleys carved from old red sandstone and prominent hilltops with extensive views in all directions.

A working, living "patchwork" of **contrasting patterns, colours, and textures** comprising well-maintained farmed landscapes, open uplands, lakes and meandering rivers punctuated by small-scale woodlands, country lanes, hedgerows and stone walls and scattered settlements.

Extensive and widespread access to the Park's **diversity of wildlife and richness of semi-natural habitats**, such as native woodlands, heathland and grassland, natural lakes and riparian habitats, ancient hedgerows, limestone pavement and blanket bogs including those of international and national importance.

In the context of the UK, **geographically rugged, remote and challenging** landscapes.

Enjoyable and accessible countryside with extensive, widespread and varied opportunities to pursue walking, cycling, fishing, water-based activities and other forms of sustainable recreation or relaxation.

An **intimate sense of community** where small, pastoral towns and villages are comparatively safe, friendly, welcoming and retain a spirit of cooperation.

Appendix 10D – LANDMAP Evaluation

Table 10D.1 : LANDMAP visual and sensory evaluation summary (Note: Overall evaluation text has been taken directly from LANDMAP without amendment)

Local landscape character area (landscape character type)	Main LANDMAP 'level 3' visual and sensory landscape aspect areas	Condition	Value	Scenic quality	Character evaluation	Overall evaluation
Hirwaun (built land)	Aberdare (urban)	Unassessed	Low	Low	Low	Low Without any positive visual and sensory qualities, this urban area with remnants of past mining industry has little or no importance. The views out to the adjacent upland areas are the only limited visual quality, and these are usually compromised by an element of built form.
Tower Colliery (workings)	Tower Colliery (excavation)	Fair	Low	Low	Moderate	Low Although distinct and relatively rare, its disturbed and unattractive qualities mean that it is overall low.
Hirwaun Common (hills / valleys and fields)	Craing Nantmelyn (hillside and scarp slopes grazing)	Unassessed	Moderate	Moderate	Moderate	Moderate No single defining feature of regional importance to justify more than local importance. Scenic quality and integrity both reduced by the presence of urban areas.
	Hirwaun Common (upland grazing)	Unassessed	High	High	High	High Attractive largely unspoilt upland area with strong sense of place and good views.
Penderyn and Abernant (hills / valleys and fields)	Penderyn (hillside and scarp slopes mosaic)	Unassessed	Moderate	Moderate	Moderate	Moderate Valley sides with pattern of field boundaries / woodland, but detractive elements, for example urban edge, pylons traffic noise, of local importance.

Local landscape character area (landscape character type)	Main LANDMAP 'level 3' visual and sensory landscape aspect areas	Condition	Value	Scenic quality	Character evaluation	Overall evaluation
	Abernant and Surrounds (hillside and scarp slopes mosaic)	Unassessed	Moderate	Moderate	Moderate	Moderate Valley sides with pattern of field boundaries / woodland and more open upland areas, but detractive elements, for example, urban area in valley below, pylons across valley and traffic noise and movement from A4059.
Penmoelallt Forest **(forestry)**	Penmoelallt (wooded upland and plateaux)	Unassessed	Moderate	Moderate	Moderate	Moderate Fairly typical upland coniferous plantation with limited views out and limited attractive features within.
Mynydd y glog **(open plateau)**	Cadair Fawr (upland grazing)	Unassessed	High	High	High	High Attractive largely unspoilt upland area with strong sop and good views. (sop = sense of place)
Baverstock **(open plateau)**	Merthyr West Flank (open / wooded mosaic upland valleys)	Fair	Moderate	Moderate	High	Moderate The area has a distinctive sense of place, especially around Cwm Glo with a mix of vegetation and industrial heritage features and patterns with a particular richness. The area provides a positive backcloth to the town of Merthyr and dominates its views west. However, there are detractors such as unvegetated tips.
	Taf / Cynon Ridge (mosaic upland and plateaux)	Fair	Low	Moderate	Low	Low The area is an important skyline between Taf and Cynon valleys and enjoys wide panoramic views of the coalfield plateau. The vegetation cover is diverse bordering on the incoherent with no discernible pattern. There

Local landscape character area (landscape character type)	Main LANDMAP 'level 3' visual and sensory landscape aspect areas	Condition	Value	Scenic quality	Character evaluation	Overall evaluation
						are detractors including a wireless mast.
	Abernant and Surrounds (hillside and scarp slopes mosaic)	Unassessed	Moderate	Moderate	Moderate	Moderate Valley sides with pattern of field boundaries / woodland and more open upland areas, but detractive elements, for example, urban area in valley below, pylons across valley and traffic noise and movement from A4059.
	Taf Fawr (open / wooded mosaic upland valleys)	Fair	High	High	High	High The area is an attractive upland valley with good views and distinctive features such as scree slopes and rocky outcrops. It is generally unspoilt and acts as a setting to the uplands of the Beacons to the north.
Cefn Coed **(hills / valleys and fields)**	Taf Fawr (open / wooded mosaic upland valleys)	Fair	High	High	High	High The area is an attractive upland valley with good views and distinctive features such as scree slopes and rocky outcrops. It is generally unspoilt and acts as a setting to the uplands of the Beacons to the north.
	Penmoelallt (wooded upland and plateaux)	Unassessed	Moderate	Moderate	Moderate	Moderate Fairly typical upland coniferous plantation with limited views out and limited attractive features within.
Taf Fawr **(gorge)**	Taf Fawr (open / wooded mosaic upland valleys)	Fair	High	High	High	High The area is an attractive upland valley with good views and distinctive features such as scree slopes and rocky outcrops. It is generally unspoilt and acts as a setting to the uplands of the Beacons to the north.

Local landscape character area (landscape character type)	Main LANDMAP 'level 3' visual and sensory landscape aspect areas	Condition	Value	Scenic quality	Character evaluation	Overall evaluation
	Penmoelallt (wooded upland and plateaux)	Unassessed	Moderate	Moderate	Moderate	Moderate Fairly typical upland coniferous plantation with limited views out and limited attractive features within.
Taf Fechan **(gorge)**	Taf Fechan (wooded upland valleys)	Fair	High	High	High	High The valley is a superb wooded gorge with interesting features such as a viaduct and stone bridges and adjacent derelict quarries, all of which give a particular and distinctive scenic quality. The area has a clear sense of place and unity.
Merthyr Tydfil **(built land)**	Merthyr Tydfil (urban)	Poor	Low	Low	Low	Low The town has a very complex form with no discernible pattern and coherence. Some areas are in poor condition and there are numerous detractors. New development and reclamation have obscured the important heritage of the area in parts. Though there is a significant story to tell about Merthyr this is not apparent.
	Cyfarthfa Park (amenity land)	Good	High	High	High	High Cyfarthfa Park acts as an important setting to the castle and is prominent in views from the A470 and other parts of Merthyr. It has a strong visual relationship with the related furnaces across the valley which is a rare feature. The park is very attractive with mature trees and well maintained grounds.
	Merthyr East Flank	Fair	Low	Low	Low	Low

Local landscape character area (landscape character type)	Main LANDMAP 'level 3' visual and sensory landscape aspect areas	Condition	Value	Scenic quality	Character evaluation	Overall evaluation
	(derelict / waste ground)					The area is still a raw landscape, prominent on the valley sides above Merthyr. While some areas are establishing a landscape infrastructure there are extensive areas which are open and lacking diversity of texture and cover. There remain a few detractors.
Morlais **(hills / valleys and fields)**	Merthyr North Flank (mosaic upland and plateaux)	Poor	Moderate	Moderate	Moderate	Moderate The mosaic of post-industrial and prehistoric features, combined with moorland, create a landscape of distinctive character with dramatic characteristics in places.
	Vaynor Farmlands (upland grazing)	Fair	Moderate	Moderate	Moderate	Moderate The area is a pleasant pastoral human scale landscape with views to adjacent uplands and valley. It has a consistent character with distinctive stone walls and small scale field pattern.
Gelligaer Common **(hills / valleys and fields)**	Rhoslas (upland grazing)	Unassessed	Moderate	High	Moderate	Moderate Partially degraded upland landscape with industrial debris and other visual detractors. Potential to regenerate to natural type.
	West of Rhymney (hillside and scarp slopes mosaic)	Unassessed	Moderate	Moderate	Moderate	Moderate Open generally unspoilt valley side, but detractive elements, for example, urban edge, pylons traffic noise.

Table 10D.2 : LandMAP historic evaluation summary

Local landscape character area (landscape character type)	Main LANDMAP 'level 3' geological landscape aspect areas	Overall evaluation
Hirwaun (built land)	Cynon Valley Corridor (nucleated settlement)	Outstanding
Tower Colliery (workings)	Tower Colliery (reclaimed land)	High
Hirwaun Common (hills / valleys and fields)	Hirwaun Common, Enclosure (regular fieldscapes)	High
	Rhondda Uplands (marginal land)	Outstanding
	Tower Colliery (reclaimed land)	High
Penderyn and Abernant (hills / valleys and fields)	Cwm Wyrfa (regular fieldscapes)	Moderate
	Cynon Valley Corridor (nucleated settlement)	Outstanding
	Fothergill's Patches & Bryn Mawr (extractive)	High
	Penderyn (other fieldscapes)	Outstanding
	Tower Colliery (reclaimed land)	High
Penmoelallt Forest (forestry)	Fothergill's Patches & Bryn Mawr (extractive)	High
	Mynydd-y-glog & Cefn Cadlan (marginal land)	Outstanding
	Upper Cwm Taf (irregular fieldscapes)	High
Mynydd y glog (open plateau)	Mynydd-y-glog & Cefn Cadlan (marginal land)	Outstanding
Baverstock (open plateau)	Cwm-glo and Bryn-y-Badell (extractive)	Outstanding
	Taf Fawr valley (irregular fieldscapes)	Moderate

Local landscape character area (landscape character type)	Main LANDMAP 'level 3' geological landscape aspect areas	Overall evaluation
Cefn Coed (hills / valleys and fields)	Taf Fawr valley (irregular fieldscapes)	Moderate
Taf Fawr (gorge)	Merthyr Tydfil Core (nucleated settlement)	Outstanding
	Taf Fawr valley (irregular fieldscapes)	Moderate

Appendix 10E – Visual Effects Schedule: People in Residential Properties

Table 10E.1 Visual effects schedule: people in residential properties

Value / sensitivity to change: High

Notes:

Residential properties assessed are generally two storey properties. Exceptions have been noted where this affects visibility.

Reference number[1] with number of properties in brackets * Listed Building	Location / address	Approx. distance from nearest point of receptor to centre line of proposed A465 alignment	Existing view	Change in view and magnitude of impact without mitigation planting	Significance of effect without mitigation planting	Change in view and magnitude of impact with mitigation planting	Significance of effect with mitigation planting
S6-R1 (3)	32 Fairview and 20 – 21 Richmond Drive, Hirwaun.	760 m	Bungalows positioned on slightly elevated ground. Oblique middle distance views south-west across rooftops, to partially filtered glimpses of tops of lighting columns and trees at Hirwaun junction, especially in winter. Longer distance views south to south-west to the opencast workings and distinctive ridgeline within Hirwaun Common. Mast and pylons are detracting features in the middle distance.	<u>Construction</u> Middle distance views south-west, partially filtered by intervening trees, of tall construction plant for construction of Hirwaun junction over bridge with associated highway infrastructure, including lighting columns. Also possible middle distance glimpsed and filtered views south-east through intervening trees, to major earthworks activities for offline A465 in foreground of Hirwaun Common, seen in context of existing detractors. The magnitude of impact would be **minor adverse**.	**Moderate adverse**	<u>Winter Year 1</u> As per operation without mitigation planting. The magnitude of impact would be **minor adverse**.	**Slight adverse**
				<u>Operation</u> Middle distance glimpsed views south-west, partially filtered by intervening trees, to tops of high sided vehicles on overbridge at Hirwaun junction and highway infrastructure, such as lighting columns / light spill. The magnitude of impact would be **minor adverse**.	**Slight adverse**	<u>Summer Year 15</u> Established mitigation planting would generally screen traffic flow at Hirwaun junction in the middle distance to south-west, though some glimpsed views of tops of high sided vehicles would remain. Tops of lighting columns / light spill at the junction would remain. The magnitude of impact would be **negligible adverse**.	**Slight adverse**
S6-R2 (16)	12 – 18 Fairview, 20 – 25 Devonshire Drive, 15 - 21 Penmark Row and Redwood Penderyn Road, Hirwaun.	530 m	Mix of bungalows and two storey houses positioned on slightly elevated and sloping ground. Lower level views are contained by properties and garden vegetation, as well as trees. Oblique, slightly elevated middle distance views from bungalows and upper storey of houses, south-west, above rooftops, to partially filtered glimpses of tops of lighting columns and trees at Hirwaun	<u>Construction</u> Middle distance views south-west, partially filtered by intervening trees, of tall construction plant for construction of Hirwaun junction over bridge with associated highway infrastructure, including lighting columns. Also possible middle distance glimpsed and filtered views south-east through intervening trees, to major earthworks activities for offline A465 in foreground of Hirwaun Common, seen in context of existing detractors. The magnitude of impact would be **minor adverse**.	**Moderate adverse**	<u>Winter Year 1</u> As per operation without mitigation planting. The magnitude of impact would be **minor adverse**.	**Slight adverse**

[1] Refer to Figure 10.8

Reference number[1] with number of properties in brackets * Listed Building	Location / address	Approx. distance from nearest point of receptor to centre line of proposed A465 alignment	Existing view	Change in view and magnitude of impact without mitigation planting	Significance of effect without mitigation planting	Change in view and magnitude of impact with mitigation planting	Significance of effect with mitigation planting
			junction, especially in winter. Longer distance views south-east to south-west to the opencast workings and distinctive ridgeline within Hirwaun Common. Mast and pylons are detracting features in the middle distance.	<u>Operation</u> Middle distance glimpsed views south-west, partially filtered by intervening trees, to tops of high sided vehicles on overbridge at Hirwaun junction and highway infrastructure, such as lighting columns / light spill. The magnitude of impact would be **minor adverse**.	**Slight adverse**	<u>Summer Year 15</u> Established mitigation planting would generally screen traffic flow at Hirwaun junction in the middle distance to south-west, though some glimpsed views of tops of high sided vehicles would remain. Tops of lighting columns / light spill at the junction would also remain. The magnitude of impact would be **negligible adverse**.	**Slight adverse**
S6-R3 (16)	3 – 14 Cae Bryn Hyfryd, Ty Hyfryd and Challis House, Penderyn Road, and, Railway Cottage and Brooklyn House, Challis Row, Hirwaun.	420 m	Elevated longer distance views south above trees and rooftops, from back gardens and upper storey windows, to opencast workings and distinctive ridgeline within Hirwaun Common. Tops of lighting columns visible in views south-west.	<u>Construction</u> Middle distance views south-west, partially filtered by intervening trees, of tall construction plant for construction of Hirwaun junction over bridge with associated highway infrastructure, including lighting columns The magnitude of impact would be **minor adverse**.	**Moderate adverse**	<u>Winter Year 1</u> As per operation without mitigation planting. The magnitude of impact would be **minor adverse**.	**Slight adverse**
				<u>Operation</u> Middle distance glimpsed views south-west, partially filtered by intervening trees, to tops of high sided vehicles on overbridge at Hirwaun junction and highway infrastructure, such as lighting columns / light spill. The magnitude of impact would be **minor adverse**.	**Slight adverse**	<u>Summer Year 15</u> Established mitigation planting would generally screen traffic flow at Hirwaun junction in the middle distance to south-west, though some glimpsed views of tops of high sided vehicles would remain. Tops of lighting columns / light spill at the junction would also remain. The magnitude of impact would be **negligible adverse**.	**Slight adverse**
S6-R4 (12)	Conifers, Treetops, Hollybush, Cherry Trees and Bryn Coch, Rhigos Road, and 1 – 7 Redhill Close, Hirwaun.	125 m	Dense belt of mixed deciduous and evergreen vegetation generally contain views west. Lighting columns at Hirwaun junction are visible above vegetation. Close filtered views of high-sided vehicles in the winter. Views south are generally contained by properties and belts of vegetation. Elevated glimpsed longer distance views to distinctive ridgeline within Hirwaun Common.	<u>Construction</u> Construction of Hirwaun junction screened by existing vegetation belt. Close views south-west of construction of A465 overbridge, on skyline above existing vegetation, including installation of highway infrastructure and lighting columns. The magnitude of impact would be **moderate adverse**.	**Moderate adverse**	<u>Winter Year 1</u> As per operation without mitigation planting. The magnitude of impact would be **minor adverse**.	**Slight adverse**
				<u>Operation</u> Existing vegetation would continue to screen views of traffic flow at Hirwaun junction. Mainly upper storey close views south-west to traffic flow on A465 overbridge'. Tops of lighting columns / light spill at Hirwaun junction and full extent of lighting columns / light spill on overbridge also visible. The magnitude of impact would be **minor adverse**.	**Slight adverse**	<u>Summer Year 15</u> Existing vegetation would continue to screen views of traffic flow at Hirwaun junction. Established mitigation planting would soften and screen views south-west to A465 overbridge at Hirwaun junction, though some views of traffic would remain, mainly from upper stories. Tops of lighting columns / light spill at Hirwaun junction and overbridge also visible. The magnitude of impact would be **minor adverse**.	**Slight adverse**

Reference number[1] with number of properties in brackets * Listed Building	Location / address	Approx. distance from nearest point of receptor to centre line of proposed A465 alignment	Existing view	Change in view and magnitude of impact without mitigation planting	Significance of effect without mitigation planting	Change in view and magnitude of impact with mitigation planting	Significance of effect with mitigation planting
S6-R5 (8)	Hawthorns, Greensleeves, Highcroft, Crud-yn Awel, Rhian Fa and Brodawel and 15-16 Rhigos Road, Hirwaun	105 m	Close oblique view west, along Rhigos Road, to Hirwaun junction. Dense vegetation screens most of junction. Tops of lighting columns visible above vegetation. Glimpsed views of traffic, particularly around the footway between Rhigos Road and the junction. Longer distance glimpses of distinctive ridgeline within Hirwaun Common. Views south are contained by dense belt of deciduous vegetation along A465 and back of gardens. Filtered views through vegetation to traffic in winter.	Construction Loss of trees at Hirwaun junction would open up generally oblique views south-west, though existing intervening vegetation would partially screen and filter views to construction of Hirwaun junction and A465 overbridge, including highway infrastructure, such as signage, lighting columns. The magnitude of impact would be **minor adverse**.	**Moderate adverse**	Winter Year 1 As per operation without mitigation planting. The magnitude of impact would be **minor adverse**.	**Moderate adverse**
				Operation Partially filtered generally oblique views south-west to traffic flow and highway infrastructure at Hirwaun junction, including highway infrastructure such as signage and lighting columns / light spill. Traffic visible on A465 overbridge. The magnitude of impact would be **minor adverse.**	**Moderate adverse**	Summer Year 15 Established mitigation planting would generally screen oblique views south-west to traffic flow on Hirwaun junction and, traffic flow on the A465 overbridge, though some glimpsed views would remain of traffic on the overbridge and views of tops of lighting columns / light spill. The magnitude of impact would be **minor adverse.**	**Slight adverse**
S6-R6 (1)	16 Longfield Court, Hirwaun	327 m	Oblique views south contained by deciduous vegetation and school buildings at lower level, with slightly elevated longer distance views above vegetation to distinctive ridgeline within Hirwaun Common. Direct view south-east along Longfield Court, contained by mix of evergreen and deciduous vegetation at end of Johnson Park.	Construction Middle distance views south-east between and above buildings to demolition of properties, traffic on temporary A465 diversion road and construction activities at Trewaun junction, including new roundabout, bridge and highway infrastructure such as signage and lighting columns, opened up by loss of trees at junction and evergreen vegetation at end of Johnson Park. The magnitude of impact would be **minor adverse.**	**Moderate adverse**	Winter Year 1 As per operation without mitigation planting. The magnitude of impact would be **minor adverse**.	**Slight adverse**
				Operation Middle distance views south-east to tops of high sided vehicles and highway infrastructure, including signage and lighting columns / light spill, above 2 m high environmental barrier at Trewaun junction, opened up by loss of existing vegetation. The magnitude of impact would be **minor adverse.**	**Slight adverse**	Summer Year 15 Established mitigation planting would generally screen views of Trewaun junction, though 2 m high environmental barrier and tops of lighting columns / light spill at junction would remain visible in middle distance, seen in context of existing street lighting in foreground. The magnitude of impact would be **negligible adverse.**	**Slight adverse**

Reference number[1] with number of properties in brackets * Listed Building	Location / address	Approx. distance from nearest point of receptor to centre line of proposed A465 alignment	Existing view	Change in view and magnitude of impact without mitigation planting	Significance of effect without mitigation planting	Change in view and magnitude of impact with mitigation planting	Significance of effect with mitigation planting
S6-R7 (19)	1-15 Galant Street and, Ty Newydd and 1a, 1 and 2 Longfield Court, Hirwaun.	120 m	Views south are mostly screened by deciduous vegetation belt along field at rear of properties and intermittent deciduous vegetation belt along the A465 in summer. Filtered views through vegetation in winter to traffic and lighting columns on A465, as well as occasional traffic on access track to windfarm. Pylons in the middle distance are detracting features. Distinctive ridgeline within Hirwaun Common in the longer distance. Oblique view along Galant Street, south-east, contained by properties and, close boarded fence and mix of evergreen and deciduous vegetation at end of Johnson Park in summer. Filtered views through vegetation above fence, to tops of vehicles and lighting columns at Trewaun junction in winter.	<u>Construction</u> Close glimpses and views south filtered by intervening vegetation to construction of Mynydd Bwllfa Wind Farm junction and access bridge, and offline A465 cutting, mainly from upper storey windows. Also close oblique views south-east to demolition of properties, traffic on temporary A465 diversion road and construction activities at Trewaun junction, including new roundabout, bridge and highway infrastructure such as signage, lighting columns and environmental barrier, opened up by loss of vegetation and fencing. The magnitude of impact would be **minor adverse.**	**Moderate adverse**	<u>Winter Year 1</u> As per operation without mitigation planting. The magnitude of impact would be **minor adverse**.	**Slight adverse**
				<u>Operation</u> Traffic flow on A465 to south and south-east would be screened by cutting. Close filtered views south through intervening vegetation, mainly from upper storey windows, to high sided vehicles at Mynydd Bwllfa Wind Farm junction and access bridge would not appear very different, with exception of visible tops of lighting columns / light spill on access bridge. Close oblique views south-east to tops of high sided vehicles and highway infrastructure, including signage and lighting columns / light spill above 2 m high environmental barrier, at Trewaun junction opened up by loss of vegetation and fencing. The magnitude of impact would be **minor adverse.**	**Slight adverse**	<u>Summer Year 15</u> Established mitigation planting would soften close glimpses and filtered views through intervening vegetation of high sided vehicles at Mynydd Bwllfa Wind Farm junction and access bridge, though tops of lighting columns / light spill would remain visible. Established mitigation planting would generally screen close oblique views of Trewaun junction, though 2 m high environmental barrier and tops of lighting columns / light spill at junction would remain visible, seen in context of existing street lighting in foreground. The magnitude of impact would be **negligible adverse.**	**Slight adverse**
S6-R8 (13)	1 – 5 Ffrwd Terrrace, 2 - 4 and 107 – 110 Brecon Road, Hirwaun.	115 m	Oblique middle distance views south-east along Brecon Road (which is lined by lighting columns) to road signage and trees at junction with existing A465. Views in other directions generally contained by properties, but some glimpsed, longer distance, elevated views south to distinctive ridgeline within Hirwaun Common.	<u>Construction</u> Loss of trees would open up close oblique views south-east to construction activities at Trewaun junction, associated with major earthworks, a new bridge and highway infrastructure, such as signage, lighting columns and environmental barriers. The magnitude of impact would be **minor adverse.**	**Moderate adverse**	<u>Winter Year 1</u> As per operation without mitigation planting. The magnitude of impact would be **minor adverse.**	**Slight adverse**
				<u>Operation</u> Close oblique views south-east to traffic flow and highway infrastructure, including signage, lighting columns / light spill and 2 m high environmental barrier, at Trewaun junction opened up by loss of existing vegetation, which also would change skyline locally. The magnitude of impact would be **minor adverse.**	**Slight adverse**	<u>Summer Year 15</u> Established mitigation planting would screen 2 m high environmental barriers at Trewaun junction and soften close views south-east to traffic flow and highway infrastructure, including signage and lighting columns / light spill, at junction. The magnitude of impact would be **negligible adverse.**	**Slight adverse**

Reference number[1] with number of properties in brackets * Listed Building	Location / address	Approx. distance from nearest point of receptor to centre line of proposed A465 alignment	Existing view	Change in view and magnitude of impact without mitigation planting	Significance of effect without mitigation planting	Change in view and magnitude of impact with mitigation planting	Significance of effect with mitigation planting
S6-R9 (2)	Beech Tree and Mountain View, Hirwaun.	55 m	Close direct views south and south-east are contained by dense belt of primarily deciduous vegetation, above which there are elevated longer distance views to distinctive ridgeline within Hirwaun Common. Filtered glimpses to traffic and lighting on A465 in winter. Views east are contained by properties.	<u>Construction</u> Close glimpses and views south-west filtered by intervening vegetation to construction of Mynydd Bwllfa Wind Farm junction and access bridge, and offline A465 cutting, mainly from upper storey windows. Also close filtered views south-east to demolition of properties, traffic on temporary A465 diversion road and construction of Trewaun junction, including highway infrastructure such as signage and lighting columns, opened up by loss of vegetation. The magnitude of impact would be **moderate adverse.**	**Moderate adverse**	<u>Winter Year 1</u> As per operation without mitigation planting. The magnitude of impact would be **moderate adverse**.	**Moderate adverse**
				<u>Operation</u> Close filtered views south-west through intervening vegetation, mainly from upper storey windows, to traffic at Mynydd Bwllfa Wind Farm junction and access bridge with lighting columns / light spill. Possible glimpses of tops of high sided vehicles in A465 cutting. Close oblique views south-east to traffic flow and highway infrastructure above 2 m high environmental barrier, including signage and lighting columns / light spill, at Trewaun junction opened up by loss of vegetation. The magnitude of impact would be **moderate adverse.**	**Moderate adverse**	<u>Summer Year 15</u> Existing vegetation would generally screen views south-east, though tops of lighting columns / light spill at access bridge would remain visible. Established mitigation planting would screen traffic flow in A465 cutting and at Trewaun junction, though glimpses of 2 m high environmental barrier and tops of lighting columns / light spill at junction would remain visible. The magnitude of impact would be **negligible adverse.**	**Slight adverse**
S6-R10 (13)	1 – 6, 9 and 14 - 15 Johnson Park, Hirwaun.	36 m	Close views south-west and south contained by mix of deciduous and evergreen vegetation, above which there are elevated longer distance views to distinctive ridgeline within Hirwaun Common. Filtered glimpses to traffic, signage and lighting on A465 in winter. Mainly oblique views south-east along Johnson Road are contained by mix of deciduous and evergreen vegetation in summer. Filtered views above fence and through vegetation to tops of vehicles at Trewaun junction in winter. Properties with rear facing the lit Brecon Road also have filtered views south-east to traffic, lighting, signage and trees at Trewaun junction.	<u>Construction</u> Close, mainly oblique views south-east to demolition of properties, traffic on temporary A465 diversion road, minor road improvements and construction activities at Trewaun junction, including new roundabout, bridge and highway infrastructure such as signage and lighting columns and environmental barrier, opened up by loss vegetation and fencing. The magnitude of impact would be **major adverse.**	**Very large adverse**	<u>Winter Year 1</u> As per operation without mitigation planting. The magnitude of impact would be **moderate adverse.**	**Moderate adverse**
				<u>Operation</u> Close oblique views south-east to tops of high sided vehicles, highway infrastructure such as signage and lighting columns / light spill above 2 m high environmental barrier at Trewaun junction opened up by loss of vegetation. Also possible upper storey glimpses from closest properties to tops of vehicles in cutting below junction. The magnitude of impact would be **moderate adverse.**	**Moderate adverse**	<u>Summer Year 15</u> Established mitigation planting would partially screen 2 m high environmental barrier and generally screen close oblique views of Trewaun junction, though tops of lighting columns / light spill at junction would remain visible, seen in context of existing street lighting along Hirwaun Road. The magnitude of impact would be **negligible adverse.**	**Slight adverse**

Reference number[1] with number of properties in brackets * Listed Building	Location / address	Approx. distance from nearest point of receptor to centre line of proposed A465 alignment	Existing view	Change in view and magnitude of impact without mitigation planting	Significance of effect without mitigation planting	Change in view and magnitude of impact with mitigation planting	Significance of effect with mitigation planting
S6-R11 (2)	Angorfa and Sunnyville, Brecon Road, Hirwaun.	95 m	Close oblique views south-east along Brecon Road (which is lined by lighting columns) to lighting columns, signage, traffic and trees at junction with A465. Views in other directions generally contained by properties and garden vegetation, with the exception of slightly elevated longer distance views south to distinctive ridgeline within Hirwaun Common. Pylons are detracting features.	Construction Loss of trees would open up close direct and oblique views south-east to traffic on temporary A465 diversion road, construction activities at Trewaun junction, associated with major earthworks, a new bridge and highway infrastructure, such as signage and lighting columns. The magnitude of impact would be **moderate adverse.**	**Moderate adverse**	Winter Year 1 As per operation without mitigation planting. The magnitude of impact would be **moderate adverse.**	**Moderate adverse**
				Operation Close direct and oblique views south-east to traffic flow and highway infrastructure such as signage and lighting columns / light spill and 2 m high environmental barriers, at Trewaun junction opened up by loss of existing vegetation, which also would change skyline locally. Also possible upper storey glimpses to tops of vehicles in cutting below Trewaun junction. The magnitude of impact would be **moderate adverse.**	**Moderate adverse**	Summer Year 15 Established mitigation planting would partially screen or soften close direct and oblique views south-east to traffic flow and highway infrastructure such as signage and environmental barriers, at Trewaun junction. Tops of lighting columns / light spill at junction would remain visible, seen in context of existing street lighting in foreground. The magnitude of impact would be **negligible adverse.**	**Slight adverse**
S6-R12 (1)	Caraway, 114 Brecon Road, Hirwaun.	12 m	Views south and east contained by mature deciduous vegetation in summer. Glimpsed views to tops of lighting columns on A465. Filtered views through vegetation in winter, to traffic and lighting columns on A465 and Trewaun junction.	Construction South-eastern extent of garden would be lost to proposed scheme. Loss of trees would open up close views west to north-east to traffic on temporary A465 diversion road, demolition of properties, construction activities at Trewaun junction and A465 mainline cutting, including major earthworks, a new bridge and highway infrastructure such as signage, lighting columns and environmental barriers, as well as middle distance views of construction of Pentwyn Cynon (Tramway) footbridge. The magnitude of impact would be **major adverse.**	**Very large adverse**	Winter Year 1 As per operation without mitigation planting. The magnitude of impact would be **major adverse**.	**Large adverse**
				Operation Close views south opened up by loss of vegetation, to 2 m high environmental barriers, which would partially obscure traffic flow and highway infrastructure such as signage and lighting columns / light spill, at Trewaun junction. Also close views south to north-east to 2 m high environmental barrier along A465 mainline, which together with cutting would screen views of traffic, except upper storey glimpses to tops of high sided vehicles. Upper parts of Pentwyn Cynon (Tramway) footbridge also visible to north-east. The magnitude of impact would be **major adverse.**	**Large adverse**	Summer Year 15 Established mitigation planting would generally screen views of traffic flow and highway infrastructure such as signage and 2 m high environmental barriers at Trewaun junction and along A465 mainline cutting, though tops of lighting columns / light spill at junction would remain visible. Glimpses of top of Pentwyn Cynon (Tramway) footbridge might also remain to north-east. The magnitude of impact would be **minor adverse.**	**Slight adverse**

Reference number[1] with number of properties in brackets * Listed Building	Location / address	Approx. distance from nearest point of receptor to centre line of proposed A465 alignment	Existing view	Change in view and magnitude of impact without mitigation planting	Significance of effect without mitigation planting	Change in view and magnitude of impact with mitigation planting	Significance of effect with mitigation planting
S6-R13 (11)	1 - 5 Ivy Cottages and, Bryn-y-Gog and 1 – 3 Tramway, Hirwaun.	14 m	Views south and south-east from houses positioned slightly lower than nearby A465, are contained by deciduous belt of vegetation along A465. Close filtered views to traffic and lighting columns at approach to Trewaun junction through vegetation in winter, mainly south.	<u>Construction</u> South-eastern extent of garden would be lost to proposed scheme.Close views south to construction of Trewaun junction with highway infrastructure, including signage and lighting columns. Close views south-east to traffic on temporary A465 diversion road, which would encroach on gardens, as well as construction of A465 mainline cutting with highway infrastructure such as environmental barrier, opened up by loss of trees on edge of gardens. Also, close views and glimpses, filtered by intervening vegetation from properties to east, to construction of Pentwyn Cynon (Tramway) footbridge. The magnitude of impact would be **major adverse.**	**Very large adverse**	<u>Winter Year 1</u> As per operation without mitigation planting. The magnitude of impact would be **major adverse**.	**Large adverse**
				<u>Operation</u> Close views south and south-east open up by loss of trees, to traffic flow at Trewaun junction and 2 m high environmental barrier along A465 mainline, which together with cutting would screen traffic. Also views to Pentwyn Cynon (Tramway) footbridge to east. The magnitude of impact would be **major adverse.**	**Large adverse**	<u>Summer Year 15</u> Established mitigation planting would mostly screen views of 2 m high environmental barrier, as well as traffic flow and highway infrastructure such as signage at Trewaun junction, though tops of lighting columns / light spill at junction would remain visible. Views to Pentwyn Cynon (Tramway) footbridge to east would also be softened by established mitigation planting. The magnitude of impact would be **minor adverse.**	**Slight adverse**
S6-R14 (1)	Cynon Farm, Hirwaun.	20 m	House positioned slightly lower than nearby A465, with slightly elevated, close, oblique views south-east, above deciduous vegetation, to traffic on A465 overbridge across NCR 46. Also filtered glimpses through vegetation to traffic on A465 to south in winter. Pylon is a detracting feature in landscape behind A465. Views east across field contained by woodland adjacent to A465.	<u>Construction</u> Close views, south-west to east to traffic on temporary A465 diversion road, which would encroach on garden. Views also opened up due to loss of trees, to construction of Pentwyn Cynon (Tramway) footbridge and A465 mainline cutting and embankments with highway infrastructure such as environmental barriers. The magnitude of impact would be **major adverse.**	**Very large adverse**	<u>Winter Year 1</u> As per operation without mitigation planting. The magnitude of impact would be **major adverse**.	**Large adverse**
				<u>Operation</u> Close views south-west to south-east, opened up by loss of trees, to Pentwyn Cynon (Tramway) footbridge and tops of high sided vehicles and tall retaining wall above 2 m high environmental barrier along A465 mainline. Glimpses of tops of lighting columns / light spill at Trewaun junction to south-west. The magnitude of impact would be **major adverse.**	**Large adverse**	<u>Summer Year 15</u> Established mitigation planting would mostly screen 2 m high environmental barrier, high sided vehicles on A465 mainline and retaining wall to south of road, with exception of direct views north-west. Views of Pentwyn Cynon (Tramway) footbridge would also be softened and partially screened. Some glimpse of tops of lighting columns / light spill at Trewaun junction to south-west might remain. The magnitude of impact would be **moderate adverse.**	**Moderate adverse**

Reference number[1] with number of properties in brackets * Listed Building	Location / address	Approx. distance from nearest point of receptor to centre line of proposed A465 alignment	Existing view	Change in view and magnitude of impact without mitigation planting	Significance of effect without mitigation planting	Change in view and magnitude of impact with mitigation planting	Significance of effect with mitigation planting
S6-R15 (1)	Waungron, Hirwaun Road, Hirwaun.	43 m	Views generally contained by mix of evergreen and deciduous vegetation, including mature belts and groups of trees. Glimpsed views west across grassland to more trees. Elevated longer distance views west to distinctive ridgeline within Hirwaun Common. Possible glimpses of tops of lighting columns at Trewaun junction, mainly in winter.	<u>Construction</u> Close views north and north-east to construction of Trewaun junction, including new roundabout, bridges and highway infrastructure such as signage and lighting columns, opened up by loss of trees. Close filtered views to construction compound with stockpiles to east. Also close views north-west, filtered by intervening vegetation, to traffic on temporary A465 diversion road and, construction of A465 mainline cutting and Mynydd Bwllfa Wind Farm access bridge. The magnitude of impact would be **major adverse.**	**Very large adverse**	<u>Winter Year 1</u> As per operation without mitigation planting. The magnitude of impact would be **major adverse**.	**Large adverse**
				<u>Operation</u> Close views north and north-east to access road to property and traffic flow and highway infrastructure, including signage and lighting columns / light spill, at Trewaun junction opened up by loss of trees. Close filtered views through intervening vegetation north-west to occasional traffic on Mynydd Bwllfa Wind Farm access bridge and and lighting columns / light spill, traffic flow on realigned 'old A465' and tops of vehicles in A465 mainline cutting. The magnitude of impact would be **major adverse.**	**Large adverse**	<u>Summer Year 15</u> Close view to realigned access road to property. Established mitigation planting would generally screen Trewaun junction and A465 mainline cutting, though some filtered glimpses of traffic flow and signage might remain to north and north-east. Tops of lighting columns / light spill at junction would remain visible. The magnitude of impact would be **minor adverse.**	**Slight adverse**
S6-R16 (18)	1 -7 and 12 – 18 Trewaun, Glannant, Ambleside and Heulwen, Hirwaun Road, and 5 Montana Park, Hirwaun.	17 m	Oblique views west to north to traffic and infrastructure at Trewaun junction, filtered and softened by mature trees along Hirwaun Road and at roundabout. Garden vegetation and belt of trees along A465 approach to junction provides limited screening of traffic in summer. Close direct view south-west to traffic and vegetation belt on Hirwaun Road, with filtered views of ridgeline within Hirwaun Common in background.	<u>Construction</u> Views opened up by loss of vegetation. Close views from south to north-west of traffic on temporary A465 diversion roads, construction compound with stockpiles, construction of Trewaun junction including new roundabout, bridges and highway infrastructure such as signage and lighting columns, opened up loss of trees. Also close views north-west to north-east of construction of A465 mainline cutting with environmental barrier and upper storey views to construction of Pentwyn Cynon (Tramway) footbridge in middle distance. The magnitude of impact would be **major adverse.**	**Large adverse**	<u>Winter Year 1</u> As per operation without mitigation planting. The magnitude of impact would be **moderate adverse.**	**Moderate adverse**

Reference number[1] with number of properties in brackets * Listed Building	Location / address	Approx. distance from nearest point of receptor to centre line of proposed A465 alignment	Existing view	Change in view and magnitude of impact without mitigation planting	Significance of effect without mitigation planting	Change in view and magnitude of impact with mitigation planting	Significance of effect with mitigation planting
				Operation Close views south to west to traffic flow and highway infrastructure, including signage and lighting columns / light spill, at Trewaun junction, opened up by loss of trees. New junction slightly further away from receptor. Also close views west to north-east to 2 m high environmental barrier along A465 mainline cutting and upper storey views to Pentwyn Cynon (Tramway) footbridge in middle distance. The magnitude of impact would be **moderate adverse.**	**Moderate adverse**	Summer Year 15 Established mitigation planting would filter views south to west to traffic flow and signage at Trewaun junction, though tops of lighting columns / light spill would be visible above the planting. 2 m high environmental barrier along A465 mainline cutting and Pentwyn Cynon (Tramway) footbridge would generally be screened by established mitigation planting, though some glimpses would remain to north and north-east. The magnitude of impact would be **minor adverse.**	**Slight adverse**
S6-R17 (4)	8 - 11 Trewaun, Hirwaun.	17 m	Mix of deciduous and evergreen vegetation along A465 generally contains views north-west, north and north-east, except close glimpsed views in summer and filtered view in winter, to traffic and lighting columns on A465. Close oblique glimpses south between properties to traffic and lighting columns on Hirwaun Road, with distinctive ridgeline within Hirwaun Common in background. Electricity lines and pylons are detracting features within surroundings.	Construction Close, partially filtered views through garden vegetation, west to north-east to to traffic on temporary A465 diversion roads and construction of A465 mainline cutting with highway infrastructure such as environmental barrier, opened up by loss of vegetation. Close oblique glimpses between buildings to south-west to construction of Trewaun junction with highway infrastructure such as signage and lighting columns. Also oblique upper storey views to construction of Pentwyn Cynon (Tramway) footbridge in middle distance. The magnitude of impact would be **moderate adverse.**	**Moderate adverse**	Winter Year 1 As per operation without mitigation planting. The magnitude of impact would be **moderate adverse.**	**Moderate adverse**
				Operation Close, partially filtered views through garden vegetation, west to north-east, opened up by loss of vegetation, to 4 m high environmental barrier, as well as upper storey glimpses north-east to tops of high sided vehicles in cutting and Pentwyn Cynon (Tramway) footbridge in middle distance. Glimpsed views between buildings to south-west to traffic flow at Trewaun junction and lighting columns / light spill. The magnitude of impact would be **moderate adverse.**	**Moderate adverse**	Summer Year 15 Established mitigation planting would screen A465 to north-east and much of the 4m high environmental barrier to north, with exception of barrier at bottom of gardens facing A465 which would not already be screened by existing garden vegetation. Trewaun junction would be softened by established mitigation planting in glimpsed views between buildings, though tops of some lighting columns / light spill would remain visible. Upper storey glimpses of top of Pentwyn Cynon (Tramway) footbridge would also remain to north-east in middle distance. The magnitude of impact would be **minor adverse.**	**Slight adverse**
S6-R18 (32)	39 – 70 Trenant, Hirwaun.	42 m	Views to the north and west are contained by mature, generally deciduous vegetation, as well as bunding along parts of the A465. Close filtered views from upper storeys through trees to high-sided vehicles and lighting columns on the A465 in winter. Pylons are detracting features. Slightly elevated distant views to hills within BBNP in the	Construction Close, mainly upper storey views west to north, filtered by intervening vegetation, to traffic on temporary A465 diversion roads, construction of Pentwyn Cynon (Tramway) footbridge and A465 mainline cutting with associated highway infrastructure such as environmental barrier, opened up by loss of vegetation. Also close filtered views of construction of attenuation ponds and access track to north. The magnitude of impact would be **moderate adverse.**	**Moderate adverse**	Winter Year 1 As per operation without mitigation planting. The magnitude of impact would be **moderate adverse.**	**Moderate adverse**

Reference number[1] with number of properties in brackets * Listed Building	Location / address	Approx. distance from nearest point of receptor to centre line of proposed A465 alignment	Existing view	Change in view and magnitude of impact without mitigation planting	Significance of effect without mitigation planting	Change in view and magnitude of impact with mitigation planting	Significance of effect with mitigation planting
			background.	<u>Operation</u> Close, mainly upper storey views west to north, filtered by intervening vegetation, to Pentwyn Cynon (Tramway) footbridge and 2 m high environmental barrier along A465 mainline cutting, opened up by loss of vegetation. barrier and cutting would generally screen traffic flow on road. Also close filtered views of earthworks for attenuation ponds and access track to north. The magnitude of impact would be **moderate adverse.**	**Moderate adverse**	<u>Summer Year 15</u> Established mitigation planting would soften views filtered by intervening vegetation to Pentwyn Cynon (Tramway) footbridge and generally screen 2 m high environmental barrier along A465 mainline. Also close filtered views of earthworks for attenuation ponds and access track to north. The magnitude of impact would be **minor adverse.**	**Slight adverse**
S6-R19 (approx. 800)	Properties at Penywaun estate within 1 km of proposed scheme.	385 m	Views to west are contained by properties and vegetation. Close views to properties and belts of trees. Elevated views north-west to north-east above properties on sloping ground, to BBNP and Baverstock ridge in background. Glimpses of traffic on A465 as it descends from Baverstock ridge towards Hirwaun, particularly in winter, when deciduous vegetation does not screen road as well. Pylons and gas works are detracting features in the distance.	<u>Construction</u> Middle distance views north of construction of A465 mainline through Croesbychan junction, opened up by loss of trees on edge of BBNP. Distant views north-east to construction of widened A465 mainline between Nant Hir and Baverstock junction, including major earthworks for junction and attenuation ponds. The magnitude of impact would be **minor adverse**.	**Moderate adverse**	<u>Winter Year 1</u> As per operation without mitigation planting. The magnitude of impact would be **minor adverse**.	**Moderate adverse**
				Operation Filtered glimpses north through trees in middle distance to tops of high sided vehicles on A465 mainline through Croesbychan junction, as well as tops of lighting columns / light spill at junction on edge of BBNP. Distant views north-east to Baverstock junction, widened Nant Hir viaduct and A465 mainline between Nant Hir viaduct and Baverstock junction with associated traffic flow and light spill. The magnitude of impact would be **minor adverse**.	**Moderate adverse**	Summer Year 15 Established mitigation planting would generally screen views of Croesbychan junction and A465 mainline to north, though glimpses of tops of tops of lighting columns / light spill would remain in middle distance. Established mitigation planting would also soften views to Baverstock junction and screen parts of traffic flow on A465 mainline, though much of the route would be left open without any mitigation proposed. Light spill would remain more noticeable at junction. The magnitude of impact would be **minor adverse.**	**Slight adverse**
S6-R20 (7)	33 – 39 Llys Cynon, Hirwaun.	120 m	Views south contained by dense woodland on a small hill. Glimpsed filtered distant views to Hirwaun Common in winter. Close filtered glimpsed views through vegetation, particularly from upper storey, south-east along river valley, to traffic on A465 River Cynon crossing. Views east, across field, contained by climbing landform, mature belt of trees and properties.	<u>Construction</u> Upper storey middle distance views south-east, opened up by loss of trees, to construction of Afon Cynon overbridge and embankments for widened A465. The magnitude of impact would be **moderate adverse**.	**Moderate adverse**	<u>Winter Year 1</u> As per operation without mitigation planting. The magnitude of impact would be **minor adverse**.	**Slight adverse**
				<u>Operation</u> Upper storey middle distance views south-east, opened up by loss of trees, to tops of high sided vehicles above 2 m high environmental barrier on A465 mainline east of Afon Cynon overbridge. Intervening trees would partially filter views to traffic flow on Afon Cynon overbridge. The magnitude of impact would be **minor adverse**.	**Slight adverse**	<u>Summer Year 15</u> Established mitigation planting would generally screen 2 m high environmental barrier and traffic flow on A465 mainline, with exception of glimpses of traffic flow on Afon Cynon overbridge, which would be filtered by intervening trees. The magnitude of impact would be **negligible adverse.**	**Slight adverse**

Reference number[1] with number of properties in brackets * Listed Building	Location / address	Approx. distance from nearest point of receptor to centre line of proposed A465 alignment	Existing view	Change in view and magnitude of impact without mitigation planting	Significance of effect without mitigation planting	Change in view and magnitude of impact with mitigation planting	Significance of effect with mitigation planting
S6-21 (6)	2 – 12 (evens) Greenwood Drive, Hirwaun.	85 m	Close views south in summer between rows of houses to deciduous tree belt along A465, as well as some glimpses of traffic, seen above close boarded fence. Close filtered views of traffic in winter, as well as longer distance views to distinctive ridgeline within Hirwaun Common. Views west and east contained by properties and vegetation.	<u>Construction</u> Close range partial views south between properties to construction of widened A465 with highway infrastructure, including signage and environmental barrier, opened up by loss of tree belt along road. The magnitude of impact would be **moderate adverse**.	**Moderate adverse**	<u>Winter Year 1</u> As per operation without mitigation planting. The magnitude of impact would be **minor adverse**.	**Slight adverse**
				Operation Close range partial views south to tops of high sided vehicles above 2 m high environmental barrier on embankment for A465. The magnitude of impact would be **minor adverse**.	**Slight adverse**	Summer Year 15 Established mitigation planting would screen views of environmental barrier and traffic flow on A465. The magnitude of impact would be **no change.**	**Neutral**
S6-R22 (49)	1-2 Oaklands Close, 1-13 Meadow Close, 1 – 17 (odds) Greenwood Drive, 4 – 7 Riverside and 8 – 24 Denbeigh Court, Hirwaun.	24 m	Views south-west to east from bungalows and houses often contained by garden vegetation, close boarded fences and / or tree belts, including belt along A465. Gaps in tree belt allow close views to traffic flow from some properties, whilst there are filtered views through tree belt to traffic flow from other properties. Some filtered longer distance views in winter to Hirwaun Common.	<u>Construction</u> Close range views south to construction of widened A465 with highway infrastructure, including signage and environmental barrier, opened up by loss of tree belt along road. Also views to construction of Vale of Neath underbridge, from eastern edge of settlement. The magnitude of impact would be **moderate adverse**.	**Large adverse**	<u>Winter Year 1</u> As per operation without mitigation planting. The magnitude of impact would be **moderate adverse**.	**Moderate adverse**
				<u>Operation</u> Close range views south to tops of high sided vehicles above 2 m high environmental barrier on embankment for A465. Glimpses of tops of lighting columns / light spill at southern periphery of Croesbychan junction, from eastern edge of settlement. The magnitude of impact would be **moderate adverse**.	**Moderate adverse**	<u>Summer Year 15</u> Established mitigation planting would screen environmental barrier and traffic flow on A465. Glimpses of tops of lighting columns / light spill at southern periphery of Croesbychan junction, from eastern edge of settlement. The magnitude of impact would be **negligible adverse.**	**Slight adverse**
S6-R23 (17)	1 – 6, 25 - 35 Denbeigh Court, Hirwaun.	55 m	Close partial or oblique filtered views south between properties to traffic on A465 through belts of mainly deciduous trees. Traffic on A465 more visible in winter. Rising landform with close boarded fence and belts of vegetation beyond contain views to the north-east.	<u>Construction</u> Close range partial views south between properties to construction of widened A465 with highway infrastructure, including signage and environmental barrier, opened up by loss of tree belt along road. The magnitude of impact would be **moderate adverse**.	**Moderate adverse**	<u>Winter Year 1</u> As per operation without mitigation planting. The magnitude of impact would be **minor adverse**.	**Slight adverse**
				<u>Operation</u> Close range partial views south to tops of high sided vehicles above 2 m high environmental barrier on embankment for A465, opened up by loss of tree belt along road. Possible glimpses of tops of lighting columns / light spill at Croesbychan junction to north-east. The magnitude of impact would be **minor adverse**.	**Slight adverse**	<u>Summer Year 15</u> Established mitigation planting would screen views of 2 m high environmental barrier and traffic flow on A465. Possible glimpses of tops of lighting columns / light spill at Croesbychan junction to north-east would remain. The magnitude of impact would be **negligible adverse.**	**Slight adverse**

Reference number[1] with number of properties in brackets * Listed Building	Location / address	Approx. distance from nearest point of receptor to centre line of proposed A465 alignment	Existing view	Change in view and magnitude of impact without mitigation planting	Significance of effect without mitigation planting	Change in view and magnitude of impact with mitigation planting	Significance of effect with mitigation planting
S6-24 (1)	7 Denbeigh Court, Hirwaun.	32 m	Close oblique and direct views south-west to south-east filtered by deciduous tree belt along A465, to traffic flow and road restraint. Views more open in summer. Upper storey views north-east above hedge to minor road bridge across Vale of Neath railway.	<u>Construction</u> Close range views south-west to east to construction of widened A465 with highway infrastructure, including Vale of Neath underbridge, and highway infrastructure, such as signage and environmental barrier, opened up by loss of tree belt along road. Also upper storey views north-east to construction compound / stockpiles and construction of southern periphery of Croesbychan junction with highway infrastructure, including signage and lighting columns. The magnitude of impact would be **major adverse**.	**Very large adverse**	<u>Winter Year 1</u> As per operation without mitigation planting. The magnitude of impact would be **major adverse**.	**Large adverse**
				<u>Operation</u> Close range views south-west to south-east to traffic flow above 2 m high environmental barrier on embankment for A465, opened up by loss of tree belt along road. Close range views of full traffic flow at Vale of Neath crossing. Upper storey views of southern periphery of Croesbychan junction with traffic and highway infrastructure, including signage and tops of lighting columns / light spill. The magnitude of impact would be **major adverse**.	**Large adverse**	<u>Summer Year 15</u> Established mitigation planting would screen views of 2 m high environmental barrier and traffic flow on A465 in views from south-west to south-east and soften upper storey views east and north-east to Vale of Neath underbridge and southern periphery of Croesbychan junction. Some glimpses of traffic flow and tops of lighting column/light spill on A465 and junction would remain. The magnitude of impact would be **moderate adverse.**	**Moderate adverse**
S6-R25 (1)	Gelli Tarw Farm, Croes Bychan Road, Llwydcoed.	195 m	Views north-west generally contained by dense evergreen vegetation and landform. Glimpsed views in summer and filtered views through trees in winter north to traffic on A465. Views south contained by mature belts of trees.	<u>Construction</u> Close range glimpsed or filtered views through garden vegetation north-west and north to construction of attenuation pond and southern extent of Croesbychan junction, including highway infrastructure such as signage and lighting columns, opened up by loss of trees. Also middle distance glimpses of construction of elevated A465 mainline in background. The magnitude of impact would be **moderate adverse.**	**Moderate adverse**	<u>Winter Year 1</u> As per operation without mitigation planting. The magnitude of impact would be **moderate adverse**.	**Moderate adverse**
				<u>Operation</u> Close range filtered views north-west and north to attenuation pond and, traffic flow and highway infrastructure, such as signage and lighting columns / light spill, at southern extent of Croesbychan junction, opened up by loss of trees. Also middle distance glimpses of traffic flow on elevated A465 mainline in background, partly screened by 1 m high environmental barrier along south side of A465 mainline. The magnitude of impact would be **moderate adverse.**	**Moderate adverse**	<u>Summer Year 15</u> Established mitigation planting would soften close range views north of attenuation pond and, partially obscure and soften traffic flow and signage at eastern extent of Croesbychan junction. Traffic flow on A465 mainline and 1 m high environmental barrier would generally be screened by established mitigation planting. The magnitude of impact would be **minor adverse.**	**Slight adverse**

Reference number[1] with number of properties in brackets * Listed Building	Location / address	Approx. distance from nearest point of receptor to centre line of proposed A465 alignment	Existing view	Change in view and magnitude of impact without mitigation planting	Significance of effect without mitigation planting	Change in view and magnitude of impact with mitigation planting	Significance of effect with mitigation planting
S6-R26 (1)	Court Lodge, Swansea Road to Nantmoel Farm, Croesbychan, Llwydcoed.	37m	Views south to north-east contained by mature deciduous and evergreen garden vegetation and tree belts along lane. Close filtered glimpses through trees to traffic on A465 in winter.	<u>Construction</u> Close views south and east to construction of Croesbychan junction, including highway infrastructure such as signage and lighting columns, and construction of elevated A465 mainline with environmental barrier. Also views of construction compounds including stockpiles. Views opened up by loss of trees, including trees on southern and south-eastern edge of garden which would be directly affected by works to realign local road and construct new drive to property. The magnitude of impact would be **major adverse.**	**Very large adverse**	<u>Winter Year 1</u> As per operation without mitigation planting. The magnitude of impact would be **major adverse.**	**Very large adverse**
				<u>Operation</u> Close views south and east, opened up by loss of trees, to tops of vehicles on realigned local road in cutting at bottom of garden, as well as tops of vehicles and highway infrastructure, such as signage and lighting columns / light spill, at Croesbychan junction, and tops of high sided vehicles above with 1 m high environmental barrier on elevated A465 mainline. The magnitude of impact would be **major adverse.**	**Very large adverse**	<u>Summer Year 15</u> Established mitigation planting would generally screen views of traffic flow and highway infrastructure on realigned local road and Croesbychan junction. Established mitigation planting would also screen A465 mainline, though some filtered glimpses of 1 m high environmental barrier and tops of high sided vehicles would remain, as well as glimpses of tops of lighting columns / light spill at junction. The magnitude if impact would be minor adverse.	**Moderate adverse**
S6-R27 (2)	Ingledene and The Oaks, Swansea Road to Nantmoel Farm, Croesbychan, Llwydcoed.	60m	Views south to north-east contained by mature deciduous and evergreen garden vegetation and tree belts along lane. Close filtered glimpses through trees to traffic on A465 in winter.	<u>Construction</u> Close views opened up by loss of trees, but partially filtered by intervening garden vegetation, south and east to construction of realigned local road, construction of slip road at Croesbychan junction with environmental barrier and signage, construction of elevated A465 mainline, and construction compounds including stockpiles. The magnitude of impact would be **major adverse.**	**Large adverse**	<u>Winter Year 1</u> As per operation without mitigation planting. The magnitude of impact would be **major adverse.**	**Large adverse**
				<u>Operation</u> Close views opened up by loss of trees, but partially filtered by intervening garden vegetation, south and east to vehicles on realigned local road, tops of high sided vehicles above 1 m high environmental barrier on elevated slip road at Croesbychan junction and on A465 mainline. Tops of lighting columns / light spill at junction also visible. The magnitude of impact would be **major adverse.**	**Large adverse**	<u>Summer Year 15</u> Established mitigation planting would soften views of traffic on local road to south, and generally screen 1 m high environmental barrier and traffic flow on elevated slip road at Croesbychan junction and on A465 mainline to south and east. Glimpses of tops of lighting columns / light spill at junction would remain. The magnitude of impact would be **minor adverse.**	**Slight adverse**

Reference number[1] with number of properties in brackets * Listed Building	Location / address	Approx. distance from nearest point of receptor to centre line of proposed A465 alignment	Existing view	Change in view and magnitude of impact without mitigation planting	Significance of effect without mitigation planting	Change in view and magnitude of impact with mitigation planting	Significance of effect with mitigation planting
S6-R28 (1)	Lynwood, Croes Bychan Road, Croesbychan, Llwydcoed.	40 m	Views south to north-east contained by deciduous vegetation along A465 and woodlands. Close filtered glimpses through trees to traffic on A465 in winter. Pylons are detracting features in landscape, visible above trees in views north-east. Elevated distant glimpses south to Hirwaun Common.	Construction Eastern extent of garden would be lost to proposed scheme. Close views to demolition of garage and greenhouse in garden. Close views east (oblique) and north-east, opened up by loss of vegetation, and close filtered views south through intervening vegetation, to construction of Croesbychan junction, including highway infrastructure such as signage, lighting columns and environmental barrier, and elevated A465 mainline. Also views of construction compound including stockpiles. The magnitude of impact would be **major adverse.**	**Large adverse**	Winter Year 1 As per operation without mitigation planting. The magnitude of impact would be **major adverse.**	**Large adverse**
				Operation Close views east (oblique) and north-east, opened up by loss of vegetation, and close filtered views south through intervening vegetation, to traffic flow and highway infrastructure such as signage and lighting columns / light spill at Croesbychan junction and elevated A465 mainline, partially screened by 1 m high environmental barrier to east and south-east. The magnitude of impact would be **major adverse.**	**Large adverse**	Summer Year 15 Established mitigation planting would screen environmental barrier, traffic flow and signage on Croesbychan junction, but partial views of traffic flow on elevated A465 mainline to north-east would remain. Tops of lighting columns / light spill at junction also visible. The magnitude of impact would be **moderate adverse.**	**Moderate adverse**
S6-R29 (1)	Min-Y-Coed, Swansea Road to Nantmoel Farm, Croesbychan, Llwydcoed.	155 m	Views from bungalow north-east and south-east contained by dense woodland surrounding property. Close views east across field to woodland along A465. Filtered views to traffic on A465 in winter.	Construction Close views east opened up by loss of woodland, but partially filtered by intervening garden vegetation, to construction of NMU route, north-western periphery of Croesbychan junction, including highway infrastructure such as signage and lighting columns, and elevated A465 mainline. The magnitude of impact would be **moderate adverse.**	**Moderate adverse**	Winter Year 1 As per operation without mitigation planting. The magnitude of impact would be **moderate adverse.**	**Moderate adverse**
				Operation Close views east opened up by loss of woodland, but partially filtered by intervening garden vegetation, to users on NMU route, traffic flow and highway infrastructure, such as signage and lighting columns / light spill, at Croesbychan junction, and traffic flow on elevated A465 mainline. The magnitude of impact would be **moderate adverse.**	**Moderate adverse**	Summer Year 15 Established mitigation planting would screen traffic flow at Croesbychan junction and A465 mainline, though users on NMU route and tops of lighting columns / light spill at junction would remain visible. The magnitude of impact would be **minor adverse.**	**Slight adverse**

Reference number[1] with number of properties in brackets * Listed Building	Location / address	Approx. distance from nearest point of receptor to centre line of proposed A465 alignment	Existing view	Change in view and magnitude of impact without mitigation planting	Significance of effect without mitigation planting	Change in view and magnitude of impact with mitigation planting	Significance of effect with mitigation planting
S6-R30 (1)	Nant Hir House, Nant Cae Farm, Crematorium Road, Llwydcoed.	240 m	Views west contained by deciduous vegetation along Nant Hir Reservoir. Ascending middle distance views north and north-east across fields to filtered glimpses through thin vegetation belt to mainly tops of high sided vehicles on A465 above false cutting, seen against woodland background. Views east across fields towards Nant Livery Farm, tree belts and woodland blocks.	<u>Construction</u> Middle distance ascending views north and north-east to construction compounds with large stockpiles, construction of large attenuation ponds with access tracks, widened A465 mainline with parallel NMU route, and, expanded Baverstock junction with associated highway infrastructure such as signage and lighting columns. The magnitude of impact would be **moderate adverse.**	**Moderate adverse**	<u>Winter Year 1</u> As per operation without mitigation planting. The magnitude of impact would be **moderate adverse**.	**Moderate adverse**
				<u>Operation</u> Middle distance views north-west to north-east to earthworks and access tracks for attenuation ponds, traffic flow on Nant Hir viaduct, widened A465 mainline and, expanded Baverstock junction with highway infrastructure such as signage and lighting columns / light spill. Users on NMU route also visible to north-east. The magnitude of impact would be **moderate adverse.**	**Moderate adverse**	<u>Summer Year 15</u> NMU route, attenuation ponds and access tracks would remain visible.Established mitigation planting would generally screen views of traffic flow at Baverstock junction to north-east, though traffic flow on Nant Hir viaduct and A465 mainline would remain more noticeable to north-west and north due to loss of vegetation belt and false cutting. Tops of lighting columns / light spill would also be visible at junction. The magnitude of impact would be **moderate adverse.**	**Moderate adverse**
S6-R31(1)	Nant Livery Farm Farmhouse, Crematorium Road, Llwydcoed.	363 m	Views west to Nant Cae Farm and primarily deciduous vegetation along Nant Hir Reservoir. Views north generally contained by farm buildings. Ascending middle distance glimpsed view north across fields to woodland. Filtered glimpses of high-sided vehicles on A465 through sparse belt of deciduous vegetation. Views east contained by farm buildings and tree belt.	<u>Construction</u> Middle distance ascending views north-west and glimpsed views between farm buildings north, to construction of NMU route, large attenuation ponds and widened A465 mainline with associated signage. The magnitude of impact would be **moderate adverse.**	**Moderate adverse**	<u>Winter Year 1</u> As per operation without mitigation planting. The magnitude of impact would be **minor adverse**.	**Slight adverse**
				<u>Operation</u> Middle distance ascending views north-west and glimpsed views between farm buildings north, to users on NMU route, earthworks and access tracks for attenuation ponds, and, traffic flow and highway infrastructure on A465 mainline. Existing vegetation would continue to screen views east. The magnitude of impact would be **minor adverse.**	**Slight adverse**	<u>Summer Year 15</u> NMU route, attenuation ponds and access tracks would remain visible Established mitigation planting to north of A465 would not affect middle distance views north-west and glimpsed views between farm buildings north, to users on NMU route and, traffic flow and highway infrastructure on widened A465 mainline. The magnitude of impact would be **minor adverse.**	**Sight adverse**

Reference number[1] with number of properties in brackets * Listed Building	Location / address	Approx. distance from nearest point of receptor to centre line of proposed A465 alignment	Existing view	Change in view and magnitude of impact without mitigation planting	Significance of effect without mitigation planting	Change in view and magnitude of impact with mitigation planting	Significance of effect with mitigation planting
S6-R32 (1)	Ty Gwyn Farm, Crematorium Road, Llwydcoed.	260 m	Views west and south-west across fields to tree belts and woodlands, with distinctive ridgeline within Hirwaun Common in background. Ascending, partially filtered views through intermittent vegetation, north-west to north-east across grassland to deciduous hedgerow along Crematorium Road, middle distance glimpses of high sided vehicles on A465 and lit A465 junction with Crematorium Road, seen against backdrop of forest on Baverstock Ridge.	<u>Construction</u> Close to middle distance ascending views north-west to north-east to construction compound with large stockpiles and, construction of expanded Baverstock junction with highway infrastructure including signage, lighting columns and attenuation pond, A465 mainline and parallel NMU route and link road, opened up by loss of vegetation along farm access track for construction of new track. Associated loss of forest would be apparent. Also distant glimpses of construction activities along A465 further south-west, such as for offline section south of Hirwaun. The magnitude if impact would be **major adverse.**	**Very large adverse**	<u>Winter Year 1</u> As per operation without mitigation planting. The magnitude of impact would be **major adverse.**	**Very large adverse**
				<u>Operation</u> Close to middle distance ascending views north-west to north-east to traffic flow and highway infrastructure such as signage, lighting columns / light spill and attenuation pond associated with Baverstock junction, as well as users on NMU route and, traffic flow on A465 mainline and parallel link road. Also distant glimpses of traffic on A465 further south-west, such as at offline section south of Hirwaun. The magnitude if impact would be **major adverse.**	**Very large adverse**	<u>Summer Year 15</u> Established mitigation planting would generally screen traffic flow on A465 mainline, though some glimpses would remain. Together with rock and scree features, established mitigation planting would also soften and partially screen views to Baverstock junction, though traffic flow and highway infrastructure such as signage, lighting columns / light spill and attenuation pond at south-facing part of junction would remain dominant in close ascending views north-west to north-east, including traffic flow on southern roundabout and link road. Users on NMU route would also remain visible. The magnitude of impact would be **moderate adverse.**	**Large adverse**
S6-R33 (1)	Jah Jireh Care Home, Heads of the Valleys Road / A465, Llwydcoed.	55 m	Fronts onto A465. Close view south to traffic on A465, with tree belt and forest in background. Mast on Mynydd Abererdar is a detracting feature in distance. Close view south-west to traffic and infrastructure at A465 Baverstock junction, with distant views across woodlands to Hirwaun Common. Close views west across access road to gas works and dense, mainly evergreen	<u>Construction</u> Close views south-west to construction of expanded Baverstock junction with highway infrastructure such as signage and lighting columns, and construction compound with large stockpiles, opened up by loss of forest. Also, close partially filtered views south and east through intervening trees, to construction of access track, widened A465 mainline, parallel link road and NMU route, involving major earthworks and loss of forest. The magnitude of impact would be **major adverse.**	**Very large adverse**	<u>Winter Year 1</u> As per operation without mitigation planting. The magnitude of impact would be **major adverse.**	**Large adverse**

Reference number[1] with number of properties in brackets * Listed Building	Location / address	Approx. distance from nearest point of receptor to centre line of proposed A465 alignment	Existing view	Change in view and magnitude of impact without mitigation planting	Significance of effect without mitigation planting	Change in view and magnitude of impact with mitigation planting	Significance of effect with mitigation planting
			forest.	Operation Close views south-west to south-east to traffic flow and highway infrastructure such as signage and lighting columns / light spill at expanded Baverstock junction and slightly sunken A465 mainline, opened up to south-west by loss of forest. Also views to occasional traffic on access track, traffic flow on link road and users of NMU route to south and south-east. Extensive cutting slope to south would be dominant in view. The magnitude of impact would be **major adverse.**	**Large adverse**	Summer Year 15 Established mitigation planting would generally screen traffic and highway infrastructure, such as signage, at Baverstock junction, A465 mainline and parallel link road in most views, though some glimpses of traffic would remain to south-west and south-east. Users of NMU route would also partially be screened by established mitigation planting. Tops of lighting columns at junction would remain visible. Occasional traffic on access track in foreground to south would be less noticeable than existing traffic flow on A465. Extensive cutting slope to south would remain a dominant feature in the view. The magnitude of impact would be **moderate adverse.**	**Moderate adverse**
S6-R34 (1)	Tyn-Y-Coedcae Farm, Merthyr Tydfil.	165 m	Views north and west contained by mature evergreen and deciduous trees, as well as rising landform. Close glimpsed filtered views, possibly only from upper storeys, to traffic on A465 in winter. Views east across grassland to wooded Nant Ffrwd valley and fields in the BBNP, with Gurnos and mountains in the BBNP in the distance beyond. Possible descending glimpses towards lighting columns at the A470 junction.	Construction Views south-west generally contained by evergreen trees and rising landform. Close filtered views south through intervening trees and open views to south-east, due to loss of trees, to construction of attenuation pond with access track, and elevated A465 mainline and link road with highway infrastructure such as signage beyond in middle distance. Also distant glimpses to construction activities associated with proposed scheme further east, such as offline route at Y Graig. The magnitude of impact would be **moderate adverse.**	**Moderate adverse**	Winter Year 1 As per operation without mitigation planting. The magnitude of impact would be **moderate adverse.**	**Moderate adverse**
				Operation Views south-west generally contained by evergreen trees and rising landform. Close filtered views south through intervening trees and open views to south-east, due to loss of trees, to attenuation pond with access track, and, traffic flow and highway infrastructure, such as signage, on elevated A465 mainline and link road beyond in middle distance. Also longer distance and distant glimpses of traffic on A465 further east, such as offline route at Y Graig. The magnitude of impact would be **moderate adverse.**	**Moderate adverse**	Summer Year 15 Established mitigation planting would soften close views south-east of attenuation pond and generally screen traffic flow on elevated A465 mainline, though glimpses of high sided vehicles on link road would be visible. Established mitigation planting would also screen or soften longer distance and distant glimpses to views of traffic on A465 further east, such as offline route at Y Graig. The magnitude of impact would **minor adverse.**	**Slight adverse**
S6-R35 (1)	Ffrwd-Isaf Farm, Cefn Coed, Merthyr Tydfil.	170 m	Views west and south contained by woodland along the Nant Ffrwd valley and tree belt along the A465. Upper storey views east and north-east, between tree canopies, across fields to traffic and lighting columns on the A465. Filtered views through trees in winter from lower storeys to A465. Possible longer distance views to lighting columns	Construction Middle distance views east and north-east, mainly from upper storeys, framed or filtered by trees, to demolition of property, construction of eastbound slip road to A470 junction and A465 mainline with associated retaining walls, bridges, major earthworks and highway infrastructure. Construction compounds and stockpiles would also be visible. The magnitude of impact would be **moderate adverse.**	**Moderate adverse**	Winter Year 1 As per operation without mitigation planting. The magnitude of impact would be **minor adverse.**	**Slight adverse**

Reference number[1] with number of properties in brackets * Listed Building	Location / address	Approx. distance from nearest point of receptor to centre line of proposed A465 alignment	Existing view	Change in view and magnitude of impact without mitigation planting	Significance of effect without mitigation planting	Change in view and magnitude of impact with mitigation planting	Significance of effect with mitigation planting
			at A470 junction.	Operation Middle distance views east and north-east, mainly from upper storeys, framed or filtered by trees, to traffic flow and highway infrastructure on slip road to A470 junction and A465 mainline, elevated on retaining walls and bridges. Also glimpses of tops of lighting columns / light spill at A470 junction. The magnitude of impact would be **minor adverse.**	**Slight adverse**	Summer Year 15 Middle distance views east and north-east, mainly from upper storeys, framed or filtered by existing trees in leaf, to traffic flow and highway infrastructure on slip road to A470 junction and A465 mainline, elevated on retaining walls and bridges. Also glimpses of tops of lighting columns / light spill at A470 junction. The magnitude of impact would be **minor adverse.**	**Slight adverse**
S6-R36 (8)	1 – 8 Clos Cribyn, Clwydyfagwyr, Merthyr Tydfil.	70 m	Lower level views north-west to south-east generally contained by close boarded fencing and deciduous trees along Swansea Road in summer. Oblique views north-west across trees to moorland and Penmoelallt forest within BBNP. Middle distance glimpsed view of traffic on A465 as it descends Baverstock ridge. Views north-east across trees to urban edge of Gurnos and Cefn Cli-Sanws in BBNP. Lighting columns along Swansea Road and pylons are detracting features in views.	Construction Close views north-west to north-east opened up by loss of trees to construction of Swansea Road link road and A465 mainline including highway infrastructure such as signage, as well as minor adjustments to track below properties. Also distant glimpses to construction activities associated with proposed scheme further east, such as offline route at Y Graig. The magnitude of impact would be **major adverse.**	**Large adverse**	Winter Year 1 As per operation without mitigation planting. The magnitude of impact would be **major adverse.**	**Large adverse**
				Operation Close views north-west to north-east opened up by loss of trees to traffic flow and highway infrastructure, such as signage, on Swansea Road link road and A465 mainline. Also distant glimpses of traffic on A465 further east, such as offline route at Y Graig. The magnitude of impact would be **major adverse.**	**Large adverse**	Summer Year 15 Established mitigation planting would generally screen traffic flow and highway infrastructure on Swansea Road link road to north-west and A465 mainline to north, though tops of high sided vehicles would remain noticeable on link road in close views above garden fence. The magnitude of impact would be **minor adverse.**	**Slight adverse**
S-6-R37 (13)	9 – 22 Heol Corn Du, Clwydyfagwyr, Merthyr Tydfil.	130 m	Oblique views west across remnant shale and grassland on undulating landforms of historic workings, with middle distance glimpses of high-sided vehicles and lighting columns on A465, with BBNP in background. Pylons are detracting features in landscape. Views north and north-east across properties and vegetation belts to BBNP.	Construction Middle distance oblique views north-west across remnant shale mounds to major earthworks and loss of vegetation for construction of link road, NMU route and A465 mainline in cutting. The magnitude of impact would be **minor adverse.**	**Moderate adverse**	Winter Year 1 As per operation without mitigation planting. The magnitude of impact would be **minor adverse.**	**Slight adverse**
				Operation Middle distance oblique views north-west across remnant shale mounds to traffic flow on Swansea Road link road and users of NMU route. The magnitude of impact would be **minor adverse.**	**Slight adverse**	Summer Year 15 Middle distance oblique views north-west across remnant shale mounds to traffic flow on Swansea Road link road and users of NMU route would remain, though established mitigation planting would slightly soften these views. The magnitude of impact would be **minor adverse.**	**Slight adverse**

Reference number[1] with number of properties in brackets * Listed Building	Location / address	Approx. distance from nearest point of receptor to centre line of proposed A465 alignment	Existing view	Change in view and magnitude of impact without mitigation planting	Significance of effect without mitigation planting	Change in view and magnitude of impact with mitigation planting	Significance of effect with mitigation planting
S6-R38 (66)	Maes r Awelon,the Haven and Tramar House,Swansea Road, and, 1-22, 24 – 34 and 44 – 73 Pen y Dryffyn, Clwydyfagwyr, Merthyr Tydfil.	55 m	Close, generally oblique, filtered views through vegetation north-west and north-east across fields to deciduous vegetation belt along A465 in summer. Filtered views through trees to tops of high sided vehicles and lighting columns / light spill in winter. Longer distance glimpsed, slightly elevated views north-east, between houses and trees, towards hills within BBNP, Trefechan, Cefn Coed and Gurnos. Glimpses of traffic on A465, as it winds its way up towards Gurnos.	<u>Construction</u> Close to middle distance, generally oblique, filtered views through vegetation north-west and north-east to construction of A465 mainline including highway infrastructure and A470 junction, including major earthworks for cutting, opened up by loss of trees. Also glimpses of construction of link road to west, from western edge, and construction compounds with stockpiles and longer distance views to construction activities associated with proposed scheme further east, such as offline route at Y Graig from eastern edge. The magnitude of impact would be **moderate adverse.**	**Moderate adverse**	<u>Winter Year 1</u> As per operation without mitigation planting. The magnitude of impact would be **moderate adverse.**	**Moderate adverse**
				<u>Operation</u> Close to middle distance, generally oblique, filtered views through vegetation to vehicles on A465 mainline to north-west, traffic flow on A465 mainline to north-east and, glimpses of traffic and highway infrastructure such as lighting columns / light spill at A470 junction, opened up by loss of trees and changes to landform. Also longer distance filtered glimpses from eastern edge to traffic on A465 further east, such as offline route at Y Graig. The magnitude of impact would be **moderate adverse.**	**Moderate adverse**	<u>Summer Year 15</u> Established mitigation planting would generally screen traffic on A465 mainline, though tops of high sided vehicles would remain visible to north-east. Traffic at A470 junction to north-east would also be screened by established mitigation planting, though tops of lighting columns / light spill would remain. Longer distance filtered glimpses from eastern edge to traffic on A465 further east, such as offline route at Y Graig, would be softened by established mitigation planting. The magnitude of impact would be **minor adverse.**	**Slight adverse**
S6-R39 (7)	35 – 41 Pen Y Dyffryn, Clwydyfagwyr, Merthyr Tydfil.	60 m	Lower level views north contained by close boarded fencing. Close filtered upper storey views north and north-west, mainly in winter, through trees, across fields to traffic and lighting columns on A465. Filtered views in winter north-east to Cefn Coed, Trefechan and glimpses of traffic on the A465 as it climbs up towards Gurnos.	<u>Construction</u> Close to middle distance, partially filtered views through vegetation north-west to north-east above fencing, mainly from upper storeys, to construction of A465 mainline with highway infrastructure and A470 junction, including major earthworks for cutting, opened up by loss of trees. Also middle distance views of construction of attenuation pond with access track and construction compounds with stockpiles to north-east, and longer distance views to construction activities associated with proposed scheme further east, such as offline route at Y Graig. The magnitude of impact would be **moderate adverse.**	**Moderate adverse**	<u>Winter Year 1</u> As per operation without mitigation planting. The magnitude of impact would be **minor adverse.**	**Slight adverse**

Reference number[1] with number of properties in brackets * Listed Building	Location / address	Approx. distance from nearest point of receptor to centre line of proposed A465 alignment	Existing view	Change in view and magnitude of impact without mitigation planting	Significance of effect without mitigation planting	Change in view and magnitude of impact with mitigation planting	Significance of effect with mitigation planting
				Operation Close to middle distance, partially filtered views through vegetation north-west to north-east above fencing to traffic flow on A465 mainline, partially screened by 2 m high environmental barrier, and glimpses of traffic and highway infrastructure, such as tops of lighting columns / light spill, at A470 junction, opened up by loss of trees and changes to landform. Also middle distance views of attenuation pond to north-east and longer distance glimpses of traffic on A465 further east, such as offline route at Y Graig. The magnitude of impact would be **minor adverse.**	**Slight adverse**	Summer Year 15 Established mitigation planting would generally screen traffic on A465 mainline, though tops of high sided vehicles would remain visible to north-east. Also middle distance views of attenuation pond and glimpses of traffic and tops of lighting columns / light spill at A470 junction. Longer distance filtered glimpses to traffic on A465 further east, such as offline route at Y Graig, would be softened by established mitigation planting. The magnitude of impact would be **negligible adverse.**	**Slight adverse**
S6-R40 (3)	23, 42 and 43 Pen Y Dyffryn, Clwydyfagwyr, Merthyr Tydfil.	115 m	Lower level views north contained by close boarded fencing. Close direct upper storey views from 23 and 42, and oblique views from 43, north across fields to gaps in vegetation belt along A465. Traffic, lighting columns and signage visible. More extensive filtered views through vegetation in winter. Longer distance views north-east to Cefn Coed and Trefechan. Glimpsed view of High Street overbridge with traffic and lighting columns in Cefn Coed, and traffic on A465 as it climbs up towards Gurnos. BBNP in background to the north and north-east. Pylons are detracting features in landscape.	Construction Close to middle distance views north and north-east, to construction of A465 mainline with highway infrastructure and A470 junction, including major earthworks for cutting, opened up by loss of vegetation. Also middle distance views of construction of attenuation pond with access track and construction compounds with stockpiles, and longer distance views to construction activities associated with proposed scheme further east, such as offline route at Y Graig. The magnitude of impact would be **major adverse.**	**Large adverse**	Winter Year 1 As per operation without mitigation planting. The magnitude of impact would be **moderate adverse.**	**Moderate adverse**
				Operation Close to middle distance views to traffic flow on A465 mainline, and glimpses of traffic and highway infrastructure, such as tops of lighting columns / light spill, at A470 junction to north-east, opened up by loss of trees and changes to landform. Also middle distance views of attenuation pond to north-east and longer distance glimpses of traffic on A465 further east, such as offline route at Y Graig. The magnitude of impact would be **moderate adverse.**	**Moderate adverse**	Summer Year 15 Established mitigation planting would generally screen traffic on A465 mainline, though tops of high sided vehicles would remain visible to north-east. Also middle distance views of attenuation pond and glimpses of traffic and tops of lighting columns / light spill at A470 junction. Longer distance filtered glimpses to traffic on A465 further east, such as offline route at Y Graig, would be softened by established mitigation planting. The magnitude of impact would be **minor adverse.**	**Slight adverse**
S6-R41 (5)	Four Winds, Gorwelion, Heathlands, Promise and Crosswinds, Coedmeyrick Close, Clwydyfagwyr,	245 m	Mainly upper storey views north across fields and trees, to glimpses of traffic and lighting columns / light spill on A465. Cefn Cli-Sanws in the BBNP in background.	Construction Mainly upper storey middle distance views north-west to north-east, to construction of A465 mainline and A470 junction, including major earthworks for cutting, opened up by loss of vegetation. Also middle distance views of construction of attenuation pond with access track and compounds with stockpiles to north-east. The magnitude of impact would be **moderate adverse.**	**Moderate adverse**	Winter Year 1 As per operation without mitigation planting. The magnitude of impact would be **moderate adverse.**	**Moderate adverse**

Reference number[1] with number of properties in brackets * Listed Building	Location / address	Approx. distance from nearest point of receptor to centre line of proposed A465 alignment	Existing view	Change in view and magnitude of impact without mitigation planting	Significance of effect without mitigation planting	Change in view and magnitude of impact with mitigation planting	Significance of effect with mitigation planting
	Merthyr Tydfil.			Operation Mainly upper storey middle distance views north-west to north-east to traffic flow on A465 mainline and, traffic flow and highway infrastructure, such as tops of lighting columns / light spill, at A470 junction, opened up by loss of vegetation. Also middle distance views of attenuation pond to north-east. The magnitude of impact would be **moderate adverse.**	**Moderate adverse**	Summer Year 15 Established mitigation planting would generally screen traffic flow on westbound slip road at A470 junction, though tops of high sided vehicles on A465 mainline and tops of lighting columns / light spill at A470 junction would remain visible. Middle distance views of attenuation pond to north-east would also remain. The magnitude of impact would be **minor adverse.**	**Slight adverse**
S6-R42 (1)	Coed Meurig Farm, Swansea Road, Clwydyfagwyr, Merthyr Tydfil.	39 m	Close glimpses in summer and filtered views through vegetation in winter south-west to north-east to traffic, signage and lighting columns on A465. Fields in BBNP in background.	Construction Close glimpses and filtered views through vegetation in winter south-west to north-east to construction of elevated A465 mainline with highway infrastructure and A470 junction including bridges across Nant Ffrwd, opened up by loss of vegetation. Also close views east to construction of attenuation pond and access track. The magnitude of impact would be **major adverse.**	**Very large adverse**	Winter Year 1 As per operation without mitigation planting. The magnitude of impact would be **major adverse.**	**Large adverse**
				Operation Close glimpses and filtered views through vegetation in winter south-west to north-east to traffic flow and highway infrastructure on elevated A465 mainline and westbound slip road at A470 junction. Also close views east to attenuation pond and access track. Lighting columns / lighting spill in views would be less noticeable, though some glimpses to north-east would remain. The magnitude of impact would be **major adverse.**	**Large adverse**	Summer Year 15 Established mitigation planting would generally screen traffic on A465 mainline and westbound A470 junction slip road, though tops of high sided vehicles on A465 mainline would remain visible to north-east. Attenuation pond and access track would also generally be screened by established mitigation planting. Lighting columns / lighting spill in views north-east would be less noticeable. The magnitude of impact would be **minor adverse.**	**Slight adverse**
S5-R1 (2)	Grawen House and Foxfields, Grawen Lane, Cefn Coed, Merthyr Tydfil.	36m	Direct views west, across wooded Taf Fawr valley. Middle distance oblique views south-west to traffic, lighting columns and signs on parts of A470 junction that are not screened / filtered by deciduous trees. Also, close mainly oblique views south to traffic and lighting columns on A465 Taf Fawr Viaduct, with Cefn Coed Viaduct and A470 Viaduct beyond. Urban edge of Gellideg with	Construction Close views south and middle distance views south-west to construction of A470 junction / elevated A465 mainline, including major earthworks, attenuation pond / tanks, two viaducts across Taf Fawr and highway infrastructure, such as signage, lighting columns and environmental barrier, opened up by loss of trees. Construction of viaducts would be particularly dominant. Also views of large construction compounds and stockpiles. The magnitude of impact would be **major adverse.**	**Very large adverse**	Winter Year 1 As per operation without mitigation planting. The magnitude of impact would be **major adverse.**	**Large adverse**

Reference number[1] with number of properties in brackets * Listed Building	Location / address	Approx. distance from nearest point of receptor to centre line of proposed A465 alignment	Existing view	Change in view and magnitude of impact without mitigation planting	Significance of effect without mitigation planting	Change in view and magnitude of impact with mitigation planting	Significance of effect with mitigation planting
			detracting pylons and Mynydd Aberdar in background. Views east contained by garden vegetation, properties and deciduous trees along A465.	Operation Close views south and middle distance views south-west opened up by loss of trees, to traffic flow at A470 junction / A465 mainline, including traffic flow brought closer to properties on two viaducts across Taf Fawr, though traffic on slip road would be partially screened by 2 m high environmental barrier. Associated highway infrastructure such as signage and lighting columns / light spill also visible. Loss of attractive views towards Cefn Coed Viaduct. The magnitude of impact would be **major adverse.**	**Large adverse**	Summer Year 15 Established mitigation planting would partially screen and soften views south-west to cutting slopes, traffic flow and highway infrastructure such as signage, at western part of A470 junction. Close views south to traffic flow on two new viaducts across Taf Fawr would largely be unaffected by established mitigation planting, but would continue to be partially screened by 2 m high environmental barrier on slip road viaduct. Llighting columns / light spill would also remain visible at junction. The magnitude of impact would be **major adverse.**	**Large adverse**
S5-R2 (7)	1-6 Grawen Houses and Kattery, Grawen Lane, Cefn Coed, Merthyr Tydfil	6m	Views south-west to south-east generally contained by dense belt of deciduous trees along edge of gardens and A465. Lighting columns and glimpses of traffic on Grawne Lane to south-east.	Construction Southern extent of garden would be lost to proposed scheme. Close partially filtered views south-west to south-east through garden vegetation, to construction of A470 junction / elevated A465 mainline, including attenuation pond / tanks, two viaducts across Taf Fawr, and highway infrastructure, such as lighting columns, signage, retaining wall and environmental barriers, opened up by loss of trees. Also close oblique filtered views east through garden vegetation to construction of widened A465 cutting, opened up by loss of trees. The magnitude of impact would be **major adverse.**	**Very large adverse**	Winter Year 1 As per operation without mitigation planting. The magnitude of impact would be **major adverse.**	**Large adverse**
				Operation Views opened up by loss of trees. Close oblique filtered views south-west through garden vegetation, to traffic flow and lighting columns / light spill through A470 junction, partially screened by 2 m high environmental barrier. Also close direct views south to east to retaining wall, attenuation tank and tops of high sided vehicles above 2 m high environmental barrier on A465 mainline and A470 slip roads, opened up by loss of trees. The magnitude of impact would be **major adverse.**	**Large adverse**	Summer Year 15 Established mitigation planting would generally screen retaining wall, attenuation tank, 2 m high environmental barrier and tops of high sided vehicles on A465 mainline in views south to east, and soften close glimpses through existing trees to traffic flow at A470 junction to south-west. Glimpses of tops of lighting columns / light spill at junction would remain to south-west. The magnitude of impact would be **minor adverse.**	**Slight adverse**
S5-R3 (4)	Autumn Leaves, Carnbrae, Lyndale House and Metford House, Grawen Lane Cefn Coed, Merthyr Tydfil	37m	Views west, south and east are generally contained by garden vegetation, properties and trees along A465. Close glimpses of tops of lighting columns on the A465 and Grawen Lane. Some glimpsed and slightly elevated views to woodland in BBNP.	Construction Close filtered views south-east through intervening garden vegetation and / or above properties to construction of widened A465 cutting with associated highway infrastructure, such as environmental barrier, opened up by loss of trees. Also oblique glimpses of construction of cutting for A470 junction within BBNP to south-west. The magnitude of impact would be **moderate adverse.**	**Moderate adverse**	Winter Year 1 As per operation without mitigation planting. The magnitude of impact would be **minor adverse.**	**Slight adverse**

Reference number[1] with number of properties in brackets * Listed Building	Location / address	Approx. distance from nearest point of receptor to centre line of proposed A465 alignment	Existing view	Change in view and magnitude of impact without mitigation planting	Significance of effect without mitigation planting	Change in view and magnitude of impact with mitigation planting	Significance of effect with mitigation planting
				<u>Operation</u> Close filtered views south-east through intervening garden vegetation and / or above properties to glimpses of tops of high sided vehicles on A465 mainline and 2 m high environmental barrier along southern edge of A465, opened up by loss of trees. Also oblique glimpses south-west to top of cutting for A470 junction. The magnitude of impact would be **minor adverse.**	**Slight adverse**	<u>Summer Year 15</u> Established mitigation planting would screen tops of high sided vehicles and 2 m high environmental barrier on A465 to south-east and soften views of top of cutting for A470 junction to south-west. The magnitude of impact would be **negligible adverse.**	**Slight adverse**
S5-R4 (5)	Penbryn, Greystones, Nelita, Prencelyn and Heddfan, Cilsanws Lane, Cefn Coed, Merthyr Tydfil.	325 m	Descending view south-west across wooded Taf Fawr valley to fields with hedgerows and trees within BBNP. A465 Taf Fawr Viaduct and A470 junction in the middle distance, including traffic and lighting columns. Woodlands, properties in Clwydyfagwyr and Baverstock ridge in background, including glimpses of vehicles on A465.	<u>Construction</u> Descending middle distance, sometimes oblique, views south-west to construction of A470 junction, including major earthworks and loss of vegetation, construction of elevated A465 mainline, highway infrastructure such as lighting columns and attenuation pond. Also distant glimpses of construction of A465 cutting at Baverstock. Properties and vegetation would screen construction of widened A465 to south-east. The magnitude of impact would be **moderate adverse.**	**Moderate adverse**	<u>Winter Year 1</u> As per operation without mitigation planting. The magnitude of impact would be **minor adverse.**	**Slight adverse**
				<u>Operation</u> Descending middle distance, sometimes oblique, views south-west to traffic flow on A470 junction, including elevated A465 mainline, as well as highway infrastructure such as lighting columns / light spill and attenuation pond. Glimpses of slight change to skyline at Baverstock ridge and traffic on widened A465 descending from ridge. The magnitude of impact would be **minor adverse.**	**Slight adverse**	<u>Summer Year 15</u> Established mitigation planting would screen attenuation pond at A470 junction and generally soften views of junction to some extent. However, traffic flow on elevated A465 and parts of junction slips would remain visible. Some glimpses of traffic on widened A465 descending from ridge would also remain in gaps in mitigation planting. The magnitude of impact would **minor adverse.**	**Slight adverse**
S5-R5 (2)	Cilsanws House, Upper High Street, Cefn Coed, Merthyr Tydfil.	21 m	Property fronts on to Upper High Street and Vaynor Road. Direct view south-west along lit Grawen Lane to dense evergreen and deciduous vegetation between lane and A465. Upper storey views to A465 Taf Fawr Viaduct and A470 junction in middle distance, including traffic and lighting columns, with Mynydd Aberdar in background. Close, mainly upper storey views south to High Street overbridge, including railings, signage and lighting on top of	<u>Construction</u> Close, mainly upper storey ascending views south-west to south-east, to demolition and construction of High Street overbridge, construction of widened A465 mainline cutting with highway infrastructure such as environmental barriers and, demolition and construction of NMU overbridge, and demolition of properties, opened up by loss of vegetation. Also middle distance views south-west to construction of A470 junction, including elevated A465 mainline and highway infrastructure such as signage, environmental barriers and lighting columns, opened up by loss of trees. The magnitude of impact would be **major adverse.**	**Large adverse**	<u>Winter Year 1</u> As per operation without mitigation planting. The magnitude of impact would be **moderate adverse.**	**Moderate adverse**

Reference number[1] with number of properties in brackets * Listed Building	Location / address	Approx. distance from nearest point of receptor to centre line of proposed A465 alignment	Existing view	Change in view and magnitude of impact without mitigation planting	Significance of effect without mitigation planting	Change in view and magnitude of impact with mitigation planting	Significance of effect with mitigation planting
			bridge, as well bridge abutments and ascending views to lighting column, traffic and signage on A465 in cutting. A465 screened by vegetation and cutting in oblique views east along Vaynor Road.	<u>Operation</u> Close views south-west to tops of high sided vehicles in A465 mainline cutting, opened up by loss of vegetation, and middle distance views to traffic flow and highway infrastructure such as signage and lighting columns / light spill at A470 junction and elevated A465 mainline. Views of High Street overbridge would be similar to existing views. Close, upper storey ascending glimpses south and south-east above 3 m high environmental barrier to tops of high sided vehicles in A465 cutting, environmental barrier along southern edge of cutting and users on NMU overbridged, opened up by loss of vegetation. The magnitude of impact would be **moderate adverse.**	**Moderate adverse**	<u>Summer Year 15</u> Views of High Street overbridge would be similar to existing views. Established mitigation planting would generally screen 2 m high environmental barrier north of A465 mainline cutting, NMU overbridge and tops of high sided vehicles in A465 mainline cutting, with exception of close ascending glimpses south. Upper storey views south-west to A470 junction and elevated A465 mainline would also be partially screened and softened by established mitigation planting, though some views of traffic flow and tops of lighting columns / light spill would remain. The magnitude of impact would be **minor adverse.**	**Slight adverse**
S5-R6 (8)	1-11 and 29 Gersanws, Fronheulog and Colindale, Upper Vaynor Road, 1 Somerset Lane Cefn Coed, Merthyr Tydfil.	42 m	Views partially screened in summer and filtered in winter by deciduous and evergreen trees. Close views of High Street overbridge with traffic from properties to west. Mostly oblique middle distance views south-west to glimpses of A465 with traffic and lighting columns in vicinity of A470 junction and / or at Taf Fawr viaduct, with fields and trees in BBNP and Baverstock ridge in background. Direct views south / south-east to vegetation belt along top of A465 cutting. Gellideg and Mynydd Aberdar in background.	<u>Construction</u> Close, often partially filtered views south-west to south-east through intervening garden vegetation, to demolition and construction of High Street overbridge, construction of widened A465 mainline cutting with highway infrastructure such as environmental barriers and, demolition and construction of NMU overbridge, opened up by loss of vegetation. Also middle distance glimpsed views south-west to construction of A470 junction, including elevated A465 mainline with highway infrastructure. The magnitude of impact would be **moderate adverse.**	**Moderate adverse**	<u>Winter Year 1</u> As per operation without mitigation planting. The magnitude of impact would be **moderate adverse.**	**Moderate adverse**
				<u>Operation</u> Close, often partially filtered ascending views south-west to south-east through intervening garden vegetation, to traffic on High Street overbridge, 2 m high environmental barriers along A465 mainline cutting and glimpses of users on NMU overbridge, with urban edge of Cefn Coed beyond, opened up by loss of vegetation. Also middle distance glimpsed, mainly oblique, views south-west to traffic flow and highway infrastructure such as lighting columns / light spill at A470 junction and elevated A465 mainline. The magnitude of impact would be **moderate adverse.**	**Moderate adverse**	<u>Summer Year 15</u> Established mitigation planting would generally screen views of 2 m high environmental barrier along northern edge of A465 mainline cutting, as well as traffic on High Street overbridge from properties to the east. Views of the High Street overbridge form properties to west would be softened and be similar to existing views. Glimpses of users on NMU overbridge would remain from some properties. Established mitigation planting would soften mainly oblique middle distance glimpsed views south-west to traffic flow and highway infrastructure such as lighting columns / light spill at A470 junction and elevated A465 mainline. The magnitude of impact would be **minor adverse.**	**Slight adverse**

Reference number[1] with number of properties in brackets * Listed Building	Location / address	Approx. distance from nearest point of receptor to centre line of proposed A465 alignment	Existing view	Change in view and magnitude of impact without mitigation planting	Significance of effect without mitigation planting	Change in view and magnitude of impact with mitigation planting	Significance of effect with mitigation planting
S5-R7 (3)	Tynewydd Bungalow, Upper Vaynor Road, Cefn Coed, Merthyr Tydfil.	17 m	Views from bungalows south-west to south-east generally contained by vegetation on cutting slope to A465. Close oblique view south through gap in vegetation, across A465 cutting to non-motorised users on footpath 111/38 and Church of St John the Baptist tower. Top of lighting column on A465 visible. Filtered ascending views south-east in winter to traffic and lighting columns on A465 in vicinity of Taf Fechan viaduct, with Y Graig in background.	<u>Construction</u> Close, partially filtered oblique views south-west and south through intervening garden vegetation, to construction of widened A465 in cutting with highway infrastructure such as signage and environmental barrier, and realigned NMU route, including demolition and construction of overbridge across A465, opened up by loss of vegetation. Also close glimpses and filtered views south-east through intervening trees, partially opened up by loss of trees, to construction of widened Taf Fechan viaduct and NMU bridge across gorge, as well as offline A465 mainline through Y Graig in middle distance to east. The magnitude of impact would be **moderate adverse.**	**Moderate adverse**	<u>Winter Year 1</u> As per operation without mitigation planting. The magnitude of impact would be moderate adverse.	**Moderate adverse**
				<u>Operation</u> Close, partially filtered oblique views south-west and south through intervening garden vegetation, to 2 m high environmental barrier and users of NMU route, opened up by loss of vegetation. Also close and middle distance partially filtered views south-east and east through intervening garden vegetation, opened up by loss of trees, to traffic and highway infrastructure on A465 mainline, which would be more visible at offline section through Y Graig. Lighting columns / light spill from A465 would be removed. The magnitude of impact would be **moderate adverse.**	**Moderate adverse**	<u>Summer Year 15</u> Established mitigation planting would screen users on NMU route, but would not affect close views south of 2 m high environmental barrier. Views towards offline A465 mainline through Y Graig would also be softened by established mitigation planting, though traffic and highway infrastructure would remain more visible in partially filtered views through garden vegetation south-east and east. The magnitude of impact would be **moderate adverse.**	**Moderate adverse**
S5-R8 (10)	1 - 9 Vaynor Villlas, Upper Vaynor Road, Cefn Coed, Merthyr Tydfil.	41 m	Oblique view south-west generally contained by trees along top of A465 cutting, looking towards Baverstock ridge in background. Views south and south-east generally contained by vegetation along top of A465 cutting and properties. Filtered views and glimpses through vegetation, generally from upper storeys, to lighting column on A465 and non-motorised	<u>Construction</u> Close views south-west and south to construction of widened A465 in cutting with highway infrastructure such as signage and environmental barrier, realigned NMU route and, demolition and construction of NMU overbridge, opened up by loss of vegetation. Views south-east generally screened by properties and vegetation, though there would be some upper storey glimpses of construction of A465 mainline through Y Graig to north-east. The magnitude of impact would be **moderate adverse.**	**Moderate adverse**	<u>Winter Year 1</u> As per operation without mitigation planting. The magnitude of impact would be **minor adverse.**	**Slight adverse**

Reference number[1] with number of properties in brackets * Listed Building	Location / address	Approx. distance from nearest point of receptor to centre line of proposed A465 alignment	Existing view	Change in view and magnitude of impact without mitigation planting	Significance of effect without mitigation planting	Change in view and magnitude of impact with mitigation planting	Significance of effect with mitigation planting
			users on Taff Trail overbridge, with trees and St John the Baptist Church tower beyond.	Operation Close views south-west and south to users on realigned NMU route and 2 m high environmental barriers along top of A465 mainline cutting, opened up by loss of vegetation. Also upper storey filtered glimpses through intervening trees to traffic on A465 mainline through Y Graig to north-east. Lighting columns / light spill from A465 would be removed. The magnitude of impact would be **minor adverse.**	**Slight adverse**	Summer Year 15 Established mitigation planting would soften and partially screen views of realigned NMU route and 2 m high environmental barriers along A465 mainline cutting to south and south-west, as well as softening glimpsed views of traffic on A465 mainline through Y Graig to north-east. The magnitude of impact would be **negligible.**	**Slight adverse**
S5-R9 (14)	Yr Aelwyn, St Davids, Leiros, Upper Vaynor Road, Wycombe, Bronant, Bryn-onen, Woodbury, Harwin, New Haven and Uplands, Vaynor Lane, and Dunromin, Glascoed, Bryngolwg, Brynheulog, Lon Maes Du, Cefn Coed, Merthyr Tydfil.	80 m	Views south-west generally contained by properties and garden vegetation, except slightly elevated glimpses of distant Mynydd Aberdar. Close to middle distance ascending views south-east, to Taf Fechan valley including A465 Taf Fechan viaduct with traffic. Y Graig woodland and Gurnos in middle distance.	Construction Close to middle distance views south-east, sometimes filtered by intervening vegetation, to construction of widened A465 Taf Fechan viaduct and parallel NMU bridge, as well as offline A465 mainline through Y Graig, slightly opened up by loss of vegetation. The magnitude of impact would be **moderate adverse.**	**Moderate adverse**	Winter Year 1 As per operation without mitigation planting. The magnitude of impact would be **minor adverse.**	**Slight adverse**
				Operation Close to middle distance views south-east sometimes filtered by intervening vegetation, to traffic flow on widened A465 Taf Fechan viaduct, slightly opened up by loss of vegetation. Traffic flow on offline A465 mainline through Y Graig would be partially screened by cutting. The magnitude of impact would be **minor adverse.**	**Slight adverse**	Summer Year 15 Established mitigation planting would generally not affect close to middle distance views of traffic flow on widened A465 Taf Fechan viaduct or A465 mainline through Y Graig, though the earthworks would be softened. The magnitude of impact would be **minor adverse.**	**Slight adverse**
S5-R10 (8)	Hawthorns, Westwood and Tanglewood, Oakdene, Tir-Pont-y-Capel, Wind Rush, Maubray House and Kilcohen House, Job's Lane, Cefn Coed, Merthyr Tydfil.	42 m	Middle distance direct view west to traffic and lighting at A470 junction, with fields and tree belts within the BBNP in background. Close oblique views north-west to traffic, lighting columns and signage on 465 Taf Fawr Viaduct, with mature deciduous trees and specimen conifers within Cefn Coed Cemetery in background. Oblique views north and north-east contained by evergreen hedge, close boarded fencing and vegetation belt	Construction Properties close to A465 to north would experience worst effects. Close views north-west to north, and middle distance views west to construction of elevated A465 mainline and A470 junction, including major earthworks, attenuation pond / tanks, two viaducts across Taf Fawr and highway infrastructure, such as lighting columns, signage and environmental barriers, opened up to some extent by loss of trees. Also views of large construction compounds and stockpiles in valley. Views seen in context of existing A465 viaduct in foreground. The magnitude of impact would be **major adverse.**	**Large adverse**	Winter Year 1 As per operation without mitigation planting. The magnitude of impact would be **moderate adverse.**	**Moderate adverse**

Reference number[1] with number of properties in brackets * Listed Building	Location / address	Approx. distance from nearest point of receptor to centre line of proposed A465 alignment	Existing view	Change in view and magnitude of impact without mitigation planting	Significance of effect without mitigation planting	Change in view and magnitude of impact with mitigation planting	Significance of effect with mitigation planting
			along A465. Tops of lighting columns on A465 visible above vegetation. Filtered glimpses of high-sided vehicles in winter.	<u>Operation</u> Properties close to A465 to north would experience worst effects. Close views north-west to north, and middle distance views south-west and west to traffic flow at A470 junction, including traffic flow on elevated A465 mainline viaduct across Taf Fawr and associated highway infrastructure such as signage, lighting columns / light spill, and attenuation pond, opened up by loss of trees. Only tops of high sided vehicles would be visible above the 3 m high environmental barrier to north. Views west seen in context of existing A465 viaduct in foreground. Traffic flow on southern approach of A470 to junction would also become visible as a result of vegetation loss. The magnitude of impact would be **moderate adverse.**	**Moderate adverse**	<u>Summer Year 15</u> Properties close to A465 to north would experience worst effects. Established mitigation planting would screen attenuation pond and traffic on southern approach of A470 to junction with A465 and soften western part of A470 junction in views south-west. Traffic flow on elevated A465 mainline and highway infrastructure at junction, such as signage and lighting columns / light spill, would remain visible in views south-west and west. Tops of high sided vehicles and environmental barrier to north would also be softened and partially screened by established mitigation planting. The magnitude of impact would be **moderate adverse.**	**Moderate adverse**
S5-R11 (3)	Old Brewery Cottage, Pontycapel Road, Cefn Coed, Merthyr Tydfil.	198 m	Property positioned at bottom of river valley facing the A465. Views west and south-west screened by rising valley sides and mature deciduous trees. Partially filtered views north-west through intervening trees, along detracting yard and Taf Fawr river valley to A465 Taf Fawr Viaduct with traffic and lighting columns, elevated above valley.	<u>Construction</u> Middle distance partially filtered views through intervening trees north-west to construction of two viaducts across Taf Fawr with associated highway infrastructure such as signage and lighting columns, seen in context of the existing A465 viaduct in foreground. Also views of large construction compounds and stockpiles below viaducts, opened up by vegetation loss in river valley. Possible glimpsed views above trees to construction activities at eastern corner of A470 junction. The magnitude of impact would be **major adverse.**	**Large adverse**	<u>Winter Year 1</u> As per operation without mitigation planting. The magnitude of impact would be **moderate adverse.**	**Moderate adverse**
				<u>Operation</u> Middle distance partially filtered ascending views through intervening trees north-west to tops of high sided vehicles on elevated A465 mainline viaduct, as well as additional signage on existing A465 viaduct and tops of lighting columns / light spill on new slip road viaduct, seen in context of existing lit A465 viaduct. Possible filtered glimpses west through and above existing trees, to earthworks for attenuation pond, as well as tops of high sided vehicles and lighting columns / light spill at A470 junction. The magnitude of impact would be **moderate adverse.**	**Moderate adverse**	<u>Summer Year 15</u> Established mitigation planting would generally screen A470 junction, though glimpses of tops of lighting columns / light spill might remain. Due to elevated nature of A465 mainline viaduct across the Taf Fawr, mitigation planting would only soften eastern abutment. Tops of high sided vehicles on A465 mainline viaduct, as well as additional signage on existing A465 viaduct and tops of lighting columns / light spill on new slip road viaduct would therefore remain visible in middle distance to north-west, partially filtered through intervening trees, but seen in context of existing lit A465 viaduct. The magnitude of impact would be **moderate adverse.**	**Moderate adverse**

Reference number[1] with number of properties in brackets * Listed Building	Location / address	Approx. distance from nearest point of receptor to centre line of proposed A465 alignment	Existing view	Change in view and magnitude of impact without mitigation planting	Significance of effect without mitigation planting	Change in view and magnitude of impact with mitigation planting	Significance of effect with mitigation planting
S5-R12 (26)	1 – 15 and 17 – 26 Maesygarreg, Cefn Coed, Merthyr Tydfil.	33 m	Views south-west to north-west generally contained by properties, with exception of partial and glimpsed middle distance to close, often oblique, views between properties and above rooftops from upper storeys to traffic and lighting at A470 junction and Taf Fawr Viaduct. Fields and tree belts within BBNP and mature deciduous trees and specimen conifers within Cefn Coed Cemetery in the background. Generally oblique views north and north-east screened in summer, except tops of lighting columns and traffic above close boarded fence at Grawen Lane junction, and filtered views in winter through vegetation belt along A465, to high-sided vehicles.	<u>Construction</u> Middle distance to close, often oblique, glimpses and partial views south-west to north-east to construction of A465 mainline and A470 junction, including major earthworks, attenuation pond / tanks, two viaducts across Taf Fawr and highway infrastructure, such as lighting columns, signage, retaining wall and environmental barriers, opened up to some extent by loss of trees. Also glimpses of large construction compounds and stockpiles in valley. Views to construction of new viaducts, seen in context of existing A465 viaduct. The magnitude of impact would be **moderate adverse.**	**Moderate adverse**	<u>Winter Year 1</u> As per operation without mitigation planting. The magnitude of impact would be **moderate adverse.**	**Moderate adverse**
				<u>Operation</u> Middle distance to close, often oblique, glimpses and partial views south-west to north-west to traffic flow at A470 junction, including traffic flow on elevated A465 mainline viaduct across Taf Fawr and associated highway infrastructure such as signage and lighting columns / light spill, opened up by loss of trees, but seen in context of existing A465 viaduct. Traffic flow on southern approach of A470 to junction would also become visible as a result of vegetation loss. To north and north-east, only tops of high sided vehicles on A465 would be visible above the 3 m high environmental barrier and existing lighting columns / light spill from A465 would be removed. The magnitude of impact would be **moderate adverse.**	**Moderate adverse**	<u>Summer Year 15</u> Established mitigation planting would screen southern approach of A470 to junction with A465, and soften western part of A470 junction in views south-west and west, but traffic flow on elevated A465 mainline and highway infrastructure at junction, such as signage and lighting columns / light spill, would remain visible in these views. Tops of high sided vehicles and environmental barrier to north and north-east would also be softened and partially screened by established mitigation planting. The magnitude of impact would be **minor adverse.**	**Slight adverse**
S5-R13 (3)	Flats 1 - 9, Ty Vaynor, Flats 1 – 12 Ty Penderyn and 1 – 12 Ty Ystradfellte (Flats facing west / north-west / north-east), Station Road, Cefn	135 m	Four storey flats. Generally views from ground level are intermittently screened by deciduous trees and properties; while views are wide open from upper storeys. Middle distance view south-west and west above rooftops to mature deciduous trees and tops of lighting columns at A470 junction and, traffic and lighting columns on the Taf Fawr Viaduct with fields and tree belts within BBNP in background. Middle distance views	<u>Construction</u> Middle distance views south-west and west to construction of elevated A465 mainline and A470 junction, including, highway infrastructure, such as lighting columns, signage and environmental barriers, and construction compounds, opened up to some extent by loss of trees. Also glimpsed middle and longer distance views, mainly from upper storeys, to construction of widened A465 mainline in cutting to north, involving demolition of properties, and offline A465 mainline through Y Graig to north-east. The magnitude of impact would be **moderate adverse.**	**Moderate adverse**	<u>Winter Year 1</u> As per operation without mitigation planting. The magnitude of impact would be **moderate adverse.**	**Moderate adverse**

Reference number[1] with number of properties in brackets * Listed Building	Location / address	Approx. distance from nearest point of receptor to centre line of proposed A465 alignment	Existing view	Change in view and magnitude of impact without mitigation planting	Significance of effect without mitigation planting	Change in view and magnitude of impact with mitigation planting	Significance of effect with mitigation planting
	Coed, Merthyr Tydfil.		above rooftops north-west to north-east to tops of lighting columns and upper storey glimpses of high sided vehicles on A465. Y Graig woodland and pylon in background of St John the Baptist Church tower to north-east.	<u>Operation</u> Middle distance views south-west and west to traffic flow at A470 junction, including traffic flow on elevated A465 mainline and associated highway infrastructure such as signage, lighting columns / light spill, and attenuation pond, opened up to some extent by loss of trees. Also glimpsed middle and longer distance views, mainly from upper storeys, to environmental barriers along top of A465 cutting to north, and traffic flow on A465 mainline through Y Graig to north-east. The magnitude of impact would be **moderate adverse.**	**Moderate adverse**	<u>Summer Year 15</u> Established mitigation planting would screen attenuation pond and soften middle distance views south-west and west to traffic flow at A470 junction, though traffic flow on elevated A465 mainline and highway infrastructure at junction, such as signage and lighting columns / light spill, would remain visible. Established mitigation planting would also soften views of environmental barriers to north and traffic flow on A465 mainline through Y Graig to north-east. The magnitude of impact would be **minor adverse.**	**Slight adverse**
S5-R14 (2)	2 and 4 Pearces Court , Cefn Coed, Merthyr Tydfil	21 m	Views south-west across rooftops to glimpses of vegetation belt along A470, tops of lighting columns and high-sided vehicles. Views west generally contained by properties and vegetation. Glimpses of tops of lighting columns on A465. Fields with trees in BBNP and Baverstock ridge in background. Close views north / north-east to High Street overbridge and highway infrastructure including lighting, as well as glimpses of lighting columns on A465. Traffic on A465 screened by cutting and, deciduous and evergreen tree belt.	<u>Construction</u> North-western extent of garden would be lost to proposed scheme. Close direct views north-west of widened A465 including highway infrastructure such as retaining walls, 3 m environmental barrier and attenuation tanks, opened up by loss of vegetation. Oblique views north-east to demolition and construction of High Street overbridge. Also middle distance views south-west above adjacent properties to construction activities for A470 junction. The magnitude of impact would be **major adverse.**	**Large adverse**	<u>Winter Year 1</u> As per operation without mitigation planting. The magnitude of impact would be **moderate adverse.**	**Moderate adverse**
				<u>Operation</u> Close direct views north-west to 3 m high environmental barrier, with upper storey glimpses of tops of high sided vehicles in cutting on A465 mainline, while existing lighting columns / light spill would be removed. Traffic on High Street overbridge would be slightly more visible in close oblique views north-east. Also middle distance views south-west above adjacent properties to tops of lighting columns at A470 junction and tops of high sided vehicles on elevated A465 mainline. The magnitude of impact would be **moderate adverse.**	**Moderate adverse**	<u>Summer Year 15</u> As per operation without mitigation planting. Close direct views north-west to 3 m high environmental barrier, with upper storey glimpses of tops of high sided vehicles in cutting on A465, while existing lighting columns / light spill would be removed. Traffic on High Street overbridge would be slightly more visible in close oblique views north-east. Also middle distance views south-west above adjacent properties to tops of lighting columns at A470 junction and tops of high sided vehicles on elevated A465 mainline. The magnitude of impact would be **moderate adverse.**	**Moderate adverse**
S5-R15 (8)	1 Pearces Court and 101 - 105 and 109 – 110 High Street, , Cefn Coed, Merthyr Tydfil.	23 m	Views south-west and west generally contained by garden vegetation and properties. Upper storey glimpsed middle distance views to lighting columns at A470 junction, with fields with trees in BBNP and Baverstock ridge in background. Close, mainly oblique views north-west to High Street overbridge and highway infrastructure including lighting at High	<u>Construction</u> Close views west to north-east to construction of widened A465 cutting with highway infrastructure such as environmental barrier and signage, and demolition and construction of High Street overbridge, opened up by loss of vegetation. Demolition of near properties to north-east. Also upper storey middle distance glimpses of construction of A470 junction to south-west, from rear of properties on south side of High Street. The magnitude if impact would be **major adverse.**	**Large adverse**	<u>Winter Year 1</u> As per operation without mitigation planting. The magnitude of impact would be **moderate adverse.**	**Moderate adverse**

Reference number[1] with number of properties in brackets * Listed Building	Location / address	Approx. distance from nearest point of receptor to centre line of proposed A465 alignment	Existing view	Change in view and magnitude of impact without mitigation planting	Significance of effect without mitigation planting	Change in view and magnitude of impact with mitigation planting	Significance of effect with mitigation planting
			Street / Grawen Lane junction. Views north-east contained by properties and tree belt along A465. Traffic on A465 screened by cutting and vegetation from all but closest properties.	<u>Operation</u> Close views west to north-east to 2 m high environmental barrier along top of A465 cutting, either side of High Street overbridge, while existing lighting columns / light spill from A465 mainline would be removed. Views of overbridge, similar to existing views, though loss of vegetation in vicinity of overbridge would make traffic on Grawen Lane visible. Some glimpses from closest properties to tops of high sided vehicles in A465 mainline cutting either side of overbridge. Also upper storey glimpses south-west to tops of lighting columns at A470 junction and tops of high sided vehicles on elevated A465 mainline. The magnitude of impact would be **moderate adverse.**	**Moderate adverse**	<u>Summer Year 15</u> Established mitigation planting would as screen traffic on Grawen Lane and, soften and partially screen 2 m high environmental barrier to north and north-east, but not affect visibility of the barrier to west. Extent of traffic and highway infrastructure in views towards High Street overbridge would be similar to existing views. Upper storey glimpses south-west to tops of lighting columns at A470 junction and tops of high sided vehicles on elevated A465 mainline would remain. The magnitude of impact would be **minor adverse.**	**Slight adverse**
S5-R16 (11)	97 – 100 and 111 – 115 High Street and, 1 and 2 Station Road, Cefn Coed, Merthyr Tydfil.	60 m	Most views contained by properties and garden vegetation, except close oblique views north-west to High Street overbridge and, signage and lighting columns at High Street / Grawen Lane junction. Traffic on A465 screened by cutting and mix of deciduous and evergreen trees.	<u>Construction</u> Close oblique views north-west to demolition and construction of High Street overbridge. Also glimpses of construction activities for widened A465 mainline, including loss of vegetation. The magnitude impact would be **moderate adverse.**	**Moderate adverse**	<u>Winter Year 1</u> As per operation without mitigation planting. The magnitude impact would be **minor adverse.**	**Slight adverse**
				<u>Operation</u> Close oblique views north-west to traffic on High Street overbridge would be similar to existing views, with exception of some loss of vegetation in vicinity of overbridge making traffic on Grawen Lane visible. Also filtered glimpses through intervening garden vegetation to 2 m high environmental barrier to north. The magnitude impact would be **minor adverse.**	**Slight adverse**	<u>Summer Year 15</u> Established mitigation planting would soften close oblique views north-west to High Street overbridge and 2 m high environmental barrier to north, as well as screening traffic on Grawen Lane, making these views similar to existing views. The magnitude impact would be **negligible adverse.**	**Slight adverse**
S5-R17 (9)	Maen Mellin, Glendere Care Home and 1, 3 - 6, St. John's Close, and Gan yr Eglwys and Valbonne, New Church Street.	20 m	Views south-west to east generally contained by mature garden vegetation and dense deciduous and evergreen vegetation belt along A465 cutting. Close filtered views in winter to tops of lighting columns on A465.	<u>Construction</u> Northern extent of gardens of 5 St. John's Close and Valbonne would be lost to proposed scheme.Close views west to north-east of widened A465 cutting with highway infrastructure such as environmental barrier and signage, and demolition and construction of High Street overbridge and NMU overbridge, opened up by loss of vegetation. Views south-west and east would continue to be contained by vegetation and properties. The magnitude if impact would be **major adverse.**	**Large adverse**	<u>Winter Year 1</u> As per operation without mitigation planting. The magnitude of impact would be **moderate adverse.**	**Moderate adverse**

Reference number[1] with number of properties in brackets * Listed Building	Location / address	Approx. distance from nearest point of receptor to centre line of proposed A465 alignment	Existing view	Change in view and magnitude of impact without mitigation planting	Significance of effect without mitigation planting	Change in view and magnitude of impact with mitigation planting	Significance of effect with mitigation planting
				Operation Close views west to north-east to 2 m high environmental barrier along top of A465 cutting, while existing lighting columns / light spill from A465 mainline would be removed. Views of NMU users on overbridge from some properties. The magnitude of impact would be **moderate adverse.**	**Moderate adverse**	Summer Year 15 Established mitigation planting would soften and partially screen 2 m high environmental barriers to west and north-east, and soften approach to NMU overbridge. The magnitude of impact would be **minor adverse.**	**Slight adverse**
S5-R18 (5)	Cherry Cottage, Cartref, Morlals Villas 1 and 2 and Taf Fechan House, Lower Vaynor Road, Cefn Coed, Merthyr Tydfil.	30 m	Views north-west contained by rising landform and mature vegetation. Oblique views north along Lower Vaynor Road to junction with A465, including traffic, lighting columns and signage. Middle distance filtered views north-east through vegetation in winter and upper storey views in summer, to Y Graig woodland and properties in Gurnos, with glimpses of traffic on A465.	Construction Close, mainly oblique views to construction of stopped up road at Lower Vaynor Road and new NMU route to north, as well as construction of widened A465 mainline to north and north-east, including Taf Fechan viaduct crossing with environmental barrier and parallel NMU bridge, partially opened up by loss of vegetation. Associated construction compounds and stockpiles also noticeable. Oblique glimpses of demolition of NMU bridge to north-west opened up by loss of vegetation. Middle distance filtered views through intervening trees to construction of A465 mainline through Y Graig to north-east. The magnitude of impact would be **moderate adverse.**	**Moderate averse**	Winter Year 1 As per operation without mitigation planting. The magnitude of impact would be **moderate adverse.**	**Moderate adverse**
				Operation Close, mainly oblique views north and north-east to traffic flow on widened A465 mainline / Taf Fechan viaduct above 1 m high environmental barrier, partially opened up by loss of vegetation. Traffic flow brought closer to properties. Also views of parallel NMU bridge and highway infrastructure such as signage and a retaining wall, while existing lighting columns / light spill would be removed. Middle distance filtered glimpses of traffic flow on offline A465 mainline through Y Graig to north-east. The magnitude of impact would be **moderate adverse.**	**Moderate adverse**	Summer Year 15 Established mitigation planting would soften and partially screen views towards traffic flow and highway infrastructure on A465 mainline immediately north and in middle distance views to Y Graig to north-east. Traffic flow on western extent of Taf Fechan viaduct above 1 m high environmental barrier, would remain slightly more visible. The magnitude of impact would be **negligible adverse.**	**Slight adverse**

Reference number[1] with number of properties in brackets * Listed Building	Location / address	Approx. distance from nearest point of receptor to centre line of proposed A465 alignment	Existing view	Change in view and magnitude of impact without mitigation planting	Significance of effect without mitigation planting	Change in view and magnitude of impact with mitigation planting	Significance of effect with mitigation planting
S5-R19 (8)	Ty Pont Pren, Vale View and Alandale, Brewery Lane, and 9a -11 and Old Police Station, Lower Vaynor Road, Cefn Coed, Merthyr Tydfil.	75 m	Views north-west contained by properties and mature vegetation. Close partially filtered views north to A465 Taf Fechan viaduct with traffic. Views north-east to wooded Taf Fechan valley, with glimpses of Y Graig woodland and Gurnos in the middle distance. Pylons are detracting features in landscape.	<u>Construction</u> Close, mainly oblique views to construction of dead end at Lower Vaynor Road and new NMU route to north, as well as construction of widened A465 mainline to north and north-east, including open views to construction of Taf Fechan viaduct crossing with environmental barrier and parallel NMU bridge, partially opened up by loss of vegetation. Associated construction compounds and stockpiles also noticeable. Oblique glimpses of demolition of NMU bridge to north-west opened up by loss of vegetation. Middle distance filtered views through intervening trees to construction of A465 mainline through Y Graig to north-east. The magnitude of impact would be **moderate adverse.**	**Moderate adverse**	<u>Winter Year 1</u> As per operation without mitigation planting. The magnitude of impact would be **minor adverse.**	**Slight adverse**
				<u>Operation</u> Loss of vegetation would make traffic flow on widened A465 mainline / Taf Fechan viaduct slightly more visible above 1 m high environmental barrier, in close, mainly oblique views north and north-east. Also views of parallel NMU bridge and glimpses of highway infrastructure such as signage. Existing lighting columns / light spill to north would be removed. Middle distance filtered glimpses of traffic flow on offline A465 mainline through Y Graig to north-east. The magnitude of impact would be **minor adverse.**	**Slight adverse**	<u>Summer Year 15</u> Established mitigation planting would soften and partially screen traffic flow and highway infrastructure on A465 mainline in views along Lower Vaynor Road to a greater extent than in existing views, but would not affect views of traffic flow on Taf Fechan viaduct and parallel NMU bridge. Traffic flow and highway infrastructure on offline A465 mainline through Y Graig to north-east would also be screened by existing trees and established mitigation planting. The magnitude of impact would be **minor adverse.**	**Slight adverse**
S5-R20 (8)	84 – 87 and 94 - 95b Lakeside Gardens, Gurnos, Merthyr Tydfil.	65 m	Slightly elevated oblique views south-west across Cefn Coed to the Baverstock ridge, including distant glimpses of traffic on the A465 descending from the ridge. Views north-west to north-east from these bungalows and two storey properties are generally contained by mix of deciduous and evergreen trees. Filtered glimpses across Y Graig Open Access Land in winter. The A465 is screened by	<u>Construction</u> Close filtered views north-west to construction of widened A465 Taf Fechan viaduct with parallel NMU route and associated compound and stockpiles. Also near open views north and north-east, due to vegetation loss, to construction of offline A465 mainline, with associated highway infrastructure such as signage and environmental barrier, parallel NMU route and a large attenuation pond. Distant glimpses of construction of A465 at Baverstock ridge to south-west. The magnitude of impact would be **major adverse.**	**Large adverse**	<u>Winter Year 1</u> As per operation without mitigation planting. The magnitude of impact would be **major adverse.**	**Large adverse**

Reference number[1] with number of properties in brackets * Listed Building	Location / address	Approx. distance from nearest point of receptor to centre line of proposed A465 alignment	Existing view	Change in view and magnitude of impact without mitigation planting	Significance of effect without mitigation planting	Change in view and magnitude of impact with mitigation planting	Significance of effect with mitigation planting
			landform and vegetation.	<u>Operation</u> Close filtered views north-west to traffic flow on Taf Fechan viaduct above 1 m integrated environmental barrier, and parallel NMU bridge. Also near open views north and north-east, due to vegetation loss, to earthworks for large attenuation pond and users on NMU route, as well as traffic flow on offline A465 mainline, partially screened by 1 m high environmental barrier and cutting. Traffic flow on A465 descending from Baverstock ridge would generally be screened by cutting in distance to south-west. The magnitude of impact would be **major adverse.**	**Large adverse**	<u>Summer Year 15</u> Established mitigation planting would screen or soften views of attenuation pond and users of NMU route, and in combination with cutting, generally screen environmental barrier and traffic flow on offline A465 mainline to north and north-east. Taf Fechan viaduct and parallel NMU bridge would be screened by existing trees in leaf. The magnitude of impact would be **minor adverse.**	**Slight adverse**
S5-R21 (4)	80 – 83 Lakeside Gardens, Gurnos, Merthyr Tydfil.	120 m	Slightly elevated direct views south-west across Cefn Coed to the Baverstock Ridge. Distant glimpses of traffic on the A465 descending from the ridge. Views north and north-west generally contained by properties and garden vegetation. Views north-east screened by trees in summer, while there are filtered ascending glimpses across Y Graig open access land in winter.	<u>Construction</u> Close and middle distance, generally oblique, filtered views through intervening trees north and north-east, partially opened up by loss of vegetation, to construction of offline A465 mainline, with associated highway infrastructure such as signage, parallel NMU route and a large attenuation pond. Distant glimpses of construction of A465 at Baverstock ridge to south-west. The magnitude of impact would be **moderate adverse.**	**Moderate adverse**	<u>Winter Year 1</u> As per operation without mitigation planting. The magnitude of impact would be **minor adverse.**	**Slight adverse**
				<u>Operation</u> Close and middle distance, generally oblique, filtered views through intervening trees north and north-east, partially opened up by loss of vegetation, to earthworks for large attenuation pond and users on NMU route. Also some views of traffic flow on offline A465 mainline to north and north-east, though cutting and landform would generally screen traffic on the offline route further up the hill. Traffic flow on A465 descending from Baverstock ridge would generally be screened by cutting in distance to south-west. The magnitude of impact would be **minor adverse.**	**Slight adverse**	<u>Summer Year 15</u> Established mitigation planting would screen attenuation pond and, in combination with cutting, generally screen traffic flow on offline A465 mainline to north and north-east, though some glimpses of users of NMU route would remain. The magnitude of impact would be **negligible adverse.**	**Slight adverse**
S5-R22 (8)	13 - 20 Maple Crescent, Trefechan, Merthyr Tydfil.	405 m	Middle distance views south and south-east across Taf Fechan Valley to tree belts, including deciduous belt along A465. Filtered views through trees of traffic on A465 in winter. Glimpses and filtered views to properties in Gurnos in background.	<u>Construction</u> Middle distance views south and partially filtered views south-east through intervening trees, across valley to construction of elevated A465 offline route north of Gurnos, including highway infrastructure such as environmental barrier and attenuation ponds with access tracks, opened up by loss of trees. The magnitude of impact would be **moderate adverse.**	**Moderate adverse**	<u>Winter Year 1</u> As per operation without mitigation planting. The magnitude of impact would be **moderate adverse.**	**Moderate adverse**

Reference number[1] with number of properties in brackets * Listed Building	Location / address	Approx. distance from nearest point of receptor to centre line of proposed A465 alignment	Existing view	Change in view and magnitude of impact without mitigation planting	Significance of effect without mitigation planting	Change in view and magnitude of impact with mitigation planting	Significance of effect with mitigation planting
				Operation Middle distance views south-east, partially filtered through intervening trees, across valley to traffic flow on elevated offline A465, as well as associated highway infrastructure such as 3 m high environmental barrier and attenuation ponds with access tracks. Traffic on A465 to south generally screened by cutting. The magnitude of impact would be **moderate adverse.**	**Moderate adverse**	Summer Year 15 Established mitigation planting would generally screen traffic and highway infrastructure associated with offline A465 to south-east, though occasional glimpses of traffic might remain. The magnitude of impact would be **negligible adverse.**	**Slight adverse**
S5-R23 (3)	1-3 Gurnos Farm Cottages, Gurnos Ring Road, Gurnos, Merthyr Tydfil.	13 m	Views south-west to east are generally contained by garden vegetation and vegetation belt along A465 in summer. Close direct filtered views to traffic on A465 in winter.	Construction Close views south-west to east, partially filtered by garden vegetation, to construction of retaining structure and embankments for widened and elevated A465, including highway infrastructure such as signage and environmental barrier. Loss of southern extent of gardens. Oblique filtered views through garden vegetation to construction of attenuation pond to east. The magnitude of impact would be **major adverse.**	**Very large adverse**	Winter Year 1 As per operation without mitigation planting. The magnitude of impact would be **major adverse.**	**Very large adverse**
				Operation Close views south-west to east, partially filtered by garden vegetation, to tall retaining structure and embankments, traffic flow and highway infrastructure such as signage, on A465. Oblique filtered views east through garden vegetation to earthworks for attenuation pond. Glimpses of tops of lighting columns / light spill to north-east above existing trees. The magnitude of impact would be **major adverse.**	**Very large adverse**	Summer Year 15 Established mitigation planting would screen lower part of vehicles on A465 and highway infrastructure , though tops of high sided vehicles and signage, and glimpses of retaining structure and environmental barrier would remain. Filtered views of attenuation pond to east would remain. Possible glimpses of tops of lighting columns / light spill to north-east. The magnitude of impact would be **moderate adverse**.	**Moderate adverse**
S5-R24 (62)	7 – 13 (odds), 12 – 26 (evens) and 59 – 65 (odds) Heather Road, 1 – 17 (odds) Lupin Close, 2 – 56 (evens) and 11 – 33 (odds) Lanvender Road, and 2 –	145 m	Wide open views south-west and west across urban areas of Cefn Coed and Clwydyfagwyr to Baverstock ridge and BBNP in background. Glimpsed views of traffic and lighting columns on A465 in Cefn Coed and near A470 junction and Baverstock ridge. Lower level views north-west and north to edge of Y Graig open space, with BBNP in background. Pylons are detracting features in landscape.	Construction Middle distance views west to construction of widened A465 with highway infrastructure through Cefn Coed, including demolition and construction of NMU bridge, and widened viaduct and new NMU bridge at Taf Fechan, as well as glimpses of construction of offline route and attenuation pond at Y Graig, opened up by loss of vegetation. Longer distance and distant views south-west to construction of A470 junction with elevated A465 mainline and widened A465 with parallel link road to Baverstock. The magnitude of impact would be **moderate adverse.**	**Moderate adverse**	Winter Year 1 As per operation without mitigation planting. The magnitude of impact would be **moderate adverse.**	**Moderate adverse**

Reference number[1] with number of properties in brackets * Listed Building	Location / address	Approx. distance from nearest point of receptor to centre line of proposed A465 alignment	Existing view	Change in view and magnitude of impact without mitigation planting	Significance of effect without mitigation planting	Change in view and magnitude of impact with mitigation planting	Significance of effect with mitigation planting
	12 Clover Road, , Gurnos, Merthyr Tydfil.			Operation Middle distance views west to traffic flow and highway infrastructure on widened A465 at eastern edge of Cefn Coed, including southern extent of offline route through Y Graig, opened up further by loss of vegetation. Earthworks on edge of BBNP, traffic flow on elevated A465 through A470 junction and on ascent to Baverstock ridge, more prominent in longer distance and distant views south-west due to loss of vegetation and vertical alignment, as well as parallel link road. Overall reduction in lighting columns / light spill along route perceptible at night. The magnitude of impact would be **moderate adverse.**	**Moderate adverse**	Summer Year 15 Established mitigation planting in combination with landform would screen views of traffic flow on offline route through Y Graig and generally soften middle distance to distant views of traffic flow and highway infrastructure on A465 to west and south-west, although traffic would remain slightly more prominent. Overall reduction in lighting columns / light spill along route perceptible at night. The magnitude of impact would be **minor adverse.**	**Slight adverse**
S5-R25 (45)	33 – 57 Forsythia Close, 9 - 16 Pen-Y-Dre and 1 - 12 Pen Gurnos, Gurnos, Merthyr Tydfil.	80 m	Views generally contained locally by surrounding properties and deciduous trees. Close filtered glimpses through trees to traffic on A465 to north in winter. Slightly elevated longer distance filtered views north-west to BBNP.	Construction Close views above properties, partial views between properties and/or filtered through vegetation north-west to north, to construction of NMU route, new access track / underpass to Gurnos Farm, and elevated offline A465 mainline through Y Graig, with highway infrastructure such as signage and environmental barrier, opened up by loss of vegetation. Also close glimpses of minor improvements on Gurnos Ring Road. The magnitude of impact would be **moderate adverse.**	**Moderate adverse**	Winter Year 1 As per operation without mitigation planting. The magnitude of impact would be **moderate adverse.**	**Moderate adverse**
				Operation Close views above properties, partial views between properties and/or filtered through vegetation north-west to north, to users on NMU route, access track / underpass to Gurnos Farm and traffic flow on elevated offline A465 mainline through Y Graig, limited to tops of high sided vehicles above 3 m high environmental barrier to east of underpass, opened up by loss of vegetation. The magnitude of impact would be **moderate adverse.**	**Moderate adverse**	Summer Year 15 Established mitigation planting would generally screen underpass to Gurnos Farm and traffic flow on A465, though filtered glimpses of tops of high sided vehicles and 3 m high environmental barrier would remain, as well as some views north from Pen Gurnos where tops of high sided vehicles and environmental barrier would be unaffected by planting. Users on NMU route and part of access track to Gurnos Farm would remain visible in views north-west. The magnitude of impact would be **minor adverse.**	**Slight adverse**
S5-R26 (12)	13 – 16 Pen Gurnos and, 1 - 8 Pen-Y-Dre, Gurnos, Merthyr Tydfil.	80 m	Views generally contained locally by surrounding properties and deciduous trees. Close filtered glimpses through trees of traffic on A465 to north in winter. Slightly oblique elevated longer distance glimpsed views in summer and filtered views through intervening deciduous vegetation in winter, north-west to BBNP.	Construction Close views west to north to construction of NMU route, new access track / underpass to Gurnos Farm, and elevated offline A465 mainline through Y Graig, with highway infrastructure such as signage and environmental barrier, opened up by loss of vegetation. Also close views to minor improvements in foreground on Gurnos Ring Road. The magnitude of impact would be **major adverse.**	**Large adverse**	Winter Year 1 As per operation without mitigation planting. The magnitude of impact would be **major adverse.**	**Large adverse**

Reference number[1] with number of properties in brackets * Listed Building	Location / address	Approx. distance from nearest point of receptor to centre line of proposed A465 alignment	Existing view	Change in view and magnitude of impact without mitigation planting	Significance of effect without mitigation planting	Change in view and magnitude of impact with mitigation planting	Significance of effect with mitigation planting
				Operation Close views west to north to users on NMU route, access track / underpass to Gurnos Farm and traffic flow on elevated offline A465 mainline through Y Graig, limited to tops of high sided vehicles above 3 m high environmental barrier to east of underpass, opened up by loss of vegetation. The magnitude of impact would be **major adverse.**	**Large adverse**	Summer Year 15 Established mitigation planting would generally screen underpass to Gurnos Farm and traffic flow on A465, though filtered glimpses of tops of high sided vehicles and 3 m high environmental barrier would remain. Users on NMU route and access track would remain visible in views west. The magnitude of impact would be **minor adverse.**	**Slight adverse**
S5-R27 (27)	17 - 32 Pen Gurnos, Ty Gwanfarren Residential Home, and 5-12 and 47 – 48 Penyfan View Gurnos, Merthyr Tydfil.	37 m	Close direct views north across Gurnos Ring Road to tree belt along A465, which screens views of traffic flow in summer and filters views in winter. Glimpses to underpass to Gurnos Farm to north-west. Views west and east contained by adjacent properties and/or trees, with exception of distant, generally oblique views above trees west to glimpses of traffic on A465 descending from Baverstock ridge.	Construction Close views west, north and east to construction of widened and elevated A465 mainline including tall retaining wall and embankment, as well as highway infrastructure such as signage and environmental barrier, opened up by loss trees. Also close generally oblique views west to construction of access track / underpass to Gurnos Farm, with distant glimpses to construction at Baverstock ridge in background. The magnitude of impact would be **major adverse.**	**Very large adverse**	Winter Year 1 As per operation without mitigation planting. The magnitude of impact would be **major adverse.**	**Very large adverse**
				Operation Close views west, north and east across Gurnos Ring Road, opened up by loss of trees, to tops of high sided vehicles and signage on A465 mainline above 3 m high environmental barrier on tall retaining wall and embankment, which would appear very dominant in views. Also close generally oblique views west to access track / underpass to Gurnos Farm, with distant glimpses to traffic flow on A465 mainline and parallel link road descending from Baverstock ridge in background. The magnitude of impact would be **major adverse.**	**Very large adverse**	Summer Year 15 Established mitigation planting would soften views of embankment and screen 3 m high environmental barrier and traffic flow on A465 in some views, but would not fully mitigate views of tall retaining wall, 3 m high environmental barrier and tops of high sided vehicles opposite some properties on Pen Gurnos. Access track / underpass to Gurnos Farm would generally be screened by established mitigation planting to west, while some oblique distant glimpses to traffic flow on A465 mainline and parallel link road descending from Baverstock ridge would remain. The magnitude of impact would be **major adverse.**	**Large adverse**
S5-R28 (32)	1 – 4 and 19 - 46 Penyfan View, Gurnos, Merthyr Tydfil.	75 m	Views generally contained locally by surrounding properties and deciduous trees. Close filtered glimpses between properties and through trees to traffic on A465 to north in winter.	Construction Close partial views north between properties to construction of widened and elevated A465 mainline including tall embankment above low retaining wall, as well as highway infrastructure such as signage and environmental barrier, opened up by loss of trees. The magnitude of impact would be **moderate adverse.**	**Moderate adverse**	Winter Year 1 As per operation without mitigation planting. The magnitude of impact would be **moderate adverse.**	**Moderate adverse**

Reference number[1] with number of properties in brackets * Listed Building	Location / address	Approx. distance from nearest point of receptor to centre line of proposed A465 alignment	Existing view	Change in view and magnitude of impact without mitigation planting	Significance of effect without mitigation planting	Change in view and magnitude of impact with mitigation planting	Significance of effect with mitigation planting
				<u>Operation</u> Close partial views north between properties, opened up by loss of vegetation, to tops of high sided vehicles and signage on A465 mainline above 3 and 4 m high environmental barrier, on tall embankment above low retaining wall. The magnitude of impact would be **moderate adverse.**	**Moderate adverse**	<u>Summer Year 15</u> Established mitigation planting would soften views of embankment and generally screen 3 and 4 m high environmental barrier and traffic flow on A465. The magnitude of impact would be **negligible adverse.**	**Slight adverse**
S5-R29 (15)	13 – 18 Penyfan View and 1- 8 Fernhill Close, Gurnos, Merthyr Tydfil.	70 m	Views generally contained locally by surrounding properties and deciduous trees. Close oblique filtered views through trees to traffic on A465 to north and north-east in winter.	<u>Construction</u> Close oblique views north and north-east to construction of widened A465 mainline and western extent of expanded Prince Charles Hospital junction, including embankments and retaining walls, as well as highway infrastructure such as environmental barrier, opened up by loss of trees. The magnitude of impact would be **moderate adverse.**	**Moderate adverse**	<u>Winter Year 1</u> As per operation without mitigation planting. The magnitude of impact would be **moderate adverse.**	**Moderate adverse**
				<u>Operation</u> Close oblique views north and north-east across Gurnos Ring Road to tops of high sided vehicles above 3 m high environmental barrier on A465 mainline and western extent of Prince Charles Hospital slip roads, opened up by loss of trees. The magnitude of impact would be **moderate adverse.**	**Moderate adverse**	<u>Summer Year 15</u> Established mitigation planting would partially screen and soften views of tops of high sided vehicles above 3 m high environmental barrier on A465 mainline and western extent of Prince Charles Hospital slip roads, in oblique views north and north-east across Gurnos Ring Road. The magnitude of impact would be **minor adverse.**	**Slight adverse**
S5-R30 (25)	1 - 9 Hornbeam Close, 2 - 12 (evens) Whitebeam Close and, 1 – 5 (odds) and 2 -12 (evens) Wellingtonia Close, Gurnos,	50 m	Lower level views generally contained locally by surrounding properties and deciduous trees. Close oblique views east to Goitre Underpass. Filtered views west, north and east in winter through trees to traffic on A465. Also slightly elevated distant views south-west to glimpses of traffic on A465 descending from Baverstock ridge.	<u>Construction</u> Close views west, north and east to minor NMU improvements along Gurnos Ring Road and construction of widened A465 and western half of expanded Prince Charles Hospital junction, with highway infrastructure such as signage, lighting columns and environmental barriers, opened up by loss of trees. Distant glimpses south-west to construction activities at Baverstock ridge. The magnitude of impact would be **major adverse.**	**Large adverse**	<u>Winter Year 1</u> As per operation without mitigation planting. The magnitude of impact would be **major adverse.**	**Large adverse**

Reference number[1] with number of properties in brackets * Listed Building	Location / address	Approx. distance from nearest point of receptor to centre line of proposed A465 alignment	Existing view	Change in view and magnitude of impact without mitigation planting	Significance of effect without mitigation planting	Change in view and magnitude of impact with mitigation planting	Significance of effect with mitigation planting
	Merthyr Tydfil.			Operation Close views west and north across lit Gurnos Ring Road to tops of high sided vehicles above 3 m high environmental barriers on widened A465 mainline, opened up by loss of vegetation. Traffic and highway infrastructure at Prince Charles Hospital junction to north and north-east would generally be screened by cutting and 3 and 4 m high environmental barriers in lower storey views, with exception of tops of lighting columns / light spill and tops of high sided vehicles on slip road on northern side of junction. Distant glimpses south-west to traffic on A465 mainline and parallel link road descending from Baverstock ridge. The magnitude of impact would be **major adverse.**	**Large adverse**	Summer Year 15 Established mitigation planting would partially screen and soften views of tops of high sided vehicles above 3 m high environmental barrier on A465 mainline to west and slightly soften views north-east to Prince Charles Hospital junction, though glimpses of tops of lighting columns / light spill would remain. Views north would not be changed and tops of high sided vehicles on slip road on northern side of junction would remain visible above 3 and 4 m high environmental barrier, as well as some upper storey views to traffic in cutting. Also distant glimpses south-west to traffic on A465 mainline and parallel link road descending from Baverstock ridge. The magnitude of impact would be **moderate adverse.**	**Moderate adverse**
S5-R31 (29)	14 – 44 (evens) and, 7- 13 and 21 (odds), Wellingtonia Close and 50 – 56 Cypress Close, Gurnos, Merthyr Tydfil.	80 m	Lower level views generally contained locally by surrounding properties and deciduous trees. Close oblique views east to Goitre Underpass. Filtered views through trees in winter west, north and east, between properties, to traffic on A465.	Construction Close partial views north and north-east between properties or oblique views from properties on eastern edge, to minor NMU improvements along Gurnos Ring Road and construction of western half of expanded Prince Charles Hospital junction, with highway infrastructure such as signage, lighting columns and environmental barriers, opened up by loss of trees. The magnitude of impact would be **moderate adverse.**	**Moderate adverse**	Winter Year 1 As per operation without mitigation planting. The magnitude of impact would be **moderate adverse.**	**Moderate adverse**
				Operation Close partial views north and north-east between properties or oblique views from properties on eastern edge, across lit Gurnos Ring Road to western half of expanded Prince Charles Hospital junction, where traffic and highway infrastructure would generally be screened by cutting and 3 and 4 m high environmental barrier, with exception of tops of lighting columns / light spill to north-east and tops of high sided vehicles on slip road on northern side of junction. The magnitude of impact would be **moderate adverse.**	**Moderate adverse**	Summer Year 15 Established mitigation planting would slightly soften views north and north-east to Prince Charles Hospital junction, although glimpses of tops of lighting columns / light spill would remain, with views of 3 and 4 m high environmental barrier in foreground. The magnitude of impact would be **minor adverse.**	**Slight adverse**
S5-R32 (1)	Dan-y-Castell Farm, Pontsarn Road, Merthyr Tydfil.	160 m	The farmhouse has direct front views between garden trees towards vegetation along the A465 with upper floors of the school and hospital buildings visible beyond.	Construction Views from the farmhouse would include tree clearance, earthworks and construction of the raised junction at Prince Charles Hospital in fields south of the property and the realigned Goitre Road NMU. The magnitude of impact would be **moderate adverse.**	**Large adverse**	Winter Year 1 As per operation without mitigation planting. The magnitude of impact would be **moderate adverse**.	**Large adverse**

Reference number[1] with number of properties in brackets * Listed Building	Location / address	Approx. distance from nearest point of receptor to centre line of proposed A465 alignment	Existing view	Change in view and magnitude of impact without mitigation planting	Significance of effect without mitigation planting	Change in view and magnitude of impact with mitigation planting	Significance of effect with mitigation planting
				Operation Traffic and lighting columns / light spill on the raised junction and slip roads and the link road would be visible. The NMU in cutting would limit views of people on it. The magnitude of impact would be **moderate adverse**.	**Large adverse**	Summer Year 15 Established mitigation planting around the junction would screen views of traffic, but the top of lighting columns / light spill would remain visible. Traffic, particularly high sided vehicles, would be visible above shrubs on the northern off slip road at the junction. The magnitude of impact would be **minor adverse.**	**Slight adverse**
S5-R33 (1)	Fernhill, Pontsarn Road, Merthyr Tydfil.	300 m	This elevated property has panoramic views from upper floors with ground floor views partially screened by woodland on the slope to the south. Vegetation along the A465, The Trade Centre for Wales, Pen-Y Dre high school and the hospital are visible.	Construction Partial descending views of tree clearance between intervening woodland on the slope south of the property, particularly from upper floor windows would be possible together with construction works, including demolition, earthworks, retaining walls, the A465, ponds and the northern link road. The compound would also be glimpsed beyond the construction. Views would extend intermittently from the Trade Centre Wales demolition site to the Prince Charles Hospital junction. The magnitude of impact would be **minor adverse.**	**Moderate adverse**	Winter Year 1 As per operation without mitigation planting. The magnitude of impact would be **minor adverse.**	**Moderate adverse**
				Operation Partial descending views of traffic in cutting would be visible on the A465, and on the link road through fields to the north of the A465. Lighting columns / light spill at the junction would be visible. The magnitude of impact would be **minor adverse**.	**Moderate adverse**	Summer Year 15 Established mitigation planting along the A465 and around the junction would reduce views but the link road would remain partially in view. The magnitude of impact would be **negligible adverse**.	**Slight adverse**
S5-R34 (1)	Kimberley, Bungalow, Pontsarn Road, Merthyr Tydfil.	145 m	Views from the front of this property look out over the road to open access land of rough grass ascending gently to the north with roofs of large industrial buildings visible beyond. The views are partial; over and between garden vegetation. To the rear descending views are oblique towards the Trade Centre for Wales and direct towards the A465 under garden trees and screened by vegetation along the A465 and fields.	Construction Loss of existing vegetation along A465 and within eastern end of garden would open up views across the A465 to Pen-Y-Dre school and towards demolition of the Trade Centre for Wales. and earthworks together with retaining wall and road construction would be visible, including the raised Prince Charles Hospital junction, between vegetation in the garden and intervening fields. The compound on the south side of the A465 would be visible. Construction of the attenuation pond and new junction slip road cutting across the corner of the garden would be visible at close proximity. The magnitude of impact would be **major adverse.**	**Very Large adverse**	Winter Year 1 As per operation without mitigation planting. The magnitude of impact would be **major adverse**.	**Large adverse**

Reference number[1] with number of properties in brackets * Listed Building	Location / address	Approx. distance from nearest point of receptor to centre line of proposed A465 alignment	Existing view	Change in view and magnitude of impact without mitigation planting	Significance of effect without mitigation planting	Change in view and magnitude of impact with mitigation planting	Significance of effect with mitigation planting
				Operation There would be traffic passing on the junction slip road at close proximity and the lit junction on embankment would be visible adjacent to the school. The enlarged A465 corridor would be closer and with traffic in cutting as well as on Gurnos Ring road would be visible in descending views south west. The magnitude of impact would be **major adverse.**	**Large adverse**	Summer Year 15 Established mitigation planting on cutting slope of the A465 and on the junction embankment would reduce views of traffic in these locations and of vehicles on Gurnos Ring Road. The junction slip road, vehicles on it and commercial units remaining at the Trade Centre Wales would remain visible in the view to the south, and the balancing pond to the north of the property. The magnitude of impact **would be moderate adverse**.	**Moderate adverse**
S5-R35 (19)	39 - 61 (odds) and 46 First Avenue, 28, 30,31 and 32 Sixth Avenue, and, 17and 19 Eighth Avenue, Galon Uchaf, Merthyr Tydfil.	90 m	Views from the rear of these properties north west towards the A465 beyond school playing fields and Gurnos Ring road are screened by vegetation along the A465, the school boundary and, in places, by garden buildings and scrub located to the rear of the properties.	Construction Loss of existing vegetation along A465 would open up views across the A465 to commercial areas and wider countryside. Compound hoarding along Gurnos Ring Road would limit views of work, materials and machinery within the compound from ground floor locations. Construction of the new junction opposite Pen-Y-Dre school buildings would be glimpsed from first floor windows beyond the compound and filtered by intervening vegetation. The magnitude of impact would be **minor adverse**.	**Moderate adverse**	Winter Year 1 As per operation without mitigation planting. The magnitude of impact would be **minor adverse**.	**Slight adverse**
				Operation The A465 would be further away. Traffic and lighting columns / light spill at the Prince Charles Hospital junction would be glimpsed over and filtered by intervening vegetation. Views beyond the A465 from first floor windows would remain. The magnitude of impact would be **minor adverse**.	**Slight adverse**	Summer Year 15 The mitigation planting would have established along the A465 and views of traffic and the traffic on junction would be reduced. Lighting columns / light spill at the junction would remain visible above the trees. The magnitude of impact would be **no change**.	**Neutral**
S5-R36 (18)	37 First Avenue, 2 – 18 (evens) and 25 – 39 (odds), Galon Uchaf Road, Merthyr Tydfil.	45 m	These properties are slightly elevated and have rear views towards the A465 to the north and west screened by vegetation along the A465 and a copse of trees in the open space along their rear boundaries.	Construction Loss of existing vegetation along A465 would open up views across the A465 to commercial areas, demolition and countryside. Compound hoarding along Gurnos Ring Road would partially limit views of work, materials and machinery within the compound from ground floor locations close to the work. From these slightly elevated properties descending views of compound and roadworks would be possible. With construction of the new junction opposite Pen-Y-Dre school buildings visible from first floor windows filtered by intervening vegetation. The magnitude of impact would be **moderate adverse**.	**Large adverse**	Winter Year 1 As per operation without mitigation planting. The magnitude of impact would be **minor adverse**.	**Moderate adverse**

Reference number[1] with number of properties in brackets * Listed Building	Location / address	Approx. distance from nearest point of receptor to centre line of proposed A465 alignment	Existing view	Change in view and magnitude of impact without mitigation planting	Significance of effect without mitigation planting	Change in view and magnitude of impact with mitigation planting	Significance of effect with mitigation planting
				Operation The A465 would be further away. Views to traffic on the A465 and commercial properties on the north side of the road would be possible, although filtered by vegetation. The junction and lighting columns / light spill would be visible crossing the A465 opposite Pen-Y-Dre school. The magnitude of impact would be **minor adverse**.	**Moderate adverse**	Summer Year 15 The mitigation planting would have established along the A465 and views of traffic and the traffic on junction would be reduced. Lighting columns / light spill at the junction would remain visible above the trees. The magnitude of impact would be **no change**.	**Neutral**
S5-R37 (8)	74 and 76 Galon Uchaf Road, 1,1b,2,4 and 6 Twelfth Avenue, and 1 Mitchell Cresent, Glaon Uchaf, Merthyr Tydfil.	65 m	From their elevated position these properties look out over the existing Gurnos Ring road roundabout and bridge over the A465 to glimpsed traffic on A465 and industrial areas to the north, partially screened by woodland north of the A465. On the southern side the A465 is screened to the south west by woodland and to the east by the industrial building on the west side of the roundabout.	Construction Loss of existing vegetation would open up and increase views across the A465 to commercial and industrial areas north of the A465. These properties would have direct views to construction of the Galon Uchaf bridge and new roundabout on the north side. There would be oblique glimpsed views of demolition and descending views to construction of the A465 from first floor windows. The magnitude of impact would be **major adverse**.	**Very Large adverse**	Winter Year 1 As per operation without mitigation planting. The magnitude of impact would be **moderate adverse**.	**Large adverse**
				Operation Traffic would be more visible particularly on northern carriageway of the widened A465 and open views to the industrial areas on the north of the A465 would remain. The magnitude of impact would be **moderate adverse.**	**Large adverse**	Summer Year 15 Mitigation planting would have established to the west of the bridge on both north and south sides and would reduce views of traffic and commercial buildings. Individual trees would define the edge of the industrial area and reduce views of the large building units slightly. The magnitude of impact would be **minor adverse.**	**Moderate adverse**
S5-R38 (12)	25 – 36 Rocky Road, Galon Uchaf, Merthyr Tydfil.	23 m	These properties have front north and north east views towards the A465 beyond Rocky Road and the slip road off the A465. The views of the A465 are largely screened in summer and filtered in winter by woodland between Rocky Road and the slip road and along the A465. More open views of the A465 and traffic in cutting are possible for properties at the northern end of the group.	Construction Tree clearance along the A465 and slip road and earthworks to construct the pond would be visible in both direct and oblique views and would open up views of the industrial area to the north and increase views of the A465 and construction along it to the east. The magnitude of impact would be **major adverse**.	**Very Large adverse**	Winter Year 1 As per operation without mitigation planting. The magnitude of impact would be **moderate adverse**.	**Moderate adverse**
				Operation From upper floor windows traffic on the A465 would be visible before the Galon Uchaf overbridge and extending east towards Pant viaduct. The industrial units on the northern side of the A465 would be visible. The earthworks for the pond and access road would be visible for the more northern receptors in this group. There would no longer be a slip road off the A465 joining Rocky Road adjacent to these receptors at this location and this reduction in views of traffic would improve the view for these receptors. The magnitude of impact would be **moderate adverse**.	**Moderate adverse**	Summer Year 15 Established mitigation planting along the A465 would screen traffic along part of the A465 and the majority of the industrial area in views north-east from some properties. The magnitude of impact would be **minor adverse**.	**Slight adverse**

Reference number[1] with number of properties in brackets * Listed Building	Location / address	Approx. distance from nearest point of receptor to centre line of proposed A465 alignment	Existing view	Change in view and magnitude of impact without mitigation planting	Significance of effect without mitigation planting	Change in view and magnitude of impact with mitigation planting	Significance of effect with mitigation planting
S5-R39 (approx. 240)	East side of Twelfth Avenue and all properties along Roberts Avenue, 1 – 42 & 43 – 77 (odds) Mitchell Crescent, 1 – 48 Marshall Crescent, 33 – 92 Haydn Terrace, 68 – 94 (evens) Penybryn (north east edge).	50 m	These properties ascend a steep east facing hillside from which panoramic views from front elevations extend to the commercial buildings and Asda at Dowlais Top. Pant Viaduct and the A465 west of it above vegetation within Ifor Park are in view until the Dowlais Cwm Community Woodland rises up the hillside and screens the road as it passes to the north.	<u>Construction</u> Tree clearance would open up and emphasise the route of the A465 from these elevated viewpoints. Earthworks and construction of the attenuation pond and road widened on embankment would be visible between Dowlais Cwm Community Woodland and Pant viaduct. There would be a clear view of the new viaduct being constructed over Pant Road. The compound area north of Pant viaduct would be partially visible. The magnitude of impact would be **minor adverse**.	**Moderate adverse**	<u>Winter Year 1</u> As per operation without mitigation planting. The magnitude of impact would be **negligible adverse**.	**Slight adverse**
				<u>Operation</u> Traffic on embankment above Ifor Park and crossing the new widened Pant viaduct would be visible above remaining vegetation within Ifor Park. The route of the widened A465 would be just visible as it approaches Dowlais junction at Asda and glimpsed longer distance views of traffic on the elevated road over the junction, as well as lighting columns / light spill at it, would be possible. The magnitude of impact would be **negligible adverse**.	**Slight adverse**	<u>Summer Year 15</u> Established mitigation planting along the length of the A465 would screen views of it and integrate it into its surroundings. Pant viaduct would remain visible. The magnitude of impact would be **negligible adverse.**	**Neutral**
S5-R40 (13)	Avoca, Wattisham, Meriel, Glendewloine, Hazeldene, Linter and 1 – 4 Rocky Road, and 1,10 and 19 Parc Brychan, Galon Uchaf, Merthyr Tydfil.	125 m	Mostly bungalows with ascending front views north east towards the A465 are possible from these properties, set back in a slightly elevated position above Rocky Road. Traffic on the A465 is visible on the horizon beyond scattered trees in Ifor Park with housing descending along the eastern edge of the park. To the west views of the A465 are screened by Dowlais Cwm Community Woodland. Similar views are possible from north west facing windows of detached properties on Parc Brychan.	<u>Construction</u> Tree removal along the A465 would increase views of the A465 corridor on the horizon through scattered trees on the sloping ground of Ifor Park. Large scale earthworks and machinery would be visible on the horizon and extend into the park as the road is widened. The magnitude of impact would be **minor adverse**.	**Moderate adverse**	<u>Winter Year 1</u> As per operation without mitigation planting. The magnitude of impact would be **negligible adverse**.	**Slight adverse**
				<u>Operation</u> There would be an increase in traffic visible on the horizon between Cwm community woodland and Pant viaduct. The magnitude of impact would be **negligible adverse**.	**Slight adverse**	<u>Summer Year 15</u> Established mitigation planting on the embankments and edge of Ifor Park would screen views of traffic on the A465 travelling across the horizon. The magnitude of impact would be **no change.**	**Neutral**
S5-R41 (115)	1 – 17 Ifor Terrace, 1 – 55 Winifred Street, 1 – 9 and 14 – 17 Wimborne Street (south side), 1 – 23	100 m	The terraced properties on this steep north west facing slope have either front or rear views direct, slightly oblique, level or ascending, over Ifor Park to the A465 on the ridge between Pant viaduct and Dowlais Cwm Community Woodland at Galon Uchaf. Views are filtered by	<u>Construction</u> Tree clearance would increase views of the A465 corridor. Earthworks to create the widened road on embankment at the north end of Ifor Park would be visible and construction of the attenuation pond would be glimpsed between existing vegetation. The magnitude of impact would be **minor adverse**.	**Moderate Adverse**	<u>Winter Year 1</u> As per operation without mitigation planting. The magnitude of impact would be **minor adverse**.	**Slight Adverse**

Reference number[1] with number of properties in brackets * Listed Building	Location / address	Approx. distance from nearest point of receptor to centre line of proposed A465 alignment	Existing view	Change in view and magnitude of impact without mitigation planting	Significance of effect without mitigation planting	Change in view and magnitude of impact with mitigation planting	Significance of effect with mitigation planting
	Frances Street, 8 – 9 Pant Terrace and, 1 – 6 and Maelog House, Cross Ivor Terrace, Dowlais, Merthyr Tydfil.		intermittent vegetation within Ifor Park.	Operation Traffic on the widened road extending on embankment between Pant viaduct and Galon Uchaf would be more visible. The magnitude of impact would be **minor adverse**.	**Slight Adverse**	Summer Year 15 Established mitigation planting to the south of the A465 would screen views of the road and traffic on it. The magnitude of impact would be **no change**.	**Neutral**
S5-R42 (17)	1 – 10 Henlwen Close and 72 – 78 Hen Rhyd-Y-Beds, Pant, Merthyr Tydfil	175 m	These properties have direct and oblique south east views towards the A465 over undulating open ground. They have slightly ascending views of the Pant viaduct and traffic on it.	Construction The loss of vegetation along the north side of the A465 would open up views to the A465 west and east of Pant viaduct. There would be views of the new Pant viaduct construction, including earthworks, retaining walls and use of cranes. Glimpsed views of higher elements within the compound would be possible. The magnitude of impact would be **moderate adverse**.	**Large Adverse**	Winter Year 1 As per operation without mitigation planting. The magnitude of impact would be **minor adverse**.	**Moderate Adverse**
				Operation Elevated traffic on embankment and viaduct would be visible from Jones Street to the industrial estate in the west. 1 m high Environmental barriers would help screen traffic east of the viaduct. The magnitude of impact would be **minor adverse**.	**Moderate Adverse**	Summer Year 15 Established mitigation planting on the road embankments to east and west of Pant viaduct would screen views of traffic on the A465. The new Pant viaduct is not as long as the existing viaduct and the length of traffic open to views would be reduced although the structure would be wider, and capable of taking a greater volume of traffic at any one time. The magnitude of impact would be **no change**.	**Neutral**
S5-R43 (32)	1 – 8, 21 and 22 Primrose Close, 1 – 19 (odds) Hedl-Y-Bryniau and 1 – 12 King Street, Pant, Merthyr Tydfil	330 m	These properties have direct and oblique south east views towards the A465 over undulating open ground. They have slightly ascending views of the Pant viaduct and traffic on it.	Construction The loss of vegetation along the north side of the A465 would open up views to the A465 west and east of Pant viaduct. There would be views of the new Pant viaduct construction, including earthworks, retaining walls and use of cranes. Glimpsed views of higher elements within the compound would be possible. The magnitude of impact would be **moderate adverse**.	**Large Adverse**	Winter Year 1 As per operation without mitigation planting. The magnitude of impact would be **minor adverse**.	**Moderate Adverse**
				Operation Elevated traffic on embankment and viaduct would be visible from Jones Street to the industrial estate in the west. 1 m high Environmental barriers would help screen traffic east of the viaduct. The magnitude of impact would be **minor adverse**.	**Moderate Adverse**	Summer Year 15 Established mitigation planting on the road embankments to east and west of Pant viaduct would screen views of traffic on the A465. The new Pant viaduct is not as long as the existing viaduct and the length of traffic open to views would be reduced although the structure would be wider, and capable of taking a greater volume of traffic at any one time. The magnitude of impact would be **no change**.	**Neutral**

Reference number[1] with number of properties in brackets * Listed Building	Location / address	Approx. distance from nearest point of receptor to centre line of proposed A465 alignment	Existing view	Change in view and magnitude of impact without mitigation planting	Significance of effect without mitigation planting	Change in view and magnitude of impact with mitigation planting	Significance of effect with mitigation planting
S5-R44 (22)	1 – 22 Caeraca Villas, Pant, Merthyr Tydfil.	355 m	These three storey properties are situated in elevated locations within Pant and have intermittent oblique and direct views towards the A465 between Jones Road to Pant Road viaduct over and between intervening buildings and the views continue west behind the industrial estate. The A465 is partly concealed by trees on embankment and mature trees within the Hafod housing estate, but Pant Road viaduct is visible as are houses on Cross Houlson Street south of the A465.	<u>Construction</u> The loss of vegetation along the A465 would open up views to the A465 west and east of Pant viaduct. There would be partial views of earthworks, the new Pant viaduct construction, retaining walls and the use of cranes. The magnitude of impact would be **minor adverse**.	**Moderate adverse**	<u>Winter Year 1</u> As per operation without mitigation planting. The magnitude of impact would be **minor adverse**.	**Slight adverse**
				<u>Operation</u> Elevated traffic on embankment and viaduct would be visible from Jones Street to the industrial estate in the west. 1 m high Environmental barriers would help screen traffic east of the viaduct. The magnitude of impact would be **minor adverse**.	**Slight adverse**	<u>Summer Year 15</u> Established mitigation planting on the road embankments to east and west of Pant viaduct would screen views of traffic on the A465. The new Pant viaduct is not as long as the existing viaduct and the length of traffic open to views would be reduced although the structure would be wider, and capable of taking a greater volume of traffic at any one time. The magnitude of impact would be **no change**.	**Neutral**
S5-R45 (9)	57 – 49 Glanmorlais, (3 storey), Pant, Merthyr Tydfil.	339 m	These three storey properties are situated in elevated locations within Pant and have intermittent oblique and direct views towards the A465 between Jones Road to Pant Road viaduct over and between intervening buildings and the views continue west behind the industrial estate. The A465 is partly concealed by trees on embankment and mature trees within the Hafod housing estate, but Pant Road viaduct is visible as are houses on Cross Houlson Street south of the A465.	<u>Construction</u> The loss of vegetation along the A465 would open up views to the A465 west and east of Pant viaduct. There would be partial views of earthworks, the new Pant viaduct construction, retaining walls and the use of cranes. The magnitude of impact would be **minor adverse**.	**Moderate adverse**	<u>Winter Year 1</u> As per operation without mitigation planting. The magnitude of impact would be **minor adverse**.	**Slight adverse**
				<u>Operation</u> Elevated traffic on embankment and viaduct would be visible from Jones Street to the industrial estate in the west. 1 m high Environmental barriers would help screen traffic east of the viaduct. The magnitude of impact would be **minor adverse**.	**Slight adverse**	<u>Summer Year 15</u> Established mitigation planting on the road embankments to east and west of Pant viaduct would screen views of traffic on the A465. The new Pant viaduct is not as long as the existing viaduct and the length of traffic open to views would be reduced although the structure would be wider, and capable of taking a greater volume of traffic at any one time. The magnitude of impact would be **no change**.	**Neutral**
S5-R46 (19)	1 - 5 Pant Road, 1 – 8 Windsor Place (Pant Road) and 1 – 6 Haford Cottages, Pant, Merthyr Tydfil.	100 m	These properties have front and rear oblique ascending views south towards the A465 at Pant viaduct and embankments. Views are possible along Pant Road and across open ground west of Pant Road and land within Haford housing estate on the east. Woodland on embankment either side of Pant viaduct	<u>Construction</u> Tree removal would extend views of the A465 on embankment either side of Pant viaduct. During construction there would be views of earthworks as well as removal of the existing viaduct and construction of the new viaduct including the use of cranes. The compound along Pant Road would be visible at close proximity. The magnitude of impact would be **minor adverse**.	**Moderate adverse**	<u>Winter Year 1</u> As per operation without mitigation planting. The magnitude of impact would be **minor adverse**.	**Slight adverse**

Reference number[1] with number of properties in brackets * Listed Building	Location / address	Approx. distance from nearest point of receptor to centre line of proposed A465 alignment	Existing view	Change in view and magnitude of impact without mitigation planting	Significance of effect without mitigation planting	Change in view and magnitude of impact with mitigation planting	Significance of effect with mitigation planting
			and within housing east of Pant Road reduces views of traffic particularly to the west of the viaduct.	<u>Operation</u> Elevated traffic on embankment and viaduct would be visible on the viaduct and on embankment, west behind the industrial area and east below housing south of the A465. Environmental barriers would be visible at the top of the embankment and screen traffic east of the viaduct. The magnitude of impact would be **minor adverse**.	**Slight adverse**	<u>Summer Year 15</u> Established mitigation planting along the embankments either side of Pant viaduct would limit views of traffic on the embankment to the viaduct. The magnitude of impact would be **no change**.	**Neutral**
S5-R47 (24)	82 – 89 and 94 – 109 Hafod Cottages, Pant, Merthyr Tydfil.	38 m	Direct and oblique views from front and rear elevations towards the A465 at Pant Road viaduct and Jones Street overbridge are possible. The A465 on embankment and landform south of the Haford Housing estate is partially screened by vegetation.	<u>Construction</u> Tree removal would increase views of the elevated A465 between Pant viaduct and Jones Street overbridge. The widening of the road would result in views of large scale earthworks at close proximity in addition to construction of bridges and the use of cranes. Glimpsed views of the compound would be partially screened by intervening trees and buildings. The magnitude of impact would be **major adverse**.	**Very Large adverse**	<u>Winter Year 1</u> As per operation without mitigation planting. The magnitude of impact would be **minor adverse**.	**Slight adverse**
				<u>Operation</u> The A465 would be on embankment and all but high sided vehicels screened by 1 m high environmental barriers in ascending views south from these properties. The magnitude of impact would be **minor adverse**.	**Slight adverse**	<u>Summer Year 15</u> The mitigation planting on the embankment slopes would have established and screened the A465 environmental barriers and high sided vehicles. The magnitude of impact would be **no change**.	**Neutral**
S5-R48 (29)	1 – 9 Beacon View, 1 – 6 Cross Houlson Street, 7 – 9 Houlson Street, 6 - 8 Davies Street, 5 - 7 Jones Street, 31 – 35 Guest Cottages, Dowlais, Merthyr Tydfil.	21 m	These properties have direct or oblique descending views north towards the A465 in close proximity. Beyond the A465 the views are extensive, towards Pant with open hillsides beyond, partially obstructed by trees on embankments and within the wider landscape. Elevated views extend along the A465 west towards Galon Uchaf and east towards Dowlais	<u>Construction</u> The road widening earthworks, Pant viaduct and Jones Road overbridge construction would be visible in addition to the road surfacing in close proximity. The compound would be visible to the west. The magnitude of impact would be **major adverse**.	**Very large adverse**	<u>Winter Year 1</u> As per operation without mitigation planting. The magnitude of impact would be **moderate adverse**.	**Moderate adverse**
				<u>Operation</u> The increased road surface and traffic on it would be visible with 2 and 3 m high environmental barriers reducing views of traffic on the road east of Pant viaduct and extending east beyond Jones Street overbridge. The magnitude of impact would be **moderate adverse**.	**Moderate adverse**	<u>Summer Year 15</u> Established mitigation planting on embankments would reduce longer views along the A465 to the east and west but the section of road between Pant viaduct and Jones Street would remain visible. The magnitude of impact would be **minor adverse**.	**Slight adverse**

Reference number[1] with number of properties in brackets * Listed Building	Location / address	Approx. distance from nearest point of receptor to centre line of proposed A465 alignment	Existing view	Change in view and magnitude of impact without mitigation planting	Significance of effect without mitigation planting	Change in view and magnitude of impact with mitigation planting	Significance of effect with mitigation planting
S5-R49 (34)	Wern House, Garn House, Bryn Awel & Fronheulog, Upper Street, 1 – 28 Guest Cottages, and, 3 and 4 Jones Street, Dowlais, Merthyr Tydfil.	33 m	These terraced properties have rear northern views to the A465 over a field and filtered through intervening vegetation and partially screened by outbuildings. Traffic on the A465 is screened by roadside vegetation.	<u>Construction</u> Vegetation clearance along the A465 would open up views of the A465 and fields beyond, including the earthworks around the reservoir. Construction activities including earthworks, movement of machines and road surfacing would be visible. Views of the NMU overbridge construction would also be possible. The magnitude of impact would be **major adverse**.	**Large adverse**	<u>Winter Year 1</u> As per operation without mitigation planting. The magnitude of impact would be **moderate adverse**.	**Moderate adverse**
				<u>Operation</u> The A465 and traffic on it would be visible in slight cutting between the NMU overbridge and Guest Cottages where it would be visible on embankment approaching Jones Street overbridge. The NMU overbridge earthworks and 3 m high environmental barrier would partially screen traffic on the road. The magnitude of impact would be **moderate adverse**.	**Moderate adverse**	<u>Summer Year 15</u> Established mitigation planting along the A465 would screen traffic on the road. NMU overbridge would remain in the view. The magnitude of impact would be **minor adverse**.	**Slight adverse**
S5-R50 (11)	7, 7a,8,9,9a and 10 – 15 Upper Row, and Penn-y-Wern House, Dowlais, Merhtyr Tydfil.	130 m	There are rear northern views to the A465 over Upper Row and parked cars, open space and play area filtered through scattered vegetation in the open space behind the properties and vegetation along the edge of the A465.	<u>Construction</u> Vegetation clearance along the A465 would open up views of the A465 and fields beyond, including the earthworks around the reservoir. Construction activities including earthworks, movement of machines and road surfacing would be visible. Views of the NMU overbridge construction would also be possible. The magnitude of impact would be **major adverse**.	**Large adverse**	<u>Winter Year 1</u> As per operation without mitigation planting. The magnitude of impact would be **moderate adverse**.	**Moderate adverse**
				<u>Operation</u> The A465 and traffic on it would be visible in shallow cutting between the NMU overbridge and Guest Cottages, and on embankment east of the NMU overbridge. The NMU overbridge earthworks and 3 m high environmental barrier would screen traffic on the road for its length. The NMU bridge and people using it would be in view. The magnitude of impact would be **moderate adverse**.	**Moderate adverse**	<u>Summer Year 15</u> Established mitigation planting along the A465 would screen traffic on the road. NMU overbridge would remain in the view. The magnitude of impact would be **minor adverse**.	**Slight adverse**

Reference number[1] with number of properties in brackets * Listed Building	Location / address	Approx. distance from nearest point of receptor to centre line of proposed A465 alignment	Existing view	Change in view and magnitude of impact without mitigation planting	Significance of effect without mitigation planting	Change in view and magnitude of impact with mitigation planting	Significance of effect with mitigation planting
S5-R51 (31)	25 – 30 Station Terrace, 32 – 48 and 50 High Street,1 – 3 New Houses, High Street and, 13 – 16 and 21 Coedcae Row, Dowlais, Methyr Tydfil.	85 m	These properties have slightly ascending views north to the A465 and the Asda building over open space, filtered by vegetation, and oblique views north east towards the roundabout junctions with the retail area and A4060.	<u>Construction</u> Vegetation removal along the A465 would open up views north beyond the A465 to Asda and other commercial buildings on rising ground. Construction activities would include large scale earthworks within adjacent field, bridge construction and road surfacing. Lighting would also be installed at the junction. The magnitude of impact would be **major adverse**.	**Very large adverse**	<u>Winter Year 1</u> As per operation without mitigation planting. The magnitude of impact would be **major adverse**	**Large adverse**
				<u>Operation</u> Traffic on embankment travelling on the main line and slip roads would be visible, limited to high sided vehicles where 1 m high environmental barriers restrict views west of the junction overbridges. Oblique views would be possible to high level traffic passing over the junction and lighting columns / light spill would be prominent. Beyond the A465 embankments views of Asda would be reduced. The magnitude of impact would be **major adverse**.	**Large adverse**	<u>Summer Year 15</u> Established mitigation planting would largely screen traffic on the embankments up to the overbridges at the junction of the A465 with the A4060, but the west bridges and traffic on it would remain visible. The east bridge would be screened by planting on the roundabout. The magnitude of impact would be **minor adverse**.	**Slight adverse**

Appendix 10F – Visual Effects Schedule: Users of Public Rights of Way and Open Access Land

Table 10F.1 Visual effects schedule: users of Public Rights of Way and Open Access Land

Value / sensitivity to change: High

Reference number[1] with length / area of PRoW / space affected in brackets	PRoW number or land name and designation	Approx. distance from nearest point of receptor to centre line of proposed A465 alignment	Existing view	Change in view and magnitude of impact without mitigation planting	Significance of effect without mitigation planting	Change in view and magnitude of impact with mitigation planting	Significance of effect with mitigation planting
S6-A1 (80 ha)	Hirwaun Common Countryside and Rights of Way Act Open Access Land.	510 m	Wide range of middle distance to distant views including panoramic views from cairn at 515 m A.O.D. Opencast workings prominent in foreground. Hirwaun visible with distant views to hills in BBNP beyond to the north. Glimpsed views north-east, through gaps in vegetation, to traffic on A465 as it descends from Baverstock ridge to Hirwaun. The A465 / A4059 junction is visible.	<u>Construction</u> Construction plant for construction of Hirwaun junction overbridge with associated highway infrastructure, including lighting columns visible. Also glimpsed distant views north-east of construction at Baverstock including major earthworks activities for deep cutting. Some construction works at Trewaun junction also visible including Trewaun South temporary diversion and traffic. The magnitude of impact would be **minor adverse**.	**Moderate adverse**	<u>Winter Year 1</u> As per operation without mitigation planting. The magnitude of impact would be **minor adverse**.	**Slight adverse**
				<u>Operation</u> Middle distance to distant views north, particularly of the elevated Hirwaun junction with associated traffic flow and highway infrastructure including overbridge signage and lighting columns / light spill. Trewaun junction also visible. Offline section south of Hirwaun screened in some views by road cutting and opencast workings. Distant views north-east of A465 and traffic and deep cutting at Baverstock. The magnitude of impact would be **minor adverse**.	**Slight adverse**	<u>Summer Year 15</u> Established mitigation planting would partly screen traffic flow and highway infrastructure at approaches to Hirwaun junction overbridge. Distant views north-east of A465 and traffic and deep cutting at Baverstock would remain. The magnitude of impact would be **minor adverse**.	**Slight adverse**
S6-A2 (840 m)	Rhigos Public Footpath 25, link 2 east (RHI/25/2).	100 m	Views north, from footpath north of opencast workings, generally contained by deciduous groups and belts of trees in the summer. Filtered glimpses to tops of high sided vehicles on A465 in middle distance in winter. Tops of lighting columns at Hirwaun junction and approaches visible above	<u>Construction</u> Close views of offline section of A465 and major cutting earthworks, south of Hirwaun. Tall construction plant for construction of Hirwaun junction overbridge with associated highway infrastructure, including lighting columns and visible to north-west. Loss of some existing vegetation opens up views to construction works and Hirwaun beyond. Some construction works at Trewaun junction also visible. The magnitude of impact would be **moderate adverse**.	**Moderate adverse**	<u>Winter Year 1</u> As per operation without mitigation planting. The magnitude of impact would be **moderate adverse**.	**Moderate adverse**

[1] Refer to Figure 10.8

Reference number[1] with length / area of PRoW / space affected in brackets	PRoW number or land name and designation	Approx. distance from nearest point of receptor to centre line of proposed A465 alignment	Existing view	Change in view and magnitude of impact without mitigation planting	Significance of effect without mitigation planting	Change in view and magnitude of impact with mitigation planting	Significance of effect with mitigation planting
			vegetation. Intermittent views north-west and north between trees, across fields to deciduous groups and belts of trees. Views north-east across grassland and gorse, contained by tall evergreen tree belt along recreation ground.	<u>Operation</u> Close views of offline section of A465 south of Hirwaun with associated traffic flow and highway infrastructure, including overbridge, signage and lighting columns / light spill at Hirwaun junction to north / north-west. Some views of A465 with associated traffic flow looking east into cutting, with Trewaun junction visible beyond. Gravel track linking to Tower Road also visible. Some screening of proposed scheme from remaining existing vegetation. The magnitude of impact would be **minor adverse**.	**Moderate adverse**	<u>Summer Year 15</u> Close views of offline section of A465 south of Hirwaun with associated traffic flow and highway infrastructure, including overbridge, signage and lighting columns / light spill at Hirwaun junction to north / north-west, although established mitigation planting would partly screen the proposed scheme at approaches to the junction. Some views of A465 with associated traffic flow looking east into cutting, with Trewaun junction visible beyond. Gravel track linking to Tower Road also visible. The magnitude of impact would be **moderate adverse**.	**Slight adverse**
S6-A3 (240 m)	Hirwaun Public Footpath 43, link 1 (HIR/43/1).	0 m	Wide open view south across gorse and grassland to distinctive ridgeline within Hirwaun Common. Stretch of powerlines and pylons, as well as opencast workings in the middle distance, are detracting features in landscape.	<u>Construction</u> Close views of offline section of A465 and major cutting earthworks, south of Hirwaun. Loss of some existing vegetation opens up views to construction works to west with glimpses of Hirwaun junction construction. Some construction works at Trewaun junction also visible and Trewaun South temporary diversion and traffic prominent. The magnitude of impact would be **major adverse**.	**Large adverse**	<u>Winter Year 1</u> As per operation without mitigation planting. The magnitude of impact would be **moderate adverse.**	**Moderate adverse**
				<u>Operation</u> Cutting screens much of the A465 in this area although some close views of offline section of A465 south of Hirwaun with associated traffic flow and highway infrastructure would be possible. Glimpses of Hirwaun junction to west. Partial views of A465 with associated traffic flow looking east into cutting, with Trewaun junction visible beyond. The magnitude of impact would be **moderate adverse**.	**Moderate adverse**	<u>Summer Year 15</u> Established mitigation planting would largely screen the proposed scheme which is also for the most part in cutting in this area. The magnitude of impact would be **minor adverse.**	**Slight adverse**
S6-A4 (1.3 km)	Hirwaun Public Footpath 44, links 1 and 4 (HIR/44/1 and HIR/44/4).	0 m	Stretch of overhead lines and pylons, as well as opencast workings, are detracting features in the landscape. Views north and north-east and north-west across open grassland with scattered clumps of scrub in places. Sports pavilion and floodlit tennis courts	<u>Construction</u> Close views of construction of offline section of A465 and major cutting earthworks, south of Hirwaun. Loss of some existing vegetation opens up views to construction works to west with glimpses of Hirwaun junction construction. Some construction works at Trewaun junction, including Trewaun South temporary diversion and traffic, also visible. The magnitude of impact would be **moderate adverse**.	**Moderate adverse**	<u>Winter Year 1</u> As per operation without mitigation planting. The magnitude of impact would be **moderate adverse.**	**Moderate adverse**

Reference number[1] with length / area of PRoW / space affected in brackets	PRoW number or land name and designation	Approx. distance from nearest point of receptor to centre line of proposed A465 alignment	Existing view	Change in view and magnitude of impact without mitigation planting	Significance of effect without mitigation planting	Change in view and magnitude of impact with mitigation planting	Significance of effect with mitigation planting
			visible. Traffic on A465 is generally screened by deciduous trees in the summer, with exception of area at footpath overbridge over HIR/42/3. More extensive filtered views through vegetation, in winter, to traffic on the A465. Background views north-west to north-east from all of path to Hirwaun town, hills within the BBNP and the Baverstock ridge. Gas works are a detracting feature in the distance.	<u>Operation</u> Close views of offline section of A465 with associated traffic flow and highway infrastructure. Hirwaun junction visible to west with associated traffic flow and highway infrastructure, including overbridge, signage and lighting columns / light spill. Partial views of A465 with associated traffic flow looking east into cutting, with Trewaun junction visible beyond. The magnitude of impact would be **moderate adverse**.	**Moderate adverse**	<u>Summer Year 15</u> Close views of offline section of A465 with associated traffic flow and highway infrastructure. Hirwaun junction visible to west with associated traffic flow and highway infrastructure, including overbridge, signage and lighting columns / light spill although established mitigation planting would partly screen the proposed scheme at approaches to the junction. Partial views of A465 with associated traffic flow looking east into cutting, with Trewaun junction visible beyond. The magnitude of impact would be **moderate adverse**.	**Moderate adverse**
S6-A5 (200 m)	Hirwaun Public Footpath 42, link 3 (HIR/42/3).	0 m	Wide open view south across gorse and grassland to distinctive ridgeline within Hirwaun Common. Stretch of overhead lines and pylons, as well as opencast workings in the middle distance, are detracting features in landscape. Close views north of sports pavilion and flood lit tennis courts.	<u>Construction</u> Close and middle distance views of construction of offline section of A465 and major cutting earthworks, south of Hirwaun. Loss of some existing vegetation opens up views to construction works to west with middle distance glimpses of Hirwaun junction construction. Some construction works at Trewaun junction also visible and Trewaun South temporary diversion and traffic prominent. The magnitude of impact would be **major adverse**.	**Large adverse**	<u>Winter Year 1</u> As per operation without mitigation planting. The magnitude of impact would be **moderate adverse.**	**Moderate adverse**
				<u>Operation</u> Cutting screens much of the A465 in this area although some close views of offline section of A465 south of Hirwaun, with associated traffic flow and highway infrastructure would be possible. Middle distance glimpses of Hirwaun junction to west. Partial views of A465 with associated traffic flow looking east into cutting, with Trewaun junction visible beyond. The magnitude of impact would be **moderate adverse**.	**Moderate adverse**	<u>Summer Year 15</u> Established mitigation planting would largely screen the proposed scheme which is also for the most part in cutting in this area. The magnitude of impact would be **minor adverse.**	**Slight adverse**
S6-A6 (940 m)	National Cycle Route 46 (NCR 46).	0 m	Conveyor from opencast workings is detracting feature crossing route. Lighting columns at Hirwaun junction, visible in views south-east from section of route along Rhigos Road, while tall hedgerow and trees	<u>Construction</u> Construction plant for construction of the Hirwaun junction overbridge with associated highway infrastructure, including lighting columns would be prominent in close and middle distance views. The magnitude of impact would be **major adverse**.	**Large adverse**	<u>Winter Year 1</u> As per operation without mitigation planting. The magnitude of impact would be **major adverse.**	**Large adverse**

Reference number[1] with length / area of PRoW / space affected in brackets	PRoW number or land name and designation	Approx. distance from nearest point of receptor to centre line of proposed A465 alignment	Existing view	Change in view and magnitude of impact without mitigation planting	Significance of effect without mitigation planting	Change in view and magnitude of impact with mitigation planting	Significance of effect with mitigation planting
			contain views north. Close channelled view to traffic and lighting columns at junction from off-road section of route. Traffic and infrastructure at junction visible where route crosses junction. Longer distance views south-west from NMU bridge across A465 linking with Tower Road, looking across scrub and trees to opencast workings and distinctive ridgeline within Hirwaun Common. Views from route along Tower Road generally contained by mature deciduous trees and properties, although there are close glimpsed views to lighting columns on A465 looking south-west.	<u>Operation</u> The elevated Hirwaun junction, with associated traffic flow and highway infrastructure, including overbridge, signage and lighting columns / light spill, would be prominent in close and middle distance views. The magnitude of impact would be **major adverse**.	**Large adverse**	<u>Summer Year 15</u> Established mitigation planting would partly screen the proposed scheme at approaches to the Hirwaun junction. The overbridge with associated highway infrastructure, including lighting columns would however, remain prominent in close and middle distance views. The magnitude of impact would be **moderate adverse.**	**Large adverse**
S6-A7 (240 m)	National Cycle Route 46 and Hirwaun Public Footpath 23, link 1 (NCR 46 and HIR/23/1).	0 m	Traffic on A465 generally screened by properties and mature deciduous vegetation in views along the Tramway, with the exception of close views to the A465 overbridge across the NMU route. A pylon is a detracting feature beyond trees to east of the A465.	<u>Construction</u> Construction of the highly prominent Trewaun north temporary diversion and traffic visible in close views. Localised construction works and removal of existing vegetation associated with the new A465 cutting and NMU overbridge and ramps would also be prominent from the Tramway in close and middle distance views. The magnitude of impact would be **major adverse**.	**Very large adverse**	<u>Winter Year 1</u> As per operation without mitigation planting. The magnitude of impact would be **moderate adverse.**	**Large adverse**
				<u>Operation</u> The change from NMU underpass to overbridge with step and ramp access where the NMU route (Tramway) crosses the A465 would be locally prominent. The 2 m high environmental barrier would be visible below the overbridge. The overbridge would present a new viewpoint for views north to the BBNP and south towards Hirwaun Common. The new A465 would however be prominent in close and middle distance views from the overbridge. The magnitude of impact would be **moderate adverse**.	**Large adverse**	<u>Summer Year 15</u> Established mitigation planting and the new road cutting would screen the A465 in views along the Tramway and integrate the A465 into the surrounding landscape in views from the new NMU overbridge. The magnitude of impact would be **moderate adverse.**	**Moderate adverse**
S6-A8 (100 m)	National Cycle Route 46 and Penywaun Public Footpath 3, link 4 (NCR 46 and	0 m	Traffic on A465 generally screened by mature deciduous vegetation and landform in view along route, towards A465 overbridge across NMU route. Traffic visible at close distance in summer and filtered	<u>Construction</u> Localised construction works and removal of existing vegetation associated with the new A465 cutting and NMU overbridge would also be prominent from the NMU route in close and middle distance views. The magnitude of impact would be **major adverse**.	**Large adverse**	<u>Winter Year 1</u> As per operation without mitigation planting. The magnitude of impact would be **moderate adverse.**	**Large adverse**

Reference number[1] with length / area of PRoW / space affected in brackets	PRoW number or land name and designation	Approx. distance from nearest point of receptor to centre line of proposed A465 alignment	Existing view	Change in view and magnitude of impact without mitigation planting	Significance of effect without mitigation planting	Change in view and magnitude of impact with mitigation planting	Significance of effect with mitigation planting
	AUN/3/4) within Special Landscape Area and Cynon Valley River Park, locally designated under Rhondda Cynon Taf Local Development Plan.		views through vegetation at slightly further distance in winter. .	<u>Operation</u> The change from NMU underpass to overbridge with step and ramp access where the NMU route crosses the A465 would be locally prominent. The overbridge would present a new viewpoint for views north to the BBNP and south towards Hirwaun Common. The new A465 would however be prominent in close and middle distance views from the overbridge. The magnitude of impact would be **moderate adverse**.	**Large adverse**	<u>Summer Year 15</u> Established mitigation planting and the new road cutting would screen the A465 in views along the NMU route and integrate the A465 into the surrounding landscape in views from the new NMU overbridge. The magnitude of impact would be **moderate adverse.**	**Moderate adverse**
S6 – A9 (885 m)	Penywaun Public Footpath 7, link 1 (AUN/7/1).	360 m	Wide views west, north and north-east across grassland with scattered trees and scrub. Caravans, outbuildings, dumped rubbish, a large number of pylons and electricity poles, and opencast workings are detracting features in landscape. Longer distance views west to distinctive ridgeline within Hirwaun Common. Blocks of deciduous trees screen edge of Hirwaun to the north-west. Urban edge of Trewaun and Penywaun to north-east. Elevated longer distance and distant views to BBNP and Baverstock ridge. Glimpses of traffic on A465 as it descends from Baverstock ridge towards Hirwaun.	<u>Construction</u> Middle distance views north and north-west of construction of offline section of A465 and major cutting earthworks, south of Hirwaun, and Trewaun junction with adjacent construction compound with stockpiles. Trewaun South temporary diversion and traffic also visible. Loss of some existing vegetation opens up views to construction works to north and north east with longer distance and distant glimpses of construction at Croesbychan and Baverstock including junctions. The magnitude of impact would be **moderate adverse**.	**Moderate adverse**	<u>Winter Year 1</u> As per operation without mitigation planting. The magnitude of impact would be **minor adverse.**	**Moderate adverse**
				<u>Operation</u> Middle distance views of offline section of A465 south of Hirwaun, and the Trewaun junction with associated traffic flow and highway infrastructure, although the mainline of the road would largely be screened by cutting. Longer distance and distant glimpses of A465 with associated traffic flow and highway infrastructure at Croesbychan and Baverstock, including junctions, particularly where the proposed scheme is elevated. The magnitude of impact would be **minor adverse**.	**Moderate adverse**	<u>Summer Year 15</u> Established mitigation planting would partially screen the proposed scheme at the Croesbychan and Trewaun junctions although some middle distance and longer distance and distant glimpses of the A465 with associated traffic flow and highway infrastructure would remain. The magnitude of impact would be **minor adverse.**	**Slight adverse**

Reference number[1] with length / area of PRoW / space affected in brackets	PRoW number or land name and designation	Approx. distance from nearest point of receptor to centre line of proposed A465 alignment	Existing view	Change in view and magnitude of impact without mitigation planting	Significance of effect without mitigation planting	Change in view and magnitude of impact with mitigation planting	Significance of effect with mitigation planting
S6-A10 (750 m)	Penywaun Public Footpath 10, link 1 (AUN/10/1).	475 m	Wide views north and north-east across grassland with scattered trees and scrub. Pylons and opencast workings are detracting features in landscape to north and north-west. Distinctive ridgeline within Hirwaun Common in longer distance views west. Blocks of deciduous trees screen edge of Hirwaun to north-west. Urban edge of Trewaun and Penywaun to north-east. Elevated longer distance to distant views to BBNP and Baverstock ridge with glimpses of the A465 and traffic. Pylons and gas works are detracting features in the distance.	<u>Construction</u> Middle to longer distance views of construction of offline section of A465 and major cutting earthworks, south of Hirwaun, and Trewaun junction with adjacent construction compound with stockpiles. Trewaun South temporary diversion and traffic also visible. Longer distance and distant glimpses of construction at Croesbychan and Baverstock (including major earthworks activities for deep cutting) to north-east and Hirwaun to north-west, including junctions, particularly from higher ground to the south. These glimpses increased through the loss of some existing vegetation along the existing road as a result of construction. The magnitude of impact would be **minor adverse**.	**Moderate adverse**	<u>Winter Year 1</u> As per operation without mitigation planting. The magnitude of impact would be **minor adverse.**	**Slight adverse**
				<u>Operation</u> Middle to longer distance views of offline section of A465 south of Hirwaun and Trewaun junction, with associated traffic flow and highway infrastructure. Longer distance and distant glimpses of A465 with associated traffic flow and highway infrastructure, at Croesbychan and Baverstock (including deep cutting) to north-east and Hirwaun to north-west, including junctions, particularly from higher ground to the south. The magnitude of impact would be **minor adverse**.	**Slight adverse**	<u>Summer Year 15</u> Established mitigation planting would partly screen traffic flow and highway infrastructure at Croesbychan, Hirwaun and Trewaun junctions. Longer distance and distant glimpses of A465 with associated traffic flow and highway infrastructure and deep cutting at Baverstock, looking north-east, would remain. The magnitude of impact would be **minor adverse**.	**Slight adverse**
S6-A11 (440 m)	Penywaun Public Footpaths 12 and 13 (AUN/12/1 and AUN/13/1/10).	810 m	Wide distant elevated views north to north-east across rough grassland, fields, woodland and scattered properties to the BBNP and Baverstock ridge. Glimpses of traffic on the A465, including the Nant Hir viaduct, as it descends from Baverstock ridge towards Hirwaun, particularly in winter, when deciduous vegetation does not screen road as well.	<u>Construction</u> Distant views to construction of widened Nant Hir viaduct and elevated A465 between Nant Hir viaduct and Baverstock junction, including major earthworks and attenuation ponds. Also possible glimpses of construction at Croesbychan junction. The magnitude of impact would be **minor adverse**.	**Moderate adverse**	<u>Winter Year 1</u> As per operation without mitigation planting. The magnitude of impact would be **minor adverse**.	**Slight adverse**
				<u>Operation</u> Distant views north-east to Baverstock junction, widened Nant Hir viaduct and A465 mainline between Nant Hir viaduct and Baverstock junction with associated traffic flow and highway infrastructure, including overbridge, signage and lighting columns / light spill. The magnitude of impact would be **minor adverse**.	**Slight adverse**	<u>Summer Year 15</u> Established mitigation planting would soften views to Baverstock junction and screen parts of traffic flow on A465 mainline, though much of the route would be left open without any mitigation proposed. Light spill would remain more noticeable at junction. The magnitude of impact would be **minor adverse**.	**Slight adverse**

Reference number[1] with length / area of PRoW / space affected in brackets	PRoW number or land name and designation	Approx. distance from nearest point of receptor to centre line of proposed A465 alignment	Existing view	Change in view and magnitude of impact without mitigation planting	Significance of effect without mitigation planting	Change in view and magnitude of impact with mitigation planting	Significance of effect with mitigation planting
S6-A12 (85 m)	Hirwaun Public Footpath 6, link 1 (HIR/6/1).	18 m	View south along path enclosed by deciduous trees. Slightly elevated close view to traffic on A465 as path approaches A465 underpass. Filtered views through trees to traffic from slightly further distance in the winter.	<u>Construction</u> Close view south along footpath of elevated A465 immediately beyond. Visibility of works increased through the loss of some existing roadside vegetation. The magnitude of impact would be **major adverse**.	**Large adverse**	<u>Winter Year 1</u> As per operation without mitigation planting. The magnitude of impact would be **major adverse**.	**Large adverse**
				<u>Operation</u> Close view south along footpath of the A465, with associated traffic flow and highway infrastructure. Visibility of the road increased through the loss of existing roadside vegetation. The magnitude of impact would be **major adverse**.	**Large adverse**	<u>Summer Year 15</u> Close view south along footpath of the A465, with associated traffic flow and highway infrastructure. Established mitigation planting would provide some screening. The magnitude of impact would be **moderate adverse**.	**Moderate adverse**
S6-A13 (350 m)	Penywaun Public Footpath 1, link 1 (AUN/1/1) within Cynon Valley River Park, locally designated under Rhondda Cynon Taf Local Development Plan Policy NSA 26.	18 m	Close views of A465 and traffic looking north and north-west along approach to A465, although some screening provided by existing roadside vegetation. Further east dense mature woodland vegetation alongside the footpath and landform contain views. Pylons are detracting features in landscape.	<u>Construction</u> Close view north and north-west along footpath of construction of the A465. Visibility of works increased through the loss of most existing roadside vegetation. The magnitude of impact would be **major adverse**.	**Large adverse**	<u>Winter Year 1</u> As per operation without mitigation planting. The magnitude of impact would be **moderate adverse**.	**Large adverse**
				<u>Operation</u> Close view north and north-west along footpath of the A465, with associated traffic flow and highway infrastructure. Visibility of the road increased through the loss of existing roadside vegetation. The magnitude of impact would be **moderate adverse**.	**Large adverse**	<u>Summer Year 15</u> Close view north and north-west along footpath of the A465, with associated traffic flow and highway infrastructure. Some screening provided by established mitigation planting. The magnitude of impact would be **moderate adverse**.	**Moderate adverse**
S6-A14 (370 m)	Hirwaun Public Footpath 7, link 1 (HIR/7/1).	145 m	Gellitarw cottages and adjacent vegetation screen views of the A465 from the southern part of path. View west across open field to belt of trees along A465 and Court Lodge junction with Croes Bychan Road. Glimpsed middle distance views in summer and filtered views through trees in winter to traffic on A465. Views north to traffic on Croes Bychan Road and tree belt along A465 beyond.	<u>Construction</u> Close view of construction of attenuation pond and new roundabout on Croes Bychan Road. Middle distance views of A465 construction to the west and north, including Croesbychan junction exacerbated by loss of existing roadside vegetation. The magnitude of impact would be **moderate adverse**.	**Large adverse**	<u>Winter Year 1</u> As per operation without mitigation planting. The magnitude of impact would be **moderate adverse**.	**Moderate adverse**
				<u>Operation</u> Close view of attenuation pond and new roundabout on Croes Bychan Road, with associated lighting and signage. Middle distance views of A465 to the west and north, including Croesbychan junction, with associated traffic flow and highway infrastructure including 1 m high environmental barrier, exacerbated by loss of existing roadside vegetation. The magnitude of impact would be **moderate adverse**.	**Moderate adverse**	<u>Summer Year 15</u> Close view of attenuation pond and new roundabout on Croes Bychan Road, with associated lighting and signage, and middle distance views of A465 to the west and north, including Croesbychan junction, with associated traffic flow and highway infrastructure, would be partially screened by established mitigation planting. The magnitude of impact would be **minor adverse**.	**Slight adverse**

Reference number[1] with length / area of PRoW / space affected in brackets	PRoW number or land name and designation	Approx. distance from nearest point of receptor to centre line of proposed A465 alignment	Existing view	Change in view and magnitude of impact without mitigation planting	Significance of effect without mitigation planting	Change in view and magnitude of impact with mitigation planting	Significance of effect with mitigation planting
S6-A15 (910 m)	Hirwaun Public Footpath 4, links 1- 3 (HIR/4/1, HIR/4/2 and HIR/4/3), and Hirwaun Public Footpath 5, links 1 and 2 (HIR/5/1 and HIR/5/2).	0 m	Footpaths cross the A465. There are closed glimpsed views in summer and filtered views in winter to traffic on the road, as the paths approach the crossings. Elsewhere, views are generally contained by deciduous woodland and mature tree belts, although there are views in places across fields.	Construction Close view of construction of A465 and Croesbychan junction including major embankment earthworks activities, exacerbated by loss of existing roadside vegetation. The magnitude of impact would be **major adverse**.	**Very large adverse**	Winter Year 1 As per operation without mitigation planting. The magnitude of impact would be **major adverse**.	**Large adverse**
				Operation Close views north, south and west (depending on viewpoint location) of A465 and Croesbychan junction, elevated mainline and sliproads, all with associated traffic flow and highway infrastructure including overbridge, signage, lighting columns / light spill and 1 m high environmental barrier. New roundabout on Croes Bychan Road, with associated lighting and signage, visible to the south. The magnitude of impact would be **major adverse**.	**Large adverse**	Summer Year 15 Close views of A465 and Croesbychan junction, elevated mainline and sliproads, with associated traffic flow and highway infrastructure including overbridge, signage and lighting columns / light spill partially screened by established mitigation planting. New roundabout on Croes Bychan Road, with associated lighting and signage, also partially screened by established mitigation planting. The magnitude of impact would be **moderate adverse**.	**Moderate adverse**
S6-A16 (720 m)	Hirwaun Public Footpath 3, link 1 (HIR/3/1).	0 m	View west and south-west across fields towards tree belts and woodlands. Distant views to Hirwaun and distinctive ridgeline within Hirwaun Common. Pylons are detracting features in landscape in middle distance. Views south-east and east to deciduous tree belt on cutting along A465. Filtered middle distance views south-east through deciduous trees to high-sided vehicles on A465, especially in winter.	Construction Close and middle distance views of construction of elevated A465 and attenuation pond access tracks including major embankment and underpass earthworks activities, exacerbated by loss of existing roadside vegetation. The magnitude of impact would be **major adverse**.	**Large adverse**	Winter Year 1 As per operation without mitigation planting. The magnitude of impact would be **major adverse**.	**Large adverse**
				Operation Close and middle distance views of elevated A465, with associated traffic flow and highway infrastructure. Attenuation pond access tracks also visible. Loss of roadside vegetation. The magnitude of impact would be **major adverse**.	**Large adverse**	Summer Year 15 Some close and middle distance views of elevated A465, with associated traffic flow and highway infrastructure would remain. Attenuation pond access tracks also visible. Some screening by established mitigation planting. The magnitude of impact would be **moderate adverse**.	**Moderate adverse**
S6-A17 (295 m)	Hirwaun Public Footpath 3, link 1 (HIR/3/1).	0 m	Views south-west across fields to mature tree belts. Stables with small mennage at Bleannant Hir Isaf Farm immediately adjacent to path. Penywaun and distinctive ridgeline within Hirwaun Common in background. View from NMU bridge across A465 to traffic in	Construction Close and middle distance views of construction of elevated A465 and attenuation pond access tracks including major embankment and underpass earthworks activities, exacerbated by loss of existing roadside vegetation. Some existing roadside vegetation on south side of road retained. Glimpses of A465 Nant Hir viaduct construction. The magnitude of impact would be **major adverse**.	**Large adverse**	Winter Year 1 As per operation without mitigation planting. The magnitude of impact would be **major adverse**.	**Large adverse**

Reference number[1] with length / area of PRoW / space affected in brackets	PRoW number or land name and designation	Approx. distance from nearest point of receptor to centre line of proposed A465 alignment	Existing view	Change in view and magnitude of impact without mitigation planting	Significance of effect without mitigation planting	Change in view and magnitude of impact with mitigation planting	Significance of effect with mitigation planting
			cutting lined with mature trees. Views north include Nant Hir Reservoir and arched viaduct carrying the existing A465 across the reservoir.	<u>Operation</u> Close and middle distance views of elevated A465, with associated traffic flow and highway infrastructure, partially screened by retained existing vegetation on south side of road. Attenuation pond access tracks also visible. Loss of roadside vegetation. The magnitude of impact would be **major adverse**.	**Large adverse**	<u>Summer Year 15</u> Some close and middle distance views of elevated A465, with associated traffic flow and highway infrastructure would remain. Attenuation pond access tracks also visible. Some limited screening by localised established mitigation planting. The magnitude of impact would be **moderate adverse**.	**Moderate adverse**
S6-A18 (450 m)	National Cycle Route 46 (NCR 46).	0 m	Views north from southern part of route generally contained by hedgerows and trees along road. Small number of glimpsed views to high-sided vehicles on A465 in summer. Filtered views through hedgerow to vehicles on A465 in winter. Middle distance views north and north-east from northern part of route on Crematorium Road across grassland to glimpses of high-sided vehicles and upper three-quarters of light columns on A465, set against backdrop of woodland.	<u>Construction</u> Close and middle distance views of construction of elevated A465 at Baverstock junction, the junction roundabouts and attenuation pond, including major earthworks activities. Views of construction exacerbated by some loss of existing vegetation. The magnitude of impact would be **major adverse**.	**Large adverse**	<u>Winter Year 1</u> As per operation without mitigation planting. The magnitude of impact would be **major adverse**.	**Large adverse**
				<u>Operation</u> Mainly close views, with intermittent middle distance views, of elevated A465 at Baverstock junction, with associated traffic flow and highway infrastructure including overbridge, signage, lighting columns / light spill, new roundabout and attenuation pond. The magnitude of impact would be **major adverse**.	**Large adverse**	<u>Summer Year 15</u> Close views, and intermittent middle distance views, of elevated A465, with associated traffic flow and highway infrastructure would remain. Attenuation pond would also be visible. Some limited screening by localised established mitigation planting. The magnitude of impact would be **major adverse**.	**Large adverse**
S6-A19 (65 ha)	Mynydd y glog Countryside and Rights of Way Act Open Access Land and Registered Common Land within BBNP.	260 m	Views east towards Baverstock ridge with gas works visible breaking the skyline. Broad panorama south and south east across Hirwaun to hills and Hirwaun Common, in distance on south side of valley. Glimpsed views south in summer and filtered descending views in winter, from south-eastern corner of land, along wooded valley at Nant Hir Reservoir to high-sided vehicles on A465 Nant Hir Viaduct.	<u>Construction</u> Distant views east of construction of Baverstock junction, including major earthworks activities, creating slight notch in skyline. Middle distance views of construction of cutting between chainages 6400 and 6650, although cutting itself would screen much of the construction activity. Some loss of existing roadside vegetation would be apparent. The magnitude of impact would be **moderate adverse**.	**Moderate adverse**	<u>Winter Year 1</u> As per operation without mitigation planting. The magnitude of impact would be **minor adverse**.	**Slight adverse**
				<u>Operation</u> Baverstock junction just visible in distant views, with a slight notch in the skyline. Cutting between chainages 6400 and 6650 would largely screen A465, with associated traffic flow and highway infrastructure. The magnitude of impact would be **minor adverse**.	**Slight adverse**	<u>Summer Year 15</u> Baverstock junction would remain visible in distant views east, with a slight notch in the skyline. Some screening by established mitigation planting. The magnitude of impact would be **negligible adverse**.	**Slight adverse**

Reference number[1] with length / area of PRoW / space affected in brackets	PRoW number or land name and designation	Approx. distance from nearest point of receptor to centre line of proposed A465 alignment	Existing view	Change in view and magnitude of impact without mitigation planting	Significance of effect without mitigation planting	Change in view and magnitude of impact with mitigation planting	Significance of effect with mitigation planting
S6-A20 (110 ha)	Penmoelallt Forest and Countryside and Rights of Way Act Open Access Land (partially within BBNP).	30 m	Longer distance views south from edge of forest and moorland, looking across moorland to Jah Jireh Care Home, traffic and lighting columns on A465. In places, views are screened in summer and filtered in winter through intermittent vegetation along A465. Glimpsed views to Baverstock junction. Several pylons are detracting features in landscape. Mynydd Aberdar in background. Views from south-eastern edge to traffic on A470 approaching A470 junction.	<u>Construction</u> From edge of forest and open areas, close, middle distance and longer distance views south of construction of A465 on embankment including major earthworks activities, and attenuation pond access track on north side of A465. Upper part of Baverstock cutting works visible although much of construction screened by the cutting. Longer distance views to south-east of A470 junction and Taf Fawr viaduct structures construction. The magnitude of impact would be **moderate adverse**.	**Large adverse**	<u>Winter Year 1</u> As per operation without mitigation planting. The magnitude of impact would be **moderate adverse**.	**Large adverse**
				<u>Operation</u> From edge of forest and open areas, close, middle distance and longer distance views south of A465 on embankment with associated traffic flow and highway infrastructure. Attenuation pond access track also visible. Upper part of south face of Baverstock cutting visible, although cutting would also screen part of A465. Longer distance view to south-east of A470 junction including slip roads, roundabouts and Taf Fawr viaducts, with associated traffic flow and lighting columns / light spill. The magnitude of impact would be **moderate adverse**.	**Large adverse**	<u>Summer Year 15</u> Close, middle distance and longer distance views of A465 and attenuation pond access track would remain. Baverstock cutting would be screened by established mitigation planting. Longer distance view to south-east of A470 junction would remain. The magnitude of impact would be **moderate adverse**.	**Moderate adverse**
S6-A21 (95 ha)	Mynydd Aberdar Countryside and Rights of Way Act Open Access Land (including scheduled ancient monument - Iron Ore Scours and Patch Workings at Winch Fawr, Merthyr Tydfil).	0 m	Close partial views from northern-most corner of open access land to traffic and lighting columns at Baverstock junction, with Jah Jireh Care Home in background Wide views from north-facing part of open access land, north across moorland to traffic and lighting columns on A465. Very sparse scattered vegetation along A465 provides limited screening in summer. Several pylons are detracting features in landscape. BBNP in background. Wide close and middle distance views north-east to properties within Gellideg. A465 and A470 generally screened by properties and vegetation. BBNP in background.	<u>Construction</u> Close, middle distance and longer distance views north of construction of A465 on embankment including major earthworks activities. Some of Baverstock cutting works visible although much of construction screened by the cutting. Longer distance glimpses to east / north-east of A470 junction and Taf Fawr viaduct structures construction. The magnitude of impact would be **moderate adverse**.	**Large adverse**	<u>Winter Year 1</u> As per operation without mitigation planting. The magnitude of impact would be **moderate adverse**.	**Moderate adverse**
				<u>Operation</u> Close, middle distance and longer distance views south of A465 on embankment with associated traffic flow and highway infrastructure. Part of Baverstock cutting visible, although cutting would also screen part of A465. Longer distance glimpses east / north-east of A470 junction including slip roads, roundabouts and Taf Fawr viaducts, with associated traffic flow, signage and lighting columns / light spill. The magnitude of impact would be **moderate adverse**.	**Moderate adverse**	<u>Summer Year 15</u> Close, middle distance and longer distance views of A465 on embankment, with associated traffic flow and highway infrastructure, would remain and part of Baverstock cutting would be visible. Longer distance glimpses to east / north-east of A470 junction would remain. The magnitude of impact would be **moderate adverse**.	**Moderate adverse**

Reference number[1] with length / area of PRoW / space affected in brackets	PRoW number or land name and designation	Approx. distance from nearest point of receptor to centre line of proposed A465 alignment	Existing view	Change in view and magnitude of impact without mitigation planting	Significance of effect without mitigation planting	Change in view and magnitude of impact with mitigation planting	Significance of effect with mitigation planting
S6-A22 (1.9 km)	National Cycle Route 46 (NCR 46) under negotiation.	45 m	Route would run parallel with the A465. Close views west to traffic and lighting at Baverstock junction and north to traffic and lighting on A465, filtered in places by sparse vegetation. Distant ascending panoramic views east to north-east, to Gurnos and Y Graig woodland, with hills in the BBNP in the background.	<u>Construction</u> Close views of A465 construction activities including major earthworks activities associated with the Baverstock cutting. Route would however, be closed and / or re-routed for part of construction period. The magnitude of impact would be **major adverse**.	**Very large adverse**	<u>Winter Year 1</u> As per operation without mitigation planting. The magnitude of impact would be **major adverse**.	**Large adverse**
				<u>Operation</u> Cycle route re-routed along new Swansea Road. Close views of A465 and Swansea Road with associated traffic flow and highway infrastructure. Baverstock cutting highly visible. The magnitude of impact would be **major adverse**.	**Large adverse**	<u>Summer Year 15</u> Some screening of A465 by established mitigation planting, but close views of parts of the A465 and Swansea Road, with associated traffic flow and highway infrastructure would remain. The magnitude of impact would be **major adverse**.	**Large adverse**
S6-A23 (640 m)	National Cycle Route 46 (NCR 46).	80 m	Lower level views north-west to north-east generally contained by trees and / or properties. Elevated, often glimpsed longer distance, views to Trefechan, Cefn Coed, Gurnos and hills within BBNP in background. Tops of light columns on A465 and filtered glimpses through trees to traffic on A465 in views north at western extent of route. Glimpsed and filtered middle distance view in winter across fields and trees to high-sided vehicles, signage and tops of lighting columns on A465, from bus-stop on Swansea Road. Glimpsed longer distance views from Heol Llwyn Brain, to tops of lighting columns on approach to A465 Taf Fechan viaduct and view of viaduct with traffic. Close glimpsed views, through and above vegetation in summer, and filtered in winter, from route approaching underpass below A470, to traffic, lighting columns and signage on A470 approaching junction with A465 in foreground.	<u>Construction</u> Close and middle distance views of A465 construction activities including major earthworks activities associated with the Baverstock cutting. Route would however, be closed and / or re-routed for part of construction period. Close views of Taf Fawr viaduct structures construction from east section of cycle route. The magnitude of impact would be **major adverse**.	**Very large adverse**	<u>Winter Year 1</u> As per operation without mitigation planting. The magnitude of impact would be **major adverse**.	**Large adverse**
				<u>Operation</u> Cycle route re-routed along new Swansea Road. Close and middle distance views of A465 and Swansea Road, with associated traffic flow and highway infrastructure, from west part of cycle route. Baverstock cutting highly visible. Close views of Taf Fawr viaduct structures from east section of cycle route. The magnitude of impact would be **major adverse**.	**Large adverse**	<u>Summer Year 15</u> Some screening of A465 by established mitigation planting, but close and middle distance views of parts of the A465 and Swansea Road, with associated traffic flow and highway infrastructure would remain for west part of cycle route. Close views of Taf Fawr viaduct structures from east section of cycle route would remain. The magnitude of impact would be **major adverse**.	**Large adverse**

Reference number[1] with length / area of PRoW / space affected in brackets	PRoW number or land name and designation	Approx. distance from nearest point of receptor to centre line of proposed A465 alignment	Existing view	Change in view and magnitude of impact without mitigation planting	Significance of effect without mitigation planting	Change in view and magnitude of impact with mitigation planting	Significance of effect with mitigation planting
S5-A1 (521 m)	National Cycle Route 8 (NCR 8) and Park Public Bridleway 3 (113/3) and Vaynor Public Bridleway 38 (111/38).	0 m	Highly cherished and historic views looking 360 degree views from Cefn Coed Viaduct across river valley. A470 Viaduct with traffic and lighting columns in close views south-west. Glimpses of signage on approach to junction with A465. Gellideg and woodlands within BBNP in middle distance. Pylons are detracting features. A465 Taf Fawr viaduct prominent to north in middle distance. A470 junction screened in views west by mature deciduous trees, although tops of lighting columns and glimpses of high-sided vehicles visible above vegetation. Where the route crosses the A465 to the east, close to middle distance views north along Taf Fechan valley, and east to A465 Taf Fechan viaduct with traffic and lighting. Middle distance view west to Cefn Coed High Street bridge.	<u>Construction</u> Construction activities associated with the A470 junction and Taf Fawr viaduct structures prominent in middle distance views to the north-west. Visibility of construction works, partly exacerbated by loss of existing vegetation. Upper parts of major cutting earthworks activities in north-west quadrant of junction also visible with loss of existing vegetation. Where the route crosses the A465 to the east, close views east and west of road construction activities including cutting earthworks activities. Construction of the Taf Fechan viaduct prominent to the east, and Cefn Coed High Street bridge to west Significant loss of existing roadside and gorge vegetation. The magnitude of impact would be **major adverse**.	**Very large adverse**	<u>Winter Year 1</u> As per operation without mitigation planting. The magnitude of impact would be **major adverse**.	**Large adverse**
				<u>Operation</u> A470 junction and Taf Fawr viaduct structures prominent in middle distance views to the north-west, with associated traffic flow and highway infrastructure, including signage, lighting columns / light spill. Upper parts of major cutting for slip road in north-west quadrant of junction also visible as 'scar' in landscape. Where the route crosses the A465 to the east (on new realigned overbridge), close views east and west of A465, with associated traffic flow and highway infrastructure, including signage, lighting columns / light spill. Taf Fawr slip roads and new cutting faces also visible edged with 2 and 3 m high environmental barriers in places. Widened Taf Fechan viaduct visible to the east and new Cefn Coed High Street bridge, to west. The magnitude of impact would be **major adverse**.	**Large adverse**	<u>Summer Year 15</u> A470 junction and Taf Fawr viaduct structures would remain prominent in middle distance views to the north-west, with associated traffic flow and highway infrastructure, including signage, lighting columns / light spill. Upper parts of major cutting for slip road in north-west quadrant of junction would blend into landscape with establishment of mitigation planting and recolonisation of cutting. Where the route crosses the A465 to the east (on new realigned overbridge), close views east and west of A465, with associated traffic flow and highway infrastructure would remain. Taf Fawr slip roads and new cutting faces, edged with environmental barriers in places, softened by recolonisation. Widened Taf Fechan viaduct would remain visible to the east and new Cefn Coed High Street bridge, to west. The magnitude of impact would be **major adverse**.	**Large adverse**
S5-A2 (1 km)	Vaynor Public Bridleway 32 (111/32).	320 m	Close views south to detracting pylon, properties and trees. Descending panoramic with longer distance views south-west to north-east. Gellideg and Mynydd Aberdar to south-west. Merthyr Tydfil, Y Graig woodland and Gurnos against a mountainous background to south-east. Tree-belt along A465	<u>Construction</u> Construction of A465 visible in longer distance views to south-east including major earthworks activities associated with attenuation ponds between chainages 12300 and 12500 north side and embankments to mainline and attenuation pond access roads. Visibility of works exacerbated by loss of existing roadside vegetation and adjacent mature tree belts. The magnitude of impact would be **moderate adverse**.	**Moderate adverse**	<u>Winter Year 1</u> As per operation without mitigation planting. The magnitude of impact would be **moderate adverse**.	**Moderate adverse**

Reference number[1] with length / area of PRoW / space affected in brackets	PRoW number or land name and designation	Approx. distance from nearest point of receptor to centre line of proposed A465 alignment	Existing view	Change in view and magnitude of impact without mitigation planting	Significance of effect without mitigation planting	Change in view and magnitude of impact with mitigation planting	Significance of effect with mitigation planting
			clearly visible in middle distance views west, with glimpses of traffic in summer. Filtered views of traffic through trees in winter. Near floodlighting at sports ground and chimney at Prince Charles Hospital in middle distance are detracting features in landscape.	<u>Operation</u> Longer distance views of A465, with associated traffic flow and highway infrastructure, to south-east and embankments associated with attenuation ponds between chainages 12300 and 12500 north side, and access road to ponds and A465 main line. Part of mainline screened by cutting. The magnitude of impact would be **moderate adverse**.	**Moderate adverse**	<u>Summer Year 15</u> Longer distance views of A465, with associated traffic flow and highway infrastructure, to south-east and embankments associated with attenuation ponds between chainages 12300 and 12500 north side, and access road to ponds and A465 main line. Part of mainline screened by cutting and establishment of mitigation planting. The magnitude of impact would be **minor adverse**.	**Slight adverse**
S5-A3 (180 ha)	Countryside and Rights of Way Act Open Access Land, also allocated as Cilsanws Open Space.	230 m	Descending panoramic middle distance to distant views across moorland south-west to north-east. Distant glimpses of A465 as it descends from Baverstock ridge to south-west. A465 Taf Fawr Viaduct, A470 junction and A470 approach to junction, including traffic and lighting columns visible to south-west, with fields with hedgerows and trees within BBNP, Gellideg and Mynydd Aberdar in background. Merthyr Tydfil, Y Graig woodland and Gurnos against a mountainous background to south-east. Tree-belt along A465 clearly visible in middle distance views east, with glimpses of traffic in summer and filtered views of traffic through trees in winter. Views south-west framed by trees, across wooded Taf Fawr valley to fields with hedgerows and trees within BBNP. A465 Taf Fawr Viaduct and A470 junction in middle distance, including traffic and lighting columns.	<u>Construction</u> Descending middle to longer distance views south-west to construction of A470 junction, including major earthworks and loss of vegetation, construction of elevated A465 mainline and highway infrastructure. Also distant glimpses of construction of A465 mainline at Baverstock ridge. Longer distance views south-east to demolition of Trade Centre Wales and construction of expanded Prince Charles Hospital junction and, offline and widened A465 mainline including major earthworks activities associated with attenuation ponds near Gurnos Farm and embankments to mainline and attenuation pond access roads. Visibility of works exacerbated by loss of existing roadside vegetation and adjacent mature tree belts. The magnitude of impact would be **moderate adverse**.	**Moderate adverse**	<u>Winter Year 1</u> As per operation without mitigation planting. The magnitude of impact would be **moderate adverse**.	**Moderate adverse**
				<u>Operation</u> Descending middle to longer distance views south-west to traffic flow on A470 junction, including elevated A465 mainline, as well as highway infrastructure such as signage, lighting columns / light spill. Slight change to skyline at Baverstock ridge and distant glimpses of traffic visible. Longer distance views of offline and widened A465 mainline, with associated traffic flow and highway infrastructure, to south-east and embankments associated with attenuation ponds and associated access roads near Gurnos Farm, and A465 main line. Part of mainline through Y Graig screened by cutting and existing trees. Also views of traffic and highway infrastructure, such as signage, lighting columns / light spill at expanded Prince Charles Hospital junction, opened up by loss of trees. The magnitude of impact would be **moderate adverse.**	**Moderate adverse**	<u>Summer Year 15</u> Established mitigation planting would screen attenuation pond at A470 junction and generally soften views of junction to south-west to some extent, though traffic flow on elevated A465 and parts of junction slips would remain visible. Established mitigation planting, in combination with localised cutting and existing vegetation, would generally screen longer distance views to A465 mainline, though some filtered glimpses of attenuation ponds near Gurnos Farm and tops of vehicles would remain. Longer distance to distant views of Prince Charles Hospital junction would also be softened and partially obscured by established mitigation planting, though some glimpses of traffic and tops of lighting columns /light spill would remain. The magnitude of impact would be **minor adverse.**	**Slight adverse**

Reference number[1] with length / area of PRoW / space affected in brackets	PRoW number or land name and designation	Approx. distance from nearest point of receptor to centre line of proposed A465 alignment	Existing view	Change in view and magnitude of impact without mitigation planting	Significance of effect without mitigation planting	Change in view and magnitude of impact with mitigation planting	Significance of effect with mitigation planting
S5-A4 (1.1 km)	Vaynor Public Footpath 43 and 45 (111/43 and 111/45).	0 m	Footpath is enclosed by overhanging trees either side of A465. Dark underpass below A465.	Construction Close views of construction of Taf Fawr viaducts exacerbated by some loss of existing vegetation. Localised re-routing of footpaths during construction. The magnitude of impact would be **major adverse**.	**Very large adverse**	Winter Year 1 As per operation without mitigation planting. The magnitude of impact would be **minor adverse**.	**Moderate adverse**
				Operation Removal of underpass with more open route under viaducts partly offsets greater extent of Taf Fawr viaduct structures overhead in close views. The magnitude of impact would be **moderate adverse**.	**Moderate adverse**	Summer Year 15 Little change in view by Year 15. Taf Fawr viaduct structures prominent overhead in close views. The magnitude of impact would be **minor adverse**.	**Moderate adverse**
S5-A5 (830 m) (5.5 ha)	Vaynor Public Footpath 35 (111/35) and Taf Fechan Nature Reserve Open Space allocation.	12 m	Close filtered views and occasional clear views, through gaps in vegetation, to traffic on A465, to the south. Traffic more visible in winter. Y Graig woodland and tree belt along A465 in background. Pylons are detracting features in landscape.	Construction Close views of construction of Taf Fechan viaduct exacerbated by some loss of existing vegetation. Construction of A465 visible to south including major earthworks activities associated with attenuation ponds between chainages 12300 and 12500 north side and embankments to mainline and attenuation pond access roads. Visibility of works exacerbated by loss of existing roadside vegetation and adjacent mature tree belts. Localised re-routing of footpath during construction. The magnitude of impact would be **moderate adverse**.	**Moderate adverse**	Winter Year 1 As per operation without mitigation planting. The magnitude of impact would be **moderate adverse**.	**Moderate adverse**
				Operation Close views to south and west of A465 and widened Taf Fechan viaduct, with associated traffic flow and highway infrastructure. Embankments associated with attenuation ponds between chainages 12300 and 12500 north side, and access road to ponds and A465 main line also visible in close views. Part of A465 mainline moves further away to the south and would be screened by cutting and retained existing vegetation in middle distance views. The magnitude of impact would be **moderate adverse**.	**Moderate adverse**	Summer Year 15 Established mitigation planting would effectively screen embankments associated with attenuation ponds and access road to ponds and A465 main line, with associated traffic flow and highway infrastructure. Minor change to views west of widened Taf Fechan viaduct, with associated traffic. The magnitude of impact would be **minor adverse**.	**Slight adverse**
S5-A6 (610 m) (5.5 ha as for S5-A5)	Vaynor Public Footpath 34 (111/34) and Taf Fechan Nature Reserve Open Space	0 m	Close and middle distance elevated views north, south, south-west and above and glimpses through mature deciduous trees, to A465 Taf Fechan viaduct with traffic. More extensive filtered views to	Construction Close and middle distance views to north, south, south-west and above of Taf Fechan viaduct widening construction and working areas, exacerbated by significant loss of mature existing woodland in gorge. The magnitude of impact would be **major adverse**.	**Very large adverse**	Winter Year 1 As per operation without mitigation planting. The magnitude of impact would be **moderate adverse**.	**Moderate adverse**

Reference number[1] with length / area of PRoW / space affected in brackets	PRoW number or land name and designation	Approx. distance from nearest point of receptor to centre line of proposed A465 alignment	Existing view	Change in view and magnitude of impact without mitigation planting	Significance of effect without mitigation planting	Change in view and magnitude of impact with mitigation planting	Significance of effect with mitigation planting
	allocation.		arch structure and traffic in winter. Views south to tall rock face with deciduous and evergreen vegetation belt along A465. Filtered views in winter of high-sided vehicles.	Operation Close and middle distance views to north, south, south-west and above of A465 and widened Taf Fechan viaduct, with associated traffic flow and highway infrastructure. The magnitude of impact would be **moderate adverse**.	**Moderate adverse**	Summer Year 15 Close and middle distance views to north, south, south-west and above of A465 and widened Taf Fechan viaduct, with associated traffic flow and highway infrastructure would remain in long term. The magnitude of impact would be **moderate adverse**.	**Moderate adverse**
S5-A7 (19.6 ha)	Countryside and Rights of Way Act Open Access Land and natural / semi natural greenspace at Y Graig.	0 m	Close intermittent views north of A465 and traffic although screening is provided by mature roadside vegetation and scattered trees and scrub. Development at Gurnos and Cefn Coed visible in close and middle distance views to east and west respectively. A465 rising up to the Baverstock ridge visible in distance to the west with hills of the BBNP forming the backdrop to the north and north-west.	Construction The proposed scheme would cut across the area and construction of the A465 would be highly visible in close and middle distance views to north and south. This would include views of major earthworks activities associated with the attenuation pond between chainages 11650 and 11760 south side and embankments / cuttings to mainline and attenuation pond access roads. Visibility of works would be exacerbated by loss of existing roadside and other existing vegetation. The magnitude of impact would be **major adverse**.	**Very large adverse**	Winter Year 1 As per operation without mitigation planting. The magnitude of impact would be **moderate adverse**.	**Large adverse**
				Operation The A465 would be largely screened by cutting to the north-east / south - east. Some close oblique views into the cutting would however, be possible with the road and associated traffic flow and highway infrastructure visible. The A465 and associated traffic flow and highway infrastructure would be prominent to the north-west / south-west where on slight embankment. Embankments associated with the attenuation pond and access roads would also be visible in close and middle distance views. Some longer distance and distant views to the west of the A470 junction with associated infrastructure including light columns / light spill, and the A465 as it rises up to the Baverstock ridge. The magnitude of impact would be **moderate adverse**.	**Large adverse**	Summer Year 15 Established mitigation planting would provide effective screening to the A465 in close and middle distance views to the north-west / south-west where it is on slight embankment. The attenuation pond would also be screened by planting although the pond access roads would remain visible. The longer distance and distant views to the west of the A470 junction and the A465 as it rises up to the Baverstock ridge would remain. Visibility of the highway infrastructure would however, be reduced by established mitigation planting in those areas. Close and middle distance views to north, south, south-west and above of A465 and widened Taf Fechan viaduct, with associated traffic flow and highway infrastructure would remain in long term. The magnitude of impact would be **minor adverse**.	**Slight adverse**
S5-A8 (540 m)	Bridleway / byway Merthyr 1 (103/1).	0 m	Route crosses A465 through an unpleasant underpass. Close views either side of A465 and traffic. Further north towards Pontsarn Road there are pleasant views south across grassland fields with wooded field boundaries. Settlement areas of Merthyr Tydfil	Construction Route diverted at site of Prince Charles Hospital junction. Close and middle distance views of construction of elevated Prince Charles Hospital junction and slip roads, particularly on north side of A465. Earthworks activities associated with formation of mainline A465 / junction embankments and attenuation ponds also prominent. The magnitude of impact would be **major adverse**.	**Large adverse**	Winter Year 1 As per operation without mitigation planting. The magnitude of impact would be **major adverse**.	**Large adverse**

Reference number[1] with length / area of PRoW / space affected in brackets	PRoW number or land name and designation	Approx. distance from nearest point of receptor to centre line of proposed A465 alignment	Existing view	Change in view and magnitude of impact without mitigation planting	Significance of effect without mitigation planting	Change in view and magnitude of impact with mitigation planting	Significance of effect with mitigation planting
			are visible in the distance with skyline of hills including Baverstock ridge beyond.	<u>Operation</u> Route diverted across Prince Charles Hospital junction. The A465 and elevated Prince Charles Hospital junction and slip roads, with associated traffic flow and highway infrastructure, including roundabout overbridges, signage and lighting columns / light spill, would be prominent in close and middle distance views. The magnitude of impact would be **major adverse**.	**Large adverse**	<u>Summer Year 15</u> The A465 and elevated Prince Charles Hospital junction and slip roads, with associated traffic flow and highway infrastructure, including roundabout overbridges, signage and lighting columns / light spill, would remain prominent in close views. Established mitigation planting would partly screen the junction in middle distance views. The magnitude of impact would be **moderate adverse**.	**Moderate adverse**
S5-A9 (1.5 km) (5.7 ha)	Merthyr proposed claimed rights of way (103/10x and 10311x) between Pontsarn Road and A465 and west of Bryniau Road and Parc Bryniau Countryside and Rights of Way Act Open Access Land, all within approximately 400 m of the A465.	40 m	Views of A465 and traffic. Further north towards Pontsarn Road there are pleasant views south across grassland fields with wooded field boundaries. Settlement areas of Merthyr Tydfil are visible in the distance with skyline of hills including Baverstock ridge beyond.	<u>Construction</u> Close and middle distance views of demolition of Trade Centre Wales and construction of elevated Prince Charles Hospital junction and slip roads, particularly on north side of A465, and Pontsarn / Bryniau Road roundabout. Earthworks, activities associated with formation of mainline A465 / junction embankments and attenuation ponds also visible. The magnitude of impact would be **major adverse**.	**Large adverse**	<u>Winter Year 1</u> As per operation without mitigation planting. The magnitude of impact would be **major adverse**.	**Large adverse**
				<u>Operation</u> The A465 and elevated Prince Charles Hospital junction and slip roads, with associated traffic flow and highway infrastructure, including roundabout overbridges, signage and lighting columns / light spill, would be prominent in close and middle distance views. Attenuation ponds also visible. The magnitude of impact would be **major adverse**.	**Large adverse**	<u>Summer Year 15</u> The A465 and elevated Prince Charles Hospital junction and slip roads, with associated traffic flow and highway infrastructure, including roundabout overbridges, signage and lighting columns / light spill, would remain prominent in close views. Established mitigation planting would partly screen the junction in middle distance views. The magnitude of impact would be **moderate adverse**.	**Moderate adverse**
S5-A10 (4.6 km) (15 ha)	Morlais Castle and Merthyr proposed claimed rights of way north of Pontsarn Road / Bryniau Road, west of Francis	400 m	Wide ranging panoramas from higher ground of moorland, quarries and sparse stunted trees. Settlement areas of Merthyr Tydfil are visible in the distance with skyline of hills including Baverstock ridge in far distance beyond. Lower down views south across grassland	<u>Construction</u> Middle distance and longer distance views of demolition of Trade Centre Wales and construction of elevated Prince Charles Hospital junction and slip roads, particularly on north side of A465 and Pontsarn Road / Bryniau Road roundabout. Major earthworks activities for roundabout cutting and various embankments also visible. The magnitude of impact would be **moderate adverse**.	**Moderate adverse**	<u>Winter Year 1</u> As per operation without mitigation planting. The magnitude of impact would be **minor adverse**.	**Slight adverse**

Reference number[1] with length / area of PRoW / space affected in brackets	PRoW number or land name and designation	Approx. distance from nearest point of receptor to centre line of proposed A465 alignment	Existing view	Change in view and magnitude of impact without mitigation planting	Significance of effect without mitigation planting	Change in view and magnitude of impact with mitigation planting	Significance of effect with mitigation planting
	Terrace and Parc Bryniau Countryside and Rights of Way Act Open Access Land, all beyond approximately 400 m of A465.		fields with wooded field boundaries. A465 and traffic visible to varying degrees but not prominent due to existing cutting and roadside vegetation. Industrial / business development also visible in vicinity of Pontsarn Road / Bryniau Road junction.	<u>Operation</u> Middle and longer distance views, generally from higher ground, partially filtered by existing vegetation, to traffic flow and highway infrastructure including signage and lighting columns / light spill at elevated and expanded Prince Charles Hospital junction to south-west and south, opened up by loss of vegetation. Traffic flow on A465 mainline through junction would generally be screened by cutting. The magnitude of impact would be **minor adverse**.	**Slight adverse**	<u>Summer Year 15</u> Established mitigation planting and existing woodlands and groups of trees in wider landscape would generally screen traffic and highway infrastructure at Prince Charles Hospital junction in views south-west and south. Tops of lighting columns / light spill at junction would remain visible. The magnitude of impact would be **negligible adverse**.	**Slight adverse**
S5-A11 (640 m) (18.4 ha)	Ifor Park open space and associated PRoW (including Merthyr 102/13 and 102/14 and Merthyr proposed claimed right of way 102/102x).	0 m	Close intermittent view of A465 from footpath 102/14 on north side of road with screening by existing roadside vegetation. Close and middle distance views from the south across Ifor Park of grassland, scrub and trees which partly screen A465 and traffic.	<u>Construction</u> Close and middle distance views of construction of A465 and major earthworks activities associated with cutting and embankment formation and attenuation pond in Ifor Park. Construction of attenuation pond access and embankments also visible. The magnitude of impact would be **major adverse**.	**Large adverse**	<u>Winter Year 1</u> As per operation without mitigation planting. The magnitude of impact would be **minor adverse**.	**Slight adverse**
				<u>Operation</u> Close and middle distance views of A465, with associated traffic flow and highway infrastructure, where on embankment between chainages 14400 and 14700. Footpath 102/14 would be diverted along new access to Ifor Park attenuation pond. The magnitude of impact would be **minor adverse**.	**Slight adverse**	<u>Summer Year 15</u> Established mitigation planting would largely screen the A465, with associated traffic flow and highway infrastructure. Established mitigation planting would also partly screen attenuation pond. The magnitude of impact would be **negligible adverse**.	**Slight adverse**
S5-A12 (7 ha)	Pant Hollow open space.	0 m	Views across open space with existing grassland and trees. Pant viaduct and A465 traffic prominent to the south.	<u>Construction</u> Close views of demolition of existing Pant viaduct and construction of new A465 viaduct together with major earthworks activities associated with viaduct embankment formation. Construction of new side road across south part of open space and its junction with Pant Road also visible. Construction compounds in the open space prominent. The magnitude of impact would be **major adverse**.	**Large adverse**	<u>Winter Year 1</u> As per operation without mitigation planting. The magnitude of impact would be **moderate adverse**.	**Moderate adverse**

Reference number[1] with length / area of PRoW / space affected in brackets	PRoW number or land name and designation	Approx. distance from nearest point of receptor to centre line of proposed A465 alignment	Existing view	Change in view and magnitude of impact without mitigation planting	Significance of effect without mitigation planting	Change in view and magnitude of impact with mitigation planting	Significance of effect with mitigation planting
				Operation Close views of new A465 viaduct, with associated traffic flow and highway infrastructure, together with new side road across south part of open space and its junction with Pant Road. 1 m high environmental barrier along north side of mainline would be visible to the south east but would also screen some of the traffic. The magnitude of impact would be **moderate adverse**.	**Moderate adverse**	Summer Year 15 Close views of new A465 viaduct, with associated traffic flow and highway infrastructure would remain, although established mitigation planting on viaduct embankments would provide some screening. The new side road across south part of open space and its junction with Pant Road, with associated traffic flows and highway infrastructure, would also remain visible in the long term. Environmental barrier to south east largely screened by planting. The magnitude of impact would be **minor adverse**.	**Slight adverse**
S5-A13 (PRoW 2.4 km) (NCR 46 1 km) (Open space 9.6 ha) (Open Access Land 2.5 ha)	Penywern Ponds North open space, and PRoW north of A465 / east of Francis Terrace and Pant Road (including footpaths 105/2, 105/4, 105/5. 105/7, 105/8, 105/9 and 105/10, and NCR 46). Merthyr Common Countryside and Rights of Way Act Open Access Land, all south of substation access road.	0m	Views across open space with existing grassland and trees and Penywern Pond (north). Development visible beyond with hills in the distance. Close and middle distance intermittent views to the south of A465 and traffic.	Construction Close views of construction of A465 and Dowlais junction eastbound egress slip road, together with major earthworks activities associated with embankment formation. Visibility of construction exacerbated by loss of existing roadside vegetation on north side of road. New NMU crossing overbridge construction also visible. Construction intermittently visible to varying degrees in middle distance to distant views looking south from higher ground. The magnitude of impact would be **major adverse**.	**Large adverse**	Winter Year 1 As per operation without mitigation planting. The magnitude of impact would be **moderate adverse**.	**Moderate adverse**
				Operation Partly elevated A465 and Dowlais junction slip road, with associated traffic flow and highway infrastructure, including new NMU overbridge, most prominent in close views but also intermittently visible to varying degrees in middle distance to distant views looking south from higher ground. The magnitude of impact would be **moderate adverse**.	**Moderate adverse**	Summer Year 15 Intermittent close views of partly elevated A465 and Dowlais junction slip road, with associated traffic flow and highway infrastructure, including new NMU overbridge, would remain although established mitigation planting on embankments would provide some effective screening. The magnitude of impact would be **minor adverse**.	**Slight adverse**

Reference number[1] with length / area of PRoW / space affected in brackets	PRoW number or land name and designation	Approx. distance from nearest point of receptor to centre line of proposed A465 alignment	Existing view	Change in view and magnitude of impact without mitigation planting	Significance of effect without mitigation planting	Change in view and magnitude of impact with mitigation planting	Significance of effect with mitigation planting
S5-A14 1.9 km (13.7 ha)	Penywern Ponds South open space, and associated PRoW (including footpaths 102/1, 102/2, 102/3, 102/4, 102/5, 102/6, 102/8, 102/10 and 102/11).	0 m	Views across open space with existing grassland and trees and Penywern Pond (south). Development visible beyond with hills in the distance. Close and middle distance intermittent views to the north of A465 and traffic.	<u>Construction</u> Close and middle distance views of construction of A465 and Dowlais junction westbound access slip road, together with major earthworks activities associated with embankment formation. Visibility of construction exacerbated by loss of existing roadside vegetation on south side of road. Demolition of stables also visible. Construction of the Dowlais junction A465 viaduct visible to the east and new NMU crossing overbridge construction visible to the north-west. The magnitude of impact would be **major adverse**.	**Large adverse**	<u>Winter Year 1</u> As per operation without mitigation planting. The magnitude of impact would be **moderate adverse**.	**Large adverse**
				<u>Operation</u> Partly elevated A465 and Dowlais junction slip road and viaduct, with associated traffic flow and highway infrastructure, prominent in close and middle distance views. 1 m high environmental barrier along south side of mainline and slip would be visible to the east but would also screen some of the traffic. New NMU overbridge would also be visible. The magnitude of impact would be **moderate adverse**.	**Large adverse**	<u>Summer Year 15</u> Intermittent close and middle distance views of partly elevated A465 and Dowlais junction slip road and viaduct, with associated traffic flow and highway infrastructure including environmental barrier, would remain although established mitigation planting on embankments would provide some effective screening. The new NMU overbridge would also be intermittently visible. The magnitude of impact would be **minor adverse**.	**Slight adverse**
S5-A15 (1.95 km)	NCR 46 east of Penywern Ponds North open space.	50 m	Close views of existing A465 and Dowlais junction roundabout with development of Merthyr Tydfil visible in middle and longer distance views, with a backdrop of distant hills including extensive opencast mining activity at Dowlais, to the south. Superstores and industrial units at Dowlais Top prominent in close and middle distance views to the north. Elevated views from existing NMU bridge over superstore access road.	<u>Construction</u> Close and middle distance views of construction of A465 and Dowlais junction including mainline viaduct, together with major earthworks activities associated with embankment formation. Visibility of construction exacerbated by loss of existing roadside vegetation between Asda superstore carpark and A465. The magnitude of impact would be **major adverse**.	**Very large adverse**	<u>Winter Year 1</u> As per operation without mitigation planting. The magnitude of impact would be **major adverse**.	**Large adverse**
				<u>Operation</u> Cycle route re-routed along new track on embankment. Partly elevated A465 and mainline viaduct, with associated traffic flow and highway infrastructure including signage and lighting columns / light spill, prominent in close and middle distance views. 1 m high environmental barrier along south side of mainline would also be visible and mainline viaduct would be prominent in elevated views from existing NMU bridge over superstore access road. The magnitude of impact would be **major adverse**.	**Large adverse**	<u>Summer Year 15</u> Partly elevated A465 and mainline viaduct, with associated traffic flow and highway infrastructure including signage and lighting columns / light spill, would be intermittently prominent in close and middle distance views. Established mitigation planting on new cycle route embankments between Asda superstore carpark and A465 and on A465 mainline embankments, would provide some effective screening. The mainline viaduct would remain prominent in elevated views from existing NMU bridge. The magnitude of impact would be **moderate adverse**.	**Moderate adverse**
S5-A16 (12.5 km)	PRoW to the south of the	60 m	Range of views across Merthyr Tydfil with associated development	<u>Construction</u> Construction of Dowlais junction visible to north and north-	**Moderate adverse**	<u>Winter Year 1</u> As per operation without mitigation planting.	**Slight adverse**

Reference number[1] with length / area of PRoW / space affected in brackets	PRoW number or land name and designation	Approx. distance from nearest point of receptor to centre line of proposed A465 alignment	Existing view	Change in view and magnitude of impact without mitigation planting	Significance of effect without mitigation planting	Change in view and magnitude of impact with mitigation planting	Significance of effect with mitigation planting
(119 ha)	A465 and A4060 (including Gelligaer FP95, FP98, FP100, FP109 and FP151 and 102/22, 102/34 to 39 and bridleway BR99). Note: Various PRoW diversions are in place at Ffos-y-Fran opencast mine. Merthyr Common Countryside and Rights of Way Act Open Access Land south of A465.		areas and the A465 to the north, north-west and west, including superstores and industrial units at Dowlais Top, with distant hills of the BBNP beyond to the north, north-east and north-west. Opencast mining activity is also prominent in the Dowlais area south of the A465.	west including mainline viaduct construction and major earthworks activities associated with embankment formation. The magnitude of impact would be **moderate adverse**.		The magnitude of impact would be **minor adverse**.	
				<u>Operation</u> Partly elevated A465 and Dowlais junction slip roads and viaduct, with associated traffic flow and highway infrastructure, visible in middle distance to distant views to north-west. 1 m high environmental barriers along south side of mainline and slip would also be just visible to the north-west but would also screen some of the traffic. The magnitude of impact would be **minor adverse**.	**Slight adverse**	<u>Summer Year 15</u> Partly elevated A465 and Dowlais junction slip roads and viaduct, with associated traffic flow and highway infrastructure, would remain intermittently visible in middle distance to distant views to north-west. Established mitigation planting would provide some effective screening. The magnitude of impact would be **negligible adverse**.	**Slight adverse**
S5-A17 (185 ha)	Merthyr Common Countryside and Rights of Way Act Open Access Land north of A465 and east of superstores and industrial units at Dowlais Top, within Special Landscape Area, locally designated under Caerphilly Local Development Plan.	16 m	Range of open moorland views towards Merthyr Tydfil with associated development areas and the A465 to the south-west, including superstores and industrial units at Dowlais Top. Backdrop of distant hills including extensive opencast mining activity at Dowlais, to the south.	<u>Construction</u> Construction of A465 and Dowlais junction visible in close and middle distance views to south-west including mainline viaduct construction and major earthworks activities associated with embankment formation. Superstores and industrial units at Dowlais Top however, screen some of the works. The magnitude of impact would be **moderate adverse**.	**Large adverse**	<u>Winter Year 1</u> As per operation without mitigation planting. The magnitude of impact would be **moderate adverse**.	**Moderate adverse**
				<u>Operation</u> Partly elevated A465 and mainline viaduct, with associated traffic flow and highway infrastructure including signage and lighting columns / light spill, prominent in close and middle distance views. Superstores and industrial units at Dowlais Top however, provide some screening. The magnitude of impact would be **moderate adverse**.	**Moderate adverse**	<u>Summer Year 15</u> Partly elevated A465 and Dowlais junction slip roads and viaduct, with associated traffic flow and highway infrastructure, would remain intermittently visible in close and middle distance to distant views to south-west. Established mitigation planting would however, provide some effective screening. The magnitude of impact would be **minor adverse**.	**Slight adverse**

Appendix 10G – Visual Effects Schedule: People at Public Facilities and Spaces

Table 10G.1 Visual effects schedule: people at public facilities and spaces with high sensitivity to change

Value / sensitivity to change: High

Note: * Listed Building / Registered Park and Garden

Reference number[1] with approx. area / length of public receptor in brackets	Location	Approx. distance from nearest point of receptor to centre line of proposed A465 alignment	Existing view	Change in view and magnitude of impact without mitigation planting	Significance of effect without mitigation planting	Change in view and magnitude of impact with mitigation planting	Significance of effect with mitigation planting
S5-P1 * (17.2 ha)	Cefn Coed Cemetery and Jewish Burial Ground (Grade II Registered Historic Park and Garden), Merthyr Tydfil.	0 m	Views within cemetery generally contained by large number of mature specimen trees, including conifers and deciduous trees, though there are filtered glimpses through vegetation in winter to traffic at A470 junction from southern edge of cemetery. Slightly elevated views west from higher ground, including southernmost Significant View (Figure 9.3), across tops of trees to fields within BBNP, while traffic on A470 is screened by trees. Partial middle distance views south-east framed by trees, from elevated ground in north-eastern part of cemetery, to traffic and lighting columns on A465 Taf Fawr viaduct, with properties in Gellideg and mountains in background.	<u>Construction</u> Part of cemetery grounds lost to proposed scheme for A470 junction. Close views west to south-east from southern part of cemetery opened up by loss of tree belt and trees in Taf Fawr valley, to construction of A470 junction, including major earthworks, realignment of A470 approaching junction, elevated A465 mainline through junction, two new viaducts and highway infrastructure such as signage and lighting columns. Also close views of construction compounds and stockpiles. Views from northern half of cemetery generally contained by vegetation, except partial views from higher ground, framed by trees, to construction of two viaducts with environmental barriers and lighting columns to south-east and views of loss of trees and earthworks on hillside in BBNP to south-west which would impact on southernmost Significant View. The magnitude of impact would be **major adverse.**	**Very large adverse**	<u>Winter Year 1</u> As per operation without mitigation planting. The magnitude of impact would be **major adverse.**	**Very large adverse**
				<u>Operation</u> Part of cemetery grounds lost to proposed scheme for A470 junction. Close views west to south-east from southern part of cemetery opened up by loss of tree belt and trees in Taf Fawr valley, to traffic flow and highway infrastructure such as signage and lighting columns at A470 junction, A470 approach to junction and elevated A465 mainline through junction. Cuttings would screen traffic flow to varying degrees in some locations. Views from northern half of cemetery generally contained by vegetation, except partial middle distance views from higher ground, framed by trees to south-east, to traffic flow and highway infrastructure such as lighting columns / light spill on two new closer viaducts across Taf Fawr, partially screened by 2 m high environmental barrier, as well as views of occasional traffic on minor road on hillside in BBNP to south-west, which would impact on	**Very large adverse**	<u>Summer Year 15</u> Established mitigation planting, in combination with cuttings in some locations, would screen much of the traffic flow at A470 junction and A470 approaching junction in close views west to south-east from southern part of cemetery, though tops of some lighting columns / light spill and some filtered views through vegetation or glimpses above vegetation to traffic on elevated A465 mainline through junction would remain. Established mitigation planting would also screen occasional traffic on minor road on hillside in BBNP in views south-west from higher ground in northern part of cemetery, including which would impact on southernmost Significant View. The extensive cutting slope to the west would generally be screened or softened by established mitigation planting in views from southern part of cemetery, although it would remain a noticeable feature in some filtered views through or above vegetation. Framed middle-distance views	**Moderate adverse**

[1] Refer to Figure 10.8

Reference number[1] with approx. area / length of public receptor in brackets	Location	Approx. distance from nearest point of receptor to centre line of proposed A465 alignment	Existing view	Change in view and magnitude of impact without mitigation planting	Significance of effect without mitigation planting	Change in view and magnitude of impact with mitigation planting	Significance of effect with mitigation planting
				southernmost Significant View. Extensive cutting slope to west would be dominant in views west, from southern part of cemetery. The magnitude of impact would be **major adverse.**		south-east would not be affected by planting and traffic flow and highway infrastructure such as lighting columns on two new closer viaducts across Taf Fawr, partially screened by 2 m high environmental barrier, would remain visible. The magnitude of impact would be **moderate adverse.**	
S5-P2* (0.3 ha)	Capel Tabor (grade II listed chapel), Grawen Lane, Cefn Coed, Merthyr Tydfil.	30 m	Close oblique view south across lit Grawen Lane to dense belt of deciduous and evergreen vegetation. Close, slightly oblique view south-east to signage at Grawen Lane / High Street junction and High Street overbridge. Traffic on A465 screened by cutting with mix of deciduous and evergreen trees, though tops of lighting columns are visible, as well as filtered glimpses through bridge railings to signage on A465. Views east generally screened by wall, fencing and adjacent property.	<u>Construction</u> Close views south-west to south-east, to demolition and construction of High Street overbridge, construction of widened A465 mainline cutting with highway infrastructure such as environmental barriers, and demolition of properties, opened up by loss of vegetation. Also middle distance views south-west to construction of A470 junction, including elevated A465 mainline and highway infrastructure such as signage, environmental barriers and lighting columns, opened up by loss of trees. The magnitude of impact would be **major adverse.**	**Large adverse**	<u>Winter Year 1</u> As per operation without mitigation planting. The magnitude of impact would be **moderate adverse.**	**Moderate adverse**
				<u>Operation</u> Close views south-west and south opened up by loss of vegetation, to tops of vehicles in A465 mainline cutting, seen against 2 m high environmental barrier. Middle distance views south-west to traffic flow and highway infrastructure such as signage and lighting columns / light spill at A470 junction and elevated A465 mainline. Views of High Street overbridge would be similar to existing views. Close views south-east to environmental barrier along southern edge of A465 cutting. The magnitude of impact would be **moderate adverse.**	**Moderate adverse**	<u>Summer Year 15</u> Views of High Street overbridge would be similar to existing views. Established mitigation planting would generally screen tops of vehicles in A465 mainline cutting; though some filtered glimpses in the vicinity of the overbridge would remain. Upper storey views south-west to traffic flow and tops of lighting columns / light spill at A470 junction and elevated A465 mainline would remain, but be partially screened and softened by established mitigation planting. The magnitude of impact would be **minor adverse.**	**Slight adverse**
S5-P4* (0.1 ha)	St John the Baptist Church (grade II listed), Cefn Coed, Merthyr Tydfil.	24 m	Views north-west generally contained by mature evergreen trees and wall. Filtered views north through vegetation to non-motorised users on footpath 111/38 bridge across A465. Views north-east generally contained by properties and vegetation in summer, though Gurnos and Y-Graig woodland is visible in background.	<u>Construction</u> Close views north-west and north to demolition of garage at adjacent property, demolition of footbridge across A465 and installation of environmental barrier, opened up slightly by loss of vegetation. Properties on north side of A465 cutting also visible due to loss of vegetation. Loss of trees would also partially open up views north-east, including middle distance glimpses of construction of A465 mainline and parallel NMU route through Y-Graig. The magnitude of impact would be **minor adverse.**	**Moderate adverse**	<u>Winter Year 1</u> As per operation without mitigation planting. The magnitude of impact would be **minor adverse.**	**Slight adverse**
				<u>Operation</u> Close partially filtered views through vegetation to north to end of 2 m environmental barrier and properties on north side of A465 cutting. Middle distance glimpses north-east to traffic flow on A465 mainline and users on	**Slight adverse**	<u>Summer Year 15</u> Established mitigation planting would soften 2 m high environmental barrier to north and screen properties on north side of A465 cutting. Middle distance glimpses north-east to traffic flow on A465 mainline and users on parallel	**Slight adverse**

Reference number[1] with approx. area / length of public receptor in brackets	Location	Approx. distance from nearest point of receptor to centre line of proposed A465 alignment	Existing view	Change in view and magnitude of impact without mitigation planting	Significance of effect without mitigation planting	Change in view and magnitude of impact with mitigation planting	Significance of effect with mitigation planting
				parallel NMU route through Y-Graig. The magnitude of impact would be **minor adverse.**		NMU route through Y-Graig would also be softened by established mitigation planting. The magnitude of impact would be **minor adverse.**	

Table 100.1 : Visual effects schedule: people at public facilities and spaces with moderate sensitivity to change

Value / sensitivity to change: Moderate

Reference number[2] with approx. area / length of public receptor in brackets	Location	Approx. distance from nearest point of receptor to centre line of proposed A465 alignment	Existing view	Change in view and magnitude of impact without mitigation planting	Significance of effect without mitigation planting	Change in view and magnitude of impact with mitigation planting	Significance of effect with mitigation planting
S6-P1 (4.3 ha)	Recreation ground, including sports facilities and playground, Hirwaun.	35 m	Views west contained by mainly deciduous vegetation. Views south either contained by tall evergreen trees or close open views across rough grassland to opencast workings and other detractors such as stretch of powerlines and pylons, seen against ridgeline within Hirwaun Common in background. Lower level middle distance views east across rough grassland to deciduous vegetation, to occasional vehicles on windfarm access track, with mountains in background. Views north partially contained by deciduous vegetation in summer, though there are some close	<u>Construction</u> Tall evergreen and deciduous tree belts would continue to screen / filter most views south and west, from western part of recreation facilities. Loss of vegetation for realigned access track at south-western corner would open up partial view to construction activities. Close views south and south-east, mainly from eastern part of recreation facilities, to traffic on temporary A465 diversion road and construction of offline A465 mainline in cutting, which would noticeably change landform locally, and include highway infrastructure such as signage and lighting columns, seen in context of open cast workings. Also views above hedgerow from eastern edge, to construction of windfarm access bridge to south-east. The magnitude of impact would be **major adverse.**	**Moderate adverse**	<u>Winter Year 1</u> As per operation without mitigation planting. The magnitude of impact would be **minor adverse**.	**Slight adverse**

[2] Refer to Figure 10.8

Reference number[2] with approx. area / length of public receptor in brackets	Location	Approx. distance from nearest point of receptor to centre line of proposed A465 alignment	Existing view	Change in view and magnitude of impact without mitigation planting	Significance of effect without mitigation planting	Change in view and magnitude of impact with mitigation planting	Significance of effect with mitigation planting
			to middle distance views to A465 with traffic and lighting, amongst other on adjacent overbridge.	Operation Tall evergreen and deciduous tree belts would continue to screen / filter most views south and west, from western part of recreation facilities, except lighting / columns / light spill at south-western corner of recreation ground, where loss of vegetation would open up a partial view to fence for visual screening of traffic. Cutting would generally screen traffic flow on A465 mainline, though there would be glimpses of tops of high sided vehicles in cutting, mainly from eastern part of recreation facilities. Views south or south-east would also include tops of lighting columns / light spill along offline route. Occasional vehicles on windfarm access would appear similar to existing views. The magnitude of impact would be **minor adverse.**	**Slight adverse**	Summer Year 15 Established mitigation planting would screen previously open views south and south-east, screening offline A465 mainline, including traffic and lighting columns / light spill. Tops of lighting columns / light spill would, however, remain visible above fence for visual screening at south-western corner of recreation ground. The magnitude of impact would be **minor adverse.**	**Slight adverse**
S6-P2 (1.9 ha)	Hirwaun County Primary Junior School and Hirwaun County Infants and Nursery School, Hirwaun. Including playgrounds and fields.	147 m	Views west to south-east generally contained by deciduous trees. Glimpsed or filtered views through vegetation to traffic and lighting on A465 to south, as well as occasional vehicles on windfarm access track to south-west.	Construction Glimpsed or filtered close to middle distance views south-west to south-east to traffic on temporary A465 diversion route and construction of offline A465 mainline within grassland, including highway infrastructure such as signage and lighting columns. Most noticeable activities associated with construction of windfarm overbridge to south-east. All views seen in context of traffic on A465 in foreground. Construction activities at Trewaun junction would not be noticeable due to screening from existing trees and properties. The magnitude of impact would be **moderate adverse.**	**Moderate adverse**	Winter Year 1 As per operation without mitigation planting. The magnitude of impact would be **minor adverse.**	**Slight adverse**
				Operation Glimpsed or filtered close to middle distance views south-west to south-east to tops of lighting columns / light spill from offline A465 mainline. Cutting would screen traffic flow and other highway infrastructure. Views of occasional vehicles at windfarm access track / bridge would appear similar to existing views. The magnitude of impact would be **minor adverse.**	**Slight adverse**	Summer Year 15 Established mitigation planting would screen lighting columns / light spill on offline A465 mainline, in glimpsed views through existing trees. Glimpses of occasional vehicles at windfarm access track / bridge would appear similar to existing views. The magnitude of impact would be **no change.**	**Neutral**

Reference number[2] with approx. area / length of public receptor in brackets	Location	Approx. distance from nearest point of receptor to centre line of proposed A465 alignment	Existing view	Change in view and magnitude of impact without mitigation planting	Significance of effect without mitigation planting	Change in view and magnitude of impact with mitigation planting	Significance of effect with mitigation planting
S5-P3 (49.7 ha)	Merthyr Tydfil Golf Club, Cefn Coed, Merthyr Tydfil.	355 m	Descending panoramic middle distance to distant views across moorland south-west to north-east. Distant glimpses of A465 as it descends from Baverstock ridge to south-west. A465 Taf Fawr Viaduct, A470 junction and A470 approach to junction, including traffic and lighting columns visible to south-west, with fields with hedgerows and trees within BBNP, Gellideg and Mynydd Aberdar in background. Merthyr Tydfil, Y Graig woodland and Gurnos against a mountainous background to south-east. Tree-belt along A465 clearly visible in middle distance views east, with glimpses of traffic in summer and filtered views of traffic through trees in winter. Near mast and floodlighting at sports ground, and chimney at Prince Charles Hospital in longer distance are detracting features in the landscape.	<u>Construction</u> Descending middle to longer distance views south-west to construction of A470 junction, including major earthworks and loss of vegetation, construction of elevated A465 mainline and highway infrastructure. Also distant glimpses of construction of A465 mainline at Baverstock ridge. Longer distance views south-east to demolition of Trade Centre Wales and construction of expanded Prince Charles Hospital junction and, offline and widened A465 mainline including major earthworks activities associated with attenuation ponds near Gurnos Farm and embankments to mainline and attenuation pond access roads. Visibility of works exacerbated by loss of existing roadside vegetation and adjacent mature tree belts. The magnitude of impact would be **moderate adverse.**	**Moderate adverse**	<u>Winter Year 1</u> As per operation without mitigation planting. The magnitude of impact would be **moderate adverse.**	**Moderate adverse**
				<u>Operation</u> Descending middle to longer distance views south-west to traffic flow on A470 junction, including elevated A465 mainline, as well as highway infrastructure such as lighting columns / light spill. Slight change to skyline at Baverstock ridge and distant glimpses of traffic visible. Longer distance views of offline and widened A465 mainline, with associated traffic flow and highway infrastructure, to south-east and embankments associated with attenuation ponds and associated access roads near Gurnos Farm, and A465 main line. Part of mainline through Y Graig screened by cutting and existing trees. Also views of traffic and highway infrastructure, such as lighting columns / light spill at expanded Prince Charles Hospital junction, opened up by loss of trees. The magnitude of impact would be **moderate adverse.**	**Moderate adverse**	<u>Summer Year 15</u> Established mitigation planting would screen attenuation pond at A470 junction and generally soften views of junction to south-west to some extent, though traffic flow on elevated A465 and parts of junction slips would remain visible. Established mitigation planting, in combination with localised cutting and existing vegetation, would generally screen longer distance views to A465 mainline, though some filtered glimpses of attenuation ponds near Gurnos Farm and tops of vehicles would remain. Longer distant to distant views of Prince Charles Hospital junction would also be softened and partially screened by established mitigation planting, though some glimpses of traffic and tops of lighting columns /light spill would remain. The magnitude of impact would be **minor adverse.**	**Slight adverse**
S5-P5 (0.5 ha)	Ysgol-Y-Graig Primary School, Brewery Lane, Cefn Coed, Merthyr Tydfil.	75 m	Views north-west contained by rising landform, properties and mature vegetation. Close partially filtered elevated views north-west to A465 Taf Fechan viaduct with traffic. Ascending views north-east across wooded Taf Fechan valley, to glimpses of Y Graig woodland and Gurnos in the middle distance. Pylons are detracting	<u>Construction</u> Close ascending, partially filtered views through trees, north-west and north to construction of widened Taf Fechan viaduct with environmental barrier and parallel NMU bridge. Associated construction compounds and stockpiles also visible. Middle distance ascending filtered glimpses through intervening trees to construction of A465 mainline through Y Graig to north-east. The magnitude of impact would be **major adverse.**	**Large adverse**	<u>Winter Year 1</u> As per operation without mitigation planting. The magnitude of impact would be **minor adverse.**	**Slight adverse**

Reference number[2] with approx. area / length of public receptor in brackets	Location	Approx. distance from nearest point of receptor to centre line of proposed A465 alignment	Existing view	Change in view and magnitude of impact without mitigation planting	Significance of effect without mitigation planting	Change in view and magnitude of impact with mitigation planting	Significance of effect with mitigation planting
			features in landscape.	Operation Traffic flow on widened Taf Fechan viaduct would be slightly more noticeable above 1 m high environmental barrier than traffic in existing close views north-west and north to A465, due to mainline being closer to school. Also views of parallel NMU bridge and glimpses of highway infrastructure such as signage. Existing vegetation and partial cutting would generally screen traffic flow on offline A465 mainline through Y Graig to north-east. The magnitude of impact would be **minor adverse.**	**Slight adverse**	Summer Year 15 Traffic flow on widened Taf Fechan viaduct would continue to be slightly more noticeable above 1 m environmental barrier than traffic in existing close views north-west and north to A465, due to mainline being closer to school. Traffic flow on offline A465 mainline through Y Graig would be screened by existing trees and established mitigation planting. The magnitude of impact would be **minor adverse.**	**Slight adverse**
S5-P6 (44.8 ha)	Morlais Castle Golf Club, Pant, Merthyr Tydfil.	440 m	Views sometimes screened by clumps of trees or landform. Panoramic views across Merthyr Tydfil from higher ground south-west to south-east, with skyline of hills like Baverstock ridge in far distance in background. Traffic on A465 generally screened by trees and industrial development in middle-distance views, though there are some filtered glimpses through vegetation to traffic in winter. Glimpses of traffic flow descending from Baverstock ridge in distance to south-west.	Construction Middle distance views, generally from higher ground within golf course, to demolition of Trade Centre Wales and construction of expanded Prince Charles Hospital junction with highway infrastructure such as signage, lighting columns and drainage ponds, to south-west and south, opened up by loss of vegetation. Also views of construction activities along A465 further west and east, such as distant views to construction of A465 mainline descending from Baverstock ridge to south-west and glimpses of demolition and construction of Pant A465 overbridge to east. The magnitude of impact would be **moderate adverse.**	**Moderate adverse**	Winter Year 1 As per operation without mitigation planting. The magnitude of impact would be **minor adverse.**	**Sight adverse**
				Operation Middle distance views, generally from higher ground within golf course, partially filtered by existing vegetation, to traffic flow and highway infrastructure such as signage and lighting columns / light spill at elevated and expanded Prince Charles Hospital junction to south-west and south, opened up by loss of vegetation. Traffic flow on A465 mainline through junction would generally be screened by cutting, though there would be longer distance and distant views and glimpses of traffic on A465 mainline further east, such as traffic descending from Baverstock ridge. Change to skyline at Baverstock ridge also perceptible, due to cutting and loss of forest. The magnitude of impact would be **minor adverse.**	**Sight adverse**	Summer Year 15 Established mitigation planting and existing woodlands and groups of trees in wider landscape would generally screen traffic and highway infrastructure at Prince Charles Hospital junction in views south-west and south. Tops of lighting columns / light spill at junction would remain visible. Distant views of traffic descending from Baverstock ridge also softened or partially screened by established mitigation planting. The magnitude of impact would be **negligible adverse.**	**Neutral**

Reference number[2] with approx. area / length of public receptor in brackets	Location	Approx. distance from nearest point of receptor to centre line of proposed A465 alignment	Existing view	Change in view and magnitude of impact without mitigation planting	Significance of effect without mitigation planting	Change in view and magnitude of impact with mitigation planting	Significance of effect with mitigation planting
S5-P7 (7.8 ha)	Pen-Y-Dre High School with playing fields, Goitre Lane, Gurnos, Merthyr Tydfil.	55 m	Views west and east contained by trees and properties. Views north-west to north-east partially filtered by thin deciduous vegetation belt along periphery of school grounds, to traffic on lit Gurnos Ring Road and dense deciduous vegetation belt along A465. Close filtered views of traffic on A465 in winter. Roof of Trade Centre Wales visible above vegetation.	<u>Construction</u> Close, partially filtered views through vegetation on periphery of school grounds, north-west to north-east across Gurnos Ring Road to demolition of Trade Centre Wales, construction of widened A465 mainline and, partially elevated and expanded Prince Charles Hospital junction with highway infrastructure such as signage, lighting columns and attenuation ponds, opened up by loss of trees. Large construction compound with stockpiles also visible adjacent to Gurnos Ring Road. The magnitude of impact would be **major adverse.**	**Large adverse**	<u>Winter Year 1</u> As per operation without mitigation planting. The magnitude of impact would be **major adverse.**	**Large adverse**
				<u>Operation</u> Close, partially filtered views through vegetation on periphery of school grounds, north-west to north of school buildings to traffic flow and highway infrastructure such as signage and lighting columns / light spill on partially elevated and expanded Prince Charles Hospital junction. Traffic flow on A465 mainline generally screened in by cutting in these views. High Vehicles and signage visible at junction and / or A465 mainline in views north and north-east across Gurnos Road from school playing fields., The magnitude of impact would be **major adverse.**	**Large adverse**	<u>Summer Year 15</u> Established mitigation plating would generally screen views of traffic and highway infrastructure such as signage at A465 mainline and Prince Charles Hospital junction, in all views except close views to junction directly north from school buildings. Various extents of lighting columns / light spill from junction would also remain visible, but seen in context of existing lighting columns / light spill associated with Gurnos Ring Road. The magnitude of impact would be **moderate adverse.**	**Moderate adverse**
S5-P8 (96 m^2)	Hall, Eighth Avenue, Galon Uchaf, Merthyr Tydfil.	70 m	Views west and east generally contained by trees or properties. Filtered views through metal railings north-west to north-east to traffic on lit Gurnos Ring Road and dense deciduous vegetation belt along A465. Close filtered views of traffic on A465 in winter.	<u>Construction</u> Close filtered views through metal railings north-west to north-east across Gurnos Ring Road to demolition of Trade Centre Wales, construction of widened A465 mainline and new link road north of road with associated highway infrastructure such as signage and lighting columns, and demolition and construction of Bryniau Road bridge, opened up by loss of trees. Large construction compound with stockpiles visible in foreground adjacent to Gurnos Ring Road. The magnitude of impact would be **major adverse.**	**Large adverse**	<u>Winter Year 1</u> As per operation without mitigation planting. The magnitude of impact would be **moderate adverse.**	**Moderate adverse**

Reference number[2] with approx. area / length of public receptor in brackets	Location	Approx. distance from nearest point of receptor to centre line of proposed A465 alignment	Existing view	Change in view and magnitude of impact without mitigation planting	Significance of effect without mitigation planting	Change in view and magnitude of impact with mitigation planting	Significance of effect with mitigation planting
				Operation Close filtered views through metal railings north-west to north-east across Gurnos Road open up by loss of vegetation, to vehicles and signage on A465 mainline, above cutting. Views to traffic and lighting columns / light spill at Bryniau Road bridge in oblique views north-east also opened up by loss of trees. Traffic and lighting columns / light spill on new link road to Prince Charles Hospital junction on north side of A465 also visible, but partially screened by industrial units. Lighting seen in context of existing lighting columns / light spill associated with Gurnos Ring Road. The magnitude of impact would be **moderate adverse.**	**Moderate adverse**	Summer Year 15 Established mitigation plating would generally screen views of traffic and highway infrastructure such as signage at A465 mainline. With exception of glimpses of tops of lighting columns / light spill from new link road to Prince Charles Hospital junction on north side of A465, views would be similar to existing views. The magnitude of impact would be **negligible adverse.**	**Neutral**
S5-P9 (0.3 ha)	Playground, Hayden Terrace Open Space, Merthyr Tydfil.	475 m	Views west contained by properties. Open middle distance views north and north-east across rooftops to partially wooded Ifor Park and with tops of high sided vehicles on A465 along edge of park, seen against backdrop of deciduous tree belt. Filtered glimpses through trees to Pant industrial estate to north in winter.	Construction Middle distance filtered views or glimpses north through / above trees to construction of large attenuation pond and access track with associated loss of trees. Middle distance views north and north-east across Ifor Park to construction of widened A465 mainline with highway infrastructure such as signage, made more visible due to loss of vegetation on northern edge of park. Tops of industrial units to north of road would also be more noticeable due to vegetation loss north of A465. The magnitude of impact would be **moderate adverse.**	**Moderate adverse**	Winter Year 1 As per operation without mitigation planting. The magnitude of impact would be **minor adverse.**	**Slight adverse**
				Operation Middle distance views north and north-east across Ifor Park to traffic flow and highway infrastructure such as signage on widened A465 mainline, opened up further due to loss of vegetation. Tops of industrial units to north of road would also be more noticeable due to vegetation loss north of A465. Existing trees in park would generally screen or filter views of attenuation pond and access track. The magnitude of impact would be **minor adverse.**	**Slight adverse**	Summer Year 15 Established mitigation planting would generally screen traffic flow and highway infrastructure on A465 mainline, as well as industrial units to north of road, in views to north and north-east across Ifor Park. In addition, established mitigation planting would add to existing vegetation, to screen earthworks for attenuation pond and access track. The magnitude of impact would be **negligible adverse.**	**Neutral**
S5-P10 (0.1 ha)	Playground on eastern edge of Ifor Park.	29 m	Close lower level views below Pant A465 viaduct and ascending views north to traffic on viaduct. Views to traffic on A465 to north-west screened in summer and filtered in winter through tree belt along road. Views north-east partially screened by tall evergreen hedge, with partial views	Construction Close views to demolition and construction of Pant viaduct and widened A465 to west, north and north-east, including large embankment on edge of playground, retaining wall to north-east and highway infrastructure. Also views of construction compound and stockpiles on north side of viaduct. The magnitude of impact would be **major adverse.**	**Large adverse**	Winter Year 1 As per operation without mitigation planting. The magnitude of impact would be **major adverse.**	**Large adverse**

Reference number[2] with approx. area / length of public receptor in brackets	Location	Approx. distance from nearest point of receptor to centre line of proposed A465 alignment	Existing view	Change in view and magnitude of impact without mitigation planting	Significance of effect without mitigation planting	Change in view and magnitude of impact with mitigation planting	Significance of effect with mitigation planting
			through gaps to vehicles at Merthyr Motor Auction and traffic on Pant A465 viaduct above.	Operation Close ascending views west to north-east to traffic flow and highway infrastructure on A465 mainline, including Pant viaduct. View north-west opened up by loss of trees, allowing glimpsed views of industrial units beyond road. Large embankment and viaduct brought closer to playground than in existing views and view below viaduct slightly more constrained due to embankment to north-west extending further east, and retaining wall to north-west extending up to Pant Road. However, much of the retaining wall would be screened by the existing evergreen hedge on boundary of Merthyr Motor Auction. The magnitude of impact would be **major adverse.**	**Large adverse**	Summer Year 15 Established mitigation planting, would soften embankment to north-west and screen traffic and highway infrastructure on A465 mainline, as well as industrial units in views west and north-west. Close ascending views of traffic flow on the closer and wider Pant viaduct to north and north-east, and part of retaining wall to north-east, would however, remain visible. The magnitude of impact would be **moderate adverse**.	**Moderate adverse**
S5-P11 (371 m2)	Playground off Station Terrace, Dowlais.	64 m	Views west generally contained by vegetation and landform. Close ascending views north to east, partially screened by stables to north, to traffic flow and lighting columns on Dowlais junction. Superstores, partially filtered by vegetation, in background.	Construction Close ascending views north to east of demolition of stables, construction of expanded Dowlais junction and elevated A465 mainline with highway infrastructure such as signage, lighting columns and environmental barriers. Construction of tall embankment for slip road in close proximity to playground would be particularly dominant. Construction of realigned NMU route to north of junction also visible. The magnitude of impact would be **major adverse.**	**Large adverse**	Winter Year 1 As per operation without mitigation planting. The magnitude of impact would be **major adverse.**	**Large adverse**
				Operation Close ascending views north to east to traffic flow and highway infrastructure such as signage and lighting columns / light spill, slightly screened by 1 m high environmental barriers above tall embankment, at expanded Dowlais junction and elevated A465 mainline. Slip road would be much closer to junction and no longer be screened by stables. The magnitude of impact would be **major adverse.**	**Large adverse**	Summer Year 15 Established mitigation planting would generally screen traffic flow and highway infrastructure such as signage and 1 m high environmental barriers at Dowlais junction, though intermittent views of traffic on elevated A465 mainline would remain, to north-east. Tops of and lighting columns / light spill would also remain visible. The magnitude of impact would be **minor adverse.**	**Slight adverse**

Page left intentionally blank

Appendix 10H – Visual Effects Schedule: People at Work

Table 10H.1 : Visual effects schedule: people at work with moderate sensitivity to change

Value / sensitivity to change: Moderate

Reference number[1] * Listed Building	Location	Approx. distance from nearest point of receptor to centre line of proposed A465 alignment	Existing view	Change in view and magnitude of impact without mitigation planting	Significance of effect without mitigation planting	Change in view and magnitude of impact with mitigation planting	Significance of effect with mitigation planting
S6-W2	Outdoor workers at Cynon Farm, Hirwaun.	50 m	Views generally contained by vegetation in summer. Filtered views south and south-east through vegetation to traffic on A465 in winter. Pylon is a detracting feature in landscape behind A465.	<u>Construction</u> Close views, filtered by intervening vegetation to south and south-east, to construction of Pentwyn Cynon (Tramway) footbridge and A465 mainline cutting and embankments with highway infrastructure such as environmental barriers, opened up by loss of trees. The magnitude of impact would be **moderate adverse.**	**Moderate adverse**	<u>Winter Year 1</u> As per operation without mitigation planting. The magnitude of impact would be **moderate adverse**.	**Moderate adverse**
				<u>Operation</u> Close views south and south-east filtered by intervening vegetation, to Pentwyn Cynon (Tramway) footbridge, tall retaining wall south of A465 and traffic flow on A465 mainline opened up by loss of trees, but partially screened by 2 m high environmental barrier in vicinity of footbridge and cutting to south-east. Glimpses of tops of lighting columns / light spill at Trewaun junction to south-west. The magnitude of impact would be **moderate adverse.**	**Moderate adverse**	<u>Summer Year 15</u> Established mitigation planting would screen traffic flow and highway infrastructure on and in vicinity of A465 mainline in any glimpsed views through existing vegetation in leaf. Glimpses of top of Pentwyn Cynon (Tramway) footbridge to south-east and tops of lighting columns / light spill at Trewaun junction to south-west. The magnitude of impact would be **minor adverse.**	**Slight adverse**
S6-W3	Outdoor workers at Bleannant Hir Isaf Farm, Crematorium Road, Llwydcoed.	80 m	View south-west to north-west partially screened by stables and contained by deciduous tree belt on cutting along the A465.	<u>Construction</u> Close views west and north partially screened by stables, of construction of widened A465 mainline with highway infrastructure, including signage, Nant Moel underbridge and access track, opened up by loss of trees. Existing trees would screen / filter views south-west towards attenuation pond construction and north-east towards Nant Hir viaduct construction. The magnitude of impact would be **moderate adverse**.	**Moderate adverse**	<u>Winter Year 1</u> As per operation without mitigation planting. The magnitude of impact would be **moderate adverse**.	**Moderate adverse**
				<u>Operation</u> Close views west and north partially screened by stables, to traffic flow and highway infrastructure, including signage, on slightly elevated A465 mainline, as well as attenuation pond access track to south-west. Existing trees would screen/filter views south-west towards attenuation pond and north-east towards widened Nant Hir (North) viaduct. The magnitude of impact would be **moderate adverse**.	**Moderate adverse**	<u>Summer Year 15</u> Established mitigation planting would generally screen traffic flow and highway infrastructure, including signage, on A465 to west and north, with exception of short stretch above Nant Moel underbridge. Attenuation pond access track also visible to south-west. The magnitude of impact would be **minor adverse**.	**Slight adverse**

[1] Refer to Figure 10.8

Reference number[1] * Listed Building	Location	Approx. distance from nearest point of receptor to centre line of proposed A465 alignment	Existing view	Change in view and magnitude of impact without mitigation planting	Significance of effect without mitigation planting	Change in view and magnitude of impact with mitigation planting	Significance of effect with mitigation planting
S6-W4	Outdoor workers at Nant Cae Farm, Crematorium Road, Llwydcoed.	215 m	Views west contained by deciduous vegetation along Nant Hir Reservoir. Ascending middle distance views north and north-east across fields to filtered glimpses through thin vegetation belt to mainly tops of high sided vehicles on A465 above false cutting, seen against woodland background. Views east across fields towards Nant Livery Farm, tree belts and woodland blocks.	Construction Close views west and north to construction of NMU route within approx. 5 m of the farm. Middle distance views north-west across reservoir to construction of parallel viaduct at A465 Nant Hir crossing, opened up by loss of trees. Middle distance ascending views north and north-east to construction compounds with large stockpiles, construction of large attenuation ponds, widened A465 mainline and expanded Baverstock junction with associated highway infrastructure such as signage and lighting columns. The magnitude of impact would be **moderate adverse.**	**Moderate adverse**	Winter Year 1 As per operation without mitigation planting. The magnitude of impact would be **moderate adverse**.	**Moderate adverse**
				Operation Close views west and north to users on new NMU route, opened up by loss of vegetation. Middle distance views north-west to north-east to earthworks and access tracks for attenuation ponds, traffic flow on Nant Hir (North) viaduct, A465 mainline and, expanded Baverstock junction with highway infrastructure such as signage and lighting columns / light spill. The magnitude of impact would be **moderate adverse.**	**Moderate adverse**	Summer Year 15 Views of NMU route, attenuation ponds and access tracks would remain visible. Established mitigation planting would generally screen views of traffic flow at Baverstock junction to north-east, though traffic flow on Nant (North) Hir viaduct and A465 mainline would remain more noticeable to north-west and north due to loss of vegetation belt and false cutting. Tops of lighting columns / light spill would also be visible at junction. The magnitude of impact would be **moderate adverse.**	**Moderate adverse**
S6-W5	Outdoor workers at Nant Livery Farm, Crematorium Road, Llwydcoed.	335 m	Views west to Nant Cae Farm and primarily deciduous vegetation along Nant Hir Reservoir. Partially filtered ascending views through foreground vegetation north and north-east across fields to woodland. Filtered middle distance glimpses of mainly tops of high-sided vehicles on the A465 above false cutting through thin belt of deciduous vegetation. Views east contained by tree belt.	Construction Middle distance partially filtered views north-west to north-east to construction of NMU route, large attenuation ponds and widened A465 with associated signage. The magnitude of impact would be **moderate adverse.**	**Moderate adverse**	Winter Year 1 As per operation without mitigation planting. The magnitude of impact would be **minor adverse**.	**Slight adverse**
				Operation Middle distance partially filtered views north-west to north-east to users on NMU route, earthworks and access tracks for attenuation ponds, and, traffic flow and highway infrastructure on widened A465 mainline. Existing vegetation would continue to screen views east. The magnitude of impact would be **minor adverse.**	**Slight adverse**	Summer Year 15 Established mitigation planting to north of A465 would not affect middle distance views north-west to north-east to attenuation ponds with access tracks, users on NMU route and, traffic flow and highway infrastructure on widened A465 mainline, which would remain more noticeable. The magnitude of impact would be **minor adverse.**	**Slight adverse**
S5-W2	Outdoor workers at Gurnos Farm Stud, Gurnos Ring Road, Gurnos, Merthyr Tydfil.	11 m	Views south-west to east contained by sheds/buildings and deciduous trees and vegetation belt along A465 in summer. Close glimpses in summer and filtered views in winter to traffic flow on A465.	Construction Close views south to east, in between and above sheds/buildings and filtered through trees, to construction of tall retaining structure and embankments for widened and elevated A465, including highway infrastructure such as signage, opened up by loss of vegetation. Partially filtered views through trees south-west to construction of attenuation ponds and embankments for realigned A465. The magnitude of impact would be **moderate adverse.**	**Moderate adverse**	Winter Year 1 As per operation without mitigation planting. The magnitude of impact would be **moderate adverse**.	**Moderate adverse**

Reference number[1] * Listed Building	Location	Approx. distance from nearest point of receptor to centre line of proposed A465 alignment	Existing view	Change in view and magnitude of impact without mitigation planting	Significance of effect without mitigation planting	Change in view and magnitude of impact with mitigation planting	Significance of effect with mitigation planting
				Operation Close views in between and above sheds/buildings and filtered through trees south-west to east to retaining structure and embankments, traffic flow on A465 and highway infrastructure such as signage, opened up by loss of vegetation. 3 m environmental barrier on south side of A465 mainline partly visible. Filtered views of earthworks for attenuation ponds through existing trees. Glimpses of tops of lighting columns / light spill to north-east above existing trees. The magnitude of impact would be **moderate adverse.**	**Moderate adverse**	Summer Year 15 Established mitigation planting would screen lower part of vehicles on A465 and highway infrastructure, though tops of high sided vehicles and signage, and glimpses of retaining structure would remain. Filtered views of attenuation ponds would be softened by established mitigation planting. Possible glimpses of tops of lighting columns / light spill to north-east. 3 m environmental barrier on south side of A465 mainline partly visible. The magnitude of impact would be **minor adverse**.	**Slight adverse**
S5-W4	Outdoor workers at Dan-Y-Castell Farm, Pontsarn Road, Merthyr Tydfil.	170 m	The farmland lies adjacent to, and has direct views south towards the A465 mostly screened by vegetation along the road. The Pen-Y-Dre High School buildings and hospital buildings are visible, glimpsed over the roadside trees from higher locations. The Trade Centre for Wales is visible to the east and western views are curtailed by woodland along Goitre Lane.	Construction Slightly descending views of tree clearance between intervening woodland would be possible from south facing slopes. Views towards construction activities between the Trade Centre Wales and the large new roundabout for Prince Charles Hospital junction would include demolition of the Trade Centre for Wales, earthworks, retaining walls, large western roundabout for Prince Charles Hospital junction, ponds and the link road crossing the farmland. The compound would also be glimpsed beyond the construction on the south side of the A465. The magnitude of impact would be **major adverse**.	**Large adverse**	Winter Year 1 As per operation without mitigation planting. The magnitude of impact would be **moderate adverse**.	**Moderate adverse**
				Operation Partial descending views of traffic in cutting would be visible on the A465 and on the link road through fields to the north of the A465. Lighting at the junction would be visible and views opened up across the road to Pen-Y-Dre High School and housing in Gurnos and Galon Uchaf. The attenuation ponds would be in view along the link road. The magnitude of impact would be **moderate adverse**.	**Moderate adverse**	Summer Year 15 Planting along the A465 and around the junction would screen views but the attenuation ponds, link road and traffic on it would remain partially visible. The magnitude of impact would be **minor adverse**.	**Slight adverse**

Table 100.2 : Visual effects schedule: people at work with low sensitivity to change

Value/ sensitivity to change: Low

Reference number[2] * Listed Building	Location	Approx. distance from nearest point of receptor to centre line of proposed A465 alignment	Existing view	Change in view and magnitude of impact without mitigation planting	Significance of effect without mitigation planting	Change in view and magnitude of impact with mitigation planting	Significance of effect with mitigation planting
S6-W1	Indoor workers at Smarter Training Group Ltd, Fairleap House, Brecon Road, Hirwaun.	55 m	Views south and east contained by mature deciduous vegetation in summer. Glimpsed views to tops of lighting columns on A465. Filtered views through vegetation in the winter, to traffic and lighting columns on A465.	Construction Loss of trees would open up close views west, south and east to traffic on temporary A465 diversion road, demolition of properties, construction activities at Trewaun junction and A465 mainline cutting, including major earthworks, a new bridge and highway infrastructure such as signage, lighting columns and environmental barriers, as well as middle distance glimpses of construction of Pentwyn Cynon (Tramway) footbridge. The magnitude of impact would be **major adverse.**	**Moderate adverse**	Winter Year 1 As per operation without mitigation planting. The magnitude of impact would be **moderate adverse**.	**Slight adverse**
				Operation Close views south opened up by loss of vegetation, to 2 m high environmental barriers, which would partially obscure traffic flow and highway infrastructure such as signage and lighting columns / light spill, at Trewaun junction. Also close views south to east to 2 m high environmental barrier along A465 mainline, which together with cutting would screen views of traffic, except upper storey glimpses to tops of high sided vehicles. Also glimpses of upper parts of Pentwyn Cynon (Tramway) footbridge to north-east. The magnitude of impact would be **moderate adverse.**	**Slight adverse**	Summer Year 15 Established mitigation planting would generally screen views of traffic flow and highway infrastructure such as signage and 2 m high environmental barriers at Trewaun junction and along A465 mainline cutting, though tops of lighting columns / light spill at junction would remain visible. The magnitude of impact would be **negligible adverse.**	**Slight adverse**
S5-W1	Workers at Yard north-west of Old Brewery Cottage, Pontycapel Road, Cefn Coed, Merthyr Tydfil.	65 m	Yard positioned at bottom of river valley facing A465. Lower level views north-west along the Taf Fawr river valley to mature trees, including specimen trees within Cefn Coed Cemetery. Close, direct and elevated views to A465 with lighting columns and tops of high-sided vehicles on Taf Fawr Viaduct. Views west and south-west screened by rising valley sides and mature deciduous trees.	Construction Close range views north-west to construction of two viaducts across Taf Fawr with highway infrastructure such as signage and lighting columns, seen in context of the existing A465 viaduct in foreground. Also views of large construction compounds and stockpiles below viaducts, opened up by vegetation loss in river valley. Possible glimpsed views above trees to construction activities at eastern corner of A470 junction. The magnitude of impact would be **major adverse.**	**Moderate adverse**	Winter Year 1 As per operation without mitigation planting. The magnitude of impact would be **moderate adverse.**	**Slight adverse**
				Operation Close range ascending views north-west to tops of high sided vehicles on elevated A465 mainline viaduct, as	**Slight adverse**	Summer Year 15 Established mitigation planting at eastern corner of A470 junction would generally screen junction, though glimpses	**Slight adverse**

[2] Refer to Figure 10.8

Reference number[2] * Listed Building	Location	Approx. distance from nearest point of receptor to centre line of proposed A465 alignment	Existing view	Change in view and magnitude of impact without mitigation planting	Significance of effect without mitigation planting	Change in view and magnitude of impact with mitigation planting	Significance of effect with mitigation planting
				well as additional signage on existing A465 viaduct and tops of lighting columns / light spill on new slip road viaduct, seen in context of existing lit A465 viaduct. Possible filtered glimpses west through and above existing trees, to earthworks for attenuation pond, as well as tops of high sided vehicles and lighting columns / light spill at A470 junction. The magnitude of impact would be **moderate adverse.**		of tops of lighting columns / light spill might remain. Due to elevated nature of A465 mainline viaduct across the Taf Fawr, mitigation planting would only soften eastern abutment. Tops of high sided vehicles on A465 mainline viaduct, as well as additional signage on existing A465 viaduct and tops of lighting columns / light spill on new slip road viaduct would therefore remain visible in middle distance to north-west, partially filtered through intervening trees, but seen in context of existing lit A465 viaduct. The magnitude of impact would be **moderate adverse.**	
S5-W3	Indoor workers at Gurnos Police Station, Gurnos Ring Road, Gurnos, Merthyr Tydfil.	41 m	Close direct views north across Gurnos Ring Road to tree belt along A465, which screens views of traffic flow in summer and filters views in winter. Views west and east contained by adjacent properties and garden vegetation.	<u>Construction</u> Close views north to construction of widened and elevated A465 mainline including low retaining wall, tall embankments and highway infrastructure such as signage and environmental barrier, opened up by loss trees. The magnitude of impact would be **major adverse.**	**Moderate adverse**	<u>Winter Year 1</u> As per operation without mitigation planting. The magnitude of impact would be **major adverse.**	**Moderate adverse**
				<u>Operation</u> Close views north across Gurnos Ring Road to tops of high sided vehicles and signage on A465 mainline above 3 m high environmental barrier, on tall embankment above low retaining wall. The magnitude of impact would be **major adverse.**	**Moderate adverse**	<u>Summer Year 15</u> Established mitigation planting would soften views of embankment and, screen 3 m high environmental barrier and traffic flow on A465, except in oblique views west. Glimpsed views of tops of signage. The magnitude of impact would be **minor adverse.**	**Slight adverse**
S5-W5	Indoor workers at commercial units, Pontsarn Road, Merthyr Tydfil.	17 m	There are limited views out from these commercial units and windows of offices are on the first floor and have views towards the A465 over the Trade Centre for Wales and vegetation along the edge of the A465 and more obliquely west towards Pen-Y-Dre High School.	<u>Construction</u> Vegetation clearance along the A465 would open up views to areas south of the A465, including housing, playing fields, and the school buildings. Demolition of the Trade Centre Wales and large scale earthworks to widen the road corridor would be visible in addition to retaining wall and road construction in near views west to south-east. Construction of the attenuation ponds and the link road from the large roundabout at Prince Charles Hospital junction to Pontsarn Road would cross fields close by and link into the grounds of the commercial units. The magnitude of impact would be **major adverse**.	**Moderate adverse**	<u>Winter Year 1</u> As per operation without mitigation planting. The magnitude of impact would be **moderate adverse**.	**Slight Adverse**
				<u>Operation</u> The properties would directly overlook road and traffic on it would be in close proximity. Traffic would be partially screened on the east bound carriageways by the retaining wall and would be less prominent in the view	**Slight adverse**	<u>Summer Year 15</u> The established mitigation planting along the cutting slope on the north side of the A465 would reduce views of traffic on the A465 and at the large roundabout at Prince Charles Hospital junction to the north-west. Planting on the south	**Slight Adverse**

Reference number[2] * Listed Building	Location	Approx. distance from nearest point of receptor to centre line of proposed A465 alignment	Existing view	Change in view and magnitude of impact without mitigation planting	Significance of effect without mitigation planting	Change in view and magnitude of impact with mitigation planting	Significance of effect with mitigation planting
				because it is set below ground level and views are from windows on the upper level of the commercial buildings from where there are panoramic views south. Traffic would be visible along the link road and at the large roundabout at Prince Charles Hospital junction in oblique views. The magnitude of impact would be **moderate adverse**.		side of the A465 would form a backdrop to moving traffic on the A465 and fully screen traffic on Gurnos Ring road. The magnitude of impact would be **minor adverse**.	
S5-W6	Indoor workers at Creative House, Rocky Road, Galon Uchaf, Merthyr Tydfil.	22 m	There are views north, west and east from windows of this large industrial unit to the A465. This building is located in an elevated positon overlooking a junction of six roads, one of which leads onto a bridge over the A465. Views north are descending to the road as it passes under the Galon Uchaf bridge and west beyond the bridge as it extends towards Gurnos screened by planting on the south side of the road, and east along the slip road until the Dowlais Cwm Community woodland obscures further views.	<u>Construction</u> Loss of vegetation along the A465 would open up views further west and east along the road. Construction activities would take place within view of three elevations of this property and would include; demolition of old, and construction of the new bridge and associated retaining walls extending east and west of the bridge structure. North of the A465 construction of the new roundabout and demolition of the Trade Centre Wales would be visible. Views of the compound area extending along the proposed scheme to the west would be possible from the windows at the front of the building. The magnitude of impact would be **major adverse**.	**Moderate adverse**	<u>Winter Year 1</u> As per operation without mitigation planting. The magnitude of impact would be **moderate adverse**.	**Slight adverse**
				<u>Operation</u> Views of the new bridge and road network to the north, the A465 extending west towards Prince Charles Hospital junction and the link road from it to Pensarn Road would be visible from the front elevation. From the north elevation the A465 would be in cutting contained by retaining walls and embankment with the industrial area prominent in the view beyond. From the rear elevation there would no longer be a slip road off the A465. The magnitude of impact would be **moderate adverse**.	**Slight adverse**	<u>Summer Year 15</u> Established mitigation planting along the A465 to the west and east of Prince Charles Hospital junction would reduce long views of the road and traffic on it. Tree planting along the edge of the industrial estate and around the new roundabout junction would improve visual amenity and integrate the new road layout in views from the south. The magnitude of impact would be **minor adverse**.	**Neutral**
S5-W7	Indoor workers at commercial units, Pant Industrial Estate, Access Road (north side), Pant, Merthyr Tydfil.	30 m	These two large units have frontages and office windows facing south west towards the Galon Uchaf over bridge and the junction with Bryniau Road. The A465 lies slightly to the south in their view screened by roadside vegetation.	<u>Construction</u> Vegetation removal would open up views to the south side of the A465 towards housing in Gurnos and a large commercial unit on the southern roundabout. Construction of the new industrial estate road layout and retaining walls to the widened A465 would be visible as would installation of the new overbridge; all in close proximity. The magnitude of impact would be **major adverse**.	**Moderate adverse**	<u>Winter Year 1</u> As per operation without mitigation planting. The magnitude of impact would be **moderate adverse**.	**Slight adverse**
				<u>Operation</u>	**Slight**	<u>Summer Year 15</u>	**Slight**

Reference number[2] * Listed Building	Location	Approx. distance from nearest point of receptor to centre line of proposed A465 alignment	Existing view	Change in view and magnitude of impact without mitigation planting	Significance of effect without mitigation planting	Change in view and magnitude of impact with mitigation planting	Significance of effect with mitigation planting
				Views south across the A465 would remain open and highway infrastructure and traffic at a lower level between retaining walls would be visible. The magnitude of impact would be **moderate adverse**.	**adverse**	Established tree planting along the north edge of the A465 would reduce views of traffic and of the commercial unit on the south side and improve the visual amenity at the entrance to the industrial estate. Mitigation planting on the south side to east and west of the overbridge would contain and integrate views. The magnitude of impact would be **minor adverse**.	**adverse**
S5-W8	Indoor / outdoor workers at commercial units, Pant Industrial Estate, Access Road (south side), Pant Merthyr Tydfil.	14 m	These commercial units occupy plots between the estate road and the A465. There are few windows in the large industrial units. They back straight onto the edge of the A465 separated from it by a thin line of hedgerow trees and shrubs at the western end which thicken into a small belt of woodland to the east at the end of the on slip. This belt of trees obscures views of traffic on the A465 with filtered views of traffic possible along the on slip.	<u>Construction</u> Loss of vegetation would open up views of the A465 corridor with the ground on the south side falling away to the south within Ifor Park and Dowlais Cwm Community Woodland. Construction of this section of new road along the ridge in close proximity would be visible from windows and frontages facing south. The magnitude of impact would be **major adverse**.	**Moderate adverse**	<u>Winter Year 1</u> As per operation without mitigation planting. The magnitude of impact would be **moderate adverse**.	**Slight adverse**
				<u>Operation</u> Traffic on the A465 would be visible in close proximity. The magnitude of impact would be **moderate adverse**.	**Slight adverse**	<u>Summer Year 15</u> Mitigation planting along the northern side of the road would screen views of traffic for receptors in the eastern half while for those located at the western end traffic would remain visible above a boundary fence. The magnitude of impact would be **negligible adverse**.	**Neutral**
S5-W9	Indoor workers at Funeral Services, Pant Road, Dowlais, Merthyr Tydfil.	90 m	Views from this building are limited to the front door facing north east and windows overlooking Pant Road. From the car park views are filtered through high palisade fencing to the west and north. Views north east are towards Pant viaduct and the Merthyr Car Auctions on the east side of Pant Road around which a tall evergreen hedge forms a screen along the road. To the north ascending views are to traffic on embankment partially filtered through vegetation.	<u>Construction</u> Tree clearance along the A465 would open up views along the ridge at the top of Ifor Park open space. Construction activities would include; demolition of the existing viaduct and construction of the new viaduct over Pant Road and earthworks to widen to road on embankment adjacent to the play area. The retaining wall construction within the Merthyr Car Auctions site would be partially visible. The compound would be glimpsed in the open space north of the A465. The magnitude of impact would be **major adverse**.	**Moderate adverse**	<u>Winter Year 1</u> As per operation without mitigation planting. The magnitude of impact would be **minor adverse**.	**Slight adverse**
				<u>Operation</u> The new viaduct and embankment, traffic visible on it, and highway infrastructure, would dominate views to the north, north east and north west. The retaining wall on the east side of the new viaduct would be visible above Merthyr Auctions boundary hedge and fence. The magnitude of impact would be **minor adverse**.	**Slight adverse**	<u>Summer Year 15</u> Established mitigation planting on the embankments would reduce views of traffic on the embankment. Views through the viaduct and the retaining wall would remain. The magnitude of impact would be **negligible adverse**.	**Neutral**

Reference number[2] * Listed Building	Location	Approx. distance from nearest point of receptor to centre line of proposed A465 alignment	Existing view	Change in view and magnitude of impact without mitigation planting	Significance of effect without mitigation planting	Change in view and magnitude of impact with mitigation planting	Significance of effect with mitigation planting
S5-W10	Indoor / outdoor workers at Merthyr Motor Auctions, Pant Road, Pant, Merthyr Tydfil.	17 m	The Merthyr Motor Auctions are located at the base of a cutting which forms the eastern edge of the site and affords no views beyond. High evergreen hedges on its southern and western boundaries also curtail views out. There are views north and north west under Pant viaduct across open space to housing in Pant and also west and south west from the northern end of the premises along the A465 on embankment towards open space in Ifor Park and to a nearby play area on Pant Road close to housing.	<u>Construction</u> Loss of land under Pant viaduct, demolition of the viaduct and construction of a retaining wall across the northern boundary of the site stopping up direct views north. Construction of the new viaduct over Pant Road and earthworks to widen to road on embankment to the west. The compound would be partially in open space north of the A465. The magnitude of impact would be **major adverse**.	**Moderate adverse**	<u>Winter Year 1</u> As per operation without mitigation planting. The magnitude of impact would be **minor adverse**	**Slight adverse**
				<u>Operation</u> Views west along the A465 on embankment would be possible with traffic glimpsed on the southern edge of the road extending towards Dowlais Cwm Community wood and Prince Charles Hospital junction. Oblique views north under the viaduct to open space and new road junction in Pant would be possible, but views north along Pant Road would have been replaced by a retaining wall. The magnitude of impact would be **minor adverse**.	**Slight adverse**	<u>Summer Year 15</u> Established mitigation planting along the embankments would soften the view and screen glimpsed views of elevated traffic. The magnitude of impact would be **minor adverse**.	**Neutral**

Appendix 10I – Landscape Assessment

Table 10I.1 : Landscape assessment

Key features of proposed scheme and approximate chainages (ch.) (m)	Assessment of landscape impacts and effects during construction and operation without landscape mitigation	Assessment of landscape impacts and effects during operation at winter year 1 and summer year 15 with landscape mitigation
Brecon Beacons National Park - landscape sensitivity: high (Note: includes part of the Fforest Fawr Geopark)		
The proposed scheme would cross the BBNP between ch. 4500 to 6650 and 10300 to 10870. It would be largely online apart from between ch. 5000 to 5600 where it would be aligned up to 20 m east of the existing A465 and at the A470 junction where it would be up to 80 m north of the existing A465. The existing A465 would form the westbound access slip road as part of the grade separation of the A470 junction. There would be sections on substantial embankments and in cuttings, with a particularly prominent cutting slope in the north west quadrant of the A470 junction. Key features would include the new grade separated Croesbychan and A470 junctions and associated structures, slip roads and lighting, the Nant Moel and Nant Ffrwd overbridges and some retaining walls. The Nant Hir viaduct would lie adjacent to the BBNP at ch. 6700. There would be attenuation ponds adjacent to the main line at ch. 5600 north side and ch 6000 and 10750 south side. The Croesbychan junction would include an elevated environmental barrier 1 m in height	Construction During construction the clearance of extensive established highway vegetation and adjacent woodland, including extensive areas of ancient woodland, and large scale earthworks within the construction footprint would have a direct adverse impact on localised parts of BBNP LCA 4. Waterfall Country and Southern Valleys (ch. 4500 to 6650) and BBNP LCA 8. Talybont and Taff Reservoir Valleys (ch. 10300 to 10900). This would be exacerbated by other construction activity and the moderate tranquillity of the BBNP in the vicinity of the A465 would be reduced. Construction activity associated with embankments and elevated elements of the junctions would be particularly prominent in characteristic long views from higher parts of the BBNP further to the north. The BBNP's 'special qualities' of peace and tranquillity, sense of place and high scenic quality, would be locally eroded. Magnitude of impact: major adverse. Significance of landscape effects: **very large adverse** (on local part of BBNP.	Operation winter year 1 Landscape ground modelling of the engineering embankments would slightly soften their impact. Finishes to bridge abutments forming part of the grade separation of the A470 junction and landscape ground modelling of the engineering embankments / cuttings would accentuate the role of the junction as a gateway to the BBNP and assist in integrating the proposed scheme into the landscape. Architectural input to the design of the Taf Fawr viaducts would enhance the contribution they make to the gorge landscape on the edge of the BBNP. The A465 would remain prominent and the moderate tranquillity of the BBNP in the vicinity of the A465 would be reduced by the new highway infrastructure including lighting and signage etc. and traffic particularly at the Croesbychan and A470 junctions. The BBNP's 'special qualities' of peace and tranquillity, sense of place and high scenic quality, would be locally eroded. Magnitude of impact: major adverse. Significance of landscape effects: **large adverse** (on local part of BBNP).
	Operation The offline sections of the proposed scheme would	Operation summer year 15 Extensive tree and shrub planting would establish on the

Key features of proposed scheme and approximate chainages (ch.) (m)	Assessment of landscape impacts and effects during construction and operation without landscape mitigation	Assessment of landscape impacts and effects during operation at winter year 1 and summer year 15 with landscape mitigation
and 485 m long.	introduce new highway infrastructure including lighting and signage etc. and traffic into localised parts of BBNP LCA 4. Waterfall Country and Southern Valleys and BBNP LCA 8. Talybont and Taff Reservoir Valleys. The dualling of online sections of the A465 would significantly increase the existing highway infrastructure footprint of the road, particularly at the new junctions. Sections of the proposed scheme on embankments would be particularly prominent and the moderate tranquillity of the BBNP in the vicinity of the A465 would be reduced by the new highway infrastructure and traffic. The removal of established highway vegetation and adjacent woodland, including extensive areas of ancient woodland, would increase the prominence of the A465 and disrupt the existing pattern of mature vegetation, particularly along the Nant-moel, the Nant Ffrwd and Pwll Annie. Overall the proposed scheme would have a linear urbanising effect on the rural character of the BBNP LCAs. The BBNP's 'special qualities' of peace and tranquillity, sense of place and high scenic quality, would be locally eroded. Magnitude of impact: major adverse. Significance of landscape effects: **large adverse** (on local part of BBNP).	landscape ground modelling to effectively integrate parts of the proposed scheme in the vicinity of the Croesbychan junction into the landscape and locally reduce the prominence of the A465. The combination of architectural finishes and planting would have some beneficial impact on landscape amenity. The established planting would also partly mitigate the loss of existing vegetation and complement the existing pattern of mature vegetation. The extensive loss of loss of ancient woodland however, could not be mitigated. The road would remain prominent to the north of the Croesbychan junction and at the A470 junction. The open treatment of parts of the road to the north of the Croesbychan junction would allow extensive and attractive views to be experienced by the road users. There would be some significant residual adverse effects on the moderate tranquillity of the BBNP in the vicinity of the A465 and landscape character. The BBNP's 'special qualities' of peace and tranquillity, sense of place and high scenic quality, would be locally eroded. Magnitude of impact: moderate adverse. Significance of landscape effects: **large adverse** (on local part of BBNP).
Rhondda Cynon Taf SLAs - landscape sensitivity: high (Note: includes part of the RCTCBC Cynon Valley River Park)		
The proposed scheme would cross the SLA between ch. 3500 to 4600 and 6700 to 8400. It would include sections on substantial embankments and in deep cutting.	Construction During construction the clearance of extensive established highway vegetation and adjacent woodland, including ancient woodland at Nant Hir and coniferous forest, and large scale earthworks within the construction footprint	Operation winter year 1 Sensitive treatment of the Baverstock cutting slopes would accentuate the exposed geology and create drama and interest along part of the proposed scheme within the SLA. Overall however, the A465 would remain

Key features of proposed scheme and approximate chainages (ch.) (m)	Assessment of landscape impacts and effects during construction and operation without landscape mitigation	Assessment of landscape impacts and effects during operation at winter year 1 and summer year 15 with landscape mitigation
Key features would include the Baverstock junction and its associated structures, slip roads and lighting, new side road links to the north-east and south-east of the Baverstock junction and the new Swansea Road running parallel to the mainline to the south. Other structures would include the Afon Cynon bridge, the Tramway footbridge, the Vale of Neath bridge and the Nant Hir viaduct. There would be attenuation ponds on the south side of the A465 at ch. 3650 to 3900, 4250, 6750 and 7000, south side. Additional attenuation ponds would also be included on the south side of the Cwmynysminton Road (side road) and the south side of the Baverstock junction.	would have a direct adverse impact on the SLA. This would be exacerbated by other construction activity and the tranquillity of the SLA would be reduced. Construction activity associated with embankments and elevated elements of the road would be particularly prominent and in the vicinity of Penmoelallt Forest substantial 'raw' cut faces would be visible from the east and west. Away from the A465 perpendicular to its alignment in the vicinity of Penmoelallt Forest, the cutting and remaining coniferous forest would reduce the influence of construction. Magnitude of impact: major adverse. Significance of landscape effects: **large adverse**.	prominent and tranquillity would be reduced by the new highway infrastructure including lighting and signage etc. and traffic. The proposed tree and shrub planting at the Baverstock junction would have little impact at this stage. Magnitude of impact: major adverse. Significance of landscape effects: **large adverse**.
	Operation The proposed scheme would introduce new highway infrastructure including lighting and signage etc. and traffic into the SLA and significantly increase the existing highway infrastructure footprint of the road, particularly at the Baverstock junction. Sections of the proposed scheme on embankments would be particularly prominent and the moderate tranquillity of the SLA would be reduced by the new highway infrastructure and traffic. The removal of established highway vegetation and adjacent woodland, including ancient woodland at Nant Hir and established coniferous forest, would increase the prominence of the A465 and disrupt the existing pattern of mature vegetation in the SLA. Overall the proposed scheme would have a linear urbanising effect on the rural character of the SLA and detract from its role in providing a setting to the BBNP. Magnitude of impact: moderate adverse. Significance of landscape effects: **large adverse**.	Operation summer year 15 Extensive tree and shrub planting would establish on the east side of the Baverstock junction to partly integrate parts of the proposed scheme into the landscape and locally reduce the prominence of the junction within the SLA. The planting would also partly mitigate the loss of existing coniferous forest. The loss of ancient woodland however, could not be mitigated. While the cutting slopes would continue to accentuate the exposed geology and provide drama and interest along part of the proposed scheme, particularly as some vegetation establishes on the cut faces and ledges, the substantial notch in the landscape would remain and there would be significant residual adverse effects on tranquillity and landscape character in the SLA and detract from its role in providing a setting to the BBNP. Magnitude of impact: major adverse. Significance of landscape effects: **large adverse**.

Key features of proposed scheme and approximate chainages (ch.) (m)	Assessment of landscape impacts and effects during construction and operation without landscape mitigation	Assessment of landscape impacts and effects during operation at winter year 1 and summer year 15 with landscape mitigation
Hirwaun (built land) - landscape sensitivity: low		
The proposed scheme would cross the local LCA between ch. 0 to 1800 and 3100 to 4500 as an online dualling and include sections on substantial embankments and in deep cutting. Key features would include the grade separation of the existing at grade junction at Hirwaun and its associated structures, slip roads and lighting. Other structures would include the Trewaun, Pentwyn Cynon and Court Farm underpasses and the A465 bridge over the Afon Cynon. Embankments at Trewaun would result in the removal of four residential properties.	Construction During construction the clearance of extensive established highway vegetation and adjacent woodland, demolition of four properties, introduction of the temporary Trewaun north diversion and large scale earthworks within the construction footprint would have a direct adverse impact on part of the local LCA. This would be exacerbated by other construction activity, particularly at the junctions, and the already low tranquillity in the local LCA would be further reduced. Construction between ch. 0 to 1800 would be perceived next to the existing opencast mining activities and industrial scale earthworks of the adjacent Tower Colliery site and this would slightly lessen the significance of the impacts. Magnitude landscape impact: major adverse. Significance of landscape effects: **moderate adverse**.	Operation winter year 1 Finishes to bridge abutments forming part of the grade separation of the Hirwaun junction, landscape ground modelling of the engineering embankments and new landscape features/walls would accentuate the role of the junction as a gateway to the BBNP and assist in integrating the proposed scheme into the landscape. Individual tree planting using large nursery stock would make some immediate contribution to landscape amenity. The A465 would however, remain prominent and tranquillity, already low, would be reduced further by the new highway infrastructure including lighting and signage etc. and traffic. The townscape / streetscape would be slightly impacted by the removal of four properties at Trewaun. Magnitude of landscape impact: major adverse. Significance of landscape effects: **moderate adverse**.
	Operation The dualling, embankments / cut slopes and junctions at Hirwaun and Trewaun and associated structures and slip roads would significantly increase the existing highway infrastructure footprint in the local LCA. This includes the attenuation pond to the north at ch. 1000 to 1200. The removal of established highway vegetation and adjacent woodland would increase the prominence of the A465, albeit within an urban / industrial setting with existing	Operation summer year 15 Extensive tree and shrub planting would establish on the landscape ground modelling to effectively integrate the proposed scheme into the landscape and reduce the prominence of the A465. There would only be slight residual adverse effects on tranquillity and landscape character. Magnitude of landscape impact: moderate adverse.

Key features of proposed scheme and approximate chainages (ch.) (m)	Assessment of landscape impacts and effects during construction and operation without landscape mitigation	Assessment of landscape impacts and effects during operation at winter year 1 and summer year 15 with landscape mitigation
	highway junctions. This would be exacerbated where the road is elevated on high embankment at the Hirwaun junction. The townscape / streetscape would be slightly impacted by the removal of four properties at Trewaun. Tranquillity in the local LCA, already low, would be reduced further by the new highway infrastructure including lighting and signage etc. and traffic. Magnitude of landscape impact: major adverse. Significance of landscape effects: **moderate adverse**.	Significance of landscape effects: **slight adverse**.
Tower Colliery (workings) - landscape sensitivity: low		
The proposed scheme would cross the local LCA between ch.1800 to 2300 as an offline dual carriageway and include a substantial embankment rising up to the Hirwaun junction to the west. Key features would include the slip road link to Tower Road to the south, the Nant y Bwlch crossing and an attenuation pond to the north at ch. 2250 to 2300.	Construction During construction the clearance of some mature vegetation and large scale earthworks within the construction footprint would have a direct adverse impact on part of the local LCA. This would be exacerbated by other construction activity and the already low tranquillity in the local LCA would be further reduced. The significance of the impacts would be lessened by the presence of existing opencast mining activities and industrial scale earthworks on the Tower Colliery site. Magnitude of impact: major adverse. Significance of landscape effects: **moderate adverse**.	Operation winter year 1 The A465 would remain prominent and tranquillity, already low, would be reduced further by the new highway infrastructure including lighting and signage etc. and traffic. The proposed tree and shrub planting would have little impact at this stage. Magnitude of impact: major adverse. Significance of landscape effects: **moderate adverse**.
	Operation This offline section of the proposed scheme would introduce extensive new highway infrastructure into this local LCA, including the attenuation pond to the north at ch. 2250 to 2300. The section of the A465 set on embankment would be prominent in the, albeit already disturbed, opencast mining landscape with an urban /	Operation summer year 15 Extensive tree and shrub planting would establish to effectively integrate the proposed scheme into the landscape and reduce the prominence of the A465. There would be slight residual adverse effects on tranquillity and landscape character.

Key features of proposed scheme and approximate chainages (ch.) (m)	Assessment of landscape impacts and effects during construction and operation without landscape mitigation	Assessment of landscape impacts and effects during operation at winter year 1 and summer year 15 with landscape mitigation
	industrial backdrop to the north, east and north-west. Some mature vegetation would be removed and tranquillity in the local LCA, already low, would be reduced further by the new highway infrastructure including lighting and signage etc. and traffic. Magnitude of impact: major adverse. Significance of landscape effects: **moderate adverse**.	Magnitude of impact: moderate adverse. Significance of landscape effects: **slight adverse**.
Hirwaun Common (hills / valleys and fields) - landscape sensitivity: moderate		
The proposed scheme would cross the local LCA between ch. 2300 to 3100 as an offline dual carriageway and include a deep cutting falling to the Trewaun underpass to the east, spanned by the wind farm access overbridge.	Construction During construction the large scale earthworks within the construction footprint would have a direct adverse impact on a small part of the local LCA. This would be exacerbated by other construction activity and the introduction of the temporary Trewaun south diversion and the moderate tranquillity in the local LCA would be reduced. The significance of the impacts would however, be slightly lessened by the existing opencast mining activities and industrial scale earthworks on the Tower Colliery site to the west. Little vegetation would be removed as part of the proposed scheme. Magnitude of impact: major adverse. Significance of landscape effects: **moderate adverse**.	Operation winter year 1 The A465 would not be prominent but the moderate tranquillity in the local LCA would be reduced by the new highway infrastructure and traffic. The proposed tree and shrub planting would have little impact at this stage. Magnitude of impact: major adverse. Significance of landscape effects: **moderate adverse**.
	Operation This offline section of the proposed scheme would introduce new highway infrastructure into this local LCA including the new wind farm access overbridge. Set largely in cutting, the A465 would not be prominent and the landscape has already been historically disturbed in places. The moderate tranquillity in the local LCA would be	Operation summer year 15 Extensive tree and shrub planting would establish to effectively integrate the proposed scheme, its associated cutting slopes and the wind farm access overbridge into the landscape. There would be some residual adverse effects on tranquillity and landscape character.

Key features of proposed scheme and approximate chainages (ch.) (m)	Assessment of landscape impacts and effects during construction and operation without landscape mitigation	Assessment of landscape impacts and effects during operation at winter year 1 and summer year 15 with landscape mitigation
	reduced by the new highway infrastructure and traffic although these would be partly screened by the cutting. Magnitude of impact: major adverse. Significance of landscape effects: **moderate adverse**.	Magnitude of impact: moderate adverse. Significance of landscape effects: **moderate adverse**.
Penderyn and Abernant (hills / valleys and fields) - landscape sensitivity: high		
The proposed scheme would cross the local LCA between ch. 4500 to 7800. It would be largely online apart from between ch. 5000 to 5600 and 6100 to 6600 where it would be aligned up to 20 m east and 15 m north-west of the existing A465 respectively. It would include sections on substantial embankments and in deep cutting. Key features would include the new grade separated junctions at Croesbychan and Baverstock and associated structures, slip roads and lighting, the Nant Moel overbridge and the Nant Hir viaduct. There would be attenuation ponds adjacent to the main line at ch. 5600, north side and ch. 3650 to 3900, 6000, 6750 and 7000, south side. Additional attenuation ponds would also be included on the south side of the Cwmynysminton Road (side road) and the south side of the Baverstock junction.	Construction During construction the clearance of extensive established highway vegetation and adjacent woodland, including ancient woodland, and large scale earthworks within the construction footprint would have a direct adverse impact on a large part of the local LCA. This would be exacerbated by other construction activity and the moderate tranquillity in the local LCA would be reduced. Construction activity associated with embankments and elevated elements of the junctions would be particularly prominent. Magnitude of impact: major adverse. Significance of landscape effects: **very large adverse**.	Operation winter year 1 Landscape ground modelling of the engineering embankments would slightly soften their impact. The A465 would remain prominent and the moderate tranquillity in the local LCA would be reduced by the new highway infrastructure including lighting and signage etc. and traffic. The proposed tree and shrub planting at the Croesbychan junction would have little impact at this stage. Magnitude of impact: major adverse. Significance of landscape effects: **large adverse**.
	Operation The offline sections of the proposed scheme would introduce new highway infrastructure into this local LCA and the dualling of online sections of the A465 would significantly increase the existing highway infrastructure footprint of the road, particularly at the new junctions where there would also be lighting and signage etc. Sections of the proposed scheme on embankments would be particularly prominent and the moderate tranquillity in the local LCA would be reduced by the new highway infrastructure and traffic. The removal of established	Operation summer year 15 Extensive tree and shrub planting would establish on the landscape ground modelling to effectively integrate parts of the proposed scheme in the vicinity of the Croesbychan junction into the landscape and locally reduce the prominence of the A465. The established planting would also partly mitigate the loss of existing vegetation and complement the existing pattern of mature vegetation. The loss of ancient woodland however, could not be mitigated. The A465 would remain prominent where on embankment, particularly at the

Key features of proposed scheme and approximate chainages (ch.) (m)	Assessment of landscape impacts and effects during construction and operation without landscape mitigation	Assessment of landscape impacts and effects during operation at winter year 1 and summer year 15 with landscape mitigation
	highway vegetation and adjacent woodland, including ancient woodland, would increase the prominence of the A465 and disrupt the existing pattern of mature vegetation, particularly along the Nant-moel in the vicinity of the Croesbychan junction. Overall the proposed scheme would have a linear urbanising effect on the rural character of the local LCA. Magnitude of impact: major adverse. Significance of landscape effects: **large adverse**.	Croesbychan and Baverstock junctions. There would be significant residual adverse effects on tranquillity and landscape character. Magnitude of impact: moderate adverse. Significance of landscape effects: **large adverse**.
Penmoelallt Forest (forestry) - landscape sensitivity: moderate		
The proposed scheme would cross the local LCA between ch. 7800 to 8400 as an online dualling and include sections in deep cutting. Key features would include new side road links to the north-east and south-east of the Baverstock junction and the new Swansea Road running parallel to the mainline to the south.	Construction During construction the clearance of established coniferous forest and large scale earthworks within the construction footprint would have a direct adverse impact on part of the local LCA. This would be exacerbated by other construction activity and the moderate tranquillity in the local LCA would be reduced. Construction activity associated with the substantial cutting would be particularly prominent with substantial 'raw' cut faces being visible from the east and west. Away from the A465 perpendicular to its alignment, the cutting and remaining coniferous forest would reduce the influence of construction. Magnitude of impact: major adverse. Significance of landscape effects: **large adverse**.	Operation winter year 1 Sensitive treatment of the cutting slopes would accentuate the exposed geology and create drama and interest along this part of the proposed scheme. The A465 would however, remain prominent from the east and west and the moderate tranquillity in the local LCA would be reduced by the new highway infrastructure including lighting and signage etc. and traffic. The proposed tree and shrub planting at the Baverstock junction would have little impact at this stage. Magnitude of impact: major adverse. Significance of landscape effects: **large adverse**.
	Operation The dualling of the A465 and the introduction of the parallel Swansea Road would significantly increase the existing highway infrastructure footprint of the road. The	Operation summer year 15 Extensive tree and shrub planting would establish on the east side of the Baverstock junction to partly integrate parts of the proposed scheme into the landscape and

Key features of proposed scheme and approximate chainages (ch.) (m)	Assessment of landscape impacts and effects during construction and operation without landscape mitigation	Assessment of landscape impacts and effects during operation at winter year 1 and summer year 15 with landscape mitigation
	deep cutting would create a substantial notch in the existing landform and geology and create a large 'scar' in the landscape. The removal of established coniferous forest would affect the forest character of the LCA. The moderate tranquillity in the local LCA would be reduced by the new highway infrastructure including lighting and signage etc. and traffic although, away from the A465 perpendicular to its alignment, the cutting and remaining coniferous forest would reduce the influence of the proposed scheme. Overall the proposed scheme would have a linear urbanising effect on the forested character of this local LCA. The setting of this local LCA would also be affected by the substantial new junction at Baverstock and associated infrastructure and lighting immediately to the west. Magnitude of impact: major adverse. Significance of landscape effects: **large adverse**.	locally reduce the prominence of the junction. The planting would also partly mitigate the loss of existing coniferous forest. While the cutting slopes would continue to accentuate the exposed geology and provide drama and interest along this part of the proposed scheme, particularly as some vegetation establishes on the cut faces and ledges, the substantial notch in the landscape would remain and there would be significant residual adverse effects on tranquillity and landscape character. Magnitude of impact: moderate adverse. Significance of landscape effects: **moderate adverse**.
Mynydd y glog (open plateau) - landscape sensitivity: high		
The proposed scheme would pass immediately adjacent to the south side of the local LCA at ch. 6600 in the vicinity of the Nant Hir Reservoir. Key features of the proposed scheme, beyond this local LCA to the south, would be as described above for the Penderyn and Abernant local LCA between ch. 4500 to 7800.	Construction During construction the clearance of some mature vegetation and large scale earthworks within the construction footprint would have an indirect adverse impact on the setting of the local LCA viewed from the south. This would be exacerbated by other construction activity and the high tranquillity in the local LCA experienced away from the A465 would be eroded. Construction activity associated with embankments and elevated elements of the junctions would be particularly prominent in views south from the local LCA. To the east Penmoelallt Forest would screen construction.	Operation winter year 1 The A465 would remain prominent and the high tranquillity in the local LCA experienced away from the A465 would be reduced by the new highway infrastructure including lighting and signage etc. and traffic visible to the south beyond the local LCA. The proposed tree and shrub planting at the Croesbychan junction and the Nant Moel overbridge would have little impact at this stage and the junction and overbridge would remain visible features. Magnitude of impact: moderate adverse (indirect).

Key features of proposed scheme and approximate chainages (ch.) (m)	Assessment of landscape impacts and effects during construction and operation without landscape mitigation	Assessment of landscape impacts and effects during operation at winter year 1 and summer year 15 with landscape mitigation
	Magnitude of impact: major adverse (indirect). Significance of landscape effects: **large adverse (indirect)**.	Significance of landscape effects: **moderate adverse (indirect)**.
	Operation The proposed scheme is in cutting at its nearest point to the local LCA and would not therefore be prominent in the landscape at this location. Further away from the local LCA the proposed scheme is elevated on embankment and this would increase the visible highway infrastructure of the A465. The high tranquillity in the local LCA experienced away from the A465 would be indirectly eroded. The removal of established highway vegetation and adjacent woodland, including ancient woodland, would increase the prominence of the A465 and disrupt the existing pattern of mature vegetation forming part of the setting to the local LCA. Some upland views south from the local LCA, a key characteristic, would be adversely impacted although Penmoelallt Forest would effectively screen the proposed scheme to the east. Magnitude of impact: moderate adverse (indirect). Significance of landscape effects: **moderate adverse (indirect)**.	Operation summer year 15 Extensive tree and shrub planting would establish to effectively integrate the Croesbychan junction and the Nant Moel overbridge into the landscape and locally reduce the prominence of the A465 to the south of the local LCA. The road would remain prominent, particularly at the Croesbychan junction. There would be some significant residual indirect adverse effects on tranquillity and landscape character. Magnitude of impact: minor adverse (indirect). Significance of landscape effects: **moderate adverse (indirect)**.
Baverstock (open plateau) - landscape sensitivity: moderate		
The proposed scheme would cross the local LCA between ch. 8400 to 9500 as an online dualling in deep cutting. Key features would include the new Swansea Road running parallel to the mainline to the	Construction During construction the large scale earthworks within the construction footprint would have a direct adverse impact on part of the local LCA. This would be exacerbated by other construction activity and the moderate tranquillity in the local LCA would be reduced. Construction activity	Operation winter year 1 Sensitive treatment of the cutting slopes would accentuate the exposed geology and create drama and interest along this part of the proposed scheme. The A465 would remain prominent from the east and west and the moderate tranquillity in the local LCA would be

Key features of proposed scheme and approximate chainages (ch.) (m)	Assessment of landscape impacts and effects during construction and operation without landscape mitigation	Assessment of landscape impacts and effects during operation at winter year 1 and summer year 15 with landscape mitigation
south. There would be an attenuation pond adjacent to the main line at ch. 9400, north side.	associated with the substantial cutting would be large scale and be particularly prominent with substantial 'raw' cut faces being visible from the east and west. Away from the A465 perpendicular to its alignment, the cutting may reduce the influence of construction. Magnitude of impact: major adverse. Significance of landscape effects: **large adverse**.	reduced by the new highway infrastructure and traffic. The localised proposed tree and shrub planting would have little impact at this stage. Magnitude of impact: major adverse. Significance of landscape effects: **large adverse**.
	Operation The dualling of the A465 and the introduction of the parallel Swansea Road would significantly increase the existing highway infrastructure footprint of the road. The deep cutting would create a substantial notch in the existing landform and geology and create a large 'scar' in the landscape. The moderate tranquillity in the local LCA would be reduced by the new highway infrastructure and traffic although, away from the A465 perpendicular to its alignment, the cutting would reduce the influence of the proposed scheme. Overall the proposed scheme would have a linear urbanising, and 'gorge like' effect on the open character of this local LCA. Little vegetation of landscape importance would be removed as part of the proposed scheme. Magnitude of impact: major adverse. Significance of landscape effects: **large adverse**.	Operation summer year 15 The localised tree and shrub planting would establish to partly integrate the proposed scheme into the landscape. While the cutting slopes would continue to accentuate the exposed geology and provide drama and interest along this part of the proposed scheme, particularly as some vegetation establishes on the cut faces and ledges, the substantial notch in the landscape would remain and there would be significant residual adverse effects on tranquillity and landscape character. Magnitude of impact: major adverse. Significance of landscape effects: **large adverse**.
Cefn Coed (hills / valleys and fields) - landscape sensitivity: high		
The proposed scheme would cross the local LCA between ch. 9500 to 10870. The mainline would peel off the existing A465 alignment to the north, east of ch. 9900. The existing A465	Construction During construction the clearance of extensive established highway vegetation and adjacent woodland, including TPO woodland, and large scale earthworks within the	Operation winter year 1 Finishes to bridge abutments forming part of the grade separation of the A470 junction and landscape ground modelling of the engineering embankments / cuttings

Key features of proposed scheme and approximate chainages (ch.) (m)	Assessment of landscape impacts and effects during construction and operation without landscape mitigation	Assessment of landscape impacts and effects during operation at winter year 1 and summer year 15 with landscape mitigation
would form the westbound access slip road as part of the grade separation of the A470 junction. Key features would include the Nant Ffrwd overbridges and various retaining walls. There would be an attenuation pond adjacent to the westbound access slip road at ch. 10300, south side.	construction footprint would have a direct adverse impact on part of the local LCA. This would be exacerbated by other construction activity and the already low tranquillity in the local LCA would be further reduced. Construction activity associated with the substantial cutting in the north west quadrant of the A470 junction would be particularly prominent with substantial 'raw' cut slopes being visible from the east and south. Magnitude of impact: major adverse. Significance of landscape effects: **very large adverse**.	would accentuate the role of the junction as a gateway to the BBNP and assist in integrating the proposed scheme into the landscape. The A465 would however, remain prominent and the already low tranquillity in the local LCA would be further reduced by the new highway infrastructure including lighting and signage etc. and traffic. The localised proposed tree and shrub planting would have little impact at this stage. Magnitude of impact: major adverse. Significance of landscape effects: **large adverse**.
	Operation The dualling of the A465 and the introduction of the A470 junction slip roads would significantly increase the existing highway infrastructure footprint of the road. The already low tranquillity in the local LCA would be further reduced by the new highway infrastructure including lighting and signage etc. and traffic. The removal of established highway vegetation and adjacent woodland, including TPO woodland, would increase the prominence of the A465 and disrupt the existing pattern of mature vegetation and fields, particularly along the Nant Ffrwd and Pwll Annie. The landform of the local LCA would also be materially affected. Overall the proposed scheme would have an urbanising effect on the rural pastoral character of the local LCA. Magnitude of impact: major adverse. Significance of landscape effects: **large adverse**.	Operation summer year 15 The localised tree and shrub planting on the landscape ground modelling would establish to further integrate the proposed scheme into the landscape. There would however, be significant residual adverse effects on tranquillity and landscape character. Magnitude of impact: moderate adverse. Significance of landscape effects: **large adverse**.

Key features of proposed scheme and approximate chainages (ch.) (m)	Assessment of landscape impacts and effects during construction and operation without landscape mitigation	Assessment of landscape impacts and effects during operation at winter year 1 and summer year 15 with landscape mitigation
Taf Fawr (gorge) - landscape sensitivity: high (Note: includes part of the Cefn Coed Cemetery Registered Park and Garden)		
The proposed scheme would cross the local LCA between ch. 10700 to 10900. Key features would include the A470 underbridge, the Taf Fawr mainline, eastbound access and westbound egress slip road viaducts forming part of the grade separation of the A470 junction. There would be an attenuation pond adjacent to south roundabout in the south-east quadrant of the junction.	Construction During construction the clearance of extensive established highway vegetation and adjacent woodland, including ancient woodland, and large scale earthworks within the construction footprint would have a direct adverse impact on part of the local LCA. This would be exacerbated by other construction activity and the tranquillity of the gorge would be eroded. Construction activity associated with the substantial viaduct and other structures would be particularly prominent. Magnitude of impact: major adverse. Significance of landscape effects: **very large adverse**.	Operation winter year 1 Architectural input to the design of the Taf Fawr viaducts would enhance the contribution they make to the gorge landscape. The A465 would however, remain prominent and tranquillity would be reduced by the new highway infrastructure including lighting and signage etc. and traffic. Magnitude of impact: major adverse. Significance of landscape effects: **large adverse**.
	Operation The dualling of the A465 and the introduction of the A470 junction slip roads and viaducts and other structures would significantly increase the existing highway infrastructure footprint of the road and the tranquillity of the gorge would be eroded by the new highway infrastructure including lighting and signage etc. and traffic. The removal of established highway vegetation and adjacent woodland would increase the prominence of the A465 and disrupt the existing pattern of mature vegetation and fields, particularly along the A465, A470 and the gorge. Overall the proposed scheme would have an urbanising effect on the unique character of the local LCA. It would also result in some landtake of the Cefn Coed Cemetery Registered Park and Garden and impact on the setting of the iconic listed Cefn Coed Viaduct. These impacts are examined in	Operation summer year 15 Architectural input to the design of the Taf Fawr viaducts would enhance the contribution they make to the gorge landscape. The loss of ancient woodland could not be mitigated and there is limited scope for mitigating the loss of other existing vegetation in the immediate area. The scale of the structures and the prominence of the traffic on them, means that there would be significant residual adverse effects on tranquillity and landscape character. Magnitude of impact: major adverse. Significance of landscape effects: **large adverse**.

Key features of proposed scheme and approximate chainages (ch.) (m)	Assessment of landscape impacts and effects during construction and operation without landscape mitigation	Assessment of landscape impacts and effects during operation at winter year 1 and summer year 15 with landscape mitigation
	more detail in Chapter 8: Cultural Heritage. Magnitude of impact: major adverse. Significance of landscape effects: **large adverse**.	
Taf Fechan (gorge) - landscape sensitivity: high		
The proposed scheme would cross the local LCA between ch. 11400 to 12300. It would include an offline section between ch.11700 to 12300. Some sections would be on embankment and in deep cutting. Key features would include the Taf Fechan viaduct widening. There would be attenuation ponds adjacent to the main line at ch.11650, south side and ch. 12300 to 12500 north side.	Construction During construction the clearance of extensive established highway vegetation and adjacent woodland, including ancient woodland and TPO woodland, and large scale earthworks within the construction footprint would have a direct adverse impact on part of the local LCA. This would be exacerbated by other construction activity and the tranquillity of the gorge would be eroded. Construction activity associated with the viaduct widening would be particularly prominent. Magnitude of impact: major adverse. Significance of landscape effects: **very large adverse**.	Operation winter year 1 Architectural input to the design of the Taf Fechan viaduct would ensure that the new widened structures complement the adjacent existing arched structure and enhance the contribution it makes to the gorge landscape. The A465 would however, remain prominent and tranquillity would be reduced by the new highway infrastructure and traffic. The proposed tree and shrub planting in the east part of this section would have little impact at this stage. Magnitude of impact: major adverse. Significance of landscape effects: **large adverse**.
	Operation The dualling of the A465 including an offline section with the introduction of a new viaduct adjacent to the existing one, would significantly increase the existing highway infrastructure footprint of the road and the tranquillity of the gorge would be eroded by the new highway infrastructure and traffic. The removal of established highway vegetation and adjacent woodland, including ancient woodland and TPO woodland, would increase the prominence of the A465 and disrupt the existing pattern of mature vegetation along the A465 and the gorge. Overall the proposed	Operation summer year 15 Architectural input to the design of the Taf Fechan viaduct would ensure that the new structure complements the adjacent existing arched structure and enhance the contribution it makes to the gorge landscape. The proposed tree and shrub planting in the east part of this section would establish to integrate this part of the proposed scheme into the landscape and partly mitigate the loss of existing vegetation. The loss of ancient woodland could not be mitigated. There would be significant residual adverse effects on tranquillity and

Key features of proposed scheme and approximate chainages (ch.) (m)	Assessment of landscape impacts and effects during construction and operation without landscape mitigation	Assessment of landscape impacts and effects during operation at winter year 1 and summer year 15 with landscape mitigation
	scheme would have an urbanising effect on the unique character of a localised part of the local LCA. It would also impact on the setting of heritage features in the gorge. This examined in more detail in Chapter 8: Cultural Heritage. Magnitude of impact: major adverse. Significance of landscape effects: **large adverse**.	landscape character. Magnitude of impact: major adverse. Significance of landscape effects: **large adverse**.
Merthyr Tydfil (built land) - landscape sensitivity: moderate		
The proposed scheme would cross the local LCA between ch. 10900 to 11400 and 12300 to 17500. Key features would include the Cefn Coed High Street, the Prince Charles Hospital junction overbridge, and its associated roundabout, slip roads and lighting, the Bryniaui Road overbridge, the Pant Road and Jones Street underbridges, the reservoir footbridge and the Dowlais junction and its associated structures, slip roads and lighting. There are also various retaining walls, required to accommodate the proposed scheme where the urban corridor narrows and attenuation ponds at the Prince Charles Hospital junction and adjacent to the main line at ch.14250, south side.	Construction During construction the clearance of extensive established highway vegetation, within the construction footprint would have a direct adverse impact on part of the local LCA and profoundly affect the setting of the A465 within the Merthyr townscape. This would be exacerbated by other construction activity and the construction of structures such as the Cefn Coed High Street and Galon Uchaf overbridges would be particularly prominent. Demolition of Trade Centre Wales would have a minor impact on townscape pattern. Magnitude of impact: major adverse. Significance of landscape effects: **large adverse**.	Operation winter year 1 Finishes to bridge abutments, landscape ground modelling of the engineering embankments and sensitive treatment of the cutting slopes to accentuate the exposed geology and create interest along parts of the proposed scheme would all complement the sense of place of the A465 as it passes through the Merthyr townscape. Splayed widening either side of the Cefn Coed High Street overbridge would allow for an element of public realm to be introduced and improve the sense of separation between the High Street and the A465. The proposed tree and shrub planting, carried out where space allows, would have little impact at this stage and the A465 widening, with its new highway infrastructure including lighting and signage etc. and traffic, in the often narrow urban corridor would remain prominent. Slight impacts on the existing townscape pattern would also remain. Magnitude of landscape impact: major adverse. Significance of landscape effects: **large adverse**.

Key features of proposed scheme and approximate chainages (ch.) (m)	Assessment of landscape impacts and effects during construction and operation without landscape mitigation	Assessment of landscape impacts and effects during operation at winter year 1 and summer year 15 with landscape mitigation
	Operation The dualling of the A465 would significantly increase the existing highway infrastructure footprint of the road as it passes through the Merthyr townscape. The removal of established highway vegetation would increase the prominence of the A465 and profoundly change the setting of the A465. While cuttings with retaining walls, such as those east and west of the Cefn Coed High Street overbridge, would reduce the prominence of the road they would also impact geology and existing exposed rock faces. The roundabout and slip roads associated with the Prince Charles Hospital junction and the removal of Trade Centre Wales would have a slight impact on the existing townscape pattern on the north side of the A465 in Pant Industrial Estate and on the south side along the Gurnos Ring Road and Rocky Road. The elevated mainline crossing the new grade separation of the Dowlais junction would be prominent and would cross an area of open land between the existing east and west bound carriageways of the A465. The existing highway infrastructure at this junction is however, already extensive. Magnitude of impact: major adverse. Significance of landscape effects: **large adverse**.	Operation summer year 15 Extensive tree and shrub planting around the Prince Charles Hospital and Dowlais junctions would establish to partly integrate the proposed scheme into the townscape and reduce the prominence of the A465. Elsewhere the A465 widening would take place in the often narrow urban corridor where opportunities for screen planting would be limited. Magnitude of landscape impact: major adverse. Significance of landscape effects: **moderate adverse**.
Morlais (hills / valleys and fields) - landscape sensitivity: moderate		
The proposed scheme would pass immediately adjacent to the south side of the local LCA between ch. 12300 to 13800 and 15100 to 15800. Key features would include the east bound	Construction During construction the clearance of extensive established highway vegetation and adjacent woodland, including ancient woodland (part of Gymos Wood), within the construction footprint would have a direct adverse impact	Operation winter year 1 The A465 would remain prominent, particularly where on embankment, and tranquillity would be reduced by the new highway infrastructure including lighting and signage etc. and traffic. The proposed tree and shrub planting

Key features of proposed scheme and approximate chainages (ch.) (m)	Assessment of landscape impacts and effects during construction and operation without landscape mitigation	Assessment of landscape impacts and effects during operation at winter year 1 and summer year 15 with landscape mitigation
egress slip road which crosses the local LCA at the Prince Charles Hospital junction and the east bound egress slip road and west bound access slip road of the Dowlais junction. The mainline and slip roads would be mostly on embankment.	on the southern fringe of the local LCA and affect its setting. This would be exacerbated by other construction activity and the construction of structures such as the Galon Uchaf overbridge and the elevated nature of much of the highway infrastructure. There would be direct localised effects resulting from construction of the east bound egress slip roads at the Prince Charles Hospital and Dowlais junctions. Magnitude of impact: major adverse. Significance of landscape effects: **large adverse**.	would have little impact at this stage. Magnitude of impact: major adverse. Significance of landscape effects: **moderate adverse**.
	Operation The dualling of the A465 would significantly increase the existing highway infrastructure footprint of the road as it passes adjacent to the local LCA. The removal of established highway vegetation and adjacent woodland and the elevated nature of much of the highway infrastructure including lighting and signage etc. and traffic would increase the prominence of the A465. There would be direct localised effects resulting from the east bound egress slip roads at the Prince Charles Hospital and Dowlais junctions. The tranquillity of the local LCA, already affected by the existing A465 and urban area of Merthyr, would be further reduced. Magnitude of impact: moderate adverse. Significance of landscape effects: **moderate adverse**.	Operation summer year 15 The tree and shrub planting on the north side of the proposed scheme would establish to integrate the highway infrastructure into the landscape and partly mitigate the loss of existing vegetation. The loss of ancient woodland (part of Gymos Wood) could not however, be mitigated and there would be some significant residual adverse effects on tranquillity and landscape character. Magnitude of impact: moderate adverse. Significance of landscape effects: **moderate adverse**.
Gelligaer Common (hills / valleys and fields) - landscape sensitivity: moderate		
The proposed scheme would pass immediately adjacent to the north side of the local LCA between ch. 16200 to 17500 partly on	Construction During construction the construction footprint would have an indirect adverse impact on part of the local LCA and	Operation winter year 1 The A465 and its associated infrastructure including lighting and signage etc. and traffic would remain

Key features of proposed scheme and approximate chainages (ch.) (m)	Assessment of landscape impacts and effects during construction and operation without landscape mitigation	Assessment of landscape impacts and effects during operation at winter year 1 and summer year 15 with landscape mitigation
embankment. Key features would include the Dowlais junction and its associated structures, slip roads and lighting beyond the local LCA to the north west.	affect its setting. The significance of the impacts would however, be lessened by the presence of existing opencast mining activities and industrial scale earthworks at Dowlais. The already low tranquillity in the local LCA would only be slightly further reduced as a result of the proposed scheme. Magnitude of impact: minor adverse (indirect). Significance of landscape effects: **slight adverse (indirect)**.	prominent, particularly where on embankment as the road rises over the Dowlais grade separated junction. The already low tranquillity of the local LCA would be slightly reduced by the new highway infrastructure and traffic. The proposed tree and shrub planting would have little impact at this stage. Magnitude of impact: minor adverse (indirect). Significance of landscape effects: **slight adverse (indirect)**.
	Operation The dualling of the A465 would increase the existing highway infrastructure footprint of the road as it passes through the area of open land between the existing east and west bound carriageways of the A465 and there would be an indirect adverse impact on the setting of the local LCA. This would be exacerbated by the elevated nature of part of the road and its associated infrastructure including lighting and signage etc. and traffic as it rises over the Dowlais grade separated junction. The tranquillity of the local LCA, already affected by the existing A465, the urban area of Merthyr and the presence of existing opencast mining activities and industrial scale earthworks at Dowlais, would only be slightly further reduced. Magnitude of impact: minor adverse (indirect). Significance of landscape effects: **slight adverse (indirect)**.	Operation summer year 15 The tree and shrub planting on the north side of the proposed scheme would establish to integrate the highway infrastructure into the landscape and partly mitigate the loss of existing vegetation. Extensive tree and shrub planting around the Dowlais junctions would mature to effectively integrate the proposed scheme into the townscape setting and reduce the prominence of the A465. There would be slight residual adverse effects on the already low tranquillity and landscape character of the local LCA. Magnitude of impact: minor adverse (indirect). Significance of landscape effects: **slight adverse (indirect)**.

Appendix 10J – Night Skies Assessment

Table 10J.1: Night skies assessment

Key features of proposed scheme that would affect the night skies	Assessment of impacts on night skies during construction and operation without landscape mitigation	Assessment of impacts and effects on night skies during operation at winter year 1 and summer year 15 with landscape mitigation
Environmental Zone E0 - High sensitivity		
The proposed scheme is within approximately 200 m of the Environmental Zones E0 at the closest point, near Nant Hir viaduct. The proposed partially lit Baverstock junction and A470 junction would be located within 1 km and 1.2 km respectively, from areas within this zone.	Construction The construction of the scheme would result in additional glare from headlight movements of construction vehicles during the hours of darkness, along haul routes on the A465 south of the Dark Sky Core Zone of the BBNP International Dark Sky Reserve. While there would be some loss of vegetation, intervening vegetation would remain between the road and the Core Zone, such as the extensive forest at Penmoelallt, which would reduce the impact of direct glare. Construction works for the scheme might have to be undertaken during the hours of darkness, which would require lighting. This would result in additional glare and light spill affecting the night skies. The exact locations of works required to be undertaken during the hours of darkness are not known. However, any such impact on the night skies would only cause a temporary effect, and would have a relatively localised effect within the wider Dark Sky Core Zone of the BBNP International Dark Sky Reserve. Magnitude of impact on the night skies: minor adverse. Significance of effect on the night skies: **moderate adverse.**	Operation winter year 1 As mitigation planting would not be established there would be glare from headlights on the road and additional lighting columns at the Baverstock and A470 junctions would cause some localised additional glare from outside the Core Zone. However, the use of dynamic systems of operation would provide the minimum amount of light required at different times, reducing the strength and duration of glare. In addition, the use of LEDs with appropriate cut off would prevent light spill from the junctions from affecting the night skies in the Core Zone of the BBNP International Dark Sky Reserve. Magnitude of impact on the night skies: negligible adverse. Significance of effect on the night skies: **slight adverse.**

Key features of proposed scheme that would affect the night skies	Assessment of impacts on night skies during construction and operation without landscape mitigation	Assessment of impacts and effects on night skies during operation at winter year 1 and summer year 15 with landscape mitigation
	Operation The widened and slightly realigned A465 would bring traffic with headlights slightly further north, towards the Core Zone, between chainage 5900 and 8100 approximately. Loss of vegetation would make headlights on the road slightly more visible. However, smaller woodlands and tree belts within the BBNP and significant forest at Penmoelallt would limit direct glare reaching the Core Zone. The proposed grade separated junctions at Baverstock and the A470 would be partially lit. While the existing junctions are fully lit, the light spill from proposed lighting columns at these larger junctions would cause some additional glare and sky glow which would be likely to impact on localised parts of the Core Zone. However, lighting would be removed from the section of the A465 between these two junctions. This would reduce direct glare and sky glow impacting a localised part of the Core Zone, to the north of this section of road. Magnitude of impact on the night skies: minor adverse. Significance of effect on the night skies: **slight adverse**.	Operation summer year 15 Woodland and hedgerow mitigation planting would have established and would provide some localised screening of headlights along the A465, as well as some luminaires on light columns at the Baverstock and A470 junctions. Although some direct glare might still influence the Core Zone it would not be significant. Magnitude of impact on the night skies: no change. Significance of effect on the night skies: **neutral.**

Key features of proposed scheme that would affect the night skies	Assessment of impacts on night skies during construction and operation without landscape mitigation	Assessment of impacts and effects on night skies during operation at winter year 1 and summer year 15 with landscape mitigation
Environmental Zone E1 in Western Part of Study Area – High sensitivity		
The proposed scheme would pass through Zone E1 between the Vale of Neath underbridge and Nant Hir viaduct. The main line and roundabouts would be lit through the Hirwaun junction; whilst at Croesbychan junction just the roundabouts would be lit.	Construction The construction of the scheme would result in additional glare from headlight movements of construction vehicles during the hours of darkness, along haul routes on the A465 within the Zone E1 in the BBNP International Dark Sky Reserve. Loss of vegetation and construction of embankments would make the direct glare travel slightly further, although the significant surrounding woodlands and tree belts would filter and screen light. Construction works for the scheme might have to be undertaken during the hours of darkness, which would require lighting. This would result in additional glare and light spill affecting the night skies. The exact locations of works required to be undertaken during the hours of darkness are not known. However, any such impact on the night skies would only cause a temporary effect, and would have a relatively localised impact on the Zone E1 in the BBNP International Dark Sky Reserve. Magnitude of impact on the night skies: moderate adverse. Significance of effect on the night skies: **large adverse.**	Operation winter year 1 As mitigation planting would not be established there would be glare from headlights on the road and additional lighting columns on the elevated mainline through Hirwaun junction, lighting of Croesbychan junction and partial lighting of the Baverstock junction that would continue to cause some localised additional glare from outside and within Zone E1. However, the use of dynamic systems of operation would provide the minimum amount of light required at different times, reducing the strength and duration of glare. In addition, the use of LEDs with appropriate cut off would prevent light spill from lighting of parts of the scheme outside Zone E1, from affecting the night skies within Zone E1 of the BBNP International Dark Sky Reserve. Light spill within Zone E1 at Croesbychan junction would also be significantly reduced by the use of the LEDs with appropriate cut off. Magnitude of impact on the night skies: moderate adverse. Significance of effect on the night skies: **moderate adverse.**

Key features of proposed scheme that would affect the night skies	Assessment of impacts on night skies during construction and operation without landscape mitigation	Assessment of impacts and effects on night skies during operation at winter year 1 and summer year 15 with landscape mitigation
	Operation Lighting of the elevated mainline through Hirwaun junction would cause more noticeable glare and light spill than the existing lit junction, which would be likely to affect the southern extent of the night skies within Zone E1 to the north of the junction. However, proposed lighting of the A465 between chainage 700 and 2800 approximately is not considered likely to significantly affect Zone E1, due to the existing vegetation which would filter and screen light, due to the lower level of the lighting columns positioned in the cutting south of Hirwaun, and due to the surrounding existing light spill already affecting the part of Zone E1 north of Hirwaun. The proposed lighting of the Croesbyhan junction would introduce additional direct lighting within the southern fringe of Zone E1. It would, however, only be likely to cause fairly localised direct glare and light spill within Zone E1, despite loss of some existing vegetation adjacent to the road, due to the remaining significant surrounding woodland and tree belts which would filter and screen light. However, it is considered likely that this would make this localised part of Zone E1 appear as an extension of the medium district brightness of Zone E3 in Hirwaun. Direct glare from headlights from traffic from a slightly wider and elevated (in part) road corridor than existing between the Croesbychan junction and Nant Hir viaduct would also affect a wider area due to loss of vegetation, but this would affect a relatively small part of the Zone E1, due to the topography and remaining existing vegetation. Glare and light spill from the partial lighting of the proposed enlarged Baverstock junction, which would be positioned slightly closer to Zone E1, than the existing junction, would be likely to have a localised effect on the eastern fringe of the night skies within this part of Zone E1, although the Penmoelallt forest would screen much of the light. Magnitude of impact on the night skies: moderate adverse. Significance of effect on the night skies: **moderate adverse.**	Operation summer year 15 Woodland mitigation planting would have established and would provide screening of headlights along parts of the A465, as well as screening of some luminaires at Hirwaun and Baverstock junctions, which would reduce direct glare from outside Zone E1 affecting the night skies within this zone. Established woodland and hedgerow mitigation planting within the proposed scheme in Zone E1 would also reduce the effect on the night skies from direct glare from headlights and, direct glare and light spill from luminaires at Croesbychan junction. The lighting of this junction would remain the main source of the residual effect and this localised part of the Zone E1 night skies would likely appear as a slight extension of the adjacent Zone E3 night skies, within the BBNP. Magnitude of impact on the night skies: minor adverse. Significance of effect on the night skies: **moderate adverse.**

Key features of proposed scheme that would affect the night skies	Assessment of impacts on night skies during construction and operation without landscape mitigation	Assessment of impacts and effects on night skies during operation at winter year 1 and summer year 15 with landscape mitigation
Environmental Zone E1 in Eastern Part of Study Area – Moderate sensitivity		
The proposed partially lit A470 junction, incorporating the Taf Fawr viaducts, would be located within Zone E1. However, the currently lit A465 mainline between Baverstock and the A470 is proposed to be unlit.	Construction The construction of the scheme would result in additional glare from headlight movements of construction vehicles during the hours of darkness, along haul routes on the A465 which pass through the southernmost tip of the Zone E1 in the BBNP International Dark Sky Reserve. While the loss of vegetation would make this glare slightly more visible, the effect on the night skies in this part of the BBNP would be relatively limited due to the existing influence of lighting from columns along the A465 between the Baverstock junction and the Lower Vaynor Road junction. Construction works for the scheme might have to be undertaken during the hours of darkness, which would require lighting. This would result in additional glare and light spill affecting the night skies. The exact locations of works required to be undertaken during the hours of darkness are not known. However, any such impact on the night skies would only cause a temporary effect, and are also considered likely to cause a relatively limited effect on the night skies in Zone E1 if required, due to the existing influence of lighting. Magnitude of impact on the night skies: minor adverse. Significance of effect on the night skies: **slight adverse.**	Operation winter year 1 As woodland and hedgerow mitigation planting would not be established there would be glare from headlights within the wider road corridor and the effect of additional lighting at the A470 junction. However, the use of dynamic systems of operation would provide the minimum amount of light required at different times, reducing the strength and duration of glare. In addition, the use of LEDs with appropriate cut off would also significantly reduce the light spill within this part of Zone E1 of the BBNP International Dark Sky Reserve. Magnitude of impact on the night skies: **no change.** Significance of effect on the night skies: **neutral.**

Key features of proposed scheme that would affect the night skies	Assessment of impacts on night skies during construction and operation without landscape mitigation	Assessment of impacts and effects on night skies during operation at winter year 1 and summer year 15 with landscape mitigation
	Operation There would be glare from headlights from traffic within a much wider road corridor than existing directly within the Zone E1, and also noticeably to the south-west, where the A465 and new link road to Swansea Road would descend in parallel from the Baverstock Ridge. Due to the upgrading of the A470 junction, including a new roundabout north of the proposed mainline and existing A465, there would be some additional lighting introduced within this part of the Zone E1. The mainline would, however, be unlit between the Baverstock junction and the eastern extent of the scheme, which would reduce the overall extent of lighting currently influencing the night skies in Zone E1. The existing retained surrounding vegetation, topography and proposed location of the A470 junction partially within cutting, would also contain the effect of the lighting on the night skies within a relatively localised part of Zone E1, which is already influenced by glare and light spill from road lighting, as well as light spill from Zone E3 in Merthyr Tydfil. Magnitude of impact on the night skies: minor adverse. Significance of effect on the night skies: **slight adverse.**	Operation summer year 15 Woodland and hedgerow planting at the A470 junction would have established and would provide some localised screening of glare from headlights and contain light spill from luminaires on columns. Magnitude of impact on the night skies: no change. Significance of effect on the night skies: **neutral.**

Key features of proposed scheme that would affect the night skies	Assessment of impacts on night skies during construction and operation without landscape mitigation	Assessment of impacts and effects on night skies during operation at winter year 1 and summer year 15 with landscape mitigation
Environmental Zone E2 in Western Part of Study Area – Generally moderate sensitivity, with localised area of moderate to low sensitivity		
The proposed offline section of the A465 on the northern edge of Zone E2, between the lit Hirwaun and Trewaun junctions is mainly proposed to be lit. The Mynydd Bwllfa Wind Farm overbridge is also proposed to be lit.	Construction The construction of the scheme would result in additional glare from headlight movements of construction vehicles during the hours of darkness, along haul routes on the A465 on the northern edge of Zone E2, as well as construction vehicles just within Zone E2 south of Hirwaun. Construction works for the scheme might also have to be undertaken during the hours of darkness, which would require lighting. This would result in additional glare and light spill affecting the night skies. The exact locations of works required to be undertaken during the hours of darkness are not known. However, any such impact on the night skies would only cause a temporary effect. The existing influence of lighting from the floodlit recreation ground located between the existing A465 and the proposed scheme, as well as light spill from Hirwaun would lead to minor impacts on the night skies. Magnitude of impact on the night skies: minor adverse. Significance of effect on the night skies: **slight adverse.**	Operation winter year 1 As mitigation planting would not be established there would be glare from headlights and, glare and light spill from lighting columns between Hirwaun junction and Trewaun junction. However, the use of dynamic systems of operation would provide the minimum amount of light required at different times, reducing the strength and duration of glare. In addition, the use of LEDs with appropriate cut off would also significantly reduce the light spill affecting the night skies within Zone E2. It is, however, considered that the magnitude of impact on the night skies within this zone would remain moderate adverse in the medium / long term mainly due to the prominent glare from headlights on the mainline through Hirwaun junction and glare from lighting columns. Magnitude of impact on the night skies: moderate adverse. Significance of effect on the night skies: **moderate adverse.**

Key features of proposed scheme that would affect the night skies	Assessment of impacts on night skies during construction and operation without landscape mitigation	Assessment of impacts and effects on night skies during operation at winter year 1 and summer year 15 with landscape mitigation
	Operation The proposed offline scheme alignment between Hirwaun and Trewaun junctions would introduce a new source of glare from headlights, as well as glare and light spill from light columns on the mainline between chainage 1800 and 2800 approximately within this part of Zone E2. The glare and light spill from the mainline through Hirwaun junction would be prominent due to the raised alignment, while the cutting would contain much of the glare from headlights along the eastern half of the offline road. There would also be some glare and light spill from lighting columns on the Mynydd Bwllfa Wind Farm overbridge and at Trewaun junction. It is considered likely that this would change the characteristics of the night skies on the northern fringe of Zone E2 from low to medium district brightness. There would be existing influence of light from the nearby built up areas in Hirwaun and the adjacent floodlit recreation ground within this localised part of Zone E2. Magnitude of impact on the night skies: moderate adverse. Significance of effect on the night skies: **moderate adverse**.	Operation summer year 15 Woodland and tree mitigation planting would have established and would provide some screening from glare from headlights of the section of mainline not in cutting. The mitigation planting would also filter or partially screen light spill from some of the light columns at Hirwaun and Trewaun junctions, although light spill from columns along the mainline, particularly through Hirwaun junction, would remain. The overall magnitude of impact on the night skies would reduce to minor adverse in the long term, although the night skies of the northern fringe of Zone E2 would likely appear as a slight extension of the adjacent Zone E3 night skies in Hirwaun. Magnitude of impact on the night skies: minor adverse. Significance of effect on the night skies: **slight adverse**.

Key features of proposed scheme that would affect the night skies	Assessment of impacts on night skies during construction and operation without landscape mitigation	Assessment of impacts and effects on night skies during operation at winter year 1 and summer year 15 with landscape mitigation
Environmental Zone E2 in Central Part of Study Area – Moderate sensitivity		
The proposed enlarged and more prominent Baverstock junction is proposed to be partially lit within Zone E2. However, existing lighting would be removed on the A465 mainline between Baverstock and the A470.	Construction The construction of the scheme would result in additional glare from headlight movements of construction vehicles during the hours of darkness, along haul routes on the A465 within Zone E2. Loss of vegetation along the route would make glare from the traffic, including construction activities, more prominent, particularly due to the topography within this part of the scheme. Construction works for the scheme might have to be undertaken during the hours of darkness, which would require lighting. This would result in additional glare and light spill affecting the night skies. The exact locations of works required to be undertaken during the hours of darkness are not known. While any such impact on the night skies would only cause a temporary effect, they would be very prominent in the landscape due to the road ascending and descending from the Baverstock ridge within Zone E2. Magnitude of impact on the night skies: moderate adverse. Significance of effect on the night skies: **moderate adverse**.	Operation winter year 1 As mitigation planting would not be established there would be glare from headlights and, glare and light spill from lighting columns at Baverstock junction, although glare form headlights would be reduced by the proposed false cutting along the southern edge of the A465 between Nant Hir viaduct and the Baverstock junction. In addition, the use of dynamic systems of operation would provide the minimum amount of light required at different times, reducing the strength and duration of glare. The use of LEDs with appropriate cut off would also significantly reduce the light spill affecting the night skies within Zone E2. Magnitude of impact on the night skies: minor adverse. Significance of effect on the night skies: **slight adverse**.

Key features of proposed scheme that would affect the night skies	Assessment of impacts on night skies during construction and operation without landscape mitigation	Assessment of impacts and effects on night skies during operation at winter year 1 and summer year 15 with landscape mitigation
	Operation Glare from headlights on the A465 between Nant Hir bridge and the Baverstock junction would be more prominent, due to the road being raised up on embankments. There would also be glare from headlights from traffic within a much wider road corridor within Zone E2 between the Baverstock junction and A470 junction, in particularly where the A465 and new link road to Swansea Road would run in parallel. However, the cutting slopes at the crest of the Baverstock ridge, would help to contain the glare to some extent. Glare and light spill form the proposed lighting columns at the partially lit Baverstock junction would be particularly prominent due to the elevated positon in the landscape, although Penmoelallt forest would provide screening to the north. However, this would to some extent be counter balanced by the removal of lighting from the A465 between Baverstock junction and the A470 junction. Magnitude of impact on the night skies: moderate adverse. Significance of effect on the night skies: **moderate adverse**.	Operation summer year 15 Woodland mitigation planting would provide some intermittent screening of glare from headlights along the route, but would generally not screen glare or light spill from lighting columns at Baverstock junction. Magnitude of impact on the night skies: minor adverse. Significance of effect on the night skies: **slight adverse**.

Key features of proposed scheme that would affect the night skies	Assessment of impacts on night skies during construction and operation without landscape mitigation	Assessment of impacts and effects on night skies during operation at winter year 1 and summer year 15 with landscape mitigation
Environmental Zone E2 in Eastern Part of Study Area – Generally moderate sensitivity, with localised areas of moderate to low sensitivity		
The proposed lit enlarged Prince Charles Hospital junction would encroach within the edge of Zone E2.	Construction The construction of the scheme would result in additional glare from headlight movements of construction vehicles during the hours of darkness, along haul routes on the A465 within localised parts of Zone E2 at Y Griag and Dowlais Top; and on the edge of Zone E2 north of Gurnos and Galon Uchaf. Loss of vegetation along the route would make glare from the traffic, including construction activities, slightly more visible than existing. Construction works for the scheme might have to be undertaken during the hours of darkness, which would require lighting. This would result in additional glare and light spill affecting the night skies. The exact locations of works required to be undertaken during the hours of darkness are not known. However, any such impact on the night skies would only cause a temporary effect. There would be existing influence of lighting from the adjacent Zone E3 in Merthyr Tydfil. Magnitude of impact on the night skies: moderate adverse. Significance of effect on the night skies: **moderate adverse**.	Operation winter year 1 As the proposed intermittent woodland planting would not be established there would be glare from headlights on the A465 or glare and light spill from light columns at Prince Charles Hospital junction. However, the use of dynamic systems of operation would provide the minimum amount of light required at different times, reducing the strength and duration of glare. In addition, the use of LEDs with appropriate cut off would also significantly reduce the light spill affecting the night skies within Zone E2. As such the magnitude of impact on the night skies in Zone E2 would reduce to minor adverse in the short / medium term, although the night skies of the southern fringe of Zone E2 would appear as a slight extension of the adjacent Zone E3 night skies in Galon Uchaf, due to the lighting columns at Prince Charles Hospital junction. Magnitude of impact on the night skies: minor adverse. Significance of effect on the night skies: **slight adverse**.

Key features of proposed scheme that would affect the night skies	Assessment of impacts on night skies during construction and operation without landscape mitigation	Assessment of impacts and effects on night skies during operation at winter year 1 and summer year 15 with landscape mitigation
	Operation Glare from headlights on the realigned A465 through Y Graig would be slightly more prominent than at present, since there would no longer be a dense vegetation belt offering screening either side of the road. However, the cutting slopes either side of the road would offer some screening. Loss of vegetation along the A465 and the slightly more elevated traffic on embankments north of Gurnos and at Dowlais Top, including the elevated mainline through Dowlais junction, would also make glare form headlights more visible. In addition, there would be glare and light spill from light columns at the fully lit junction at Prince Charles Hospital, which would extend within the edge of Zone E2. It is considered likely that this would lead to a minor localised change to the characteristics of the night skies on the southern fringe of Zone E2 in this location, from low to medium district brightness. There would be existing influence of lighting from the adjacent Zone E3 in Merthyr Tydfil, particularly at Dowlais Top. Magnitude of impact on the night skies: moderate adverse. Significance of effect on the night skies: **moderate adverse**.	Operation summer year 15 Woodland planting would provide some intermittent screening of glare from headlights. Magnitude of impact on the night skies: minor adverse. Significance of effect on the night skies: **slight adverse**.

Key features of proposed scheme that would affect the night skies	Assessment of impacts on night skies during construction and operation without landscape mitigation	Assessment of impacts and effects on night skies during operation at winter year 1 and summer year 15 with landscape mitigation
Environmental Zone E3 – Moderate to low sensitivity		
In the west, the A465 would be lit between Hirwaun Industrial Estate and Hirwaun Junction, where it is currently not lit. The elevated mainline is also proposed to be lit through Hirwaun junction. In the east, the currently lit Prince Charles Hospital junction is proposed to be made larger, which would increase the amount of lighting at this junction.	Construction The construction of the scheme would result in additional glare from headlight movements of construction vehicles during the hours of darkness, along haul routes on the A465 which pass along the fringes of the Zone E3 night skies in the Study Area. While the loss of vegetation along the route would make this glare slightly more visible, the effect on the night skies would be relatively limited due to the existing influence of lighting from built up areas within Zone E3. Construction works for the scheme might have to be undertaken during the hours of darkness, which would require lighting. This would result in additional glare and light spill affecting the night skies. The exact locations of works required to be undertaken during the hours of darkness are not known. However, any such impact on the night skies would only cause a temporary effect, and are also considered likely to cause a relatively limited effect on the night skies in Zone E1 if required, due to the existing influence of lighting. Magnitude of impact on the night skies: minor adverse. Significance of effect on the night skies: **slight adverse**.	Operation winter year 1 As mitigation planting would not be established there would be glare from headlights, additional lighting to the west of Hirwaun junction and at Prince Charles Hospital junction, and more prominent lighting at Hirwaun junction. However, the use of dynamic systems of operation would provide the minimum amount of light required at different times, reducing the strength and duration of glare. In addition, the use of LEDs with appropriate cut off would also significantly reduce the light spill affecting the night skies within Zone E3. Magnitude of impact on the night skies: negligible adverse. Significance of effect on the night skies: s**light adverse**.

Key features of proposed scheme that would affect the night skies	Assessment of impacts on night skies during construction and operation without landscape mitigation	Assessment of impacts and effects on night skies during operation at winter year 1 and summer year 15 with landscape mitigation
	Operation Glare from headlights on the widened A465 corridor would be slightly more noticeable than the current route due to loss of existing vegetation, particularly in locations where the mainline is proposed to be elevated, such as at Hirwaun junction. Additional lighting is proposed within Zone E3 to the west of Hirwaun junction and the elevated mainline through the junction is also proposed to be lit, making the lighting slightly more prominent than existing. However, the additional lighting would bridge a short gap in lighting between the Hirwaun Industrial Estate and the built up area in Hirwaun and would not be out of keeping with the general character of the night sky in this area. Additional lighting is also proposed at Prince Charles Hospital junction within Zone E3 in the eastern part of the Study Area. There would be existing influence of lighting within Zones E3. Magnitude of impact on the night skies: minor adverse. Significance of effect on the night skies: **slight adverse**.	Operation summer year 15 Proposed woodland mitigation planting would reduce glare from headlights along parts of the proposed scheme and would provide some screening for additional lighting to the west of Hirwaun junction and at Prince Charles Hospital junction, and more prominent lighting at Hirwaun junction. Magnitude of impact on the night skies: negligible adverse. Residual significance of effect on the night skies: **neutral**.

1. Introduction

1.1 Client instruction

1.1.1 Jacobs UK Ltd was instructed by the Welsh Government to carry out a tree survey along sections 5 and 6 of the A465 in South Wales, in accordance with 'BS5837:2012 – Trees in Relation to Design, Demolition and Construction' and to provide a report.

1.1.2 The requirements of the survey were to:-

- Record information about the trees, hedges and woodlands that may be impacted upon by the proposed development within a 25 metre buffer zone either side of the proposed scheme.
- Assess the potential impact upon those trees likely to be affected by the development, including potential tree loss; and
- Provide a tree survey report with positioning and constraints of the features surveyed.

1.2 Documents provided

- General Arrangement Key Plan - Drawing title: A465 Heads of the Valleys Dualling – April 27th Scheme, Figure 1, Sheets 1-17 R0.

1.2.1 On-line aerial photography of the survey site was used during the tree survey and during a desktop study of the areas included in this report.

1.3 Documents produced

- Tree Survey and Protection Schedules – available on request
- Tree Constraints Plans (drawing no. B2191100/Sc5-6/TC01 Rev0, Sheets 1 to 64) – available on request
- Arboricultural Impact Assessment with reference to landscape designated areas – available on request
- Within Jacobs this scheme is supported by WebGIS, therefore the 'Tree Constraints Plans' are available to view as separate layer within the model.

1.4 Scope of survey

1.4.1 The survey relates to trees with a stem diameter of 75mm or more (measured at 1.5m above ground level) located within the area highlighted on the site plan. Trees, hedges and woodlands included in the survey included those in close proximity (within the defined buffer zone) and/or within the footprint of the proposed development.

1.4.2 Grouping of trees within high density tree cover areas has been used extensively during the survey however individual specimens have been recorded as such where a combination of their attributes, quality, location, protection status and relevance within the landscape were deemed to justify inclusion as such.

1.4.3 The tree survey has been completed independently of any specific proposals for development.

1.5 Survey method

1.5.1 Observations were conducted from ground level, using the 'Visual Tree Assessment' system (VTA by Mattheck, C & Breloer, H (1994) and The Body Language of Trees, Research for Amenity Trees No 4 Department of the Environment). No internal diagnostic equipment was used other than a sounding mallet and probe.

1.5.2 No internal investigations were carried out or tissue samples taken from the surveyed trees. Information was collected in accordance with the recommendations in subsections 4.4.2.5 and 4.4.2.6 of BS 5837:2012 and included species, height, diameter, branch spread, crown clearance, age class, physiological condition, structural condition and estimated remaining contribution. Stem diameters (DBH) of each tree were taken using a rounded down diameter tape in millimetres, at 1.5m above ground level, unless access was not possible due to issues with land access/ownership or safety concerns. All other dimensions were estimated. No soil samples were taken.

1.5.3 Tree species identification was based on a visual observation. The quality and value of the trees surveyed was categorised in accordance with ‘Table 1 Cascade chart for tree quality assessment’, in BS5837:2012 (a full copy extract is attached to the ‘Tree Survey and Protection Schedules’). The ‘Root Protection Area’ (RPA) of each tree was determined using the calculation methods detailed in BS 5837: 2012 and are shown in the ‘Tree Constraints Plans’. In this report, the radius given was measured from the centre of the main trunk for individual trees. For groups of trees and woodlands the radius of the largest diameter tree observed is then applied as an off-set distance from the edge of the canopy for the respective groups, to attain the RPA area, unless otherwise stated. Hedge RPAs, in the schedule, are also measured from the edge of the crown canopies unless otherwise stated.

1.6 Limitations

1.6.1 A topographical plan of the areas included in the tree survey was not available at the time of the survey therefore all the tree locations were hand plotted onto aerial photographic reproductions. As a result the positions of the arboricultural features recorded within the tree survey plans are approximate. Jacobs accepts no liability for the accuracy of the tree survey drawings.

1.6.2 Due to safety concerns regarding the proximity of the surveyors to the roads within the survey area, highway land was not accessed during the survey. Those trees located upon highway land were therefore assessed from a safe vantage point. DBH measurements for these trees were estimated and data recorded for structural and physiological condition was based upon a restricted view of the tree parts visible to the surveyors from the vantage point. The corresponding comments should not, therefore, be taken as a full and complete assessment of the condition of those trees affected.

1.6.3 Trees are living organisms whose health and condition can change rapidly and all trees, even healthy ones, are at risk from unpredictable climatic and man-made events. The assessment of risk for any tree is based upon factors evident at the time of the inspection and the interpretation of those factors by suitably qualified inspectors. The health, condition and safety of trees should be checked on a basis commensurate with the level of risk and preferably on an annual basis.

2. Site Visit and Observations

2.1 Site visit

2.1.1 Site visits were undertaken by trained arboriculturists from 18th to 22nd April, 2nd to 6th May and 9th to 11th May, 2016. These visits involved the surveying of trees located along the route of the proposed development and those within the 25 metre buffer zone, designated to be potentially affected by the scheme and associated works.

2.2 Site observations

2.2.1 The survey site lies along approximately 17km of the A465 (Head of the Valleys Road), between Hirwaun to the west and Dowlais Top to the east. The Breacon Beacons National Park extends south across the survey site adjacent to Cefn-coed-y-cymmer and also adjacent to the Nant-hir Reservoir. The national park lies to the north of the entire survey route.

2.2.2 Land use within the area included in the survey varies. There are several settlements through which the A465 passes and also farmland, public access routes, industrial areas, tree plantations and privately owned mining land.

2.2.3 The area surveyed for trees extends from the scheme footprint by approximately 25 metres (this varies in certain areas depending on the current design proposals) both north and south, following the main route of the development but also partially along subsidiary routes adjoining the A465.

2.2.4 Topography of the land is characterised by long undulating sections interspersed by occasional small valleys or gorges with exposed rocky substrate and dense tree cover. Other areas characterised by high levels of tree cover include several woodland remnants (some of which are classified as Ancient Woodlands), conifer plantation blocks and roadside embankments/verges containing trees planted for screening purposes.

2.2.5 Other relevant features of the site include numerous field boundary, stone ‘bund’ structures from which trees have grown and/or been planted upon. Large open areas were observed across the scheme which relate to farming practices, relatively recently reclaimed land following open cast mining operations and the recent clear felling of forestry plantation blocks.

2.2.6 The survey area contains a mixture of trees of varying age, species and quality as listed in the ‘Tree Survey and Protection Schedule’, which can be provided upon request.

3. Tree survey

3.1 Tree survey and constraints

3.1.1 The results of the tree survey are shown in the 'Tree Survey and Protection Schedule' and within the 'Tree Constraints Plans', (drawing no. B2191100/Sc5-6/TC01 Rev0, Sheets 1 to 64), both of which can be provided on request as a separate document due to the large file size required for the data.

3.1.2 A detailed assessment of the arboricultural impacts with respect to the areas of the tree survey which have special landscape designations, as referenced in subsection 3.2.1, can be produced upon request. This provides specific detail, separated out from the full Arboricultural Impact Assessment, in order to provide a focused assessment of these key areas.

3.1.3 The field data gathered for this survey was divided into two data sets, Northside and Southside. These correspond to the arboricultural features within the survey buffer situated to either the north or south of the current A465. Both sets have independent numbering distinguished by the prefix 'N-' (Northside) or 'S-' (Southside), which are used within the schedules and the 'Tree Constraints Plans'.

3.1.4 The survey identified **1328** arboricultural features which include trees, tree groups, hedges and woodlands. The amounts of each arboricultural feature attributed to the respective grading categories are given in **Table 1**.

Table 1 : Grading of arboricultural features

BS5837:2012 categories	Trees	Tree groups	Woodlands	Hedges
'A' grade	35	11	0	0
'B' grade	225	156	21	12
'C' grade	342	398	28	19
'U' grade	56	23	1	1
TOTALS	658	588	50	32

3.1.5 'A' grade trees are of high quality and value and should be retained. 'B' grade trees are of moderate quality and value and should be considered for retention where possible, although care should be taken to avoid misplaced retention. Any scheme should take into account the retention and protection of trees, but also the tree's future growth. The 'C' grade trees are of low quality and value and should not place a constraint on the proposals. From an arboricultural point of view, the 'U' grade trees cannot realistically be considered for retention as a living tree in the context of the current land use due to their low life expectancy of less than 10 years in their current poor condition. However within this report 'U' grade trees are shown as constraints as retention may be appropriate for other reasons e.g. habitat retention or short term amenity value.

3.2 Legal constraints

3.2.1 Information was provided giving the locations of all trees and groups of trees under the protection of Tree Preservation Orders (TPOs), Conservation Areas (CAs), Sites of Special Scientific Interest (SSSIs), Ancient Woodlands (AWs) and National Park (Beacon Beacons) within the surveyed areas. This information was up to date at the time of writing this report.

3.2.2 It is recommended that arboricultural advice is sought before carrying out any works to trees that are covered by the protection of any of the landscape designations that are found across the site.

3.3 Root Protection Area

3.3.1 The Root Protection Area (RPA) has been plotted as a circle which centres on the base of the stem (subsection 4.6.2 of British Standard 5837:2012).

3.3.2 Deviation in the RPA (subsection 4.6.3 of British Standard 5837:2012) from the original would have to take into account the following factors whilst still providing adequate protection for the root system.

- Morphology and disposition of the roots, when influenced by past or existing site conditions e.g. the presence of roads.
- Topography and drainage.
- The soil type and structure.
- The likely tolerance of the tree to root disturbance or damage, based on factors such as species, age, condition and past management.

3.3.3 No RPA deviation has been applied at this stage in the design process, however this may be necessary when further design details are provided.

4. Arboricultural Impact Assessment (AIA)

4.1 AIA Results

4.2 Tree survey plans

4.2.1 The tree survey plans (i.e. 'The Tree Constraints Plans') can only be used in relation to the tree issues. The tree survey plans show the existing trees numbered (as per subsection 3.1.2) and categorised in accordance with BS 5837:2012. Below ground constraints are represented by the RPA. The above ground constraints arise from the current and ultimate height and spread of the trees. The plans are available on request due to the large file size.

4.2.2 The 'Tree Constraints Plan' shows the extent of the RPAs of the surveyed arboricultural features in relation to the design proposals. An assessment of these has determined the likely impact of the design proposals on the trees/hedges/woodlands and vice-versa.

4.3 Tree to be removed

4.3.1 An assessment of the' Tree Constraints Plans' indicates that those trees requiring removal (as highlighted for removal in the 'Tree Survey and Protection Schedule') will be unsustainably impacted upon by the scheme proposals. Those tree groups, hedges and woodlands that have been assessed to be partially impacted upon (therefore only some of the trees within those features are recommended for removal) are also highlighted. It is recommended that all partial removals of groups and woodlands are confirmed on site by the appointed arboriculturist to avoid issues such as wind throw.

4.3.2 The results are recorded within **Table 2** under the heading 'Removals' and 'Partial Removals', respectively.

4.4 Trees with encroachment into RPAs

4.4.1 The proposed scheme is likely to result in encroachment within the RPAs of the trees detailed in **Table 2**, under 'Encroached'. These trees are considered to be retainable post-construction but may need specific protection measures to be implemented in order to minimize the potential impacts of the design and/or construction activity, as it currently stands.

4.4.2 To mitigate any potential impact on the retained trees, a method statement should be provided by the contractor to demonstrate that all operations proposed within or near to the RPAs can be undertaken to ensure their safe protection and retention. The works should also be supervised by a competent arboriculturist and include adequate protection measures, as detailed in subsection 4.5 – 'General Tree Protection Measures', particularly where there is potentially a greater risk of root damage occurring to trees by virtue of their age/size and close proximity to the development. No roots over 25mm in diameter should be severed without consultation with a competent arboriculturist.

4.4.3 No drainage or other underground apparatus details were provided at the time of writing this report. Particular care should be given to positioning all underground apparatus outside the RPAs of all retained trees. If this is not possible, detailed plans showing the proposed routing will need to be provided for further assessment by a competent arboriculturist.

4.5 Arboricultural Impact Assessment – General tree protection measures

4.5.1 It is important that measures for protection are in place throughout the scheme and for as long as a risk of damage remains and also installed prior to work being conducted. Particular care and planning is necessary in the operation of excavators, lifting machinery and cranes to ensure all vehicle movements and lifting operations will not impact on retained trees.

4.5.2 Protective barriers, fit for purpose, should be placed around the retained trees, to provide a construction exclusion zone and prevent incursion within the RPAs where practicable.

4.5.3 The location for the compound and storage area has yet to be agreed. Consideration should be given to positioning the compounds and storage areas outside the RPAs of all retained trees.

4.5.4 Wherever possible, underground utility services should be routed outside the RPA. Where underground apparatus is to pass within the RPA, detailed plans showing the proposed routing should be drawn up in conjunction with a competent arboriculturist.

5. Site Management and Supervision

5.1 Site management and supervision

5.1.1 Consideration should be given to a competent arboriculturist visiting site and monitoring the works at an interval agreed at the pre-commencement site meeting. The interval should be sufficiently flexible to allow the supervision of key works as they occur. The arboriculturist's role is to monitor compliance with arboricultural conditions and advising on any tree problems that arise or modification that become necessary.

5.1.2 The key stages requiring supervision will be agreed at the pre-commencement site meeting, but will usually include:

- Tree pruning and felling operations
- Installation of tree protection barriers
- Installation of ground protection
- Regular monitoring of compliance

6. Conclusions

6.1 Conclusions

6.1.1 Consideration has been given to retaining all trees where appropriate depending upon their general condition and value. However, ultimately their removal is dependent on their proximity to the footprint of the proposed development.

6.1.2 The trees, groups of trees, hedges and woodlands listed in **Table 2** under 'Removals' and 'Partial Removal' are located within (either fully or partially) or directly adjacent to the proposed development footprint and will need to be removed. The loss of these trees can be mitigated by appropriate replacement tree planting as part of the scheme. Suitability of species selection should be made regarding their location, potential ultimate size, life span, shade tolerance and growth habits.

6.1.3 The scheme proposals are likely to result in encroachment within the RPAs of those trees listed in **Table 2** under 'Encroached'. Encroachment within the RPAs of these trees should be limited to only those works necessary to enable the construction of the required works and include all mitigation and protective measures (including the supervision of works by a competent arboriculturist), as recommended in subsection 4.5 - 'General Tree Protection Measures'. No other excavations or encroachment should be carried out within the RPA of the remaining retained trees, unless approved by a competent arboriculturist.

6.1.4 It is recommended that at final design stage a method statement is produced specifying the methodology to be used for all works within the RPAs, to ensure the safe protection and retention of these trees, prior to the commencement of works.

6.1.5 Particular care should be given to positioning all underground apparatus outside the RPAs of all retained trees. If this is not possible, detailed plans showing the proposed routing will need to be provided for further assessment by a competent arboriculturist. Adequate allowance for and the planning of site access arrangements and the provision of a compound and storage area should be made to avoid encroachment with the RPAs of, or prevent direct contact with, all retained trees on site (see subsection 4.5 'General Tree Protection Measures').

6.1.6 Prior to the removal of the trees listed in **Table 2**, it is essential that the trees are assessed for the presence of nesting birds and protected species such as bats. The disturbance or destruction of nesting sites is an offence under the Wildlife and Countryside Act 1981 and the Countryside and Rights of Way Act 2000. Further advice on bats can be obtained from the Bat Conservation Trust (tel: 0845 1300 2280 / www.bats.org.uk). Advice on nesting birds can be obtained from Natural England (tel: 08456003078 / www.naturalengland.org.uk) or The Royal Society for the Protection of Birds (tel: 01767 693690 / www.rspb.org.uk).

7. Recommendations

7.1 Recommendations

7.1.1 It is recommended that;

a) the contents of this arboricultural report are incorporated within the final scheme proposals;

b) further arboricultural input is requested as and when design details relating to the scheme (i.e. any design change altering the impacts upon adjacent trees) and associated works (e.g. haulage routes, site compounds, drainage placement) have been produced;

c) an Arboricultural Method Statement is prepared and approved before any works commence on site;

d) a Tree Protection Plan is produced following an agreed final scheme design, relating to the recommended special protection measures for those trees which are to be retained post-construction.

6.5 Account has been taken of advice from NRW in development of the proposed scheme. 14
6.6 Summary 14
7. References 15

1. Introduction

This technical report describes the consideration of the compliance with the legislative duties of the proponent (Welsh Government – (WG)) of the proposed scheme, with regard to Sites of Special Scientific Interest (SSSIs).

The report sets out the legislative requirements and the compliance tests; followed by an assessment of implications from the proposed scheme for SSSIs. Mitigation and offsetting for SSSIs is then outlined, followed by a conclusion on compliance with the legislative duties.

2. Legislative Requirements

SSSIs are legally protected under the Wildlife and Countryside Act 1981 (as amended). Each SSSI is protected by law from damage through development, unsuitable management or other activities. They are also protected through working partnerships and agreements with owners and others who manage the sites.

WG, as a statutory undertaker, has a number of duties under the Wildlife and Countryside Act 1981 (as amended) in respect of SSSIs which are outlined below and which form the basis of this report.

28G Statutory undertakers, etcetera: general duty.

(2)The duty is to take reasonable steps, consistent with the proper exercise of the authority's functions, to further the conservation and enhancement of the flora, fauna or geological or physiographical features by reason of which the site is of special scientific interest.

28H Statutory undertakers, etcetera: duty in relation to carrying out operations.

(1)A section 28G authority shall give notice to Natural Resources Wales (NRW) before carrying out, in the exercise of its functions, operations likely to damage any of the flora, fauna or geological or physiographical features by reason of which a site of special scientific interest is of special interest.

(2)Subsection (1) applies even if the operations would not take place on land included in a site of special scientific interest.

(6)The requirements are:

(a) that the authority carry out the operations in such a way as to give rise to as little damage as is reasonably practicable in all the circumstances to the flora, fauna or geological or physiographical features by reason of which the site is of special interest (taking account, in particular, of any such advice as is referred to in subsection (5)(b)); and

(b) that the authority restore the site to its former condition, so far as is reasonably practicable, if any such damage does occur.

3. Tests of Compliance

The objective of this report is to consider if the proposed scheme would comply with the legislation outlined in Section 2 and thus the duty of the proponent, WG, in respect of the Wildlife and Countryside Act 1981 (as amended). The report reviews the information available with regards to potential impacts on SSSIs collated as part of the Environmental Statement (ES) and considers this in respect of the following tests of compliance, based on the Wildlife and Countryside Act 1981 (as amended) Sections 28G and 28H:

- reasonable steps have been taken to further the conservation and enhancement of the features of SSSIs;
- notice has been given to NRW before carrying out operations likely to damage the features of SSSIs;
- operations have been, and would be, carried out in such a way as to give rise to as little damage as is reasonably practicable to the features of SSSIs;
- SSSIs would be restored to their former condition, so far as is reasonably practical, if any damage occurs; and
- account has been taken of advice from Natural Resources Wales (NRW) in development of the proposed scheme.

4. Assessment of Implications for SSSIs

4.1 Consultation

Consultation has been undertaken with NRW, and other statutory consultees, during the development of the proposed scheme design and preparation of the ES. The details of this are provided in Chapter 6: Consultations during Scheme Development of the ES and summarised in Section 11.5 of the Chapter 11: Nature Conservation. NRW have been involved in a number of technical working groups with regard to nature conservation, and their advice has been incorporated into the development of the proposed scheme design, mitigation and offsetting. For example, NRW have expressed a preference for larger ecological mitigation and offsetting areas with dual purposes and easy access for ongoing management over multiple smaller mitigation and offsetting areas, even if this results in lower quality habitat being selected as mitigation or offsetting areas. NRW have also been consulted as a statutory consultee on this report and the ES.

4.2 Baseline

The desk study identified eleven SSSIs located within a 4 km wide corridor centred on the proposed scheme. These sites are listed in Table 4.1 and are presented in order of proximity from the proposed scheme. The location of each site is shown in Volume 3 of the ES - Figure 11.1. Citation sheets describing reasons for designation are provided in Volume 2 of the ES - Appendix 11J.

Note that all figures referred to in this report are provided in Volume 3 of the ES. The Environmental Masterplan is provided in Volume 4.

Table 4.1 : SSSIs located within a 4 km wide corridor centred on the proposed scheme

Site name	Area (ha)	Approximate distance (km) and relative location from proposed scheme	Designated for:
Cwm Taf Fechan Woodlands	60.9	0 km north and south	Mixed deciduous woodlands cover steep slopes and spoil from quarries with one of the few Glamorgan stations for the limestone fern *Gymnocarpium robertianum*.
Tir Mawr a Dderi Hir, Llwydcoed	49.85	0 km south-east	Species-rich neutral grassland and for its marshy grassland, some of which is heathy fen-meadow.
Cors Bryn-y-Gaer (part of Blaen Cynon Special Area of Conservation (SAC))	52.1	0.05 km north	Lowland bog and for areas of soligenous flush, marshy grassland, dry neutral grassland and lowland acid grassland. Also of special interest for the marsh fritillary *Euphydryas aurinia*.
Bryncarnau Grasslands, Llwydcoed	24.8	0.08 km south	Gradation from lowland mesotrophic grassland to pasture of a more upland character.
Woodland Park and Pontpren (part of Blaen Cynon SAC)	14.5	0.82 km north	Marsh fritillary butterfly and provided by its mixture of habitat types, including marshy grassland, dry acid and neutral grassland, heathland and woodland.
Nant Glais Caves	15.7	1.55 km north	Limestone gorge of the Nant Glais and two vadose cave systems which lie parallel to it and under each bank. The caves are also important for their unusually large populations of white trout *Salmo trutta*.

Site name	Area (ha)	Approximate distance (km) and relative location from proposed scheme	Designated for:
Penmoelallt	8.0	0.29 km west	A mixed woodland of ash *Fraxinus excelsior*, oak *Quercus* species, wych elm *Ulmus glabra* and small-leaved lime *Tilia cordata* overlying Carboniferous Limestone. The rare Ley's whitebeam *Sorbus leyana* grows on a small escarpment within the wood.
Dyffrynoedd Nedd a Mellte a Moel Penderyn	420.5	1.23 km west	Extensive and diverse semi-natural woodland, important populations of several flowering plants and supporting outstanding assemblages of mosses, liverworts and lichens.
Daren Fach	8.0	0.64 km north	Concentration of *Sorbus* species. On the southern end of the Darren Fach crags. This is the type locality for the rare Ley's whitebeam.
Cwm Glo a Glyndyrys	181.3	1.70 km south	Extensive areas of marshy grassland, species-rich neutral grassland and acid grassland, and for the association of these habitats with others including woodland and heath.
Lower House Stream Section	0.11	1.64 km north	This site yields the most diverse *Gastrioceras cancellatum* Marine Band fauna known in southern Britain, including goniatites, brachiopods, bivalves and crinoids. It is a horizon of considerable stratigraphical importance, since it is used to locate the boundary between the Marsdenian and Yeadonian stages of the Namurian."

4.3 Design Mitigation

A hierarchical process has been adopted to avoid, reduce, mitigate and offset ecological impacts of the proposed scheme. The impact assessment in the ES (Chapter 11: Nature Conservation) takes into account design mitigation that is integral to the proposed scheme and mitigation that is committed to in the proposed scheme design (see ES Chapter 5: Scheme Description and Appendix 11M). Avoidance was a key feature of the proposed scheme design ensuring as far as practicable the proposed scheme has been designed to avoid impacts on ecological receptors.

The ES also takes into account mitigation incorporated into the proposed scheme to avoid offences under protected species legislation (as described in the Compliance with Protected and Controlled Species Legislation Report, ES - Appendix 11B).

WG would require its main contractors to have an Environmental Management System certified to BS EN ISO14001. Integral to this compliance, would be the Construction Environment Management Plan (CEMP). The CEMP would include roles and responsibilities, together with appropriate control measures, training and briefing procedures, risk assessments and monitoring systems to be employed during planning and constructing the proposed scheme for all relevant topic areas. Standard construction practices for avoiding; mitigating and offsetting environmental effects would be implemented. An indicative CEMP has been compiled and is available on request.

Likely significant effects on and specific measures to avoid or reduce impacts identified on SSSIs are detailed in the ES and are summarised in Sections 4.4 and 5 of this report for ease of reference.

4.4 Potentially Damaging Operations

4.4.1 SSSIs with no likely significant effect

No feasible source-pathway-receptor links were identified between the proposed scheme and the following SSSIs located within of the 4 km wide corridor centred on the proposed scheme:

- Woodland Park and Pontpren (part of Blaen Cynon SAC) SSSI;
- Dyffrynoedd Nedd a Mellte a Moel Penderyn SSSI;
- Nant Glais Caves SSSI;
- Penmoelallt SSSI;
- Daren Fach SSSI; and
- Lower House Stream Section SSSI.

4.4.2 Habitat loss

There would be direct land take (habitat loss) from Tir Mawr a Dderi Hir, Llwydcoed SSSI and Cwm Taf Fechan Woodlands SSSI. There would be a loss of approximately 2.07 ha within the Tir Mawr a Dderi Hir, Llwydcoed SSSI boundary which lies immediately south of the proposed scheme between approximate chainages (ch.) 5475 and 6225. There would be a loss of approximately 0.44 ha within the Cwm Taf Fechan Woodland SSSI boundary between approximately ch. 11525 and 11575 to the north east of the proposed scheme. The breakdown of habitat types lost within each SSSI is presented in Table 4.2.

Table 4.2 : Approximate SSSI habitat loss ('Other' refers to habitats of limited ecological value: amenity grassland, scrub, bracken and hard standing)

Site	Approximate total area of habitat loss (ha)	Habitat types lost (ha)
Tir Mawr a Dderi Hir, Llwydcoed SSSI	2.07	Neutral grassland - semi-improved: 1.07 Broadleaved woodland - semi-natural: 0.45 Wet heath / acid grassland mosaic: 0.44 Marshy grassland: 0.11
Cwm Taf Fechan Woodlands SSSI and LNR	0.44	Broadleaved woodland - semi-natural: 0.26 Other: 0.18

4.4.3 Habitat degradation - air quality impacts

SSSIs within a 400 m wide corridor centred on the proposed scheme are considered sensitive to air quality impacts. Impacts are possible in the construction phase due to dust deposition and the operational phase due to increased vehicle emissions generating increased levels of nitrogen oxides (NOx) and acid and nitrogen deposition(as per Design Manual for Roads and Bridges (DMRB), Vol 11, Section 3, Part 1, HA 207/07, Air Quality). Any SSSIs more than 200 m from the proposed scheme (i.e. outside of the 400 m wide corridor) are not considered likely to be impacted by this pathway.

Potential effects on habitats impacted by a reduction in air quality could include:

- changes in species composition, especially in nutrient poor ecosystems with a shift towards species associated with higher nitrogen availability (e.g. dominance of tall grasses);
- reduction in species richness;
- increases in plant production; and / or

- a decrease in or loss of sensitive lichens and bryophytes.

Please note that the 400 m wide corridor for the operational effects of the proposed scheme extends from all 'affected roads' (please refer to ES Chapter 8: Air Quality) which also considers traffic changes on the surrounding roads around the proposed scheme. Please refer to Figure 11.1, specifically 'Air Quality Study Area'.

Four SSSIs lie within a 400 m wide corridor centred on the proposed scheme:

- Cors Bryn-y-Gaer SSSI;
- Tir Mawr a Dderi Hir, Llwydcoed SSSI;
- Bryncarnau Grassland, Llwydcoed SSSI; and
- Cwm Taf Fechan Woodlands SSSI.

The Cwm Glo a Glyndyrs SSSI is also located within the 400 m wide corridor centred on the 'affected roads'.

4.4.3.1 Construction phase impacts

Impact on SSSIs as a result of construction dust would be temporary and would be mitigated via standard best practice (see ES Chapters 5: Scheme Description and 8: Air Quality). As such, no likely significant effects are anticipated on SSSIs as a result of dust emissions during the construction phase. A qualitative assessment for potential impact on SSSIs from construction traffic was undertaken and detailed in Chapter 8: Air Quality. No potential impact on SSSIs was identified.

4.4.3.2 Operational phase impacts

Nitrogen oxides

None of the SSSIs within the 'affected roads' study area would experience an estimated annual average NOx concentration of over 30 µg/m³, the threshold as specified by HA 207/07 (Highways Agency, 2007) whereby vegetation would be significantly affected. Therefore, as per Interim Advice Notice 174/13 – Evaluation of Significant Local Air Quality Effects (Highways Agency, 2013), the modelled NOx concentrations (critical level) for the proposed scheme during its operation are unlikely to cause a likely significant effect on the SSSIs.

Acid and nitrogen deposition

Further detailed assessment of potential acid and nitrogen deposition (critical loads) modelled from proposed vehicle emissions using predicted traffic data was undertaken in Chapter 8: Air Quality, specifically Appendix 8E in relation to Designated Sites.

- An additional detailed assessment using predicted traffic data for the proposed scheme was used to model the 'process contribution' of acid and nitrogen deposition on SSSIs with the proposed scheme in operation. This was undertaken as reported in ES Chapter 8: Air Quality, specifically Appendix 8E. The significance of the predicted long-term deposition at SSSIs was determined in line with guidance provided by the Environment Agency (Environment Agency, 2016); "*Where the process contribution (PC) is less than 1% of the relevant critical level or critical load, the emission is not likely to have a significant effect alone or in combination irrespective of the existing concentrations or deposition rates*". Table 4.3 and Table 4.4 below detail the modelled deposition rates of acid and nitrogen for SSSIs.

The modelled process contribution of the proposed scheme was less than 1% of the relevant critical load for all SSSIs modelled, except for Tir Mawr a Dderi Hir, Llwydcoed SSSI. Therefore no significant adverse effect on the habitats of SSSIs due to acid or nitrogen deposition is considered likely, except for Tir Mawr a Dderi Hir, Llwydcoed SSSI.

The acid and nitrogen deposition due to operation vehicular emissions is modelled to increase at Tir Mawr a Dderi Hir, Llwydcoed SSSI at 3.07% and 4.8% of their respective critical loads. Using the transect modelling data in the Air Quality assessment, it is considered that this has the potential to result in habitat degradation for

a distance of up to 50 m from the road edge into the SSSI (a strip of habitat totalling an approximate 4.5 ha). Possible effects on the habitats could include competition from more vigorous species over the key marshy and acidic grassland species in this part of the SSSI.

Table 4.3 : Modelled air quality impact – operational phase – acid deposition

SSSI	Priority habitat	Critical Load (CL) CLMaxN	Estimated acid deposition (kEqH+/ha-year)		
			Existing Deposition (ED)	Process Contribution (PC)	PC / CL (%)
Cors Bryn-y-Gaer	Acid grassland	2.28	1.81	-0.00014	-0.01%
Tir Mawr a Dderi Hir, Llwydcoed	Acid grassland	1.77	1.81	0.068	**3.07%**
Bryncarnau Grassland, Llwydcoed	Acid grassland	1.21	1.82	0.003	0.29%
Cwm Glo a Glyndyrys	Acid grassland	1.77	1.82	0.0002	0.02%
Cwm Taf Fechan Woodlands	Woodland	2.43	2.53	0.002	0.1%

Table 4.4 : Modelled air quality impact – operational phase – nitrogen deposition

SSSI	Priority habitat	Critical Load (CL) minimum	Critical Load (CL) maximum	Estimated nutrient N deposition (kgN/ha-year)			
				Existing Deposition (ED)	Process Contribution (PC)	PC / CL (min) (%)	PC / CL (max) (%)
Cors Bryn-y-Gaer	Acid grassland	20	25	25.3	-0.002	-0.02%	-
Tir Mawr a Dderi Hir, Llwydcoed	Acid grassland	20	25	25.3	1.0	**4.8%**	**3.8%**
Bryncarnau Grassland, Llwydcoed	Acid grassland	10	25	25.5	0.05	0.5%	-
Cwm Glo a Glyndyrys	Acid grassland	20	25	25.5	0.002	0.02%	-
Cwm Taf Fechan Woodlands	Woodland	10	20	35.4	0.034	0.34%	-

It should be noted that the existing deposition rate at the SSSI (and all other relevant SSSIs in this assessment) already exceed habitat specific critical load ranges for nitrogen deposition. As such, the area of SSSI potentially affected may have undergone some habitat degradation already meaning any additional impact may not be proportionally as significant.

It is also considered that the habitat quality at the Tir Mawr a Dderi Hir, Llwydcoed SSSI is more likely to reflect the current management regime rather than any effects from nitrogen or acid deposition associated with vehicle emissions. As such, air quality is unlikely to be a limiting factor in habitat quality at this SSSI. However, it is not

possible to be confident that no degradation would occur within the SSSI due to changes in air quality and there is potential that this could be considered significant.

4.4.4 Water pollution

Potential pollution pathways were identified with the following SSSIs:

- Tir Mawr a Dderi Hir, Llwydcoed SSSI;
- Cwm Taf Fechan Woodlands SSSI;
- Cors Bryn-y-Gaer SSSI; and
- Bryncarnau Grassland, Llwydcoed SSSI.

4.4.4.1 Construction phase impacts

During construction of the proposed scheme there could be a potential risk via changes in environmental conditions if local water quality was affected by pollution from suspended solids and other pollution sources, including metals and hydrocarbons.

Construction related impacts on water quality would be temporary and would be mitigated by implementing best practice measures included in the proposed scheme design mitigation (Charles & Edwards, 2015) (Masters-Williams, *et al.,* 2001). See ES Chapter 5: Scheme Description, Chapter 17: Road Drainage and Water Environment (Volume 1 of ES) and Appendix 11M: Design mitigation (Volume 2 of ES) for further details. In summary, these would include:

- a construction commitment to comply with best practice guidelines on environmental protection, for example CIRIA C741 - Environmental Good Practice on Site (4th Edition) (CIRIA, 2015), CIRIA C532 - Control of Water Pollution from Construction Sites (CIRIA, 2001) and CIRIA C648 - Control of water pollution from linear construction projects (CIRIA, 2006);
- a commitment to work in accordance with: GPP2: Above ground oil storage tanks; GPP5: Works and maintenance in or near water; and GPP13: Vehicle washing and cleaning.

These guidelines specifically detail techniques to remove potential water pollution pathways during construction.

No likely significant effects are therefore anticipated on SSSIs as a result of water pollution during the construction phase of the proposed scheme.

4.4.4.2 Operational phase impacts

Discharge of water from the proposed scheme during its operational phase would be appropriately attenuated and discharged at greenfield rate. This is in comparison to the existing road drainage on the existing A465 where there is no defined drainage strategy. The implementation of water attenuation and pollution prevention controls to current best practice standards would be a significant improvement in local water quality with potential improvements to any SSSIs that currently experience uncontrolled receipt of surface waters from road drainage. Water discharges would either be entirely prevented or be at a level where no adverse effects would be anticipated. This and the improvement quality of discharged water would be a beneficial impact of the proposed scheme on SSSIs and the wider environment.

4.4.5 Hydrology

No abstraction or discharge to ground water is required as part of the proposed scheme construction or operation. The design mitigation would minimise changes to hydrology sufficiently that either there is no pathway to affect or if a feasible connection were possible, no likely significant effects would occur. See ES Chapter 5: Scheme Description and Chapter 17: Road Drainage and Water Environment for further details.

4.4.6 Summary

No feasible source-pathway-receptor links were identified between the proposed scheme and the following SSSIs located within the 4 km wide corridor centred on the proposed scheme:

- Woodland Park and Pontpren (part of Blaen Cynon SAC) SSSI;
- Dyffrynoedd Nedd a Mellte a Moel Penderyn SSSI;
- Nant Glais Caves SSSI;
- Penmoelallt SSSI;
- Daren Fach SSSI; and
- Lower House Stream Section SSSI.

Feasible source-pathway-receptor links were identified for the following SSSIs but were scoped out as having no likely significant effects when embedded design measures and specific air quality assessment were undertaken:

- Cors Bryn-y-Gaer SSSI;
- Cwm Glo a Glyndyrys SSSI; and
- Bryncarnau Grassland, Llwydcoed SSSI.

Taking into account the design mitigation outlined above, the following impacts on SSSIs would be anticipated as a result of the proposed scheme. These impacts are summarised in Table 4.5.

Table 4.5 : Summary of potential impacts on SSSIs as a result of the proposed scheme

Site name	Approximate distance from proposed scheme	Potential impacts (taking into account design mitigation and offsetting)
Cwm Taf Fechan Woodlands SSSI (also a LNR)	0 km north and south	• Direct loss of approximately 0.44 ha of habitat during construction.
Tir Mawr a Dderi Hir, Llwydcoed SSSI	0 km south-east	• Direct loss of approximately 2.07 ha of grassland habitat during construction; • Potential habitat degradation of up to 4.5 ha of habitat within the SSSI along the northern boundary, adjacent the proposed A465.

5. Mitigation

Additional mitigation is proposed, in addition to the embedded design mitigation, to mitigate the losses of habitat at Tir Mawr a Dderi Hir, Llwydcoed SSSI and at Cwm Taf Fechan Woodlands SSSI. Mitigation at each site is discussed separately in the sections below. In accordance with the Wildlife and Countryside Act 1981 (as amended) Sections 28G and 28H, specifically that 'reasonable steps have been taken to further the *conservation* and *enhancement* of the features of SSSIs', the mitigation features below are separated into distinct *conservation* and *enhancement* sections.

5.1 Tir Mawr a Dderi Hir, Llwydcoed SSSI

5.1.1 Conservation

The direct loss of approximately 2.07 ha of habitat within the SSSI would be mitigated as follows:

- Reinstatement of the new soft estate within the SSSI boundary. Existing topsoil[1] from within the SSSI would be salvaged during vegetation clearance and reinstated on the new soft estate as soon as possible (between approximate ch. 5475 and ch. 6225, south side); and
- Where necessary, enhancement of the new soft estate habitat within the existing SSSI boundary involving supplementary seeding using seed harvested from the adjacent SSSI unaffected by construction works.

These mitigation measures would result in minor net loss from the Tir Mawr a Dderi Hir SSSI of approximately 0.24 ha. Approximate 0.14 ha of existing SSSI habitat would be permanently lost under the widened A465 and a further approximate 0.1 ha would be lost under the proposed attenuation pond access track.

However, proposed habitat enhancement of an additional approximate 0.34 ha in the proposed soft estate immediately adjacent to the SSSI to the north-east (approximate ch. 6250 – 6350, see Figure 11.15 and Environmental Masterplan in ES Volume 4) by planting trees (replacing those lost in the SSSI) and enhancing the proposed grassland area using soil salvage and seed harvest from the SSSI would mitigate this loss.

A Habitat Management Plan (HMP) for these locations within the wider soft estate would be implemented with the aim to bring this land up to SSSI quality. The plan would also include a management prescriptions post construction and a monitoring programme. The plan would have annual review to allow for amendments to both management and monitoring.

5.1.2 Enhancement

Provision of a solid highway fence around the northern boundary Tir Mawr a Dderi Hir, Llwydcoed SSSI to avoid cattle escaping onto the A465 is proposed as the existing highway fence is regularly vandalised. The provision of suitable fencing would enable grazing of the SSSI (at agreed levels for nature conservation benefit) which is currently intermittent due to the poor condition and intermittent nature of the existing barrier. This would allow grazing to be undertaken in a manner more compatible with the desired management of grassland within the SSSI and thus act as an enhancement.

In addition to increasing the overall area of high quality grassland habitat in the soft estate, the proposed area of marsh fritillary habitat creation at Llwydcoed Slopes (approximately 14.4 ha) would be the receptor site for grassland turfs lost from the Tir Mawr a Dderi Hir, Llwydcoed SSSI. With appropriate management, the Llwydcoed Slopes site would increase the distribution of SSSI quality habitat in the local area and potential to create a new link in the landscape between the Tir Mawr a Dderi Hir, Llwydcoed SSSI and the Bryncarnau Grassland, Llwydcoed SSSI (to the south east, see ES, Volume 3, Figure 11.15). The Llwydcoed Slopes mitigation site would create a protected and appropriately managed wildlife dispersal corridor. The mitigation site would also provide a buffer between other land use pressures and the SSSIs, thereby furthering the

[1] Although the term 'top soil' is referenced throughout this report, it is possible that a mixture of top soil stripping, top soil inversion or top soil mixing would be used to reduce soil fertility and allow the valuable seed bank that is contained deeper in the soil profile to become established. A method statement for soil management and habitat restoration would be developed in consultation with NRW during the detailed design stage of the proposed scheme.

conservation of the Tir Mawr a Dderi Hir, Llwydcoed SSSI itself but also Bryncarnau Grasslands, Llwydcoed SSSI, enhancing the SSSI network in the region as a whole.

In Environmental Liaison Group (ELG) meetings (Minutes contained within ES Volume 2 - Appendix 6A) it was suggested that Butterfly Conservation, local authorities and PONT (Pori Natur a Threftadaeth / Grazing, Nature and Heritage) have active grazing programmes in the local area. Opportunities potentially exist to develop collaborative management plans such as the 'Flexigraze' partnership operated by Northumbrian Wildlife Trust whereby grazing management across a number of different sites with differing requirement can be co-ordinated by a single enterprise without the need for specific organisations to invest in their own stock ownership. A commitment has be added to the Register of Environmental Actions and Commitments (REAC) specifying that the Contractor / Special Purpose Vehicle for the proposed scheme will co-ordinate with these groups when finalising the HMP. Again, this further enhances not only the specific SSSI impacted by the proposed scheme but has a synergistic beneficial impact on the wider network of local sites managed in the area by facilitating more integrated and appropriate management options.

5.2 Cwm Taf Fechan Woodlands SSSI

5.2.1 Conservation

The loss of approximately 0.26 ha of woodland habitat within the Cwm Taf Fechan Woodlands SSSI would be mitigated via the reinstatement and creation of woodland habitat within the proposed landscape planting scheme. The loss of approximately 0.18 ha of habitat types of low ecological value is not mitigated for.

Woodland habitat loss immediately north of the Taf Fechan structure and east of the Taf Fechan watercourse would be reinstated with woodland planting post construction. Minor permanent loss where the new structural supports are located (approximately 0.02 ha) would remain. An additional 0.01 ha would be lost under the proposed attenuation pond access track.

Top soil salvage and coppiced trees and shrubs from cleared habitats within the SSSI at the proposed attenuation ponds access track (ch. 12250 – 12500) would be used for reinstatement on the proposed soft estate at two woodland mitigation blocks (see Figure 11.15) adjacent the SSSI on the new soft estate. Together, these plots would create a new woodland area of approximately 0.31 ha, a marginal net gain.

5.2.2 Enhancement

In addition to the site specific mitigation above, woodland habitat would be planted as part of the proposed landscape planting across the proposed soft estate, totalling approximately 43.2 ha. Some of this would be contiguous with the SSSI, providing an ecological enhancement of the botanical features for which the SSSI is designated. This would be just one component of a more continuous, connective and high quality soft estate nature conservation resource across the entire proposed scheme. These areas are shown on the Environmental Masterplan (ES Volume 4).

A new access to the SSSI for recreational users and land managers (including pony grazing) would be provided at approximately ch. 12250. This new access would permit safe and continued access to and into the SSSI allowing conservation management options previously unavailable to the site, further aiding continued conservation and enhancement.

.

6. Assessment of Compliance

6.1 Reasonable steps have been taken to further the conservation and enhancement of SSSIs

WG (the proponent) is, within its wider remit, responsible for:

- constructing new roads and improving existing ones;
- renewing roads, bridges and other structures; and
- the day-to-day maintenance, including winter maintenance.

Whilst providing this duty the WG must also take 'reasonable steps' to further the conservation and enhancement of the flora, fauna or geological or physiographical features by reason of which a site is of special scientific interest.

For the proposed scheme, in addition to design mitigation to avoid and mitigate for likely significant effects on ecological features, specific mitigation is proposed to take into account impacts of habitat loss at Tir Mawr a Dderi Hir, Llwydcoed SSSI and Cwm Taf Fechan Woodlands SSSI, where impacts would be unavoidable. The proposed mitigation is beyond simply replacing what is lost by providing high quality, comparable habitats. The proposed mitigation would further the conservation and enhancement of the features for which these SSSIs were designated both by extending the areas of comparable habitats, would provide a buffer between the impacted SSSI and other land uses and also would create new wildlife corridors / habitat connections.

6.2 Notice has been given to NRW before carrying out operations likely to damage SSSIs

For the proposed scheme, notice has been (and will continue to be) given to NRW via the planning process (in this case the Highways Act 1980 (as amended) Orders process), through the statutory and non-statutory consultation undertaken as part of the scheme development (see ES Chapter 6: Consultations during Proposed Scheme Development) and approval of the proposed scheme through the planning process. This is relevant to all those potentially damaging operations covered in the ES and in this report. The inclusion of statutory consultation on a planning process negates the requirement to complete a notification / consent form.

Where any additional potentially damaging operations may be required subsequent to the publishing of Draft Orders and the ES as part of the development of the proposed scheme (for example, ground investigation works as part of the detailed design and pre-construction surveys) notification would be made via the relevant 'Section 28H notice of works likely to damage the special interest of an SSSI form[2].

6.3 Operations have been and would be carried out in such a way as to give rise to as little damage as is reasonably practicable to SSSIs

The ES outlines the hierarchical process that has been adopted to avoid, reduce and mitigate the ecological impacts of the proposed scheme. A comprehensive list of mitigation actions and commitments has been provided in the Register of Environmental Actions and Commitments (REAC), which would be implemented via contractual documents with the WG's main contractors. Specific mitigation is proposed to take into account impacts of habitat loss at Tir Mawr a Dderi Hir, Llwydcoed SSSI and Cwm Taf Fechan Woodlands SSSI where impacts were unavoidable. Thus operations have been and would be carried out in such a way as to give rise to as little damage as is reasonably practicable to SSSIs.

[2] Available at: https://naturalresources.wales/conservation-biodiversity-and-wildlife/find-protected-areas-of-land-and-seas/guidance-to-site-of-special-scientific-interest-sssi-land-owners-and-occupiers/?lang=en

6.4 The site is restored to its former condition, so far as is reasonably practical, if any damage occurs

Two SSSIs have been identified as being impacted by the proposed scheme: Tir Mawr a Dderi Hir, Llwydcoed SSSI; and Cwm Taf Fechan Woodlands SSSI.

Any areas impacted temporarily by construction would be restored, for example via turf storage and soil salvage. Habitat loss at Cwm Taf Fechan Woodlands SSSI and Tir Mawr a Dderi Hir, Llwydcoed SSSI; would be mitigated by the creation of new habitats contiguous with the SSSI effected or by creating a landscape scale link. Topsoil salvage will occur along the habitat corridor directly lost to the proposed scheme and reinstated within new soft estate that will be within the SSSI boundary, meaning no net loss of habitats within the designated site boundaries.

6.5 Account has been taken of advice from NRW in development of the proposed scheme.

There has been statutory and non-statutory consultation with NRW, and other consultees, throughout the process of developing the proposed scheme design and preparing the ES. Details are provided in ES Chapter 6: Consultations during Proposed Scheme Development.

6.6 Summary

A hierarchical process has been adopted to avoid, reduce and mitigate the impacts of the proposed scheme on SSSIs, in consultation with NRW. This would ensure that operations would be carried out in such a way as to give rise to as little damage as is reasonably practicable to the features of SSSIs. Design mitigation for avoiding and mitigating environmental effects would be implemented along with mitigation related to protected species. Where residual impacts would remain following avoidance and implementation of proposed scheme design mitigation, additional mitigation is proposed to mitigate habitat lost and further enhance the conservation value of the features of SSSIs.

Annex A. NRW response letter – marsh fritillary

Annex B. Great crested newt fencing specification

1. Introduction

This technical report describes the likely risks of the construction and operation of the proposed scheme to contravene the following legislation:

- Conservation of Habitats and Species Regulations 2010 (as amended);
- Wildlife and Countryside Act 1981 (as amended);
- Protection of Badgers Act 1992;
- The Eels (England and Wales) Regulations 2009 (as amended);
- Salmon and Freshwater Fisheries Act 1975 (as amended by the Marine and Coastal Access Act (2009); and
- Environmental Protection Act 1990.

This report provides a summary of the protected and controlled species present in the vicinity of the proposed scheme and reviews the legal offences that the proposed scheme is at risk of breaching. It also sets out the steps (proposed approach) that would be taken when implementing the proposed scheme in order to avoid offences under the legislation.

The mitigation measures that are included with the proposed approach which are in addition to those outlined in the Environment Statement (ES) to minimise likely significant effects on nature conservation, would be included within the Register of Environmental Actions and Commitments (REAC).

This report considers species that are protected or controlled by UK law, but it does not constitute legal advice.

As a publically issued report, any sensitive species records have been redacted. For further information, please contact Welsh Government.

1.1 Summary

There is potential for activities associated with the construction phase of the proposed scheme to commit potential offences related to a number of protected species. However, careful design and best practice would ensure that appropriate working practices would avoid contravention of relevant wildlife legislation. Primarily this would be via avoidance of impact and subsequently the use of European Protected Species (EPS) derogation licences and / or suitable method statements.

2. Methodology

The legislation under which species are protected or controlled has been reviewed to identify the potential for the proposed scheme to cause offences.

The protected and controlled species that are relevant to the proposed scheme have been determined through the ecological baseline information collated for the proposed scheme.

The ecological baseline information was derived from desk-based study and ecological field survey. The desk study included consultation with:

- Natural Resources Wales (NRW);
- South East Wales Biodiversity Records Centre (SEWBReC);
- Biodiversity Information Service (BIS) for Powys and the Brecon Beacons National Park; and
- Brecon Beacons National Park Authority (BBNPA).

A summary of baseline information is provided within this report and full details are provided in the relevant factual survey reports:

- Jacobs Winter 2015 Ecology Survey Results (ES – Appendix 11E);
- Jacobs Summer 2015 Ecology Survey Results (ES – Appendix 11F);
- Jacobs 2016 Ecology Survey Results (ES – Appendix 11G); and
- Jacobs Bat Survey Results 2016 (ES – Appendix 11H).

All Figures referred to are included in Volume 3 of the ES.

The proposed approach to avoid offences (or required to secure a derogation licence) over and above the measures proposed to mitigate likely significant effects (as detailed in Chapter 5: Scheme Description and Chapter 11: Nature Conservation of the ES) are then described. Where indicative dates are provided this assumes a construction start date of November 2019.

3. Scope

Offences considered in this report are only those that could occur as a result of the proposed scheme. Offences relating to cruelty, possession, transport, sale and certain methods for capturing / taking and killing have not been considered as such activities are not required for the implementation of the proposals and, therefore, any such offence committed would be the personal liability of the individual concerned and not the proponent of the proposed scheme (Welsh Government).

Table 3.1 sets out the relevant legislation and potential offences that could occur as a result of the proposed scheme.

The Hedgerow Regulations, 1997 do not apply as the proposed scheme would only be taken forward if Orders under the Highways Act 1980 (as amended) are made, meaning any hedgerow removal would be considered to be permitted work under regulation 6(1)(h) of the Hedgerow Regulations.

All wild plants are protected under the Wildlife and Countryside Act 1981 (as amended) from unauthorised removal. As vegetation clearance for the proposed scheme would be a lawful operation, authorised by the proponent and land owner these offences would not apply.

In relation to the offence of introducing new species to the wild under the Wildlife and Countryside Act 1981 (as amended), the disposal of waste containing controlled species such as Japanese knotweed *Fallopia japonica* falls under the Environmental Protection Act 1990.

For species protected under Schedule 5 of the Wildlife and Countryside Act, 1981 (as amended), there are no provisions for derogation and no licence can, therefore, be issued (as can be with species protected by the Conservation of Habitats and Species Regulations 2010 (as amended)).

Table 3.1 : Potential offences under UK protected species legislation

General descriptor	Conservation of Habitats and Species Regulations, 2010 (as amended)	Wildlife and Countryside Act, 1981 (as amended)	Protection of Badgers Act, 1992	The Eels (England and Wales) Regulations, 2009 (as amended)	Salmon and Freshwater Fisheries Act, 1975 (as amended)
Capturing, killing, and injuring.	To deliberately capture, injure or kill any wild animal of a European Protected Species (EPS) (Reg 41(1)(a)).	To intentionally kill, injure or take any wild bird (s1(1)). To intentionally kill, injure or take any wild animal included in Schedule 5 (s9(1)).	To wilfully kill, injure or take, or attempt to kill, injure or take a badger (s1(1)).	-	-
Disturbing (affecting ability to survive, breed or rear young).	To deliberately disturb wild animals of a EPS [note wherever they are occurring] (Reg41(1)(b)) Reg 41(2)(a)(i) For the purposes of Reg 41(1)(b), disturbance of animals includes in particular any disturbance which is likely to impair their ability to survive, to breed or reproduce, or to rear or nurture their young.	-	-	-	-
Disturbing (impairing ability to migrate or hibernate).	To deliberately disturb wild animals of an EPS [note wherever they are occurring] (Reg41(1)(b)) Reg 41(2)(a)(ii) For the purposes of Reg 41(1)(b), disturbance of animals includes in particular any disturbance which is likely to impair their ability, in the case of animals of a hibernating or migratory species, to hibernate or migrate.	-	-	To construct, alter or maintain a dam or structure and fail to notify the Environment Agency first (Part 4, 12 (1), (2).(4)).	-

General descriptor	Conservation of Habitats and Species Regulations, 2010 (as amended)	Wildlife and Countryside Act, 1981 (as amended)	Protection of Badgers Act, 1992	The Eels (England and Wales) Regulations, 2009 (as amended)	Salmon and Freshwater Fisheries Act, 1975 (as amended)
Disturbing (affecting local distribution or abundance).	To deliberately disturb wild animals of an EPS [note wherever they are occurring] (Reg41(1)(b)) Reg 41(2)(b) For the purposes of Reg 41(1)(b), disturbance of animals includes in particular any disturbance which is likely to affect significantly the local distribution or abundance of the species to which they belong.	-	-	-	-
Disturbing (whilst occupying a structure or place used for shelter or protection).	-	To intentionally or recklessly disturb any wild bird included in Schedule 1 while it is building a nest or is in, on or near a nest containing eggs or young; or disturbs dependent young of such a bird (s1(5)). To intentionally or recklessly disturb any wild Schedule 5 animal while it is occupying a structure or place which it uses for shelter or protection (s9(4)(b)).	To disturb a badger when it is occupying a badger sett (s3(e)).	-	-
Taking eggs.	To deliberately take or destroy the eggs of such a EPS (Reg 41(1)(c).	To intentionally take or destroy an egg of any wild bird (s(1)(c).	-	-	-

General descriptor	Conservation of Habitats and Species Regulations, 2010 (as amended)	Wildlife and Countryside Act, 1981 (as amended)	Protection of Badgers Act, 1992	The Eels (England and Wales) Regulations, 2009 (as amended)	Salmon and Freshwater Fisheries Act, 1975 (as amended)
Obstructing access.	-	To intentionally or recklessly obstruct access to any structure or place which any Schedule 5 animal uses for shelter or protection (s9(4)(c)).	To - obstruct access to, or any entrance of, a badger sett (s3(c)).	-	-
Damage or destruction of a breeding site or resting place.	To damage or destroy a breeding site or resting place of a EPS (Reg 41(1)(d)).	To intentionally take, damage or destroy the nest of a wild bird included in Schedule 1 (s1(1)(aa)). To intentionally take, damage or destroy the nest of any wild bird while that nest is in use or being built (s1(1)(b)). To intentionally or recklessly damage or destroy any structure or place which any wild animal specified in Schedule 5 uses for shelter or protection (s(4)(a)).	To damage a badger sett or any part of it or to destroy a badger sett (s3(a)(b)).	-	Knowingly permits to flow, or puts or knowingly permits to be put, into any waters containing fish or into any tributaries of waters containing fish, any liquid or solid matter to such an extent as to cause the waters to be poisonous or injurious to fish or the spawning grounds, spawn or food of fish, shall be guilty of an offence (Part I, 4 (1)).

General descriptor	Conservation of Habitats and Species Regulations, 2010 (as amended)	Wildlife and Countryside Act, 1981 (as amended)	Protection of Badgers Act, 1992	The Eels (England and Wales) Regulations, 2009 (as amended)	Salmon and Freshwater Fisheries Act, 1975 (as amended)
Introducing new species.	-	To plant or otherwise cause to grow in the wild any plant which is included in Part II of Schedule 9 (s14 (2)). Waste produced from management of some species would be “controlled waste” and managed accordingly under the Environmental Protection Act (s33 (1a) and (1b)).	-	-	-
Picking, cutting etc. plants.		An unauthorised person, intentionally or recklessly uproots any wild plant (s13(1)(b)).	-	-	-

4. European protected species derogation licence tests

A European Protected Species (EPS) derogation licence can only be granted by NRW if the following three tests can be met:

i. the purpose of the work meets one of those listed (see below) in the Conservation of Habitats and Species Regulations 2010 (as amended);

ii. that there is no satisfactory alternative; and

iii. that the action authorised will not be detrimental to the maintenance of the population of the species concerned at a favourable conservation status (FCS) in their natural range.

The specific set of purposes includes:

- preserving public health or public safety or other imperative reasons of over-riding public interest including those of a social or economic nature and beneficial consequences of primary importance for the environment;
- scientific and educational purposes;
- ringing or marking;
- conserving wild animals or wild plants;
- protecting any zoological or botanical collection;
- preventing the spread of disease; and / or
- preventing serious damage.

Test One: The purpose of the proposed scheme relates to 'preserving public health or public safety or other imperative reasons of over-riding public interest, including those of a social or economic nature and beneficial consequences of primary importance for the environment'.

Test Two: There is no satisfactory alternative to the proposed scheme. The requirement for the proposed scheme is discussed in ES Chapter 3: The Need for the Proposed Scheme and the staged and iterative design development is discussed in ES Chapter 4: Scheme Design Development and Alternatives Considered.

Test Three: This test would be met via the various measures discussed in the individual chapters relating to EPS so that species concerned would be maintained at a FCS in their natural range.

5. Relevant species

The baseline data collection has recorded evidence of the following taxa for which the legislation listed in Table 3.1 applies:

- protected species:
  - marsh fritillary *Euphydryas aurinia*;
  - bats;
  - otter *Lutra lutra*;
  - great crested newt (GCN) *Triturus cristatus*;
  - badger *Meles meles*;
  - reptiles;
  - birds; and
  - freshwater fish.
- controlled species:
  - Japanese knotweed;
  - Himalayan balsam *Impatiens glandulifera*;
  - wall cotoneaster *Cotoneaster horizontalis*; and
  - Japanese rose *Rosa rugose.*

Protected species for which habitats within the study area may be suitable including dormouse *Muscardinus avellanarius* and white-clawed crayfish *Austropotamobius pallipes* are not considered within this compliance report. These species have been previously scoped out as it is considered that they are unlikely to be present, and therefore there is considered to be no scope to contravene the relevant legislation.

There is the possibility that the presence of some protected species that are rare and / or difficult to survey effectively (for example red squirrel *Sciurus vulgaris*, pine marten *Martes martes* and certain invertebrates) may have been overlooked. As these species are generally associated with rarer and more diverse habitats, it is considered that the mitigation implemented, including minimising the loss of and damage to such habitats, would constitute a reasonable effort to avoid offences.

No plants on Schedule 5 of the Wildlife and Countryside Act 1981 (as amended) were recorded and therefore no offence with regard to these species would occur.

6. Marsh fritillary

6.1 Relevant legislation

- Wildlife and Countryside Act, 1981 (as amended), Schedule 5.

6.2 Baseline information

6.2.1 Desk study

During the desk study records of marsh fritillary were found within a 1 km wide corridor centred on the proposed scheme, mainly to the west in Section 6 of the proposed scheme. The location of these records can be seen in Figure 11.5.

6.2.2 Field survey

Since 2008, ten sites within a 1 km wide corridor centred on Section 6 of the proposed scheme have been surveyed by Jacobs on an annual basis for marsh fritillary. Natural Resources Wales survey the Blaen Cynon SAC. The locations of the monitoring sites and results from the latest monitoring survey report (ES - Appendix 11I) are presented in Figure 11.6.

Larval webs were recorded on four sites in 2016 (2, 2a, 4 and 6). Sites 2 and 4 both supported high numbers of webs, with webs recorded for only the second time on site 6 since monitoring began in 2009. Site 6a had no webs recorded in 2016 for the first time since 2009 due to excessive grazing by ponies on the site.

Adult marsh fritillary (butterflies) was recorded on three sites in 2016 (2, 4 and 7a). High numbers were recorded on Sites 2 and 4 in comparison to other sites, although numbers are lower than those recorded in 2015. No marsh fritillaries have been recorded on Site 5 since monitoring began in 2008. A maximum count of 433 adults was counted at Site 4 in 2015.

Further habitat assessment for marsh fritillary suitability, out with the long term monitoring sites, was undertaken in 2016 and full details are provided in ES - Appendix 11G. The accumulated survey results for marsh fritillary habitat types recorded during all three of the marsh fritillary surveys can be seen in Figure 11.6.
