6.3 Potential for an offence

Site clearance could potentially kill, injure or disturb marsh fritillary in their larval (caterpillar life stage) and / or damage habitats of the larval and adult life stages of the species. Table 6.1 sets out the likely risks of contravening the legislation relating to marsh fritillary.

Table 6.1 : Marsh fritillary– relevant legislation and potential for an offence

Wildlife and Countryside Act, 1981 (as amended)	Offence likely (in absence of mitigation)	Location
To intentionally kill, injure or take any wild animal included in Schedule 5 (s9(1)).	Yes – the larval life stage (caterpillar) could be killed or injured during site clearance and the take offence could be considered to apply to the translocation works.	Suitable marsh fritillary habitat under the proposed scheme footprint at: ch. 2750 – 2950 north and south ch. 3150 – 3300 south ch. 3600 – 3800 south ch. 5500 – 6500 south ch. 7900 – 8100 south ch. 8250 – 8300 south ch. 9500 – 9800 south
To intentionally or recklessly disturbs any wild animal listed in Schedule 5 while it is occupying a structure or place which it uses for shelter or protection (s9(4)(b)).	No – the larval stages and adults are not considered sensitive to disturbance.	N/A
To intentionally or recklessly obstruct access to any structure or place which any animal listed on Schedule 5 uses for shelter or protection (s9(4)(c)).	No – access retained marsh fritillary habitat would not be obstructed.	N/A
Intentionally or recklessly damages or destroys any structure or place which any wild animal listed in Schedule 5 uses for shelter or protection (s(4)(a)).	Yes – removal of devils bit scabious during site clearance.	Suitable marsh fritillary habitat under the proposed scheme footprint at: ch. 2750 – 2950 north and south ch. 3150 – 3300 south ch. 3600 – 3800 south ch. 5500 – 6500 south ch. 7900 – 8100 south ch. 8250 – 8300 south ch. 9500 – 9800 south ch. 2750 – 2950

6.4 Proposed approach

The following paragraphs set out the steps that would be taken prior to construction to ensure the legislation protecting marsh fritillary would not be contravened.

NRW provided guidance to the project team, dated 12 May 2016 (See Annex A) with regard to the legal protection of marsh fritillary. NRW reiterated that the only way to avoid potentially committing offences under this act was by avoidance and that:

"The Act says that, if it can be shown that the potentially unlawful act was the incidental result of a lawful operation and could not reasonably have been avoided, no offence will have been committed. To this end a method statement should be prepared and agreed with NRW prior to the commencement of works. Whilst this is not the same as derogation it might be used as part of a defence".

6.4.1 Preconstruction survey

All areas identified as suitable for marsh fritillary under the footprint of the proposed scheme would be inspected for larval webs in late summer 2019 prior to the start of works.

6.4.2 Translocation

It is proposed that larval webs, the devil's-bit scabious plant upon which the larvae feed and their immediate turf is translocated from the proposed scheme footprint to a suitable and prepared receptor site (Llwydcoed Slopes Land Acquired for Ecological Mitigation (ch. 6750 – 7750 south side) see Figure 11.15). Translocation of larval webs would occur in November 2019 when the caterpillars are caterpillars are minimally active in the grassland turfs and can be easily relocated. These activities would be undertaken in accordance with a detailed method statement agreed with NRW as it considered the translocation proposal whilst avoiding killing or injuring could be considered to contravene the 'taking' offence.

6.4.3 Provision of construction phase method statement

A method statement would be developed to ensure the protection of marsh fritillary during site clearance and fencing, which would specify the actions necessary to demonstrate all reasonable efforts had been made to avoid an offence taking place. The method statement would be prepared and agreed with NRW prior to the commencement of any works. The method statement would include detail on appropriately timed vegetation clearance and fencing works in marsh fritillary habitats and a larval web translocation programme.

6.4.4 Reporting

A memo report detailing the numbers and locations of translocated of larval webs would be provided to the proponent, NRW and the Rhondda Cynon Taf (RCT) local authority ecologist within two months of the translocation (anticipated date – Winter 2019/20.

Report on the establishment and management activities of mitigation areas would be provided to the proponent, NRW, and RCT ecologist through the construction phase at six month intervals. Annual reports would be provided during the five year post construction phase.

Monitoring activities on habitat condition and adult marsh fritillary and larval web counts would be incorporated into the factual annual reports which include the long-term monitoring sites.

ELG meetings between the proponent, Jacobs, NRW and the RTC ecologist would be organised after issue of each six monthly report during construction. These would occur annually during the five year post construction phase to discuss the mitigation area and its translocation / establishment success.

6.5 Conclusion

The approach detailed above would avoid the offences listed being committed during the vegetation clearance and fencing stages that are usually the critical early stages of construction which would be the key period of impact.

7. Bats

7.1 Relevant legislation

- Wildlife and Countryside Act 1981 (as amended), Schedule 5; and
- Conservation of Habitats and Species Regulations 2010 (as amended), Schedule 2.

7.2 Baseline information

7.2.1 Desk study

Records of several British bat species have been historically recorded in surrounding 4 km wide corridor centred on the proposed scheme. Species including lesser horseshoe bat *Rhinolophus hipposideros*, noctule bat *Nyctalus noctula,* Daubenton's bat *Myotis daubentonii*, Natterer's bat *Myotis nattere*ri, common pipistrelle *Pipistrellus pipistrellus,* soprano pipistrelle *Pipistrellus pygmaeus* and brown long-eared bat *Plecotus auritus* have been historically recorded within a 1 km wide corridor centred on the proposed scheme. These are shown in Figure 11.8.

Confirmed bat roosts of note within a 1 km wide corridor centred on the proposed scheme are:

[redacted]

- [redacted]

7.2.2 Field Survey

7.2.2.1 Cave roosts

Seventeen of the 30 caves surveyed in March and September 2016 were confirmed bat roosts (see Figure 11.9) and included:

[redacted]

A number of additional unknown caves and roosting features in the Taf Fechan and Taf Fawr gorges are likely to be present due to the fractured and fissured nature of the limestone cliffs.

7.2.2.2 Structure roosts

The results of the ground based assessment of the existing road structures within the proposed scheme footprint, for roosting bats is shown in Table 7.1 below and the structures surveyed can be seen in Figure 11.9.

Table 7.1 : Bat roost assessment in structures – ground assessment

Existing road structure	Grade of potential roost features suitable to support lesser horseshoe bats	Grade of potential roost features suitable to support other species of bats	Result of further inspections where applicable
Rhigos Halt Road Underpass	Negligible	Negligible	N/A
Fifth Avenue Underpass	None	None	N/A
Hirwaun Industrial Estate	None	Moderate	N/A
Nant y Bwlch Culvert	None	None	N/A
Trewaun Subway	None	Negligible	N/A
Afon Cynon Bridge	None	East Abutment - Moderate	N/A
Vale Neath Railway	No access	No access	N/A
Nant Melyn Mainline Viaduct	None	High	N/A
Nant Hir (North) Viaduct	None	East abutment - Moderate	N/A
Nant Ffrwd Viaduct	None	East abutment - Moderate West abutment - Low	N/A

[redacted]	[redacted]	[redacted]	[redacted]
Vaynor Road retaining wall	None	None	N/A
Taf Fechan viaduct	None	West Abutment – Moderate East Cliff face - High	N/A
Gurnos Culvert	None	None	N/A

7.2.2.3 Building roosts

A total of 1780 individual buildings were externally assessed for the potential to contain bat roosts within the study area. 311 buildings were identified as having some potential and were categorised as:

- Known roost – 6 (see desk study above);
- High potential – 112;
- Moderate potential – 61; and
- Low potential – 132.

Dusk emergence and pre-dawn return to roost surveys were undertaken at 15 buildings and bat roosts were confirmed within 11 of the buildings surveyed (see Figure 11.10). A further seven bat roosts were located during the backtracking surveys (see Figure 11.10). A summary of the confirmed bat roosts in buildings are listed in Table 7.2 below.

Table 7.2 : Bat roosts in buildings (*identified during Jacobs back tracking survey)

Roost type	Bat species	Building address	Approximate distance from proposed scheme (m)	Maximum number of bats counted
Maternity	Common pipistrelle	[redacted]	43 m	Approximately 10 seen re-entering roost (up to 50 previously seen emerging)
		[redacted]	218 m	Approximately 12
		[redacted]	40 m	Approximately 55
Maternity	Soprano pipistrelle	[redacted]	18 m	Approximately 33
		[redacted]	111 m	150+
Maternity roost	Pipistrelle species	[redacted]	180 m	22
Summer day	Common pipistrelle	[redacted]	17 m	3
		[redacted]	35 m	3
		[redacted]	39 m	1
		[redacted]	0 m	Approximately 8 from barn and 2 from farmhouse
		[redacted]	61 m	3
		[redacted]	290 m	Approximately 3
		[redacted]	244 m	3
		[redacted]	28 m	1
		[redacted]	45 m	1
Summer day	Soprano pipistrelle	[redacted]	3 m	1
		[redacted]	4 m	3
Summer day	Pipistrelle species	[redacted]	183 m	1
Summer day	Brown long-eared	[redacted]	61 m	1
		[redacted]	4 m	1
		[redacted]	17 m	3

7.2.2.4 Tree roosts

Ground assessment and climbing surveys identified a total of 125 trees within a 20 m wide corridor centred on the proposed scheme. Of these, 121 trees were climbed to inspect features located at height or were inspected with an endoscope from ground level, the number of trees within each category was determined as follows:

- Confirmed roost: 0;
- grade 1* (high value): 11
- grade 1 (moderate value): 31
- grade 2 (low value): 32
- grade 3 (negligible value): 51

Of the four trees that were not climbed or assessed with an endoscope from ground level during the surveys, the number of trees within each category was determined as follows:

- confirmed roost: 0;
- grade 1* (high value): 0
- grade 1 (moderate value): 3
- grade 2 (low value): 1
- grade 3 (negligible value): 0

The locations of the trees are presented in Figure 11.10. No evidence of roosting bats in trees was identified during the surveys.

7.3 Potential for an offence

Construction works which directly impact caves, buildings, structures or trees that have been identified as bat roosts have the potential to contravene the legislation relating to bats. Table 7.3 sets out the likely risks of contravening the legislation in relation to bats. Table 7.4 lists the buildings proposed for demolition and their bat roost status.

Table 7.3 : Bats – relevant legislation and potential for committing an offence

Conservation of Habitats and Species Regulations, 2010 (as amended)	Wildlife and Countryside Act, 1981 (as amended)	Offence likely (in absence of mitigation)	Location
To deliberately capture, injure or kill any wild animal of an EPS (Reg 41(1)(a)).	Intentionally kills, injures or takes any wild animal included in Schedule 5 (s9(1)).	If bats are present within; buildings and structures which require demolition; underground sites which may be impacted during geological survey or construction; and trees within the site clearance footprint.	• Cave to be damaged / demolished with known bat roost - Knuckleduster West (Figure 11.9) and any unidentified roosting features in the proposed scheme footprint. • Buildings to be demolished with confirmed bat roosts (to be confirmed with pre-construction survey) (see Table 7.4 below). • Tree roosts with roosting bats (to be confirmed by pre-construction survey) (Figure11.10).
To deliberately disturb wild animals of a EPS [note wherever they are occurring] (Reg 41(1)(b)). Reg 41(2)(a)(i) For the purposes of Reg 41(1)(b), disturbance of animals includes in particular any disturbance which is likely to impair their ability to survive, to breed or reproduce, or to rear or nurture their young.	-	If bats are present within buildings, structures, trees or underground sites lost to or impacted by the proposed scheme. The noise assessment (ES Chapter 14) has confirmed that there would be no significant noise change predicted at identified maternity roosts during the construction or operational phases (extrapolated from adjacent property data).	<u>Loss of roosts at:</u> • Cave to be damaged / demolished with known bat roost - Knuckleduster West (Figure 11.9) and unidentified roosting features in the proposed scheme footprint. • Buildings to be demolished with confirmed bat roosts (to be confirmed with pre-construction survey) (see Table 7.4 below). • Tree roosts with roosting bats (to be confirmed with pre-construction survey) (Figure 11.10). <u>Disturbance of retained roosts:</u> • Caves with bat roosts within 250 m of proposed works at Taf Fawr and Taf Fechan (see Figure 11.9). • Structures with confirmed roosts (to be confirmed with pre-construction survey) (Figure 11.9).

Conservation of Habitats and Species Regulations, 2010 (as amended)	Wildlife and Countryside Act, 1981 (as amended)	Offence likely (in absence of mitigation)	Location
To deliberately disturb wild animals of a EPS [note wherever they are occurring] (Reg 41(1)(b)). Reg 41(2)(a)(ii) For the purposes of Reg 41(1)(b), disturbance of animals includes in particular any disturbance which is likely to impair their ability, in the case of animals of a hibernating or migratory species, to hibernate or migrate.	-	If hibernating bats are present within structures, trees or underground sites within the proposed scheme footprint.	<u>Loss of roosts at:</u> • Cave to be damaged / demolished with known bat hibernation roost - Knuckleduster West (Figure 11.9) and unidentified roosting features in the proposed scheme footprint at Taf Fechan. <u>Disturbance of retained roosts:</u> • Caves with bat hibernation roosts within 250 m of proposed works at Taf Fawr and Taf Fechan (see Figure 11.9).
To deliberately disturb wild animals of a EPS [note wherever they are occurring] (Reg 41(1)(b)). Reg 41(2)(b) For the purposes of Reg 41(1)(b), disturbance of animals includes in particular any disturbance which is likely to affect significantly the local distribution or abundance of the species to which they belong.	-	If bat maternity roosts or hibernacula present within structures or underground within the site clearance footprint. The noise assessment (ES Chapter 14) has confirmed that there would be no significant noise change predicted at identified maternity roosts during the construction or operational phases (extrapolated from adjacent property data).	• Caves with bat hibernation roosts within 250 m of proposed works at Taf Fawr and Taf Fechan (see Figure 11.9).

Conservation of Habitats and Species Regulations, 2010 (as amended)	Wildlife and Countryside Act, 1981 (as amended)	Offence likely (in absence of mitigation)	Location
-	To intentionally or recklessly disturb any wild Schedule 5 animal while it is occupying a structure or place which it uses for shelter or protection (s9(4)(b)).	If bats are present within buildings, structures or underground requiring demolition, or trees likely to be felled or underground sites which may be impacted where significant noise change predicted. The noise assessment (ES Chapter 14) has confirmed that there would be no significant noise change predicted at identified maternity roosts during the construction or operational phases (extrapolated from adjacent property data).	<u>Loss of roosts at:</u> • Cave to be damaged / demolished with known bat roost - Knuckleduster West (Figure 11.9) and unidentified roosting features in the proposed scheme footprint. • Buildings to be demolished with confirmed bat roosts (to be confirmed) (Table 7.4). • Tree roosts with roosting bats (to be confirmed) (Figure 11.10). <u>Disturbance of retained roosts:</u> • Caves with bat roosts within 250 m of proposed works at Taf Fawr and Taf Fechan (see Figure 11.9). • Structures with confirmed roosts (to be confirmed by pre-construction surveys) (Figure 11.9). • No disturbance is considered likely of roosts in buildings or trees.
-	To intentionally or recklessly obstruct access to any structure or place which any Schedule 5 animal uses for shelter or protection (s9(4)(c)).	Lighting may act as a barrier and obstruct access to roosts.	N/A No night time working during construction and the proposed lighting strategy minimises lighting which is located at junctions only.

Conservation of Habitats and Species Regulations, 2010 (as amended)	Wildlife and Countryside Act, 1981 (as amended)	Offence likely (in absence of mitigation)	Location
To damage or destroy a breeding site or resting place of a wild animal of a EPS (Reg 41(1)(d).	Intentionally or recklessly damages or destroys any structure or place which any wild animal specified in Schedule 5 uses for shelter or protection (s(4)(a)).	If bats are present within buildings and structures due to be demolished, and trees likely to be felled.	<u>Loss of roosts at:</u> • Cave to be damaged / demolished with known bat roost - Knuckleduster West (Figure 11.9) and unidentified roosting features in the proposed scheme footprint. • Buildings to be demolished with confirmed bat roosts (to be confirmed) (Table 7.4). • Tree roosts with roosting bats (to be confirmed) (Figure 11.10).

Table 7.4 : Buildings to be demolished

Building	Location (chainage)	Bat roosting potential
Field shelter	2180 (under footprint)	Bat roost potential unknown. No roost surveys to date. Pre-construction surveys to be undertaken.
Stable	2990 South	Bat roost potential unknown. No roost surveys to date. Pre-construction surveys to be undertaken.
Stable	3030 South	Bat roost potential unknown. No roost surveys to date. Pre-construction surveys to be undertaken.
Stable	3050 North	Bat roost potential unknown. No roost surveys to date. Pre-construction surveys to be undertaken.
Field shelter	3070 North	Low potential (external assessment). No roost surveys to date. Pre-construction surveys to be undertaken.
Lyndhurst (Welsh Ministers owned)	3150 South	High potential (external assessment). No roost surveys to date. Pre-construction surveys to be undertaken.
8 Johnson Park (Welsh Ministers owned)	3180 North	High potential (external assessment). No surveys to date. Pre-construction surveys to be undertaken.
12 Johnson Park (Welsh Ministers owned)	3220 North	High potential (external assessment). No surveys to date. Pre-construction surveys to be undertaken.
13 Johnson Park (Welsh Ministers owned)	3220 North	High potential (external assessment). No surveys to date. Pre-construction surveys to be undertaken.
Parc-Hensol	3880 South	Bat roost potential unknown. No roost surveys to date. Pre-construction surveys to be undertaken.
Garage at Lynwood	5010 South	Moderate potential (external assessment). No surveys to date. Pre-construction surveys to be undertaken.
Greenhouse at Lynwood	5030 South	Negligible potential (external assessment). No surveys to date. Pre-construction surveys to be undertaken.
Barn at Coed Meurig Farm	10150 to 10190 (under footprint)	[redacted]
Garage at 2 Pearce's Court	11120 South	Bat roost potential unknown. No roost surveys to date. Pre-construction surveys to be undertaken.
Garage at Tynycoed	11190 South	High potential (external assessment). No surveys to date. Pre-construction surveys to be undertaken.
Garage at Aloha	11280 South	High potential (external assessment). No roost surveys to date. Pre-construction surveys to be undertaken (Survey on an adjacent property had soprano pipistrelle roost).
Garage at Valbonne	11360	High potential (external assessment).

Building	Location (chainage)	Bat roosting potential
	South	No surveys to date. Pre-construction surveys to be undertaken.
Trade Centre Wales	13530 to 13710 North	Low potential (external assessment). No surveys to date. Pre-construction surveys to be undertaken.
Stables at Lower Reservoir	15580 South	Bat roost potential unknown. No roost surveys to date. Pre-construction surveys to be undertaken.
Dowlais Stables and Kennels	15890 to 15930 South	High potential (external assessment). No roost surveys to date. Pre-construction surveys to be undertaken.

7.4 Proposed approach

The following section sets out the steps that would be taken prior to the construction of the proposed scheme to ensure the legislation protecting bats was not contravened. In summary the process would be:

- pre-construction surveys;
- application to NRW for a derogation licence for confirmed bat roosts; and
- method statement for the licence would include measures such as; capture and exclusion techniques, habitat mitigation proposals, and avoidance of Schedule 5 offences.

7.4.1 Pre-construction survey

All trees that require felling would be surveyed prior to felling to ascertain whether or not are being used or likely to have been used by bats for roosting. All buildings and known caves would be surveyed prior to demolition / start of construction and all existing road structures (bridges and viaducts) surveyed prior to construction works. These surveys would be carried out, at the latest, 12 weeks prior to the site clearance and fencing phase to allow sufficient time for an EPS licence to be sought if required.

A full geological investigation of the proposed construction footprint would be undertaken in the Taf Fawr and Taf Fechan gorges which would subsequently identify any additional roosting features and caves where bats could roost. These would also then be surveyed for roosting bats. A Karst protocol (a document detailing the necessary survey of geological features and process if unknown caves or geological features are unwittingly disturbed during the construction phase) would be developed in consultation with NRW to minimise effects on limestone features and define responses to unexpected findings during construction.

7.4.2 Derogation licence

The caves and buildings with confirmed bat roosts for demolition and any trees to be felled that have evidence of use by bats would require a derogation licence application and licence to derogate the offences listed in Table 7.3.

Derogation licence applications would be accompanied by method statements which would outline how the work would be undertaken and these would be adhered to in order to safeguard any bats on site during the works. If applicable, the method for capture and exclusion of bats from the roost(s) prior to destruction would be detailed in the bat licence method statement and would include timings and weather conditions during which exclusion work would be carried out; effort and methods of exclusion such as use of one-way excluders, disturbance by noise or lights, or destructive search by soft demolition and equipment to be used (endoscope).

A bio-security risk assessment would be undertaken in advance of the work and would outline the following:

- all personnel involved with the licensable bat work would be wearing gloves, and the supervising ecologist has been vaccinated against rabies;

- any equipment used for housing bats captured during the works (plastic tanks) would be disinfected and rinsed thoroughly before and after use; and
- the supervising ecologist would adhere to the Bat Conservation Trust's advice (Collins, 2016) concerning White-nose syndrome in bats and report any incidences of the disease to BCT as required.

The application would be likely to include the following methods to avoid killing and injuring bats and mitigating for the damage and destruction of roosts.

7.4.3 Avoiding killing or injuring of bats

7.4.3.1 Capture and exclusion

Bats would be excluded from roosts prior to destruction of the roost. Methods would follow best practice (Mitchell-Jones, 2004) and (Collins, 2016) as defined within the method statement of the EPS development licence. This would also define timeframes for the specific proposed works.

The method for capturing and excluding bats would include a contingency plan for dealing with injured bats and / or those found unexpectedly during the works.

7.4.3.2 Tree felling techniques

Sympathetic tree felling techniques (soft felling) would be employed at those trees where there is a risk of bats being present. The areas where this technique would be employed would be agreed in advance of the works between the contractor and licenced bat ecologist. Where possible the tree felling would be timed to take place between the end of September and mid-November. An Ecological Clerk of Works (EcCoW) would be present on site to supervise this work.

7.4.4 Avoiding disturbance of bats

EPS licensing would define specific timeframes in which destruction of roosts could occur, avoiding times of bat presence / activity, reducing unnecessary disturbance to bats. Works at Taf Fechan would not be permitted to occur during the hibernation period i.e. 15 December to 31 March. Working method statements would also require construction works to cease during the hours of darkness and the periods of associated dusk and dawn (approximately 1 hour before sunset and 1 hour after sunrise).

The provision of, or enhancement of, culverts at certain points along the proposed scheme would permit safe passage for bats under the road. Vegetation planting around the culvert entrances would be enhanced so that bats are encouraged towards and directed to the culvert entrances. A full culvert schedule is provided in ES Chapter 11: Nature Conservation, Table 11.33.

7.4.5 Minimising and mitigating for habitat damage

7.4.5.1 Protection of retained and mitigation habitats

Areas of retained vegetation and areas of mitigation habitat would be clearly demarcated to ensure no accidental incursion by construction works.

7.4.5.2 Mitigation habitat

Alternative roosting opportunities would be provided for cave dwelling bat species, particularly lesser horseshoe bat, in the form of pipe roosts. These would be embedded in the abutments of the proposed structures throughout the proposed scheme, including those mainly associated with watercourses. A total of 12 pipe roosts are proposed, as listed below and shown in the EMP (Volume 4).

- Afon Cynon - western abutment (1 pipe) at ch.3875
- Nant Melyn – eastern abutment (1 pipe) at ch. 5450

- Nant Hir - eastern and western abutments of new structure (2 pipes) at ch.6850-6700
- Nant Ffwrd – eastern and western abutment of both structures (4 pipes) at ch.10300-10375
- In north side of retaining wall (1 pipe) at ch.9900-10050
- Taf Fawr – eastern abutment (1 pipe) at ch.10900
- Taf Fechan - Eastern and western abutments (2 pipes) at ch.11500

Internal features to the bat pipes would be added to provide roosting features for other bat species, in addition to lesser horseshoe bat. The addition of breeze blocks, rough sawn wooden baffles and other perching options would increase roosting opportunities for a crevice dwelling (pipistrelle bat) and roof-void dwelling species of bats (such as Daubenton's and Serotine).

Loss of roosts in buildings would be addressed individually in the licence application. Prior to clearance of habitats, bat boxes would be provided throughout retained woodland and trees within the proposed scheme to offset the loss of potential roost features in the short-term. A minimum of three bat boxes would be provided for every 'high' category tree to be lost. At present 11 such trees have been identified. This would require a minimum of 33 bat boxes. Indicative locations for proposed bat boxes would be at ch.2300, ch.3900, ch.5050, ch.5525 and ch.7400. Bat boxes would cover a range of designs including maternity boxes, hibernation boxes and boxes designed for crevice dwelling species.

The landscaping design for the proposed scheme includes approximately 43.2 ha of woodland planting which in the long-term would provide replacement roosting opportunities for bats.

7.4.5.3 Habitat management and monitoring

It is proposed that the bat boxes and replacement planting would be monitored by the contractor following completion of the proposed scheme. A monitoring scheme would be devised as part of the derogation licence application to scrutinise the development of the habitat mitigation with the aim of informing management practices. Such a scheme would include regular surveillance of; vegetation (trees and shrubs) cover; bat box roost functionality (state of repair / vegetation cover etc.); and bat numbers.

7.4.6 Avoiding Schedule 5 offences

The measures set out in the preceding paragraphs would result in the Schedule 5 offences, disturbance and obstruction, being avoided.

7.4.7 Conclusions

The proposed scheme is likely to result in the contravention of the legislation with respect to bats. There is a risk that the offences of killing or injuring bats, disturbing bats, and damage or destroy a resting place as a result of the proposed scheme. The strategy set out would result in these offences being avoided or derogated under licence.

8. Otter

8.1 Relevant legislation

- Wildlife and Countryside Act, 1981 (as amended), Schedule 5; and
- Conservation of Habitats and Species Regulations, 2010 (as amended), Schedule 2.

8.2 Baseline information

8.2.1 Desk study

Consultation was undertaken with SEWBReC and BIS for recent records (since 2004) of otter. Three records of otter were confirmed within 500 m of the proposed scheme; [redacted] The locations of these results are shown in Figure 11.12.

8.2.2 Field survey

The otter field survey focused on the major watercourses in the survey area with additional watercourses where access permissions allowed and the following evidence was recorded:

[redacted]

- [redacted].

The exact location of these is shown in Figure 11.12.

8.3 Potential for an offence

Major watercourses that are crossed by the proposed scheme would have buffer areas where no works were permitted. The construction of the proposed scheme is likely to involve some vegetation clearance along the minor watercourses that currently pass under the road where culverting is required. All major watercourses would be crossed by clear span bridges.

Site fencing and clearance, works near watercourses and works associated with structures may have an effect on otter holts or hovers. Such activities could also cause disturbance to otters.

Table 8.1 below shows the relevant legislation and potential for committing an offence with regard to otter.

Table 8.1 : Otter – relevant legislation and potential for an offence

Conservation of Habitats and Species Regulations, 2010 (as amended)	Wildlife and Countryside Act, 1981 (as amended)	Offence likely (in absence of mitigation)	Location
To deliberately capture, injure or kill any wild animal of an EPS (Reg 41(1)(a)).	To intentionally kill, injure or take any wild animal included in Schedule 5 (s9(1)).	No. No holts or resting places recorded in the proposed scheme footprint.	N/A
To deliberately disturb wild animals of an EPS [note wherever they are occurring] (Reg 41(1)(b)). Reg 41(2)(a)(i) For the purposes of Reg 41(1)(b), disturbance of animals includes in particular any disturbance which is likely to impair their ability to survive, to breed or reproduce, or to rear or nurture their young.	-	Possible –during site clearance and main construction if an active otter holt or couch is encountered within the footprint of the proposed scheme.	All major watercourses crossed by the proposed scheme. Taf Fechan and Taf Fawr during construction (due to temporary rock cutting activities).
To deliberately disturb wild animals of an EPS [note wherever they are occurring] (Reg 41(1)(b)). Reg 41(2)(a)(ii) For the purposes of Reg 41(1)(b), disturbance of animals includes in particular any disturbance which is likely to impair their ability, in the case of animals of a hibernating or migratory species, to hibernate or migrate.	-	No.	N/A
To deliberately disturb wild animals of an EPS [note wherever they are occurring] (Reg 41(1)(b)). Reg 41(2)(b) For the purposes of Reg 41(1)(b), disturbance of animals includes in particular any disturbance which is likely to affect significantly the local distribution or abundance of the species to which they belong.	-	No.	N/A
-	To intentionally or recklessly disturb any wild animal listed on Schedule 5 while it is occupying a structure or place which it uses for shelter or protection (s9(4)(b)).	Possible –during site clearance and main construction if an active otter holt or couch is encountered within the footprint of the proposed scheme.	Taf Fechan and Taf Fawr during construction (due to rock cutting activities).

Conservation of Habitats and Species Regulations, 2010 (as amended)	Wildlife and Countryside Act, 1981 (as amended)	Offence likely (in absence of mitigation)	Location
-	To intentionally or recklessly obstruct access to any structure or place which any animal listed on Schedule 5 uses for shelter or protection (s9(4)(c).	Possible –during site clearance and main construction if an active otter holt or couch is encountered within the footprint of the proposed scheme.	All major watercourses crossed by the proposed scheme.
To damage or destroy a breeding site or resting place of a wild animal of a EPS (Reg 41(1)(d).	To intentionally or recklessly damage or destroy any structure or place which any wild animal listed on Schedule 5 uses for shelter or protection (S9(4)(a)).	Possible –during site clearance and main construction if an active otter holt or couch is encountered within the footprint of the proposed scheme.	All major watercourses crossed by the proposed scheme.

8.4 Proposed approach

The following paragraphs set out the steps that would be taken prior to the construction of the proposed scheme to ensure the legislation protecting otter was not contravened. **To date, no otter holts or couches have been identified within the footprint of the proposed scheme**. In summary it would take the following form:

- pre-construction survey.
- application for a derogation licence, if required.
- construction method statements for proposed works near watercourses and, if required, for the derogation licence which would include exclusion techniques, habitat mitigation proposals and avoidance of Schedule 5 offences.

8.4.1 Pre-construction survey

Otter surveys would be carried out in advance of any site clearance works. All proposed crossing points and any proposed flood alleviation areas would be searched for holts and lying-up sites. If any such features are discovered within the footprint of proposed works, they would be assessed to consider whether they would need to be closed under licence from the NRW. In order to minimise risks to the construction programme the surveys and any subsequent work would be scheduled at least 12 weeks in advance of works to enable an EPS development licence to be secured, if required.

8.4.2 Avoiding killing or injuring

No otter holts or couches have been identified within the footprint of the proposed footprint to date. However, if otter hovers or holts are encountered within the footprint of the proposed scheme prior to or during construction, a derogation licence would need to be secured. The methods would follow best practice and would be defined within the method statement that would form part of the licence.

8.4.3 Avoiding disturbance

Working protocols during construction, detailed in the Construction Environmental Management Plan (CEMP), would ensure that construction lighting and disruptive activities would not occur at night (including the hours of dusk and dawn) and all watercourses and adjacent riparian habitat would maintain an undisturbed route of passage. Best practice site construction processes (Charles & Edwards, 2015) and working near watercourses (Masters-Williams, *et al*., 2001) would also be followed.

An emergency response protocol to set out the appropriate course of action in the unlikely event should a water pollution incident occur would be part of the CEMP.

8.4.4 Minimising and mitigating for habitat damage

8.4.4.1 Protection of retained habitats

Structures crossing major watercourses are clear span and no works are required within the watercourses themselves. Watercourses, areas of retained vegetation and areas of retained habitat would be clearly fenced and demarcated to ensure no accidental incursion by construction works.

8.4.4.2 Mitigation habitat

The provision of new, or enhancement of existing, culverts along the proposed scheme would permit safe passage for otters under the proposed scheme. The ledge or bank available for mammal passage would be designed to remain dry in a 1 in 10 year flood. Planting around the culvert entrances would be enhanced so that otters are encouraged towards and directed to the culvert entrances. Culverts with mammal ledges would be located at the following approximate mainline locations: ch.1955; ch.4491; (at Croesbychan junction - ch. 4800, 4850 & 4900); ch.4824; ch.5021; ch.5969; ch.7448; south of Baverstock junction at ch.7775; and ch.9303.

8.4.4.3 Habitat management and monitoring

Watercourses would be regularly monitored during the construction phase by the EcCoW. Otter activity would also be monitored as part of the working near watercourses construction method statement / CEMP.

Otter would be additionally monitored in line with any derogation licence conditions. A derogation licence return would be submitted to NRW following completion of the works, including results of any during construction or post-construction monitoring conditioned by the licence.

8.4.5 Avoiding Schedule 5 offences

The measures set out in the preceding paragraphs will result in the Schedule 5 offences, disturbance and obstruction, being avoided.

8.5 Conclusion

Although no holts or lying up areas have been identified in surveys to date, otters are present on many of the watercourses crossed by the proposed scheme. There is currently a low risk that the legislation protecting otter would be contravened. The proposed strategy provides measures to ensure that the risks are managed through construction of the proposed scheme to minimise the risk of contravening the legislation.

9. Great crested newt

9.1 Relevant legislation

- Wildlife and Countryside Act, 1981 (as amended), Schedule 5; and
- Conservation of Habitats and Species Regulations, 2010 (as amended) Schedule 2.

9.2 Baseline information

9.2.1 Desk study

Consultation was undertaken with SEWBReC and BIS and six recent records (since 2004) of GCN were recorded within a 1 km wide corridor centred on the proposed scheme; mainly associated with Winchfawr West SINC and Bryniau SINC with an additional single record located to the east of Dowlais Top. The locations of these records are shown on Figure 11.11.

9.2.2 Field Surveys

Eighty-four waterbodies were identified within a 1 km wide corridor centred on the proposed scheme and were subject to a Habitat Suitability Index assessment (HSI) for great crested newt. Additional waterbodies were identified in the survey area but were found to be not suitable for GCN (dry or identified as flowing waterbodies such as streams and rivers).

Environmental DNA (eDNA) samples were taken from 31 waterbodies (where sampling allowed) with a HSI score of above 0.59 and, therefore, a predicted presence of GCN described as 'average' or above (ARGUK, 2010). The eDNA results indicated probable GCN absence in all samples (Biggs, *et al*., 2014). The locations of surveyed ponds are shown in Figure 11.11. Full survey methodology and results can be found in Appendix 11F - Summer 2015 Ecology Survey Results.

Ponds within the Winchfawr West SINC and Bryniau SINC were surveyed in 2016 using standard presence / absence methodology (Langton, *et al*., 2001) (due to the presence of recent desk study records). A peak count of 12 great crested newts (10 male, two female) was recorded in pond 2254. One great crested newt (1 male) was recorded in pond 2256 (See Figure 11.11) in the Winch Fawr West SINC. Seven other ponds exist within 250 m from these ponds as shown in Figure 11.11. No GCN were recorded in the Bryniau SINC.

9.3 Potential for an offence

Loss of standing waterbodies would be limited to a partial infill of a reservoir west of Dowlais Top and infill of a small natural pond on the off-line section at Hirwaun. No evidence of GCN presence has been recorded within 250 m of either of these locations during Jacobs' surveys or the desk study. No potential for offence is considered likely at these locations.

Approximately 4 ha of suitable terrestrial habitat for GCN would be lost within 250 m, either side, of the waterbodies with confirmed GCN presence at the Winchfawr West SINC (approximate ch. 8800-9450), see Figure 11.11. Vegetation clearance activities within this suitable terrestrial habitat for GCN could potentially kill, injure or disturb GCN and / or damage habitats that they use which would be an offence under the Conservation of Habitats and Species Regulations, 2010 (as amended) and the Wildlife and Countryside Act 1981 (as amended).

The potential offences in the area of Winchfawr West SINC and along the length of the proposed scheme in relation to GCN is outlined below in Table 9.1.

Table 9.1 : GCN – relevant legislation and potential for an offence

Conservation of Habitats and Species Regulations, 2010 (as amended)	Wildlife and Countryside Act, 1981 (as amended)	Offence likely (in absence of mitigation)	Location
To deliberately capture, injure or kill any wild animal of an EPS (Reg 41(1)(a)).	To intentionally kill, injure or take any wild animal included in Schedule 5 (s9(1)).	Yes – during site clearance; but only if breeding in ponds within 250 m of the site clearance footprint.	In terrestrial habitat within 250 m of ponds with confirmed GCN presence: Between ch.8950 – 9450 (south).
To deliberately disturb wild animals of an EPS [note wherever they are occurring] (Reg 41(1)(b)). Reg 41(2)(a)(i) For the purposes of Reg 41(1)(b), disturbance of animals includes in particular any disturbance which is likely to impair their ability to survive, to breed or reproduce, or to rear or nurture their young.	-	Yes – during construction; but only if breeding in ponds within 250 m of the site clearance footprint.	In terrestrial habitat within 250 m of ponds with confirmed GCN presence: Between ch.8950 – 9450 (south).
To deliberately disturb wild animals of an EPS [note wherever they are occurring] (Reg 41(1)(b)). Reg 41(2)(a)(ii) For the purposes of Reg 41(1)(b), disturbance of animals includes in particular any disturbance which is likely to impair their ability, in the case of animals of a hibernating or migratory species, to hibernate or migrate.	-	Yes – during construction; but only if breeding in ponds within 250 m of the site clearance footprint.	In terrestrial habitat within 250 m of ponds with confirmed GCN presence: Between ch.8950 – 9450 (south).
To deliberately disturb wild animals of an EPS [note wherever they are occurring] (Reg41(1)(b)). Reg 41(2)(b) For the purposes of Reg 41(1)(b), disturbance of animals includes in particular any disturbance which is likely to affect significantly the local distribution or abundance of the species to which they belong.	-	No.	N/A
-	To intentionally or recklessly disturb any wild schedule 5 animal while it is occupying a structure or place which it uses for shelter or protection (s9(4)(b)).	Yes – during construction; but only if breeding in ponds within 250 m of the site clearance footprint.	In terrestrial habitat within 250 m of ponds with confirmed GCN presence: Between ch.8950 – 9450 (south).

Conservation of Habitats and Species Regulations, 2010 (as amended)	Wildlife and Countryside Act, 1981 (as amended)	Offence likely (in absence of mitigation)	Location
-	To intentionally or recklessly obstruct access to any structure or place which any Schedule 5 animal uses for shelter or protection (s9(4)(c)).	Yes – during construction; but only if breeding in ponds within 250 m of the site clearance footprint.	In terrestrial habitat within 250 m of ponds with confirmed GCN presence: Between ch.8950 – 9450 (south).
To damage or destroy a breeding site or resting place of a wild animal of a EPS (Reg 41(1)(d)).	To intentionally or recklessly damage or destroy any structure or place which any wild animal specified in Schedule 5 uses for shelter or protection (s(4)(a)).	Yes – during construction; but only if breeding in ponds within 250 m of the site clearance footprint.	In terrestrial habitat within 250 m of ponds with confirmed GCN presence: Between ch.8950 – 9450 (south).

9.4 Proposed approach

The following paragraphs set out the steps that would be taken prior to the construction of the proposed scheme to ensure the legislation protecting GCN was not contravened. In summary it would take the following form:

- pre-construction surveys;
- application for a derogation licence; and
- method statement for the licence to include measures such as avoidance of Schedule 5 offences, trap and translocation techniques and habitat mitigation proposals.

9.4.1 Pre-construction survey

GCN surveys would be carried out in the appropriate survey period prior to construction (March to June 2019) on all ponds within a 1 km wide corridor centred on the proposed scheme with a HSI score of above 0.59 and, therefore, a predicted presence of GCN described as 'average' or above (ARGUK, 2010). The methods to be used include bottle trapping, egg searching, netting and torching, as per the guidelines set out in the Great Crested Newt Conservation Handbook (Langton, *et al.*, 2001). This would allow the full assessment of presence or absence of the species in the area, and if presence is confirmed, allow a population size class assessment to be carried out.

9.4.2 Derogation licence

A derogation licence from NRW would be required prior to the construction phase of the proposed scheme.

The method statement accompanying the licence application is likely to include measures to avoid killing and injuring GCN, minimising damage to terrestrial habitat, avoiding disturbance of individual GCN and obstruction of access to GCN habitat. Examples of the types of measure that are likely to form part of this method statement are set out in the following paragraphs.

9.4.3 Avoiding killing or injuring

9.4.3.1 Exclusion fencing

Durable Temporary Amphibian Fencing (TAF) would be installed between the construction area at Winchfawr West SINC and the receptor site to prevent great crested newt mortality. An example of the proposed specification for the TAF can be found in Annex B. This would be installed along the length of the boundary of the Winchfawr West SINC and the proposed works area.

The area proposed for durable TAF would be fingertip searched and cleared of great crested newts by a suitably skilled, experienced and licenced ecologist prior to installation. All installation works would also be supervised. Any vegetation would then be cut back ready for setting up.

Any GCN that are trapped during capture and exclusion works would be relocated into the receptor site. When the proposed scheme is complete, and the soft estate has matured, the TAF would be removed and the GCN would be allowed to recolonize the newly created habitat on the road verges.

This fencing would be extended to other appropriate locations if GCN were identified in additional ponds during pre-construction surveys.

9.4.3.2 Trapping, translocation and exclusion

Translocation of GCN, from habitat that would be impacted by the proposed scheme to the receptor site, would be carried out prior to any works commencing by a suitably qualified, experienced and licenced ecologist.

The receptor site would be located directly south of the works in the Winchfawr West SINC. A 2.5 m wide strip of land to the south of the TAF, for its entire length, would be created into which the captured newts will be released. The 2.5 m wide strip of land will be demarcated with durable TAF fencing between the construction works and the receptor area (along north boundary) and a permeable fence to the south to allow the translocated GCN to move back into the Winchfawr West SINC.

Pitfall traps and carpet tiles would be installed every 5 m along the TAF on the side of the proposed scheme. The traps would be fitted flush to the TAF with the tops just below ground level. This would take place during the appropriate seasonal window prior to construction works, presently estimated to be between February and October 2019. Pitfall traps would not be installed until the evening before the translocation is to commence. Drift fencing would be used to divide the areas into smaller compartments (potentially allowing smaller areas to be considered ‘clear’ after the minimum number of nights trapping).

Capture of great crested newts can occur throughout the active season (February to October inclusive). It is generally considered unacceptable when they have gone into hibernation (November to January inclusive). The pitfall traps would be checked daily before 11:00 am, or earlier after periods of heavy rainfall or dry weather. All captures would be recorded with notes on location, species, sex and life-stage. All amphibians (i.e. including species in addition to GCN) captured would be moved in buckets to the receptor area and released into the refuges or hibernaculum as soon as possible.

The process would be continuously reviewed and if low capture rates were recorded, additional methods to increase capture rates would be considered. During the GCN presence / absence surveys carried out on ponds within 250 m of the proposed scheme in the Winchfawr West SINC, a peak count of 12 individuals was recorded (See Appendix 11G – 2016 Ecology Survey Results). Table 9.2 below shows the minimum trap density and number of nights trapping according to population size class assessment (Natural England, 2001). Pit fall traps would be removed immediately after the completion of the translocation to avoid mortality.

Table 9.2 : GCN trapping effort required according to population size class assessment (Langton, *et al*., 2001)

Population size class assessment	Minimum trap density (traps / ha)	Minimum number of nights trapping
Small (maximum counts up to 10)	50	30
Medium (maximum counts between 11-100)	**80**	**60**
Large (maximum counts over 100)	100	90

9.4.3.3 Supervision of soil stripping

After trapping and translocation, a finger-tip search would be carried out by the EcCoW as a precautionary measure before the top soil were stripped. The EcCoW would also be present on site during the soil strip and vegetation clearance works in these areas.

Where areas of potential hibernaculum are identified during site clearance and these cannot be avoided they would be dismantled by hand by the EcCoW under suitable weather conditions. The EcCoW would advise on a suitable area for which the hibernaculum can be re-installed. If any GCN are found all works would cease until the GCN had been translocated.

9.4.3.4 Construction site management

A CEMP would be created and implemented by the contractor and would include measures such as those listed below to reduce the risk of killing or injuring GCN within the construction site.

- No equipment or soil would be stored / stockpiled within 250 m of any waterbody known to be used by GCN.
- There would be a clear demarcation of construction and retained vegetation areas.

9.4.4 Minimising and compensating for habitat damage

9.4.4.1 Protection of retained habitats

Areas of habitat important for GCN and the receptor area for translocated individuals would be clearly demarcated to ensure no accidental incursion by construction works. Durable temporary amphibian exclusion fencing would be installed between the 'working area' and the receptor sites to prevent newt mortality. Any great crested newts that are trapped during capture and exclusion works would be relocated into the receptor site. When the proposed scheme is complete the TAF would be removed and the great crested newts would be allowed to recolonise the newly created land which forms the road verges as well as the rest of the proposed scheme.

9.4.4.2 Mitigation strategy

The overall mitigation strategy for GCN across the entire proposed scheme would include the following measures:

- creation of high quality connective habitat throughout the soft estate along the length of the proposed scheme;
- attenuation ponds would be enhanced for biodiversity and GCN with marginal vegetation planting at locations where GCN species are known to be present or historically present – approximate ch. 2275 (1 pond), ch. 3650-3900 (3 ponds), ch. 6750-7100 (2 ponds),ch.7700 (1 pond); ch.9400 (1 pond), ch.13250 - 13400 (2 ponds), ch. 13700 (1 pond); and
- hibernacula suitable for use by terrestrial GCN would be provided within the soft estate along the length of the proposed scheme (approximate ch. 1225, 3750, 4250, 4775, 6025, 6875, 7700, 9150, 9500, 10300, 11900, 12350, 13300, 13750 and 14225).

In addition, an approximate 2.5 m wide strip of land, directly south of the area of proposed works within the Winchfawr West SINC, would be temporarily obtained (hereinafter referred to as the receptor site). This receptor site would be enhanced with the installation of hibernacula to receive any translocated individuals. This work would be ideally carried out sufficiently in advance of site clearance and any species translocation work to allow time for the maturation of hibernaculum and the receptor sites.

A box culvert with dry ledge is proposed be between the Winchfawr West SINC and the land to the north of the proposed scheme to permit safe passage for terrestrial GCN under the proposed scheme at approximate ch. 9303.

9.4.4.3 Habitat management and monitoring

A monitoring scheme would be devised as part of the derogation licence application to scrutinise the development of the habitat mitigation with the aim of informing management practices.

An EPS development licence return would be submitted to NRW following completion of the works, including results of any monitoring. Monitoring would continue for a minimum of five years post-completion of the proposed scheme in any areas found to have GCN presence during pre-construction surveys. The monitoring targets and success criteria would be defined prior to construction but could include regular surveillance of vegetation (trees and shrubs) cover; fish presence; and GCN numbers.

9.4.5 Avoiding Schedule 5 offences

The measures set out in the preceding paragraphs would result in the Schedule 5 offences, disturbance and obstruction, being avoided.

9.5 Conclusion

The proposed scheme is likely to result in the contravention of the legislation with respect to GCN. There is a risk that the offences of killing or injuring GCN, damage or destroy a resting place, disturbance whilst in a place of shelter / protection and obstruction to a place of shelter / protection would occur as a result of the proposed scheme. The strategy set out would result in these offences being avoided or derogated under licence.

10. Badger

10.1 Relevant legislation

- The Protection of Badgers Act, 1992.

10.2 Baseline information

10.2.1 Desk study

Consultation was undertaken with SEWBReC and BIS and recent records (since 2004) of badgers were found to exist within a 1 km wide corridor centred on the proposed scheme. Six records of badger were found: records of a live badger and spraint in the Hirwaun area; records of a sett and field signs in the Taf Fechan gorge area; and dead specimens near the Croesbychan and Gurnos areas. These records are shown in Appendix 11E and Appendix 11G.

10.2.2 Field surveys

Badger surveys were carried out in 2015 and 2016. The objective of the surveys was to provide baseline information on presence or absence and distribution in the study area. The survey area comprised a 200 m wide corridor centred on the proposed scheme. Habitats suitable for foraging badgers exist on site, including good quality grassland and woodland suitable for badger setts.

No evidence of the presence of badger was observed in the survey area during the field surveys. However, a dead badger was noted in 2016 site visit on the main A465 eastbound carriageway near the central reservation between Nant Hir Viaduct and the turn off for the Crematorium. This suggests that badgers are present in the wider area. Badger footprints were also found in mud outside Ogof Trefechan in the Taf Fechan gorge during the 2016 cave surveys for bats. These records are shown and discussed in ES – Appendix 11G: 2016 Ecology Survey Results.

10.3 Potential for an offence

Latest field survey suggests that no setts would be lost, damaged or disturbed. A very low level of badger activity has been identified. As such, no offence would be committed.

Table 10.1 below shows the relevant legislation and potential for committing an offence with regard to badger.

Table 10.1 : Badgers – relevant legislation and potential for committing an offence

Protection of Badgers Act 1992	Offence likely (in absence of mitigation)	Location
To wilfully kill, injure or take, or attempt to kill, injure or take a badger (s1(1)).	Yes – if active sett entrances present within 30 m of site clearance footprint.	N/A
To disturb a badger when it is occupying a badger sett (s3(e)).	Yes – if active sett entrances present within 30 m of site clearance footprint.	N/A
To obstruct access to, or any entrance of, a badger sett (s3(c)).	Yes – if active sett entrances present within 30 m of site clearance footprint.	N/A
To damage a badger sett or any part of it or to destroy a badger sett (s3(a)(b)).	Yes – if active sett entrances present within 30 m of earthworks.	N/A

10.4 Proposed approach

The following paragraphs set out the steps that would be taken prior to the construction of the proposed scheme to ensure the legislation protecting badgers was not contravened. In summary it would take the following form.

- Pre-construction surveys.
- Application to NRW for a licence.
- Minimising disturbance / damage.
- Sett closure.

10.4.1 Pre-construction survey

A pre-construction survey within a 100 m wide corridor centred on the proposed scheme footprint would be carried out prior to the start of site clearance and fencing activities in order to identify whether new badger setts have been dug in the area. Site clearance for the proposed scheme would commence in November 2019. Therefore a pre-construction badger survey would be carried out in in July 2019, at the latest, to give sufficient time to prepare and implement suitable mitigation, if required.

Any active sett identified in pre-construction surveys, or during construction would be assessed as to whether it is within 30 m of works (English Nature, 2002) requiring the use of machinery or groundworks. Any works within 30 m of an active sett would then be assessed as potentially causing an offence and mitigation and / or licensing would be implemented.

10.4.2 Licencing

If an active badger sett is discovered within 30 m of an area that is required for construction during the pre-construction survey or construction period, construction work would not proceed or would cease in that area until a licence has been obtained from NRW to permit sett exclusion (Protection of Badgers Act, 1992).

Badger licences are normally only granted for exclusions between July and November, which would be incorporated into work scheduling. However, depending on the exact nature of the work required and proximity and type of sett it may be possible to alter working methods to minimise disturbance to badgers or avoiding damage to a sett. Sometimes, for linear infrastructure projects, it is appropriate to temporarily close outlier setts, under licence, for the duration of construction activities but to make them available again once the construction phase, and risk of killing or injury by construction plan movements, is removed.

An example methodology for both avoiding damage / disturbance and sett exclusion is set out in the following paragraphs.

10.4.3 Avoiding damage and disturbance

If an active sett is recorded in close proximity to the construction works and does not need to be destroyed it may be possible to alter working methods such as reducing machinery sizes or work with hand tools to ensure that disturbance and damage is minimised or avoided.

10.4.4 Sett exclusion

No sett exclusions are currently planned as no active setts were identified during the surveys.

The following method would be followed if a badger sett is subsequently established within 30 m of the area required for construction prior to the start of works:

- all active sett entrances would be fitted with badger gates, using the designs shown in Design Manual for Roads and Bridges (DMRB) (Highways Agency, 2007) as well as wire mesh across the surrounding area to prevent digging;
- the fitted badger gates would initially be set to swing freely for a period of seven days in order to accustom any animals to the gate and allow them to leave. After this period the gates would be set in a one-way position to effect the exclusion;
- the exclusion would be carried out over a minimum period of 21 days. The sett and gate would be monitored a minimum of every three days to determine if badgers are still active in the sett (Natural

England, 2011). This would be achieved by using either small sticks in front of the one way gates at the sett entrance to monitor activity or by sand smoothed out over the entrance to reveal badger footprints;

- the monitoring would also confirm that the gates are still functioning properly by manually testing them and to ensure that they are still intact. If at any point the gates or wire mesh is breached, these are repaired and a further 21 day period observed before works begin;
- once it has been ascertained that all animals have been excluded, the gate would be set in a permanent closed position which would not allow any badgers access in or out; and
- the sett would then be excavated under the supervision of the licenced ecologist. The excavation would be conducted to avoid collapsing any chambers within the sett because of the possibility of badgers remaining undetected. If any badgers were disturbed, all work would cease to allow any badgers to leave the area without interference.

Any active sett identified would be monitored throughout the exclusion process and considered empty only when the one way gates are in place and there have no indications of badger activity within the fence for two weeks.

Given the risk of a main sett needing to be closed is extremely low, a replacement sett is unlikely to be required. However, in the unlikely event of a replacement sett being required, sufficient land would be acquired for mitigation such that an appropriate area for artificial sett construction could be provided.

10.4.5 Mitigation habitat

The provision of, or enhancement of, culverts along the proposed scheme would permit safe passage for badgers under the road. The ledge or bank available for mammal passage would be designed to remain dry in a 1 in 10 year flood. Vegetation planting around the culvert entrances would be enhanced so that animals are encouraged towards and directed to the culvert entrances. Culvert with mammal ledges are proposed at the following approximate locations: ch.1955; ch.4491; ch.4824; ch.5021; ch.8850; ch.4825; ch.5969; ch.7448; ch.7775; and ch.9303.

10.4.6 Monitoring

Any active sett identified would be monitored throughout the exclusion process and considered abandoned only when the one way gates are in place and there are no indications of badger activity for two weeks. Reporting would be in accordance with licencing requirements.

10.5 Conclusion

There is a low risk that the proposed scheme would result in any contravention of the legislation with regard to badger. This is primarily because of the limited evidence of badger presence in the area. However, in the unlikely event of the proposed scheme resulting in the damage, destruction or disturbance of a badger sett then the proposed strategy would be to firstly avoid an offence but if required exclude and close the sett under NRW licence.

11. Reptiles

11.1 Relevant legislation

- Wildlife and Countryside Act 1981 (as amended) only part of sub-section 9(1) (killing & injuring).

11.2 Baseline information

11.2.1 Desk study

Local record centre data (since 2004) within a 1 km wide corridor centred on the proposed scheme provided 16 records of slow worm *Anguis fragilis* and 20 records of common lizard *Zootoca vivipara;* the majority located in the Taf Fechan Gorge. The exact location of these records is shown in Appendix 11F.

11.2.2 Field surveys

An assessment of the value of habitats for supporting reptiles was undertaken using the methods in the Reptile Management Handbook (Edgar, *et al.,* 2010). Full methodology and results can be found in Appendix 11F: Summer 2015 Ecology Survey results. Habitats were assessed as being of low, moderate or high value to reptiles depending on the variety of features of value to reptiles recorded. The areas within the proposed scheme where reptiles are most likely to occur are areas of scrub, rough grassland, unmanaged road verges and boundary features (walls and hedgerows).

Common and widespread reptile species in Wales are assumed to be present throughout the proposed scheme.

11.3 Potential for an offence

It is likely that reptiles, particularly slow worms, would be present in the existing verge and scrub along most of the route corridor. Site clearance may, therefore, kill or injure reptiles, resulting in an offence being committed.

Table 11.1 below shows the relevant legislation and potential for committing an offence with regard to reptiles.

Table 11.1 : Reptiles – relevant legislation and potential for an offence

Wildlife and Countryside Act 1981	Offence likely without mitigation	Location
To intentionally kill, injure or take any wild animal included in Schedule 5 (s9(1)).	Yes – during site clearance and fencing phase.	High potential for reptile presence: • ch.900-1700; • ch. 8400-9800; and • ch. 11650-12200. Moderate potential for reptile presence: • ch. 950-1850; • ch. 1850-2100; • ch. 2300-3000; • ch. 3350-3800; • ch. 4500-4600; • ch. 5450-5850; • ch. 5950-6600; • ch. 13660-13800; • ch. 14100-14600; and

Wildlife and Countryside Act 1981	Offence likely without mitigation	Location
		• ch. 16050-17700.

11.4 Proposed approach

The following paragraphs set out the steps that would be taken prior to the construction of the proposed scheme to ensure the legislation protecting reptiles was not contravened. In summary the process would take the following form.

- Measures to avoid killing and injuring by:
  - habitat manipulation; and
  - trapping and translocation of individuals.

11.4.1 Avoiding killing or injury

11.4.1.1 Protection of retained habitats

Receptor sites and retained habitat suitable for reptiles would be fenced with protective fencing to avoid entry by construction machinery where they are contiguous with the proposed scheme.

11.4.1.2 Habitat manipulation

A method statement for vegetation clearance would be developed to ensure the protection of reptiles and to specify the actions necessary to avoid killing or injuring them.

The primary approach to reptile mitigation would be displacement. This approach is appropriate at locations where retained suitable habitat for reptiles exists adjacent to an area that is to be cleared (within suitable seasonal constraints i.e. high risk areas would not be cleared in winter when reptiles cannot respond to displacement activities as they would be in torpor / hibernation). Habitat manipulation would be utilised to displace reptiles from an area subject to clearance into an adjacent undisturbed area in order to protect animals from mortality. This is achieved by cutting and clearance of vegetation in stages towards the direction of the receptor area.

Vegetation to be cleared would first be cut with hand tools (for example using strimmers / brush cutters and chain saws), with cut material removed from the site and the remaining habitat would be cleared with machinery.

Where potential refugia / hibernacula are identified within the construction footprint and their destruction cannot be avoided, these would be dismantled by hand by the EcCoW under suitable weather conditions. Destructive searches would then proceed in areas of potential for reptiles where displacement from vegetation clearance is insufficient to guarantee dispersal of reptiles. Destructive searches would commence and finish before the end of autumn, due to the potential of reptiles entering into hibernation over winter. During the final stage of the destructive search potential refugia such as tree stumps, concrete waste and other debris on site would be removed. The supervising EcCoW would undertake a finger-tip search of these features before the contractors remove them. Any reptiles found would be allowed to relocate naturally or, if necessary, captured and relocated to a 2.5 m strip area (previously described in Section 10).

11.4.1.3 Trapping, translocation and exclusion

Where a displacement strategy is not appropriate due to the lack of retained adjacent suitable habitat to receive displaced individuals, trapping and translocation to a prescribed receptor area would be considered. This receptor area would be ready prior to any translocation. The use of reptile fencing would be minimised but may be needed where receptor sites are directly adjacent to high quality reptile habitat. Artificial Cover Objects (ACOs) would be installed and be checked by an ecologist during appropriate weather conditions.

ACOs would be checked on a daily basis for a recommended 26 days, followed by five days of no reptile capture or observations. If the capture programme cannot start until a suboptimal period (for example late June) then extra effort should planned (extra 10 days). (Natural England, 2011) Any reptiles captured would be placed in buckets and released into the receptor areas as soon as possible.

Where potential refugia / hibernacula were identified within the proposed scheme footprint and cannot be avoided, these would be dismantled by hand by the on-site ecologist under suitable weather conditions and translocated to nearby retained habitat.

11.4.2 Habitat enhancement

The habitat enhancement strategy for reptile species across the proposed scheme would include the following measures:

- creation of high quality connective habitat throughout the new soft estate throughout the proposed scheme; and
- hibernacula suitable for use by reptiles, such as log piles and artificial hibernacula provided within the proposed soft estate at the following indicative locations: (approximate ch.1225, ch.3750, ch.4250, ch.4775, ch.6025, ch.6875, ch.7700, ch.9150, ch.9500, ch.10300, ch.11900, ch.12350, ch.13300, ch.13750 and ch.14225).

11.5 Conclusion

The proposed scheme is likely to result in the contravention of the legislation with respect to reptiles. There is a risk that the offence of killing or injuring reptiles would occur as a result of the proposed scheme. The strategy set out would result in this offence being avoided.

12. Birds

12.1 Relevant legislation

- Wildlife and Countryside Act, 1981 (as amended).

12.2 Baseline Information

12.2.1 Desk study

Records of ten Schedule 1 (Wildlife and Countryside Act, 1981) bird species were found to exist within a 4 km wide corridor centred on the proposed scheme, including [redacted] Twenty-two bird species listed on Section 7 of the Environment (Wales) Act 2016 were found to exist within a 4 km wide corridor centred on the proposed scheme including [redacted].

Over 100 records of lapwing exist within a 4 km wide corridor centred on the proposed scheme (in the breeding season i.e. March to August, inclusive). Of these, [redacted].

12.2.2 Field survey

12.2.2.1 Breeding bird habitat assessment

Habitat suitable for supporting breeding birds was identified in woodland, hedgerows, scrub and on ephemeral grassland on former hard standing (suitable for ground nesting birds).

Four records of barn owl were made by Jacobs' ecologists during other ecological surveys within a 4 km wide corridor centred on the proposed scheme. [redacted].

12.2.2.2 Lapwing

2016 surveys recorded a peak count of 37 individual lapwing at the breeding colony [redacted].

12.2.2.3 Schedule 1 species Taf Fechan

No breeding Schedule 1 species were recorded during the surveys.

12.3 Potential for an offence

The site clearance and fencing works would incorporate the approximate loss of approximately 48.99 ha of semi-natural broadleaved woodland (of which approximately 4.52 ha is ancient woodland), approximately 11.69 ha of plantation coniferous woodland, approximately 23.08 ha of marsh / marshy grassland, approximately 6.25 ha of ephemeral / short perennial disturbed land – ephemeral and approximately 10.37 ha of wet heath / acid grassland. All habitats subject to clearance are likely to support breeding birds.

Table 12.1 below shows the relevant legislation and potential for committing an offence with regard to birds.

Table 12.1 : Breeding birds – relevant legislation and potential for committing an offence

Wildlife and Countryside Act, 1981 (as amended)	Offence likely (in absence of mitigation)	Location
To intentionally kill, injure or take any wild bird (s1(1)).	No	N/A
To intentionally or recklessly disturb any wild bird included in Schedule 1 while it is building a nest or is in, on or near a nest containing eggs or young; or disturbs dependent young of such a bird (s1(5)(a)(b)).	Yes - Potential for Schedule 1 birds to be present within zone of influence during site clearance.	[redacted]
To take or destroy an egg of any wild bird (s1(1)(c)).	Yes - during site clearance if undertaken within main breeding season (considered to be March to August inclusive), or with species that can breed outside of main breeding season.	Across the proposed scheme footprint where suitable habitat is to be cleared.
To intentionally take, damage or destroy the nest of a wild bird included in Schedule ZA1.	No – these species are highly unlikely to be nesting in the vicinity of the proposed scheme.	N/A
To intentionally take, damage or destroy the nest of any wild bird while that nest is in use or being built.	Yes - during site clearance if undertaken within main breeding season (considered to be March to August inclusive), or with species that can breed outside of main breeding season.	Across the proposed scheme footprint where suitable habitat is to be cleared.

12.4 Proposed approach

The following paragraphs set out the steps that would be taken prior to the construction of the proposed scheme to ensure the legislation protecting birds was not contravened. In summary the process would take the following form:

- pre-construction survey;
- provision and implementation of a construction method statement; and
- a method statement that would include measures such as; protection of habitats and features and supervision of works.

12.4.1 Pre-construction surveys

Due to the potential for certain Schedule 1 species (barn owl, common crossbill, goshawk, hobby, kingfisher, merlin, peregrine and red kite) to breed in or adjacent to the footprint of the site clearance and fencing works, and subsequent construction activities, detailed surveys for these species would be undertaken prior to construction to identify any nest sites that could be susceptible to disturbance.

The potential breeding season of Schedule 1 species and the distances at which they can be disturbed whilst nesting is shown in Table 12.2 below. As such, any preconstruction surveys would be undertaken to ensure that any active nests are identified within these months. The species displayed in bold are those that can breed

during months outside of the main breeding season (March to August, inclusive). The months shown in brackets are those in which breeding has been recorded but it is not considered to be within that species' regular season.

The minimum and maximum disturbance distances shown in Table 12.2 relate to the nesting stage of that species. Birds are generally less tolerant of human activities whilst nest building and, therefore, can be subject to disturbance at greater distance than later on in the breeding period, such as at the chick rearing stage. These distances would be used to inform the pre-construction survey area for each species. Species for which no disturbance distances have been published are labelled 'N/A'.

The need for pre-construction surveys of birds, and any required ongoing surveys by the EcCoW during construction, would be detailed within the CEMP.

Table 12.2 : Breeding season and disturbance distances of Schedule 1 species potentially present

Species	Breeding season (Currie, 1997) (Cramp, 2004) (Joys, 2004)		Disturbance distance (m) (Currie, 1997) (Ruddock, 2007)	
	Start	Finish	Nest building	Chick rearing
Barn owl	April **(February)**	**October (December)**	250	100
Common crossbill	**February (January)**	May **(December)**	150	50
Goshawk	April (March)	July (August)	500	250
Hobby	June (May)	August **(September)**	200	500
Kingfisher	May (April)	**September (October)**	N/A	N/A
Merlin	May (April)	July (August)	400	200
Peregrine	April (March)	August	750	600
Red kite	May (April)	July **(September)**	600	300

12.4.2 Provision and implementation of method statements

A site clearance method statement would be produced to identify / demonstrate how damage or disturbance to bird nests would be avoided.

Lapwing

No construction work would occur in or near the current breeding colony [redacted] and the lapwing mitigation area during the lapwing breeding season (March – July inclusive).

The proposed mitigation area ([redacted]) would be prepared and ready prior to any works in the area where lapwing are known to be breeding.

Measures to prevent occupancy of areas within the construction footprint by breeding pairs would be implemented ahead of the breeding season (i.e. during the months of January and February inclusive) where necessary to reduce the risks of delays in construction. The use of deterrents (such as scarers (visual), repeller ribbons, water jet sprays, netting (on ground habitats) and human activity), would be employed to prevent nesting in areas due to be topsoil stripped, earthworked or otherwise disturbed, once the absence of active nests had been confirmed.

12.4.3 Avoiding damage or destruction of eggs and nests

12.4.3.1 Habitat management

Measures to prevent occupancy by breeding birds would be implemented where necessary, subject to consultation with NRW, to reduce the risks of delays in construction.

Deterrents would be employed to prevent nesting in areas due to be cleared, once the absence of active nests has been confirmed. This would include maintaining short grass throughout the nesting period to deter ground nesting birds such as skylark *Alauda arvensis* and meadow pipit *Anthus pratensis*. Cleared areas would be kept unsuitable for re-colonisation by species that nest on short vegetation or bare earth, such as lapwing. Potential methods of deterrent employed would be agreed on site and could include scarers (visual), repeller ribbons, water jet sprays, netting (on ground habitats) and human disturbance.

Bare, vertical earth banks would not be created in areas in which further works have been proposed, particularly during February and March in order to prevent species such as kingfisher and sand martin *Riparia riparia* from using this type of habitat as a breeding site.

12.4.3.2 Supervision of vegetation clearance

The areas of vegetation and structures scheduled to be cleared each day would be walked by a suitably qualified and experienced ecologist or EcCoW prior to the arrival on site of clearance contractors to avoid the risk of disturbance to birds from excessive movement of vehicles / people or through the noise of the hand tools used in the clearance works. This would also include times outside the main breeding season in habitats that support species that can breed before and / or after this period, such as corvids and pigeons, and Schedule 1 species including barn owl, crossbill and kingfisher.

The EcCoW would look for signs of nesting activity within the areas to be cleared: males singing; individuals carrying nesting material into these areas; and agitated behaviour during the walkover. Should any signs be identified, an immediate detailed inspection of the vegetation would be undertaken in an effort to locate any active nest(s) present.

Should a nest be identified, works in the vicinity would stop and the EcCoW present would determine a suitable buffer zone around the nest within which no further clearance or other works would occur. This would be dependent on the type and density of vegetation surrounding the nest and the species present. A minimum buffer zone would be 5 m from a nest but may be extended on advice from the EcCoW. The buffer zone would be clearly marked using demarcation tape or fencing to ensure no works take place within that area. These would also be marked on an Environmental Constraints map and displayed in the site office as well as being issued to all contractors on site.

The EcCoW would monitor activity at each nest to determine when it is no longer active and works can continue. Should there be no sign of birds nesting in an area the clearance contractor would undertake vegetation clearance. The EcCoW would be available on site should any further input / assistance be required.

12.4.4 Protection of retained vegetation

Retained habitats would be fenced to prevent accidental incursion or clearance.

12.5 Conclusion

The proposed scheme is likely to result in the contravention of the legislation with respect to birds. There is a risk that the offences of destroying eggs and damaging or destroying nests as a result of the proposed scheme. The strategy set out would result in these offences being avoided.

13. Freshwater fish

13.1 Relevant legislation

- The Eels (England and Wales) Regulations, 2009 (as amended); and
- Salmon and Freshwater Fisheries Act, 1975 (as amended).

13.2 Baseline information

13.2.1 Desk study

Consultation was undertaken with the SEWBReC, BIS and NRW to obtain records of protected species within a 4 km wide corridor centred on the proposed scheme. These records and their location (NGR) can be found in the ES Appendix 11G: 2016 Ecology Survey Results.

Fifty six watercourses are crossed by or are located within a 100 m wide corridor of the proposed scheme, falling within seven Water Framework Directive (WFD) water body catchments across two River Basin Management Plans; Western Wales and River Severn.

13.3 Potential for an offence

The ground clearance works, construction and operation of the proposed scheme would not result in the permanent loss of aquatic habitat within running water and would not construct or amend any in water barriers to fish migration. As all major watercourses are proposed to be crossed by clear span bridges, potential impacts would be upon minor drainage channels with limited potential to support fish species.

Release of solids and liquids into waters would be mitigated through embedded design mitigation which are addressed separately in Chapter 17 (Road Drainage and the Water Environment) and Appendix 11M of the ES and not discussed further here. There are therefore no activities potentially causing an offence with regard to fish.

Table 13.1 below shows the relevant legislation and potential for committing an offence with regard to freshwater fish.

Table 13.1 : Freshwater fish – relevant legislation and potential for an offence

The Eels (England and Wales) Regulations, 2009 (as amended)	Salmon and Freshwater Fisheries Act, 1975 (as amended)	Offence likely (in absence of mitigation)	Location
To construct, alter or maintain a dam or structure and failing to notify the Environment Agency first would be guilty of an offence (Part 4, 12 (1), (2),(4)).	-	Yes – in areas where culverts are required to cross watercourses.	Proposed new and modified existing culverts (no. 41).

The Eels (England and Wales) Regulations, 2009 (as amended)	Salmon and Freshwater Fisheries Act, 1975 (as amended)	Offence likely (in absence of mitigation)	Location
-	To cause or knowingly permit to flow, or put or knowingly permits to be put, into any waters containing fish or into any tributaries of waters containing fish, any liquid or solid matter to such an extent as to cause the waters to be poisonous or injurious to fish or the spawning grounds, spawn or food of fish, shall be guilty of an offence (Part I, 4 (1)).	Yes – risk of sediment and pollutant run off from the construction works or road drainage.	Across the proposed scheme where it intersects with watercourses.

13.4 Proposed approach

The following paragraphs set out the steps that would be taken prior to the construction of the proposed scheme to ensure the legislation concerning freshwater fish was not contravened. In summary the process would take the following form:

- appropriate engineering design;
- NRW permitting; and
- provision and implementation of a construction method statement.

13.4.1 Engineering design

The design of the proposed scheme included embedded mitigation which addresses any potential contravention of the specified legislation in Table 13.1. This is as follows:

- drainage design and attenuation of water before discharge;
- new outfalls would be designed and sited to minimise the impact of increased discharge on the downstream waterbody;
- Sustainable Drainage Systems (SuDS) would be used in the design of the project to reduce and control velocities and volume for runoff to resemble pre-existing flow conditions within the water courses (PPG 5);
- best practice guidance would be adhered to when working within salmonid watercourses. Reasonable precautions would be undertaken to avoid / reduce in-channel works and translocation of channel substrate; and
- construction works to create new culverts, or to extend or upgrade existing culverts would abide by the relevant guidelines and would take into consideration the CIRIA Culvert Design and Operation Guide (C689) (Balkham, *et al.,* 2010) and The River Restoration Centre Manual of Techniques (River Restoration Centre, 2013). Where new culverts are required, their length would be kept to a practical minimum. Where practicable, the insertion of each culvert would not alter the gradients markedly from existing conditions. Altered flow regimes resulting from the use of culvert extensions or channel realignments would be avoided. Culverts would be oversized to allow natural bed and bank profiles to remain, where practicable, and would help to reduce the risk of erosion through increased velocities and heightened flood risk.

13.4.2 NRW permitting

The appropriate consents from NRW for water discharges required during the proposed construction works would be obtained ahead of the start of works and all relevant activities would operate in accordance with this. The necessary consents for working in proximity to watercourses would be obtained and all NRW water

abstraction licence conditions would be complied with. NRW would be notified of any action that is likely to impact on the migration of eels, either temporarily or permanently, and work toward resolution by sensitive design and implementation of construction and operational works.

13.4.3 Avoiding pollutants reaching watercourses

A construction method statement could include the following measures to avoid pollutants accidentally reaching watercourses.

- Maintenance of vegetation buffer strips where practicable.
- Works compounds, storage sites, access roads and construction work would be located / carried out at an agreed minimum distance from water features as advised by the EcCoW. Temporary fencing and signage would be installed to prevent encroachment by vehicles, machinery and personnel into sensitive areas such as banks of rivers and ponds.
- Adoption of good working practices during construction:
  - CIRIA C532 Control of water pollution from construction sites; and
  - CIRIA C648 Control of water pollution from linear construction projects – technical guidance.
- Targeted sediment control and erosion considerations (to meet the requirement in HD45/09) as detailed in the CEMP.
- Details within the CEMP:
  - construction drainage strategy;
  - sediment management strategy;
  - works to watercourses;
  - management of historic contamination;
  - materials inventory;
  - material storage and handling requirements;
  - construction monitoring requirements; and
  - pollution response plan.

More detail on each is provided in ES Chapter 17 (Road Drainage and the Water Environment); Appendix 17H: Good construction practice.

13.5 Conclusion

The proposed scheme has demonstrated that the commitments and actions undertaken would result in no offence being committed with regard to freshwater fish.

14. Controlled species

14.1 Relevant legislation

- Wildlife and Countryside Act, 1981 (as amended); and
- Environmental Protection Act, 1990.

14.2 Baseline information

14.2.1 Desk study

Consultation was undertaken with SEWBReC and BIS to obtain recent records (since 2004) of controlled species present within the footprint of the proposed scheme. The full results can be found in the A465 Section 5 and 6 Environmental Scoping Report (Jacobs, 2016b). In summary, both Himalayan balsam and Japanese knotweed have been recorded on waterbodies up and downstream of the existing A465. New Zealand pigmy weed *Crassula helmsii* and curly water weed *Lagarosiphon major* have also been recorded within a 1 km wide corridor centred on the proposed scheme.

14.2.2 Field surveys

A controlled species survey was undertaken concurrently with the extended Phase 1 habitat survey during July and August 2015. Controlled plant species, including Japanese knotweed and Himalayan balsam were recorded within the study area, often in association with watercourses and road corridors. The locations of these species are shown in ES Vol 3, Figure 11.3.

14.3 Potential for an offence

Site clearance and / or inappropriate disposal could lead to the spread of invasive species in contravention of legislation detailed in Table 14.1

Invasive species could also be imported from other sites into the proposed scheme footprint. Table 14.1 below shows the relevant legislation and potential for committing an offence with regard to controlled species.

Table 14.1 : Controlled species – relevant legislation and potential for an offence

Wildlife and Countryside Act, 1981 (as amended)	Environmental Protection Act, 1990	Offence likely (in absence of mitigation)	Location
To plant or otherwise cause to grow in the wild any plant which is included in Part II of Schedule 9 (s14 (2)).	-	Yes, by spread of existing plants in footprint or importation of plants from outside proposed scheme.	Within proposed construction footprint at : ch.1650 south ch.3900 north ch.4850 south ch.6975 north ch.10750 south ch.11150 north ch.16050 south plus any additional locations identified in pre-construction surveys. Across proposed soft estate where landscape planting is proposed.
Section 33 (1a) and (1b). These create offences to do with the deposit, treating, keeping or disposing of controlled waste without a permit. Section 33 (1)(c) makes it an offence to keep, treat or dispose of controlled waste in a manner likely to cause pollution of the environment.	(a) To deposit controlled waste or extractive waste, or knowingly cause or knowingly permit controlled waste or extractive waste to be deposited in or on any land unless an environmental permit authorising the deposit is in force and the deposit is in accordance with the licence (b) submit controlled waste, or knowingly cause or knowingly permit controlled waste to be submitted, to any listed operation (other than an operation within subsection (1)(a)) that - (i) is carried out in or on any land, or by means of any mobile plant, and (ii) is not carried out under and in accordance with an environmental permit. (c) treat, keep or dispose of controlled waste or extractive waste in a manner likely to cause pollution of the environment or harm to human health.	Yes, by management and disposal of existing plants cleared from site.	Within proposed construction footprint at: ch.1650 south ch.3900 north ch.4850 south ch.6975 north ch.10750 south ch.11150 north ch.16050 south plus any additional locations identified in pre-construction surveys.

14.4 Proposed approach

The following paragraphs set out the steps that would be taken prior to the construction of the proposed scheme to ensure the legislation relating to schedule 9 species was not contravened. In summary the process would take the following form.

- pre-construction surveys;
- provision and implementation of a construction method statement; and
- environmental permit from NRW, if required.

14.4.1 Pre-construction survey

Pre-construction surveys would be undertaken to record the location and extent of controlled species within the footprint of the proposed scheme immediately prior to the start of works. An assessment of control measures required, including waste disposal, would then be made.

14.4.2 Provision and implementation of a construction method statement

A method statement detailing control and eradication methods of the invasive species present would be produced, using best practice guidance publications for example 'Managing Japanese Knotweed on Development Sites: the Knotweed Code of Practice, (Environment Agency, 2013) and Managing Invasive Non-native Plants (Environment Agency, 2010).

Other measures to avoid accidental incursion in to invasive species areas could include:

- Invasive species areas would be fenced and / or clearly marked with hazard warning tape. In the case of Japanese knotweed this would be to a width of at least 7 m from the outermost plant and no tracked excavators would enter the 7 m exclusion zone.
- Haulage routes in areas of invasive species would be clearly demarcated and strictly adhered to. If haulage routes are required to pass through exclusion zones appropriate methods to prevent contact with the soil would be implemented.

14.4.3 Environmental permit

A waste licence would be secured to remove any soil contaminated with Japanese knotweed or Himalayan balsam. Disposal of the soil would only be permitted at landfill sites that are licensed to receive controlled waste of this type. Alternatively, it may be possible to bury the material on site under a method statement agreed with NRW.

14.4.4 Monitoring

An EcCoW would be employed to ensure that the implementation of the appropriate control measures is undertaken during construction. Post construction monitoring would be undertaken to confirm that non-native invasive species have not re-established or spread as a result of the proposed scheme.

14.5 Conclusion

The proposed scheme has demonstrated that actions and commitments would ensure no offence is committed with regard to invasive species.

15. Summary and conclusions

There is potential for the proposed scheme to have significant effects on a number of protected species, primarily during the construction phase. However, careful design and best practice would ensure that appropriate working practices would reduce impacts and avoid contravention of wildlife legislation.

Gareth Protheroe
Project Manager
A465 Dualling Improvement Scheme
Section 5 and 6
Jacobs UK Ltd
Churchill House
Churchill Way
Cardiff.
CF10 2HH

Dyddiad/Date: 12 May 2016

Dear Mr Prothero

A465 DUALLING IMPROVEMENT SCHEME SECTION 5 AND 6
ASSESSMENT OF IMPLICATIONS ON EUROPEAN SITES: SCREENING.
MEETING ACTION 29 MARCH 2016

We refer to the meeting of 29 March 2016 where we were asked to provide advice in regard to the Wildlife and Countryside Act 1981 (as amended) and protected species. We advise as follows;

The Marsh Fritillary is protected under Schedule 5 of the Wildlife and Countryside Act 1981 (as amended). This makes the following unlawful (in respect of all life stages):

a) Intentional killing, injuring, taking.
b) Possession or control (live or dead animal, part or derivative).
c) Damage to or destruction of any structure or place used by a scheduled animal for shelter or protection.
d) Disturbance of any animal occupying such a structure or place.
e) Obstructed access to any such structure or place.
f) Selling, offering for sale, possessing or transporting for the purpose of sale (live or dead animal, part or derivative). And,
g) Advertising for buying or selling live or dead animal, part or derivative.

There is no provision for derogation under the Act and so no licences can be issued. The only way to avoid potentially committing offences is by avoidance. The Act says that, if it can be shown that the potentially unlawful act was the incidental result of a *lawful operation* and could not *reasonably* have been *avoided, no offence will have been committed.* To this end a method statement should be prepared and agreed with NRW prior to the commencement of works. Whilst this is not the same as derogation it might be used as part of a defence.

The above comments represents NRW's understanding of the law. It should not be taken as a definitive interpretation of the Act and the advice of a legal professional should be sought before taking any action that might affect Marsh Fritillaries.

Yn ddiffuant / Yours sincerely

Mrs Jackie Walters
Senior Development Planning Advisor / Uwch Ymgynghorydd Cynllunio Datblygu
Cyfoeth Naturiol Cymru / Natural Resources Wales

Gwefan / Website: www.cyfoethnaturiolcymru.gov.uk / www.naturalresourceswales.gov.uk

Ein pwrpas yw sicrhau fod adnoddau naturiol Cymru yn cael eu cynnal, gwella a'u defnyddio yn gynaliadwy, yn awr ac i'r dyfodol / Our purpose is to ensure that the natural resources of Wales are sustainably maintained, enhanced and used, now and in the future.

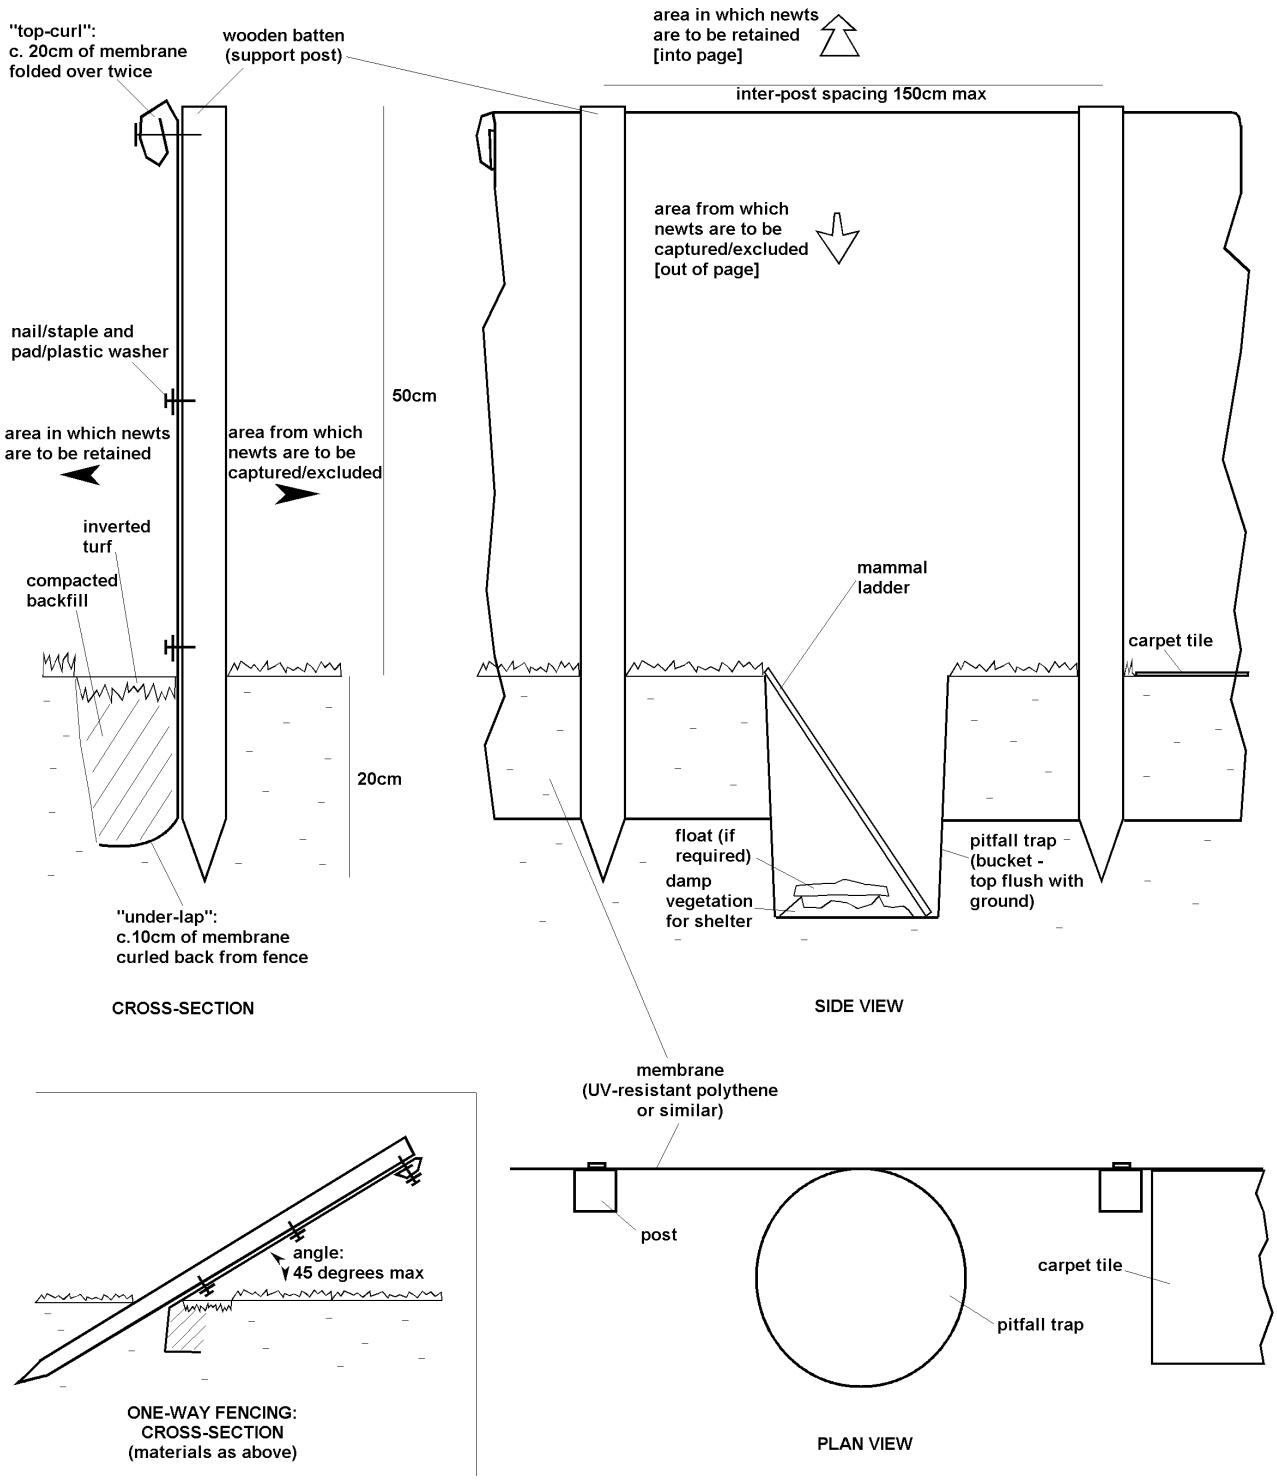
Annex B. Great crested newt fencing specification

See following page.

Page left intentionally blank.

Fence and pitfall trap design

Recommended design for exclusion fence (temporary amphibian fence), drift fence, and pitfall trap placement. This design can be used for a variety of capture and exclusion/retention purposes.



Page left intentionally blank.

1. Introduction

This technical report describes the consideration of the compliance with the legislative duties of the proponent (Welsh Government (WG)) with regard to the Environment (Wales) Act 2016, specifically Section 7 which relates to biodiversity. The report sets out the legislative duties followed by review of compliance with those duties.

Section 7 of the Environment (Wales) Act 2016 places a duty on the WG to prepare and publish a list, in consultation with Natural Resources Wales (NRW), of the living organisms and types of habitat of principal importance in Wales. This replaces the duty in Section 42 of the Natural Environment and Rural Communities (NERC) Act 2006 and the new duty came into force on 21 May 2016. It should be noted that the current interim Section 7 list of species and habitats is exactly the same as the previous list under Section 42 of the NERC Act 2006 and is under review with NRW.

This report identifies the habitats and species listed in the Section 7 list under the Environment (Wales) Act 2016, which could be present or have been recorded within a 1 km wide corridor centred on the proposed scheme and reviews the measures described in the Environmental Statement (ES) to demonstrate where these duties have been realised.

2. Methodology

This section outlines the approach that has been adopted to review the compliance of the proposed scheme with the Environment (Wales) Act 2016.

2.1 Establish Legislative Requirements

The sections of the Environment (Wales) Act 2016 relevant to the proposed scheme, in terms of the biodiversity duty and habitats and species of principal importance for the purpose of conserving biodiversity will be provided. These are detailed in Section 3 – Legislative Requirements.

2.2 Establish the Baseline

The desk study included a data search of species, including Section 7 species, and designated sites within a 4 km corridor centred on the proposed scheme. Field surveys comprised an extended Phase 1 habitat assessment of the area within a 1 km corridor centred on the proposed scheme and targeted surveys of protected species. No specific surveys for species solely listed in Section 7 have been undertaken as part of this assessment.

Surveys carried out from February 2015 to September 2016 are detailed in the following appendices: ES Appendix 11E: Winter 2015 Ecology Surveys Results; ES Appendix 11F: Summer 2016 Ecology Survey Results; ES Appendix 11G: 2016 Ecology Results; and ES Appendix 11H: Bat Survey Results 2016. In summary these surveys included:

- extended Phase 1 habitat survey;
- badger survey;
- bats survey – ground inspection for tree roosts and subsequent tree climbing; external building roost assessments and subsequent emergence / re-entry survey; bat activity transects; back tracking surveys; automated monitoring of road culverts for commuting bats; hibernation and summer survey of caves for roosts;
- breeding bird habitat assessment, lapwing survey at Dowlais Top and Schedule 1 species survey in Taf Fechan;
- great crested newt survey - Habitat Suitability Index (HSI), Environmental DNA (eDNA) and traditional techniques;
- reptile habitat assessment;
- marsh fritillary habitat survey, web and adult counts;
- otter survey; and
- aquatic ecology survey.

Section 7 species that were not recorded during the field survey work, but with potential to be present (i.e. were identified using the biological record centre data), were also included[1].

2.3 Consideration of the Duties

ES Chapter 11: Nature Conservation considers valuable ecological features on which the proposed scheme is considered likely to have a significant effect. Some Section 7 features were scoped into this assessment including purple moor-grass and rush pasture, lowland dry acid grassland, lowland heathland, hedgerows, wet woodland and species including great crested newt, otter, and bats.

[1] Species that have been recorded outside of the 1 km wide corridor centred on the proposed scheme but within a 4 km wide corridor centred on the proposed scheme since 2004 and where suitable habitat exists within a 1 km wide corridor centred on the proposed scheme.

The maintenance and enhancement of biodiversity is assessed through considering the mitigation described in the ES and which Section 7 habitats and species it could apply to, based on those considered likely to be present within a 1 km wide corridor centred on the proposed scheme.

3. Legislative requirements

The sections of the Environment (Wales) Act 2016 relevant to the proposed scheme, in terms of the biodiversity duty and habitats and species of principal importance for the purpose of conserving biodiversity, are outlined below.

Section 7 - Biodiversity lists and duty to take steps to maintain and enhance biodiversity.

1) The Welsh Ministers must prepare and publish a list of the living organisms and types of habitat which in their opinion are of principal importance for the purpose of maintaining and enhancing biodiversity in relation to Wales.

2) Before publishing a list under this section the Welsh Ministers must consult the Natural Resources Body for Wales ("NRW") as to the living organisms or types of habitat to be included in the list.

3) Without prejudice to section 6, the Welsh Ministers must—

   a) take all reasonable steps to maintain and enhance the living organisms and types of habitat included in any list published under this section, and

   b) encourage others to take such steps.

4) The Welsh Ministers must, in consultation with NRW—

   a) keep under review any list published by them under this section,

   b) make such revisions of any such list as appear to them appropriate, and

   c) publish any list so revised as soon as is reasonably practicable after revising it.

5) In exercising their functions under this section, the Welsh Ministers must apply the principles of sustainable management of natural resources.

This report focuses on Section 7 part 1 and part 3 as listed above.

4. Baseline

4.1 Principal habitats

Section 7 habitats of principal importance in Wales known to be present within a 1 km wide corridor centred on the proposed scheme are listed in Table 4.1.

Table 4.1 : Section 7 habitats and principal habitats within a 1 km wide corridor centred on the proposed scheme

Phase 1 habitat type	Equivalent Section 7 principal habitats
Broadleaved woodland	Lowland mixed deciduous woodland
	Wet woodland
Boundary and linear features	Hedgerows
Neutral grassland	Lowland meadows
Acid grassland	Lowland dry acid grassland
Dwarf shrub heath	Lowland heathland
Fen, marsh (grassland) and swamp	Purple moor-grass and rush pasture
Rivers and streams	Rivers
Standing open waters and canals	Ponds
Inland rock	Inland rock outcrop and scree habitats

4.2 Principal species

Section 7 species of principal importance in Wales known to be present within a 1 km wide corridor centred on the proposed scheme are listed in Table 4.2.

In addition, the extended Phase 1 habitat survey results (ES Volume 2 - Appendix 11F) displayed in Figure 11.3 of the ES (Volume 3), suggest that the habitats present are likely to support a number of additional Section 7 species of principal importance in Wales, as follows:

- old stone walls are likely to provide a habitat for amphibians, reptiles and invertebrates;
- mature trees are likely to provide a habitat for birds, invertebrates and lower plants;
- ponds are likely to support a range of amphibians;
- brownfield habitat is likely to support terrestrial invertebrates and reptiles;
- inland river cliffs are likely to support assemblages of lower plants, lichens and roosting bats;
- grasslands are suitable for supporting assemblages of grassland fungi, and habitat for invertebrates, birds, amphibians, reptiles and mammals; and
- rivers and streams are likely to provide spawning, migration and feeding opportunities for fish.

Table 4.2 : Species of principal importance (Environment (Wales) Act 2016, Section 7) present within a 1 km wide corridor centred on the proposed scheme (■ = yes; - = no)

Taxonomic group	Species	Recorded within 1 km wide corridor centred on the proposed scheme		
		Jacobs field survey	Biological records	Listed in designated site citation

5. Measures Provided

The Environmental Impact Assessment (EIA) process aids the identification of measures required to identify and then maintain the habitats and species of principal importance in Wales and consequently highlight areas where measures could be considered to enhance biodiversity.

Measures described in the ES to avoid / mitigate likely significant effects on ecological features or avoid contravention of legislation for species would also be of benefit to other habitats and species of principal importance and include the following.

Construction working method

- Nocturnal and crepuscular species would benefit from the avoidance of night-time working, including the hours of dusk and dawn.
- Areas of vegetation clearance have been minimised. Bat foraging habitat would be created through the planting of trees and woodland to replace areas of woodland lost. This new habitat has consequential benefits for a range of species groups.
- Awareness building through toolbox talks during construction for bats, nesting birds, reptiles and amphibians. These would include mention of other species of principal importance that may be encountered. Construction would be supervised by Ecological Clerk of Works (ECoW) in sensitive areas. There would also be habitat management to deter nesting lapwing which would also apply to other nesting bird species.
- The proposed scheme is designed to avoid aquatic habitats. No major watercourses are to be realigned. Where culverting of small watercourses and ditches are required, appropriate river restoration techniques would be incorporated.

Habitat creation and management

- A variety of habitats would be created as set out in Table 5.1.
- Long term habitat management plans (5 year post construction with review for later years) for mitigation areas and the proposed soft estate are provided. These outline plans will be finalised with agreement from Natural Resources Wales at the detailed design stage. Outline management strategies for mitigation areas are provided:
  - Llwydcoed Slopes for marsh fritillary and SSSI botanical features – Appendix 11N;
  - Ancient woodland habitat – Appendix 11O; and
  - Blaencarno mitigation area for lapwing – Appendix 11P.
- These new habitats would provide increased diversity and quality of habitats that would contribute to the further creation and enhancement of habitats of principal importance in Wales (see Table 5.1) but also benefit additional, non-target, species of principal importance in Wales.
- Creation of hibernaculum and refugia for relocation of reptiles and great crested newt and enhanced verge habitats would benefit other non-target amphibian and reptile species including common toad (a species of principal importance in Wales).
- The proposed new soft estate would be would be left to recolonise naturally to benefit species already present in the area. Some supplementary wildflower seeding could be necessary with emphasis on food plants for insects, particularly marsh fritillary. Some of the new road verges would be south-facing, creating beneficial habitat for insects and reptiles. This would, in turn, provide a food source for bird species of principal importance.

Under road crossing points (bridges, culverts and underpasses)

- Existing culverts and underpasses would be retained and in some cases improved for bats, otters and other species by widening and adding mammal ledges. These culverts would remain open during

construction. New culverts are proposed at sufficient size to enable passage by animals and also have mammal ledges included. This would be of benefit to other species of principal importance in Wales, such as hedgehog and brown hare that would utilise the culverts as crossing points.

- Improvement measures include planting of suitable terrestrial habitat around the culvert entrances to connect to the wider landscape which would benefit bats and other terrestrial mammals. Planting would use native species with extra biodiversity benefits, for example plants with flowers / fruits.
- Mammal passage on banks of rivers under the proposed scheme would be maintained during works.

Table 5.1 : Proposed habitat creation

Habitats of principal importance observed during surveys	Habitat creation / enhancement measures (see Environmental Master Plan – ES, Volume 4)
Lowland mixed deciduous woodland	To mitigate woodland loss, approximately 43.2 ha of woodland would be created within the soft estate. An additional 7 ha of ancient woodland creation and enhancement is also proposed around Croesbychan junction.
Wet woodland	
Hedgerows	Removed species rich hedgerows would be translocated in to woodland planting areas. Additionally, planting of strips of trees as part of woodland mitigation would provide the same ecological function as hedgerows.
Lowland dry acid grassland	The creation of approximately 24.94 ha of acid grassland within the soft estate.
Lowland heathland	Mitigation involves the creation of approximately 8.19 ha of heathland within the soft estate and management / enhancement of an additional 14.4 ha area of multi-purpose mitigation where heathland is a component habitat.
Purple moor-grass and rush pasture	The proposed scheme design results in approximately 8.03 ha land take of species rich marshy grassland habitat. Mitigation for this includes enhancement of approximately 14.4 ha of grassland within at the Lwydcoed Slopes mitigation area which has marshy grassland, including purple moor-grass as a component habitat.
Rivers	The proposed scheme would not directly affect any major running features. Naturally occurring biodiversity enhancements would occur as a subsequence of improved water quality (result of proposed drainage system).
Ponds	The proposed scheme would result in approximately 0.51 ha land take of standing water at two locations (one pond and part of a reservoir). Twenty-six new water bodies (attenuation ponds) would be created within the soft estate creating a network of priority habitat elements across the proposed scheme. The attenuation ponds would be planted with marginal vegetation having subsequent beneficial effects for a range of species of principal importance in Wales.
Inland rock outcrop and scree habitats	An area of exposed rock would be created at Baverstock cutting within the soft estate.

6. Conclusions

It is concluded that the development and design of the proposed scheme has taken reasonable steps to maintain and enhance biodiversity and through the measures that have been identified during the EIA, and described in the ES.

Opportunities have been taken within the proposed scheme to enhance habitat by the provision of features that add diversity and distribution of habitats of principal importance in Wales. Connectivity of the habitats in the new soft estate, provide a greater number of niches for species to exploit.

Appendix 11D - Trunk Road Estate Biodiversity Action Plan (TREBAP) Compliance Report

Rev 0

July 2017

Final

Contents

1. Introduction 1
2. Policy Requirements 2
3. Compliance with TREBAP Specific Actions 3
4. Conclusion 37
5. References 38

1. Introduction

This technical report describes the consideration of the proposed A465 Section 5 and 6 scheme's compliance with the Trunk Road Estates Biodiversity Action Plan (TREBAP) (Welsh Assembly Government, 2004).

This report sets out the policy requirements of the TREBAP; followed by an assessment of the compliance of the proposed scheme with its objectives. Although the TREBAP is dated 2004 to 2014 the principles of this published report remain relevant in the absence of an updated edition (yet to be released).

The Environmental Statement (ES) for the proposed scheme considers likely significant effects on all ecological features, but not necessarily the fulfilment of TREBAP actions. This report considers TREBAP compliance regardless of whether or not likely significant effects have been identified on TREBAP features for the purposes of the Environmental Impact Assessment (EIA) Regulations. For the purpose of EIA, the regulations only require the identification and description of likely significant effects so that the decision maker can balance any such effects with the benefits of the proposals. This differs from delivering a Biodiversity Action Plan (BAP) which is a policy document.

2. Policy Requirements

Welsh Government (WG) has a responsibility to limit the impact of the proposed scheme on biodiversity and take into account the presence of habitats and species of biodiversity interest when considering new proposals (Welsh Assembly Government, 2004). Guidance on this is provided in Section 4, Volume 10 of the Design Manual for Roads and Bridges (DMRB) (2001) and the Welsh Trunk Road Maintenance Manual (WTRMM) (1999). The TREBAP sets out actions to encourage the use of best practice for biodiversity in the management and development of the estate in order to comply with that duty. New road schemes are cited as one of main mechanisms through which TREBAP should be delivered.

The key policy requirements within the TREBAP are to:

- conserve or enhance biodiversity of areas of new land take wherever practicable; and
- undertake targeted ecological surveys to collect information on biodiversity.

Overall in the TREBAP, 251 actions are listed for the WG to undertake within 11 habitat action plans, 17 species action plans and two generic action plans: Ecological Survey; and Education and Awareness. Not all of these actions are relevant to the proposed scheme, but those which are appropriate are discussed in Section 3.

3. Compliance with TREBAP Specific Actions

Table 3.1 lists each action under the generic, species and habitat action plans that form the TREBAP. For each action, the table shows whether it applies to the proposed scheme and, if so, how the proposed scheme would comply with each action.

The compliance assessment uses information available from baseline studies, both desktop study and field survey, completed for the proposed scheme (ES Volume 2 - Appendices 11E; 11F; 11G; and 11H) with regards to the relevance of each species or habitat action plan. It then goes on to review the proposed actions for each action plan against commitments to nature conservation as set out in the ES.

Table 3.1 : TREBAP actions and proposed scheme compliance

Key: CP = communications and policy; DCM = road design, construction and maintenance; FRM = future research and monitoring; PGA = policy, guidance and advice; SUR = survey.

Action name	Action	Applicable (Y / N)	Compliance of proposed scheme with action
GENERIC ACTION PLAN			
Ecological Survey			
1 SUR	Undertake two route surveys of 50 km each, per year.	N	N/A
2 SUR	Ensure results relating to existing or potential TREBAP species and habitats are sent to the trunk road managers in the relevant network area(s).	Y	The survey results of the proposed scheme would belong to WG so would be available to share those data with the Trunk Road Agent.
3 SUR	Identify grassland verges of importance, as defined in the WTRMM, such that the relevant management requirements can be applied.	Y	Grassland verges of importance have been identified in the Environmental Masterplan (EMP) and have been assigned relevant management prescriptions. Specifically, the existing species rich neutral grassland road on Rhigos roundabout has a programme of topsoil translocation to the new roundabout proposed.
4 DCM	Ensure records of TREBAP and protected habitats/species in road verges or structures are considered within all stages of new schemes	Y	A biological record search within 2 km of the proposed scheme was undertaken and results considered during scoping. A detailed Phase 1 Habitat Survey and a suite of species surveys were then undertaken to inform the Environmental Statement. Pre-construction surveys would be undertaken where needed.
5 DCM	Ensure that surveys for new road schemes comply with developing best practice and DMRB advice.	Y	Ecological surveys were carried out in reference to the following best practice documents. Amendments to specified methodologies are justified in the relevant factual reports: • Guidelines for Ecological Report Writing (CIEEM, 2015); • Extended Phase 1 Habitat Survey - Phase 1 Habitat Survey Handbook (JNCC, 2010); • Bats - Bat Surveys: Good Practice Survey Guidelines (Hundt, 2012);

Action name	Action	Applicable (Y / N)	Compliance of proposed scheme with action
			• Bat Surveys for Professional Ecologists: Good Practice Guidelines 3rd Edition (Collins 2016); • The Bat Worker's Manual (Mitchell-Jones & McLeish, 2004); • Great Crested Newts - Great Crested Newt Conservation Handbook (Langton *et al.*, 2001); • Analytical and Methodological development for Improved Surveillance of the Great Crested Newt (Biggs *et al*., 2014); • Badgers - Design Manual for Roads and Bridges (DMRB) Volume 10, Section 1 – Part 5 HA59/92; • Otters - Design Manual for Roads and Bridges (DMRB) Volume 10, Section 4 – Part 4 HA81/99; and • Reptile Management Handbook (Edgar *et al.*, 2010). • Habitat mapping for marsh fritillary (Fowles & Smith, 2006)
6 DCM	Ensure that surveys for routine and one off maintenance comply with DMRB and WTRMM.	N	N/A
7 DCM	Ensure records of biodiversity interest (for example TREBAP and protected habitats and species) in road verges or structures are used to inform management.	Y	A post-construction, environmental management plan would be developed, in accordance with Natural Resources Wales (NRW), to ensure biodiversity features present are appropriately managed.
8 CP	In areas where LBAPs include a Road Verge Action Plan, liaise with BAP originators and Lead Partners to ensure all parties are aware of current actions that may complement, or may be complemented by, actions undertaken by Trunk Road Managers. Take steps to eliminate or modify actions which conflict with proposed LBAP targets where possible.	Y	Road verges are included as locally important habitat on the Rhondda Cynon Taf County Borough Council (CBC) Local Biodiversity Action Plan (LBAP) and form part of Urban habitat which is highlighted on the Merthyr Tydfil CBC LBAP and Wildlife Corridor habitat which is highlighted as locally important on the Caerphilly CBC LBAP. Objectives listed on these plans include identifying verges of biodiversity interest and reviewing verge management practices. Local Planning Authority (LPA) ecologists have been consulted at Environmental Liaison Groups (ELGs) and Technical Working Groups (TWGs) as part of the proposed scheme where there were opportunities to discuss LBAP actions and

Action name	Action	Applicable (Y / N)	Compliance of proposed scheme with action
			TREBAP actions with trunk road representatives who were also involved.
9 CP	Collate survey results relating to UKBAP species and habitats that are found to be on the network, but which are not the subject of TREBAP Action Plans, for consideration at the five-year review.	N	Not applicable to the proposed scheme as the UK BAP reporting process is no longer in use.
Education and awareness			
10 PGA	Participate actively in the development of DMRB advice with the other UK National Highway Authorities.	N	N/A
11 PGA	Review WTRMM advice to ensure staff and Trunk Road Managers are aware of constraints in relation to the bird-breeding season and the effects of management operations (including, for example, the potential effects of spreading chippings on valuable grasslands; pollution from fuel spillage; not removing arisings from grasslands; pesticide use; etc).	N	N/A
12 PGA	Review, and if necessary update, current advice in WTRMM on control practices with respect to invasive weed and alien species on road verges.	N	N/A
13 DCM	Ensure that those involved in these actions are familiar with relevant advice in DMRB and WTRMM.	N	N/A
14 CP	Organise training seminars for Trunk Road Managers to ensure that they understand their responsibilities for implementing actions under the TREBAP and the requirements for reporting and maintaining records.	N	N/A
15 CP	Liaise with interested parties to ensure that road verges that carry any kind of designation are known to Trunk Road Managers.	Y	Any designations within a 4 km wide corridor centred on the proposed scheme are highlighted in the relevant ecology factual reports and ES Chapter 11: Nature Conservation. The survey results of the proposed scheme would belong to WG and so would be available to data share with the Trunk Road Agent.
16 CP	Liaise with NRW and LAs to ensure that all other lands within the soft estate which carries a statutory or non-statutory wildlife designation,	Y	NRW and LPAs have been involved in the consultation process. The reports compiled by Jacobs highlight all statutory and non-statutory

Action name	Action	Applicable (Y / N)	Compliance of proposed scheme with action
	or which are covered by existing Management Plans, are known to Trunk Road Managers.		wildlife designations. The survey results of the proposed scheme would belong to WG and so would be available to data share with the Trunk Road Agent.
17 CP	Produce publicity information relating to the TREBAP.	N	N/A
18 CP	Produce public information on the value of highways verges and the rationale for management techniques.	N	N/A
19 CP	Review the way information is collected and reported in relation to existing data systems to ensure information on biodiversity issues is available to Trunk Road Agents and contractors.	N	N/A
HABITAT ACTION PLANS			
Boundary Features			
20 PGA	Review existing advice within the WTRMM to ensure it reflects best practice, particularly with respect to boundary features classified as ancient and/or species-rich hedgerows, cloddiau, or hedgerows classified as 'important' under the Hedgerow Regulations.	N	N/A
21 PGA	Review, with the UK Highway Authorities, the need for boundary features advice in the DMRB.	N	N/A
22 SUR	Ensure any surveys that are undertaken are extended sufficiently to assess the connectivity of boundary features and to identify opportunities for new linkages, as well as covering any legal requirements.	Y	Surveys carried out were sufficient to assess connectivity of boundary features. Opportunities for planting vegetation to increase connectivity have been identified and mapped on the EMP – ES, Volume 4.
23 DCM	For all proposed road schemes, seek to identify boundary features of ecological value and identify areas where the boundary features may be improved for the benefit of biodiversity. Identification of valuable boundary features within the scoping phase should help avoid impacts and highlight any potential opportunities.	Y	Boundary features of ecological value were recorded during the Phase 1 Habitat Survey. However, none of these were in the existing soft estate. Boundary features potentially impacted by the proposed scheme include linear corridors of plantation / broadleaved woodland, tree-lines, ditches, walls and hedgerows. Where habitats are impacted, connectivity would be maintained (where possible) during construction and replacement connective habitat would be provided post-construction.

Action name	Action	Applicable (Y / N)	Compliance of proposed scheme with action
			Opportunities for planting vegetation to increase connectivity have been identified and mapped on the EMP – ES, Volume 4.
24 DCM	Where road widening is to be carried out to the detriment of existing boundary features, aim to preserve features on one side of the improvement scheme.	Y	Boundary features would be preserved in situ and connective habitats provided (see EMP).
25 DCM	Where a hedgerow classified as 'important' under The Hedgerow Regulations is removed, replace and/or (as a last resort) translocate it as part of the mitigation.	Y	Approximately 537 m of species-rich hedgerow would be lost to the proposed scheme. Hedgerow translocation would take place (see EMP, Volume 4) and approximately 2250 m of new hedgerow planting proposed. This would connect to the existing hedgerow network in the area. No net loss of hedgerow would result.
26 DCM	Where valuable non-hedgerow boundary features will be lost through new roads or improvement schemes, replace and enhance remaining features through re-creation and translocation.	N	No valuable non-hedgerow boundary features would be lost due to the proposed scheme.
27 DCM	Promote, through Environmental Management Plans wherever possible, environmentally-sensitive management of hedgerows in the Directorate's control. This should include appropriate cutting regimes, retention of standing trees and the use of native species of local provenance where available in planting regimes.	Y	An Environmental Management Plan would be produced, which details management of retained and newly-created hedgerows. New hedgerows planting would use native species of local provenance and translocated material from within the construction footprint of the proposed scheme. Control of non-native invasive and undesirable species and long-term management recommendations would be made.
28 FRM	Monitor successes of hedgerow translocations, replanting and enhancements that have been carried out as mitigation measures.	Y	Newly created and enhanced hedgerow habitat would be monitored, post-construction. The precise approach and objectives / targets of monitoring would be specified in an environmental management aftercare plan. This is also a commitment in the Register of Environmental Actions and Commitments (REAC).
29CP	Include information on the value and management techniques of boundary features within environmental training for the Transport Directorate staff and Trunk Road Agents.	N	N/A
Calcareous Grassland			
30 PGA	Review and, if necessary, issue revised guidance with respect to	N	N/A

Action name	Action	Applicable (Y / N)	Compliance of proposed scheme with action
	calcareous grassland in WTRMM.		
31 SUR	Identify and survey areas of the soft estate that are known or likely to contain calcareous grassland: for example areas adjacent to significant areas of calcareous grassland (using NRW's current grassland surveys), and record the distribution of the habitat on the network on a database.	N	No calcareous grassland was identified within the proposed scheme soft estate or within 500 m of the proposed scheme during the Phase 1 habitat survey (ES Volume 2 – Appendix 11F).
32 SUR	Identify areas of calcareous grassland within the soft estate suitable for restoration.	N	N/A
33 DCM	At the design stage for new road and improvement schemes, ensure that valuable calcareous grassland is taken into consideration. Avoid the direct loss of such habitat wherever possible.	N	No valuable calcareous grassland was identified therefore this action is not applicable.
34 DCM	Phase out the use of seed that is not of local or bioregional provenance.	Y	N/A
35 DCM	Where habitat is unavoidably lost, consider the recreation of calcareous grassland on the road verge or, as a last resort, translocation.	N	No areas of calcareous grassland would be affected by the proposed scheme; therefore, this is not applicable.
36 DCM	Develop appropriate grass-cutting regimes to maintain species diversity in identified areas.	N	N/A
37 DCM	Aim to create or restore five sites of calcareous grasslands using good management practices in road verges.	N	N/A
38 FRM	Set up a system for monitoring known sites (including newly-created sites) to ensure that management is having the desired effect. Modify management when existing techniques are failing.	N	N/A
39 CP	Increase awareness of Transport Directorate staff, Trunk Road Agents and the general public to the importance of calcareous grassland.	N	N/A

Action name	Action	Applicable (Y / N)	Compliance of proposed scheme with action
Coastal and Estuarine			
40 PGA	Review advice provided in the WTRMM on maintenance on, or near, coastal and estuarine habitats. Issue revised guidance where necessary.	N	N/A
41 PGA	Review the need for advice in DMRB with UK Highway National Highway Authorities	N	N/A
42 SUR	Identify all areas of the network, and any relevant road drainage systems, that run within 50 m of coastal and estuarine habitats.	N	N/A
43 DCM	Ensure that valuable habitats (particularly protected sites and UKBAP habitats) are considered at the design stage of new road and improvement schemes; seek advice from the Environment Agency Wales and NRW to help identify and resolve relevant issues.	N	N/A
44 DCM	Ensure avoidable impacts do not occur to estuarine and coastal habitats during road construction.	N	N/A
45 DCM	During operation and maintenance of the road, reduce the impacts of pollution to a minimum by ensuring that drainage systems are kept functional at all times.	N	N/A
46 CP	Raise the profile of coastal and estuarine habitats and their nature conservation value with respect to design, construction and maintenance of schemes.	N	N/A
Heathland			
47 PGA	Review and, if necessary, update guidelines for best practice management of the soft estate within the WTRMM with reference to heathland habitats.	N	N/A
48 SUR	In areas where heathland within and outside of the soft estate, encourage coordination of surveys and subsequent exchange of results by those involved.	Y	The Phase 1 Habitat survey (ES Volume 2 – Appendix 11F) identified areas of dry and wet heathland habitat within and outside of the soft estate. These areas are highlighted on the Phase 1 Habitat survey maps (ES – Figure 11.3). This survey data is owned by WG and is publically

Action name	Action	Applicable (Y / N)	Compliance of proposed scheme with action
			available once planning documentation has been published.
49 DCM	Identify areas of heathland at the route selection stage of road schemes to avoid impacting the habitat where possible.	Y	The areas of heathland habitat were identified during the Phase 1 Habitat survey and were highlighted on the Environmental Constraints and Master Plans in order to inform the proposed scheme design.
50 DCM	At the design stage for new road and improvement schemes, ensure that valuable heathland is taken into consideration. Avoid the direct loss of heathland habitat wherever possible.	Y	Areas of heathland were highlighted on Environmental Constraints and Master Plans that were used to inform the proposed scheme design and would be retained where possible.
51 DCM *	Consider opportunities for habitat creation or restoration where practicable, and take forward 10 sites by 2014.	Y	Acid / heathland habitat would be (re-)created within the new proposed soft estate to mitigate the loss of heathland habitat (see EMP – ES, Volume 4).
52 DCM	Ensure management of heathland is appropriate to maintain its heathland value.	Y	Approximately 8.19 ha of heathland habitat creation within the proposed soft estate would be managed appropriately. This would be implemented via an environmental management plan (a requirement in the REAC).
53 FRM	Review best practice for the management of heathland with the UK government national highway organisations.	N	N/A
54 CP	Raise public awareness to help prevent deliberate / accidental fires, fly-tipping, and parking / driving on heathland in the network.	N	N/A
Lowland Dry Acid Grassland			
55 PG	Review, and if necessary, issue revised guidance with respect to lowland dry acid grassland in WTRMM.	N	N/A
56 SUR	Identify and survey areas of the soft estate that are known or likely to contain lowland dry acid grassland: for example areas adjacent to significant areas of lowland dry acid grassland (using NRW's current grassland surveys), and record the distribution of the habitat on the network on a database.	Y	Areas of acid grassland habitat along the proposed scheme were recorded during the Phase 1 Habitat Survey. Details are discussed and displayed in the Ecology Summer Factual Report (ES Volume 2 – Appendix 11F).
57 SUR	Identify areas of lowland dry acid grassland within the soft estate suitable for restoration.	N	The proposed scheme would result in the loss of the majority of existing habitats in the current soft estate. No remnant areas of acid grassland would remain. However, approximately 24.94 ha of new acid grassland

Action name	Action	Applicable (Y / N)	Compliance of proposed scheme with action
			habitats would be created (see EMP, ES – Volume 4).
58 DCM	At the design stage for new road and improvement schemes, ensure that valuable dry acid grasslands are taken into consideration. Avoid direct loss of such habitats wherever possible, or the potential for changes in the hydrology of such areas.	Y	Areas of acid grassland were mapped on an environmental constraints map issued to the design team and was considered during the design stage to avoid valuable examples of this habitat, where possible.
59 DCM	Phase out the use of seed that is not of local or bioregional provenance.	Y	Minimal seeding would be used in the creation of new grassland habitats. Where necessary, only seed of local or bioregional provenance would be used in habitat replacement or enhancement along the proposed soft estate. The majority of the road verges would allow wildflowers to re-colonise naturally with grass seed mix applied only. This is specified in the ES.
60 DCM	Where habitat is unavoidably lost, consider the recreation of lowland dry acid grassland on the road verge or, as a last resort, translocation.	Y	Some species rich acid grassland would be unavoidably lost to the proposed scheme. Mitigation would, in the first instance, involve like-for-like habitat replacement as close to the original location as possible on the new proposed soft estate (see EMP, ES, Volume 4). Appropriate habitat management plans would be developed in the detailed design stage and are a requirement in the ES i.e. listed in the REAC.
61 DCM *	Create or enhance five sites of lowland dry acid grassland in road verges.	Y	Approximately 24.94 ha of species rich acid grassland would be created in the proposed soft estate.
62 FRM	Set up a system for monitoring known sites (including newly-created sites) to ensure that the management is having the desired effect. Modify management when existing techniques are failing.	Y	Newly created acid grassland habitat would be monitored going forward as part of a post construction environmental management plan. Such a management plan is required in the REAC.
63 CP	Increase awareness of Transport Directorate staff, Trunk Road Agents and the general public to the importance of lowland dry acid grassland.	N	N/A
Lowland Meadows			
64 PGA	Review and, if necessary, issue revised guidance with respect to lowland meadow grassland in WTRMM.	N	N/A

Action name	Action	Applicable (Y / N)	Compliance of proposed scheme with action
65 SUR	Identify and survey areas of the soft estate that are known or likely to contain lowland meadow, for example, areas adjacent to significant areas of lowland meadow (using NRW's current grassland survey information), and record the distribution of the habitat on the network on to a database.	N	The Phase 1 Habitat Survey carried out did not identify areas of unimproved neutral grassland – the Phase 1 Habitat equivalent to lowland meadows - along the proposed scheme (ES Volume 2 – Appendix 11F). Some areas of species rich semi-improved neutral grassland were recorded but this is not comparable to the lowland meadow category.
66 SUR	Identify areas of lowland meadows within the soft estate suitable for restoration.	N	No areas of lowland meadow (unimproved neutral grassland) were identified within the soft estate.
67 DCM	At the design stage for new road and improvement schemes, ensure that valuable lowland meadows are taken into consideration. Avoid the direct loss of lowland meadow habitat wherever possible.	N	N/A
68 DCM	Phase out the use of seed that is not of local or bioregional provenance.	N	N/A for this habitat type
69 DCM	Where the loss of lowland meadow habitat is unavoidable, consideration should be given to the creation of a similar meadow habitat on the road verge or, as a last resort, translocation.	N	N/A
70 DCM	Create or restore six sites of lowland meadow within the highway boundary.	N	N/A
71 FRM	Set up a system for monitoring known sites (including newly-created sites) to ensure that the management is having the desired effect. Modify management when existing techniques are failing.	N	N/A
72 CP	Increase awareness of Transport directorate staff, Trunk Road Agents and the general public to the importance of lowland dry acid grassland.	N	N/A
Purple moor grass and rush pasture			
73 PGA	Review and, if necessary, issue revised guidance with respect to purple moor-grass and rush pasture.	N	N/A
74 SUR	Survey the soft estate that is adjacent to known areas of purple moor-	Y	The Phase 1 Habitat survey identified areas of marshy grassland (Phase

Action name	Action	Applicable (Y / N)	Compliance of proposed scheme with action
	grass and rush pasture habitat to establish distribution of this habitat on the network.		1 equivalent) along the proposed scheme, the results of which are discussed in ES Volume 2 – Appendix 11F – Table 3.9 and shown in Figure 11.3. Target notes within this report show the locations of with additional features of purple moor grass and rush pasture.
75 DCM	At the design stage for new road and improvement schemes, ensure that this habitat is taken into consideration, and avoid its direct loss or fragmentation wherever possible.	Y	Areas of purple moor grass and rush pasture along the proposed scheme were marked onto an environmental constraints map issued to the design team to inform proposed scheme design. Proposed loss of this habitat has been minimised and mitigation in the form of soil salvage, turf translocation and habitat enhancement would be undertaken.
76 DCM	Phase out the use of seed which is not of local or bioregional provenance.	Y	Minimal seeding would be used in the creation of new grassland habitats. Where necessary, only seed of local or bioregional provenance would be used in habitat replacement or enhancement along the proposed soft estate. The majority of the road verges would allow wildflowers to re-colonise naturally with grass seed mix applied only. This is specified in the ES.
77 DCM	Where habitat is unavoidably lost, consider the recreation of purple moor grass and rush pasture on the road verge or, as a last resort, translocation.	Y	Some areas of purple moor grass and rush pasture would be unavoidably lost to the proposed scheme. Mitigation would involve like-for-like habitat replacement as close to the original location as possible (see EMP, ES Volume 4) using translocation or soil salvage techniques. The mitigation site at Llwydcoed slopes to mitigate for marsh fritillary and SSSI loss contains purple moor-grass habitats that would be enhanced for general biodiversity.
78 DCM *	Enhance or create six sites by 2014 within the highway boundary.	Y	The enhancement and creation of species rich marshy grassland sites, incorporating features of purple moor grass, has been incorporated into the proposed scheme (see EMP, ES – Volume 4).
79 FRM	Set up a recording system and monitor known sites (particularly those identified as marsh fritillary butterfly habitat) to ensure maintenance of quality and diversity. Modify management when techniques are failing.	Y	An environmental management plan for the post construction phase is to be produced (requirement of the ES – in the REAC) in which the new soft estate and mitigation habitats would be monitored for a minimum of five years. Known marsh fritillary sites would continue to be monitored pre-construction, during construction and post-construction. An outline management strategy is provided in ES Volume 2 - Appendix 11N. This

Action name	Action	Applicable (Y / N)	Compliance of proposed scheme with action
			would be finalised in agreement with NRW and implemented by the contractor. This would be a dynamic document with management modifications made after consideration of monitoring results.
80 CP	Increase awareness of Transport directorate staff, Trunk Road Agents and the general public to the importance of purple moor-grass and rush pasture.	N	N/A
Rivers and Streams			
81 PGA	Consider the results of the EU Life project to advise on management issues.	N	N/A
82 PGA	Review and, if necessary, update guidelines relating to rivers and streams within the WTRMM, in particular, the way maintenance is carried out (pesticide use, etc.).	N	N/A
83 SUR	Collate the results of any surveys to gain a clearer picture of the extent and quality of river / stream habitats on the network, and liaise with organisations such as NRW to identify any other relevant issues.	Y	Hydromorphology and aquatic ecology walkover surveys (ES Volume 2 – Appendix 11G) have been undertaken along the watercourses and information provided by biodiversity local record centres and NRW has been reviewed. Additionally, Jacobs have liaised with NRW regarding flooding and other issues. This information, as relevant to the proposed scheme, is summarised in the ES.
84 DCM	At the design stage of any scheme, ensure that watercourses, particularly those supporting protected species, are taken into consideration. Liaise with organisations such as the NRW to identify relevant issues, and avoid the direct loss of riverine habitat (for example through inappropriate culverting).	Y	All major watercourses would be crossed by clear span structures, at height. No direct effects on these habitats or species dependent on this habitat are anticipated. Consultation with NRW has been carried out. Additionally hydromorphological walkover and ecological surveying has been undertaken to identify sensitive aquatic habitats. A Water Framework Directive (WFD) assessment has been carried out to assess all modified existing and new proposed culverts. These are of minor watercourses and ditches with limited potential to support protected species.
85 DCM	Before road schemes commence, take into account drainage issues and potential changes in groundwater, and any likely/potential effects	Y	Hydrological assessment has been undertaken as part of ES Chapter 17: Road Drainage and the Water Environment.

Action name	Action	Applicable (Y / N)	Compliance of proposed scheme with action
	on local watercourses.		
86 DCM	Maintain and develop pollution controls, in line with best practice, to stop untreated road runoff and vehicle pollution seeping into nearby watercourses.	Y	Controls in line with CIRIA (2015) guidance would be applied to treat runoff in relation to risk from both routine pollution and major spillages during construction. The operational phase drainage has been designed to best practice with incorporation of Sustainable Urban Drainage techniques. Additionally these have would be adapted to provide wildlife habitat i.e. planting of marginal vegetation (see EMP, ES – Volume 4).
87 DCM	Implement watercourse restoration schemes where road construction has unavoidably disturbed a river or stream where land ownership allows. Apply to 10 different locations by 2014.	Y	New culverts would be designed in accordance with best practice guidelines (CIRIA, 2015) and river beds would be reinstated as per The River restoration Centre (2013).
88 FRM	Monitor the condition of rivers and streams on and adjacent to the soft estate to ensure maintenance of quality following improvement or major maintenance where there are specific identifiable issues of biodiversity concern. Where significant effects remain after mitigation, considerate whether retro-fitted measures can be applied.	Y	Water quality would be monitored during and post-construction where necessary, as per the Construction Environmental Management Plan (CEMP) and the environmental management plan for the post-construction phases.
89 CP	Raise awareness about the importance and vulnerability of water bodies and their associated species within those organisations involved in design, construction and maintenance.	N	N/A
Rock Faces and Screes			
90 PGA	Review WTRMM advice and best practice generally so to include advice on management of rock face and scree habitats, including the management of invasive species, within the WTRMM.	N	N/A
91 PGA	Review the need for advice in the DMRB with the UK National Highway Authorities.	N	N/A
92 SUR	As part of surveys, ensure the location and value of rock faces and screes are assessed.	Y	The Phase 1 habitat survey identified natural rock faces at Taf Fawr and Taf Fechan gorges (ES – Appendix 11F).
93 DCM	At the design stage for new road and improvement schemes, ensure that valuable rock faces and scree, in particular UKBAP habitats and designated sites, are taken into consideration. Avoid the direct loss of	Y	An environmental constraints plan was issued to the design team highlighting ecological constraints to the proposed scheme. The use of natural rock to form retaining edges, where the geology allows, has been

Action name	Action	Applicable (Y / N)	Compliance of proposed scheme with action
	rock faces and scree wherever possible.		investigated as well as the use of scree where space and suitability of the landform allows during proposed scheme design. Direct loss to rock faces and scree has been unavoidable at Taf Fechan and Taf Fawr but has been minimised wherever possible through proposed scheme design.
94 DCM	Create or restore 10 new sites by 2014	Y	Rock faces would be created as part of the proposed scheme in relation to proposed retaining walls and in the proposed cutting east of Baverstocks junction.
95 DCM	Consider creating wet rock faces where road drainage issues allow, and road safety issues are not compromised.	Y	Rock faces would be created as part of the proposed scheme but would be kept dry. Wet rock faces are located naturally at the Taf Fechan and Taf Fawr gorges where proposed loss has been minimised.
96 CP	Raise the awareness of the value of rock face and scree communities within the Transport Directorate staff, Trunk Road Agents and the general public.	N	N/A
Waterbodies			
97 PGA	Review and, if necessary, update guidance in WTRMM on the management of water-bodies on the soft estate.	N	N/A
98 DCM	At the design stage for new road and improvement schemes, ensure that valuable water bodies, in particular UKBAP habitats and designated sites, are taken into consideration. Avoid the direct loss of water bodies wherever possible.	Y	All waterbodies were mapped during the Phase 1 habitats survey (Appendix 11F).Their locations were shown on an environmental constraints map issued to the design team in order to influence the design to avoid impacts on these features as far as possible. The WFD Framework was applied to assess all waterbodies. Waterbody loss would be limited to a partial infill of a reservoir west of Dowlais Top and of a small natural pond on the off-line section at Hirwaun.
99 DCM	Take into account during design and construction indirect effects of drainage or alterations to ground water on surrounding water bodies.	Y	The impacts of design and construction on groundwater, including quality, quantity and the relationship with surrounding waterbodies, is assessed within the ES, specifically Chapter 17: Road Drainage and Water Environment.

Action name	Action	Applicable (Y / N)	Compliance of proposed scheme with action
100 DCM *	Undertake further pond/reed bed creation for biodiversity purposes, at the rate of one pond or reed bed/year.	Y	No reed beds are proposed. The rate of one per year is not applicable to the proposed scheme. Twenty-six attenuation ponds would be created to prevent increased flooding. These would also serve a dual purpose of enhancing biodiversity, where possible.
101 DCM *	Improve road runoff protection in existing schemes or scheme improvements as opportunities arise and/or where the need arises following assessments of risk, at the rate of one d scheme per year.	Y	The existing drainage arrangements along Sections 5 and 6 of the A465 do not include flow attenuation or significant deliberate pollution control measures. The proposed scheme would include SuDS drainage which would seek to reduce peak rates of storm water runoff and reduce pollution being discharged into local waterbodies. The rate of one / year is not applicable to the proposed scheme.
102 FRM	Set up a system to collate records of pollution incidents and monitor effects on waterbodies.	N	N/A
103 FRM	Monitor the waterbodies on and adjacent to the soft estate to ensure maintenance of quality following improvement or major maintenance, or where there are specific identifiable issues of biodiversity concern. Where significant effects remain after mitigation, consider whether retro-fitted measures can be applied.	Y	Water quality would be monitored during and post-construction where necessary, as per the Construction Environmental Management Plan (CEMP) and the environmental management plan for the post-construction phases. However, the proposals are likely to result in a net improvement in water quality over the current proposed scheme.
104 CP	Raise awareness about the importance and vulnerability of water bodies and their associated species within those organisations involved in design, construction and maintenance.	N	N/A
Woodlands and Planted Native Trees and Shrubs			
105 PGA	Review the WTRMM and, if necessary, update guidance to provide detailed information on the appropriate management of woodland, veteran trees and roadside plantings within and adjacent to road verges to maximise biodiversity. Include in this the use of landscape planting to create corridors and links between existing habitat types.	N	N/A
106 SUR	Review existing information on the location of UKBAP woodlands within the network, including NRW's Priority Habitats and Ancient	Y	All ancient woodland within the survey area has been mapped using desktop data including Ancient Woodland Inventories and Phase 1

Action name	Action	Applicable (Y / N)	Compliance of proposed scheme with action
	Woodland Inventories and Forest Enterprise's review data.		habitat survey (ES Volume 2 – Appendix 11F).
107 SUR	Ensure all surveys undertaken take fully into account planted/woodland areas and mature / ancient trees in the network.	Y	A465 Summer 2016 Ecology Factual Report (ES Volume 2 – Appendix 11F) included both a desk study and a detailed Phase 1 Habitat Survey which identified any areas of planted / woodland areas and mature / ancient trees.
108 DCM	At the design stage for new road and improvement schemes, ensure that valuable woodlands and trees, in particular UKBAP habitats and designated sites, are taken into consideration. Avoid the direct loss of valuable woodland habitat and individual trees wherever possible.	Y	The locations of valuable woodland habitats were shown on an environmental constraints map which was used to inform design to minimise woodland loss. Further arboricultural surveys were also undertaken as described in the Tree Survey Report (ES Volume 2 – Appendix 10L).
109 DCM	Protect existing and retained woodland habitat during construction operations by the use of appropriate fencing, and by not stockpiling construction materials in these areas.	Y	Recommendations are made in the draft REAC and CEMP in the ES on appropriate ways of protecting woodland habitat along the proposed scheme such as keeping works, access corridors and stockpiles as far as possible away from woodland habitat along with appropriate fencing for root protection zones. Details are provided in the Tree Survey Report (ES Volume 2 – Appendix 10L).
110 DCM	Where the loss of woodland is unavoidable, consider options for mitigation and enhancement, including the extension of areas of existing woodland, or increasing connections with other woodland areas by the use of native planting. Translocation should only be considered as a last resort.	Y	Some areas of woodland including ancient woodland would be unavoidably lost. Approximately 43 ha of new woodland habitat would be created. An ancient woodland mitigation site (approximately 7 ha) would accept translocation of vegetative material and topsoil. An appropriate habitat management plan would also be put in place; an outline management plan for ancient woodland mitigation habitats is described in ES Volume 2 – Appendix 11O.
111 DCM	Prior to undertaking management on existing planted areas, identify those areas that may benefit from enhancement measures. See enhancement action below.	Y	Retained woodland within the new soft estate (see EMP, ES – Volume 4 at Croesbychan junction) would undergo enhancement and long term management.
112 DCM	Encourage additional tree and shrub planting in existing planted areas in order to enhance species mix and age structure, to extend the areas of existing woodland, or to link valuable woodland habitats	Y	Opportunities for enhancement of existing planted areas, extension of existing woodland and linking of woodland habitat by supplementary planting are identified in the ES and EMP, along with the preferred species to do this.

Action name	Action	Applicable (Y / N)	Compliance of proposed scheme with action
113 DCM	Use only native species when carrying out planting and, where possible, stock of local provenance, ensuring that the species are used in 'natural' abundance and distributions. If appropriate, consider growing from seeds from particular sites.	Y	Any planting would be carried out using species of local / bioregional provenance and abundance and diversity of planted trees would match that already present except where species richness is to be enhanced. Ancient woodland mitigation sites would be planted with saplings propagated from mature and veteran trees lost to the proposed scheme. This is specified in the ES.
114 FRM	Monitor existing mature trees alongside new/improved roads to try to ensure that they remain healthy, and determine whether the road or its construction has adversely affected them.	Y	A tree survey has been carried out as part of the landscape section of the ES to assess the health of nearby existing mature trees and recommendations have been made to ensure retained trees remain unaffected by the proposed scheme, where possible (ES Volume 2 – Appendix 10L).
115 FRM	Assess areas of new planting with respect to their growth/health.	Y	A post construction environmental / habitat management plan would monitor growth / health of new planting (requirement of the REAC).
116 CP	Raise awareness within the Transport Directorate staff and Trunk Road Agents of the value of UKBAP woodland habitats on the network, for example through the use of internal training. See Education and Awareness GAP.	N	N/A
117 CP	Ensure that Transport Directorate staff and Trunk Road Agents involved in road verge management are aware of any updating of the WTRMM with regard to woodland management.	N	N/A
118 CP	Raise public awareness of the value of native trees and shrubs for wildlife, for example through the use of publications (internal and external).	N	N/A
SPECIES ACTION PLANS			
Amphibians			
119 PGA	Review existing advice within WTRMM to ensure it incorporates best practice.	N	N/A
120 SUR	Where new road schemes are proposed, survey terrestrial and	Y	Surveys (HSI assessments and eDNA surveys) were carried out in 2015

Action name	Action	Applicable (Y / N)	Compliance of proposed scheme with action
	aquatic habitat in the area to assess local amphibian populations and predict potential migration routes.		to provide baseline knowledge on great crested newt (*Triturus cristatus*) (GCN) presence or absence and distribution. Thirty-one ponds within 500 m of the proposed scheme were surveyed using eDNA surveys and all samples were negative for great crested newt presence. Further traditional presence / absence surveys were undertaken at ponds within Winchfawr West SINC and Bryniau SINC in 2016. GCN with a peak count of 12 (10 male, two female) was recorded in pond 2254 and one great crested newt (1 male) was recorded in pond 2256. (see ES Volume 2 – Appendix 11G for full details) Amphibians are unlikely to cross the existing A465.
121 DCM	Where a road will unavoidably destroy or degrade amphibian habitat, consider the creation of new breeding waters, artificial hibernacula and suitable foraging habitat (these may be incorporated into soft estate planting depending on the species involved).	Y	One pond would be lost as part of the proposed scheme and a reservoir would be partially infilled. Neither had GCN recorded within them or are located within 500 m of positive GCN records. Attenuation ponds would be created to prevent increased flooding which would also serve a dual purpose of enhancing biodiversity. These would be planted with marginal vegetation to enhance terrestrial habitat. Hibernaculum which would also benefit other amphibian and reptile species are proposed across the proposed scheme soft estate (see EMP – ES – Volume 4)
122 DCM	Where existing amphibian road-kill black spots are known, consider building mitigation measures into the road: these may include tunnels, fencing and road signs.	Y	No road-kill black spots were identified during the desktop study. The proposed scheme would include the creation of new culverts and underpasses and retain existing culverts where possible, permitting amphibian dispersal.
123 DCM	Take into account the possible impacts of alterations to drainage or water levels on the surrounding amphibian populations during construction and maintenance operations.	Y	Road drainage is considered in ES Chapter 17: Road Drainage and the water Environment for the proposed scheme. No impacts on amphibian species are considered likely.
124 DCM *	Replace or amend gully pots that can trap amphibians, with more suitable structures on a rolling programme (as maintenance is undertaken). Aim to replace/amend these on a minimum of three locations/year.	Y	No gully pots are proposed. The features of SuDS would be incorporated into design to limit potential to trap amphibians.
125 DCM	Consider the provision of habitats suitable for amphibians (both for	Y	Mitigation for GCN would include the creation of enhanced terrestrial

Action name	Action	Applicable (Y / N)	Compliance of proposed scheme with action
	foraging and hibernating) when managing the soft estate, to enhance the area for the local amphibian population.		habitats which would form the new soft estate and would include hibernaculum which would benefit additional amphibian and reptile species.
126 DCM	Ensure measures are in place to prevent road runoff pollution events in line with best practice in new schemes.	Y	Mitigation to prevent road run-off pollution events is considered in the ES, in line with best practice guidance (CIRIA, 2015) and SuDS.
127 FRM	Set up a system to collate current and future records of amphibian sites on the network, including road-kill black spots and migration routes.	N	N/A
128 CP	Liaise with local amphibian groups in each county that can survey, monitor and help flag up road-kill black spots and migration routes.	N	N/A
129 CP	Raise awareness of Transport Directorate staff with respect to road-kill black spots, and encourage reporting of such areas.	N	N/A
130 CP	Raise public awareness of amphibian issues via publicity materials.	N	N/A
Aquatic Species			
131 PGA	Review advice within the WTRMM regarding maintenance operations as they impact upon aquatic systems.	N	N/A
132 DCM	During the design phase of a road scheme, assess the impacts upon aquatic species, particularly at river crossing points, at both desk study and field survey phases.	Y	A desk study using local biodiversity record centre data and aquatic and fisheries data from NRW was undertaken along with field visits to watercourse crossing points. The results of the aquatic ecology and hydromorphology assessments were used to inform the design phase of the proposed scheme.
133 DCM	During construction, in consultation with Environment Agency Wales and NRW, ensure as little disruption as possible to aquatic species occurs. Maintain water quality, and the ability of species to move along rivers and water bodies, throughout construction. Ensure footings do not significantly encroach on water courses.	Y	Designed mitigation would avoid in-channel working as far as practicable Use of CIRIA guidance would reduce the likelihood of water quality impacts from construction activities (CIRIA, 2015). Hydrological continuity would be maintained throughout construction (screened over pumping should temporary dry working areas be required in-channel). Supporting infrastructure has been designed so not to encroach in channel footprint (developed through WFD compliance assessment).

Action name	Action	Applicable (Y / N)	Compliance of proposed scheme with action
134 DCM	Ensure that, following construction, runoff from roads does not directly enter watercourses.	Y	Designed mitigation would include the use of buffer zones along aquatic corridors and sustainable drainage design incorporating attenuation ponds to reduce point source inputs into watercourses.
135 DCM *	During design and maintenance, identify opportunities to enhance the ecological value of streams to aquatic birds by the provision of nesting structures including burrows and platforms. Five sites a year in appropriate locations.	Y	Four dipper nest boxes are proposed, see EMP, ES – Volume 4 for locations.
136 CP	Create awareness within the Transport Directorate and the Trunk Road Agents of Ongoing and opportunities for enhancement for aquatic species.	N	N/A
Barn Owl (*Tyto alba*)			
137 PGA	Work with Highways Agency and other UK National Highway Authorities to produce advice in DMRB.	N	N/A
138 PGA	Review Highways Agency and Barn Owl Trust research on the impact of roads on barn owls and any recommendations for soft estate management, and apply in the context of the Welsh trunk road network through the WTRMM.	N	N/A
139 SUR	Set up a system for reporting barn owl casualties to the Transport Directorate.	N	N/A
140 SUR	Identify the extent of the soft estate used by barn owls as current/potential foraging and nesting habitat by collating current information.	Y	Habitat maps along with target notes within the A456 Summer Ecology Factual Report (ES Volume 2 - Appendix 11F) report show the locations of potential suitable habitat for barn owl.
141 DCM	Identify stretches of road where regularly high levels of mortality are recorded.	Y	Local records centre (SEWBReC) contacted for records of barn owl, including for road mortality.
142 DCM	Where new road developments are planned, ensure prior desk studies and surveys determine any likely impacts on the local barn owl population and options available for the mitigation of these impacts.	Y	Local records centre were contacted for records of barn owl, surveys undertaken in summer 2015 (ES Volume 2 - Appendix 11F) to assess habitat suitable to support birds including barn owl and Schedule 1 bird species survey at Taf Fechan were undertaken in 2016 (ES Volume 2 -

Action name	Action	Applicable (Y / N)	Compliance of proposed scheme with action
			Appendix 11G). Suitable habitat for barn owl is highlighted in Summer Ecology Factual Report (ES Volume 2 – Appendix 11F). Incidental records of barn owl are presented in the 2016 Ecology Factual Report (ES Volume 2 – Appendix 11G). Proposed mitigation for barn owl is given in the Protected Species Compliance Report (ES Volume 2 - Appendix 11B).
143 DCM	Apply mitigation to areas of high barn owl road mortality.	N	No specific areas highlighted.
144 CP	Investigate the possibility of warning signs in areas known as important barn owl hunting areas.	N	No important barn owl hunting areas identified along the proposed scheme.
145 CP	Encourage the public to report barn owl road traffic accidents or sightings of barn owls on the network.	N	N/A
Bats			
146 PGA	Review, with the Highways Agency and other UK National Highway Authorities, the DMRB Bat Advice Note.	N	N/A
147 PGA	Review the WTRMM, and publish advice for all network operators to ensure maintenance works are undertaken at the correct time of year, and after the appropriate surveys have been carried out.	N	N/A
148 DCM	Include bats at the earliest stages of road design, construction and maintenance in order to ensure the early identification (and appropriate management) of sites valuable as roosts, foraging areas, and linear corridors.	Y	Bat surveys were undertaken by Jacobs in 2015 and 2016 (ES Volume 2 – Appendix 11E, Appendix 11G and Appendix 11H) including building and tree roost assessments, back-tracking surveys, activity transects, dusk emergence / dawn re-entry surveys and assessments of structures and caves within the vicinity of the proposed scheme for bat roost potential.
149 DCM	Avoid the indirect impacts of water-based pollution on valuable feeding areas by using and maintaining appropriate road runoff control and treatment measures.	Y	Mitigation to prevent road run-off pollution events in both the construction and operational phases of the proposed scheme is considered in the ES (requirement of the REAC).Best practice CIRIA guidelines would be adhered to and best practice drainage design would be implemented.
150 DCM	Consider options for mitigation and enhancement in all road construction and maintenance operations (for example bat tunnels,	Y	Mitigation to off-set any negative effects of the proposed scheme on bats is outlined in the ES and shown in the EMP, ES – Volume 4. This

Action name	Action	Applicable (Y / N)	Compliance of proposed scheme with action
	habitat enhancements and hibernacula).		includes provision of new roosting opportunities, commuting routes and foraging habitat.
151 DCM	Increase opportunities for roosting bats in areas of woodland within the highway boundary (which are otherwise suitable for use by foraging bats) by adding artificial roosts.	Y	Bat boxes would be deployed in suitable retained vegetation in the proposed soft estate. Indicative locations are illustrated in the EMP, ES-Volume 4.
152 DCM *	Provide bat boxes which are suitable for the species likely to be present in order to enhance 30 appropriate locations within the highway boundary.	Y	Bat boxes would be deployed in suitable retained vegetation in the proposed soft estate. Indicative locations are illustrated in the EMP, ES-Volume 4.
153 FRM	Develop a system to collect and maintain information of known roosts which are located on or very near the network.	Y	Information on roosts near the proposed scheme was collected during surveys undertaken in summer 2015 (ES Volume 2– Appendix 11E) and 2016 (ES Volume 2 – Appendix 11G). Monitoring artificial bat boxes will be a requirement of European Protected Species (EPS) licencing. This information is owned by WG and would, therefore, be shared with trunk road maintaining agents.
154 FRM	Develop a system to identify and collate information on well-used crossing points within the network, and any areas of high road mortality of bats.	Y	Bat activity surveys were used to identify crossing points within the proposed scheme and mitigation to reduce the likelihood of mortality for bats would be put in place, especially on offline sections of the proposed scheme. New culverts suitable for commuting bats would be monitored post construction.
155 CP	Develop training materials to support the information in the WTRMM and DMRB after their review.	N	N/A
156 CP	Liaise with NRW and local bat groups who may be able to provide additional information on species distributions.	Y	NRW representatives and LA ecologists were present at ELG and TWG meetings to provide additional information.
157 CP	Ensure maintenance personnel and engineers are aware of issues such as seasonal constraints and licensing requirements, and the consequent need for forward planning.	Y	Seasonal constraints and licencing requirements are outlined in the ES for the proposed scheme and would be communicated to all those involved in the delivery of the proposed scheme.
Dormouse (*Muscardinus avellanarius*)			
158 PGA	Review the need to incorporate detailed advice into the WTRMM	N	N/A

Action name	Action	Applicable (Y / N)	Compliance of proposed scheme with action
	regarding management of the soft estate with regard to dormice.		
159 SUR	For new schemes, identify dormouse suitable habitats within soft estate, and undertake surveys (using licensed surveyors) wherever these are present.	N	Not applicable to the proposed scheme. Dormouse presence scoped out during the environmental scoping stage as no records exist within a 1 km wide corridor centred on the proposed scheme.
160 SUR	Concentrate survey effort on the existing soft estate around areas identified as having local dormouse populations for example Wye Valley.	N	N/A
161 DCM	Include dormice at the earliest stages of road design, construction and maintenance, in order to ensure the early identification of dormice populations.	Y	Dormouse presence considered at environmental scoping stage and was scoped out due to the low risk this species is present along the proposed scheme.
162 DCM	Where impacts are unavoidable, make efforts to create alternative habitats and enhance remaining habitat. Consider the provision of 'links' (such as rope bridges) across roads to prevent them acting as barriers to dispersal.	N	N/A
163 DCM	Promote soft estate management techniques that enhance potentially suitable dormouse habitat. Extend current planting schemes to provide habitats of value to dormice.	N	N/A
164 DCM *	Enhance suitable habitat through the provision of dormouse boxes in 30 locations within the highway boundary.	N	N/A
165 FRM *	Set up a system to monitor suitable dormouse habitats within the soft estate so that the success of management of the soft estate can be assessed.	N	N/A
166 FRM	Monitor mitigation measures (for example, those to connect woodlands that have been fragmented by roads) to inform future schemes.	N	N/A
167 CP	Provide Transport Directorate staff and Trunk Road Agents with information on dormice issues.	N	N/A

Action name	Action	Applicable (Y / N)	Compliance of proposed scheme with action
Marsh Fritillary (*Euphydryas aurinia*)			
168 PGA	Review with the UK National Highways Authorities the need for an advice note within the DMRB on marsh fritillaries.	N	N/A
169 PGA	Update the WTRMM to include information on management of the soft estate to promote marsh fritillary conservation.	N	N/A
170 SUR	Identify areas of marshy grassland in relation to existing and proposed road schemes using the NRW Phase I maps and existing information.	Y	A465 Summer Ecology Factual Report (ES Volume 2 – Appendix 11F) included both a desk study and a detailed Phase 1 Habitat Survey which identified areas of marshy grassland with subsequent species specific habitat suitability assessment for marsh fritillary. .
171 SUR	Survey these areas of suitable habitat on the soft estate that are adjacent to known populations of marsh fritillary for their suitability and presence of larval webs.	Y	Baseline monitoring of 11 sites identified as representative habitats of those across the proposed scheme has been in place since 2008. Over 100 ha of additional suitable habitat for has been identified within the 2 km Blaen Cynon SAC metapopulation area for marsh fritillary in this region.
172 DCM	Identify road schemes that might fragment further known metapopulations of marsh fritillary butterflies. Investigate mechanisms of reducing the effects of fragmentation where this is unavoidable.	Y	The proposed scheme was subject to a Statement to Inform Appropriate Assessment (SIAA) for Blaen Cynon SAC and its marsh fritillary metapopulation. Mitigation for marsh fritillary has involved influencing the proposed scheme design and construction methods to limit fragmentation and isolation of suitable habitat. Provision of additional suitable habitat in specified mitigation land for marsh fritillary lost to the proposed scheme is proposed (see EMP, ES – Volume 4).
173 DCM *	Avoid the indirect effects of road runoff pollution on suitable habitat by appropriate hydrological design: during design phase and as pollution events occur.	Y	Design of road drainage network would reduce significant impact on existing habitat by retaining existing hydrological sources and preventing discharge to sensitive habitats through following CIRIA guidelines (CIRIA, 2015).
174 DCM	Consider options for mitigation and enhancement in road construction and maintenance operations, particularly where small alterations in management (within the soft estate) may result in habitat that might link remnant parcels outside of the soft estate.	Y	There would be some wildflower seed mix provided along the new verges near suitable marsh fritillary habitat which would aim to maintain connectivity and encourage dispersal of the species between suitable habitats in its adult form. An additional area of mitigation land

Action name	Action	Applicable (Y / N)	Compliance of proposed scheme with action
			(approximately 14 ha) is proposed to further link suitable habitat in the wider landscape.
175 DCM	Where marsh fritillaries are found on road verges, consider whether to modify existing management.	Y	Road verges would not be specifically managed to encourage marsh fritillary, other than in its adult dispersal. This is set out in the management prescriptions for such sites, as described in the ES Chapter 11: Nature Conservation and SIAA.
176 FRM	Create and maintain a database of all sites within or adjacent to the trunk road and motorway network that are either known breeding grounds or are potentially suitable for the marsh fritillary.	Y	All sites known to or have potential to support marsh fritillary have identified as part of the ES.
177 FRM	Consider research to determine if major roads do present a barrier to dispersal with the UK National Highway Authorities.	N	N/A
Otter (*Lutra lutra*)			
178 PGA	With the UK National Highway Authorities, review the current Otter Advice Note.	N	N/A
179 PGA	Review the WTRMM on the management of the soft estate for the benefit of otters.	N	N/A
180 DCM	Where impacts of new schemes and road improvements on otter habitat are unavoidable, consider the options for wide-span bridges, otter ledges, road underpasses, otter resting places, other habitat improvements, and artificial holts, and prevent effects on feeding areas through appropriate pollution controls.	Y	Otter surveys were carried out to inform the ES and evidence of otter presence was recorded on all major watercourses. Clear span bridges are proposed at major watercourse crossings to minimise potential impacts. The proposed scheme would involve the creation on new culverts and underpasses, which would be made suitable for mammals through the provision of ledges, where appropriate. The proposed scheme construction would be carried out under current good practice CIRIA guidelines; this would reduce the risk of a water pollution incident occurring.
181 DCM	Increase the amount of available otter habitat by removing barriers to dispersal (for example, under bridges and through culverts) and by	Y	The proposed scheme would include the creation of new culverts with mammal underpasses to improve connectivity between habitats for animal species in general. New commuting and resting habitat features

Action name	Action	Applicable (Y / N)	Compliance of proposed scheme with action
	creating suitable habitat wherever possible.		for otters would be created as part of the proposed scheme as an indirect result of habitat replacement for woodland and hedge / scrub planting.
182 DCM *	Continue providing mitigation for existing roads at sites identified as 'black spots' across the network. Ten appropriate sites/year.	Y	Identified by Cardiff University Otter Project (Wilkinson and Chadwick, 2012) as an area of concern: the A470 junction and Dowlais Top - two road traffic casualties found (although not a priority for action). Otter mitigation is provided in the ES and would aim to minimise impact of the proposed scheme on otter through the provision of underpasses and culverts. Ten sites per year is not applicable to the proposed scheme.
183 DCM	Undertake regular checks of artificial holts, otter underpasses and fences as part of maintenance activities to check that they are not blocked or in bad condition.	Y	Culverts and underpasses would be identified for post construction monitoring which would include regular checks for use by mammals including otter.
184 FRM	Continue supporting work to identify black spots on existing roads which pose a threat to otters.	N	N/A
185 FRM	Monitor the use and success of otter mitigation already installed across the road network to inform future mitigation.	N	N/A
186 CP	Include information on otter issues for Transport Directorate staff and Trunk Road Agents.	N	N/A
Reptiles			
187 PGA	Review existing advice within WTRMM to ensure it incorporates best practice.	N	N/A
188 PGA	With Highways Agency and other UK National Highway Authorities produce advice for DMRB.	N	N/A
189 SUR	Undertake surveys of suitable habitat to build up a more complete picture of soft estate use by reptiles.	Y	Suitable reptile habitat was identified and highlighted during Phase 1 habitat survey as detailed in Summer Ecology Factual Report (ES Volume 2 – Appendix 11F).
190 DCM	Identify the likely presence of reptiles early, particularly for schemes where there is no alternative to effects on reptiles, and which would require translocation as a last resort.	Y	Habitat suitable for reptiles has been identified as part of the Phase 1 habitat surveys undertaken in the summer of 2015 (ES Volume 2 – Appendix 11F). SEWBReC was contacted for records of reptiles within

Action name	Action	Applicable (Y / N)	Compliance of proposed scheme with action
			the vicinity of the proposed scheme and SINC citations were reviewed as part of the exercise of valuing the habitat surrounding the proposed scheme for reptiles. This was provided in the early EMP to influence design. A mitigation plan for reptiles is presented in the Protected Species Compliance Report (ES Volume 2 – Appendix 11B).
191 DCM *	Create reptile habitats on five new sites/year in appropriate locations.	Y	Hibernacula have been incorporated into proposed scheme design for both amphibians and reptiles. Habitats would be created for reptiles as an indirect result of habitat creation throughout the proposed new soft estate.
192 CP	Ensure Trunk Road Agents are aware of current best practice regarding reptiles, particularly new additions to the DMRB and WTRMM.	N	N/A
Water vole (*Arvicola amphibious*)			
193 PGA	Review with the UK National Highway Authorities the need for an advice note within the DMRB on water voles.	N	N/A
194 PGA	Review and update the WTRMM as necessary to include information on management of the soft estate to promote water vole conservation.	N	N/A
195 SUR	Set up system to monitor water vole populations and suitable habitat in areas of the soft estate known to already have vole populations.	N	Not applicable - no known areas with water vole populations. The species was scoped out at the environmental scoping stage as an ecological constraint.
196 DCM	For all road construction and road improvement schemes, include an initial desk study and water vole survey as identification within the scoping stage of the development may allow impacts to be avoided.	Y	Not applicable. Water vole presence scoped out during the environmental scoping stage as no records exist within a 1 km wide corridor centred on the proposed scheme. No evidence of water vole was recorded during other aquatic surveys.
197 DCM	Offset unavoidable impacts from road development by the provision of new habitats, improvement of existing habitats, positive management actions (for example, provision of fencing, scrub control) and control of pollution from road runoff.	N	Proposed scheme not considered to impact occupied water vole habitat. Mitigation would be in place to offset effects of pollution on from road run-off on nearby watercourses.

Action name	Action	Applicable (Y / N)	Compliance of proposed scheme with action
198 DCM *	Remove the barriers to the dispersal of water voles through the provision of purpose designed drains and water features.	N	N/A
199 DCM	Provide new water vole habitat, either through habitat creation or changes in management, in suitable locations: two sites / year.	N	N/A
200 FRM	Monitor water vole populations on or close to the soft estate as part of any mitigation scheme; ascertain the success of any such mitigation measures to inform future actions.	N	N/A
201 CP	Provide information on water voles within environmental training provided within the Transport Directorate and by Managing Agents.	N	N/A
Welsh Clearwing Moth (*Synanthedon scoliaeformis*)			
202 PGA	Update the WTRMM to include information on management of the soft estate to promote Welsh clearwing conservation in appropriate locations.	N	N/A
203 SUR	Identify suitable stands of mature birch on the soft estate, and undertake surveys for Welsh clearwing. Give priority to stands of birch in the locations where Welsh clearwing have been identified in previous surveys.	N	No records exist within a 1 km wide corridor centred on the proposed scheme. No stands of mature birch are located on the existing soft estate or within a 1 km wide corridor centred on the proposed scheme.
204 DCM	Ensure the potential presence of Welsh clearwing is considered in advance of birch tree maintenance and construction of new schemes.	N	N/A
205 DCM	Encourage birch regeneration by using fencing, and plant new birch trees where appropriate.	N	N/A
Native Black Poplar (*Populus nigra*)			
206 SUR	Identify any existing black-poplar trees on the soft-estate.	N	Species not recorded during extended Phase 1 habitat surveys and no records exist within a 1 km wide corridor centred on the proposed scheme.
207 SUR	Monitor the condition of the native black-poplar trees on the soft estate.	N	N/A

Action name	Action	Applicable (Y / N)	Compliance of proposed scheme with action
208 DCM	Identify new opportunities for including native black-poplar trees in any new planting schemes. Plant in ten sites by 2014	N	N/A
209 DCM	For all new road schemes and road improvements, avoid any direct impacts on native black-poplar trees, particularly female trees. Where this is unavoidable, plant new trees of local provenance in appropriate locations.	N	N/A
210 DCM	Undertake any tree surgery necessary to maintain any mature trees in a safe condition so they can be retained.	N	N/A
211 FRM	Consider DNA testing the trees on the soft estate and adjacent land to compare results with similar studies undertaken in the Upper Severn.	N	N/A
Bluebell (*Hyacynthoides non-scripta*)			
212 PGA	Review the WTRMM, and provide detailed information on the appropriate management of woodland ground flora and hedgerows containing bluebells.	N	N/A
213 PGA	Review with other UK National Highway Authorities advice for inclusion in the DMRB on the enhancement of existing planted areas, including bulbs.	N	N/A
214 DCM	At the design stage for new road and improvement schemes, ensure that valuable woodlands and ancient hedgerows with bluebells are taken into consideration. Avoid the direct loss of this habitat wherever possible.	Y	The A465 Summer 2015 Ecology Factual Report (ES – Appendix 11F) included both a desk study and a detailed Phase 1 Habitat Survey which identified valuable woodlands and hedgerows supporting bluebells. Woodland habitat was identified to the design team as a feature to be avoided.
215 DCM	Sympathetically manage woodland sites and ancient hedgerows, and other locations which contain bluebells that are within the soft estate	Y	Management of ancient woodland sites including woodland sites created as part of the proposed scheme would be undertaken, as described in the ES. The presence of bluebells has been taken account of in management prescriptions as presented in the outline management strategy for ancient woodland (Appendix 11O) in terms of soil translocation.

Action name	Action	Applicable (Y / N)	Compliance of proposed scheme with action
216 DCM	Consider the retention, storage and relocation of bulbs and topsoil, wherever road schemes affect areas of native bluebells.	Y	Where the proposed scheme affect areas of native bluebells (i.e. woodland habitats) the bulbs and topsoil would be relocated to the ancient woodland mitigation area (see EMP, ES – Volume 4).
217 DCM *	Plant forty new bluebell sites within the soft estate by 2014. Ensure that locally native bulbs are used and not non-native species such as Spanish bluebell.	Y	Bluebells would be translocated within top soils, where they already exist, to mitigation areas.
218 CP	Raise awareness within the Transport Directorate and Trunk Road Agents of the protection and appropriate management of bluebells.	N	N/A
219 CP	Increase public awareness of the value of bluebells in road verges.	N	N/A
Deptford Pink (*Dianthus armeria*)			
220 PGA	Provide guidance on the management of roadside verges for the benefit of the Deptford pink if populations are found.	N	N/A.
221 SUR	Survey areas of the network which may be suitable.	N	Species not recorded during extended Phase 1 habitat surveys and no records exist within a 1 km wide corridor centred on the proposed scheme.
222 SUR	Set up system for reporting of potential areas of suitable habitat.	N	N/A
223 DCM	Where colonies are found on the soft estate, avoid impacting the species through road construction.	N	N/A
224 DCM	Where impacts on the species cannot be avoided provide appropriate mitigation and consider habitat recreation / translocation.	N	N/A
225 DCM	Manage network verges to be favourable to Deptford pink in existing and potential areas of colonisation close to known sites.	N	N/A
226 FRM	Monitor known existing colonies of Deptford pink on the soft estate.	N	N/A
Limestone Woundwort (*Stachys alpina*)			
227 DCM	In areas close to known populations, survey suitable habitat for limestone woundwort before any road construction or improvement	N	Species not recorded during extended Phase 1 habitat surveys and no records exist within a 1 km wide corridor centred on the proposed

Action name	Action	Applicable (Y / N)	Compliance of proposed scheme with action
	takes place.		scheme.
228 DCM	Where conditions are appropriate, consider introduction schemes onto the soft estate.	N	N/A
229 DCM	All parties (the Directorate and the North-East Wales Trunk Road Agency/Forest Enterprise) to liaise with current interested parties (CCW; Ness Botanic Gardens; and Gloucestershire Wildlife Trust) to obtain advice on management, propagation and reintroduction. Apply results of liaison to existing population.	N	N/A
230 FRM	Monitor all existing (and future) colonies on the network.	N	N/A
Orchids			
231 PGA	Review existing recommendations within WTRMM for management of habitats that currently have orchids or could support them.	N	N/A
232 SUR	Identify areas that support orchids through a combination of field survey and desk study.	Y	The A465 Summer 2015 Ecology Factual Report (ES Volume 2 – Appendix 11F) included both a desk study and a detailed Phase 1 Habitat Survey which identified the presence of orchid species, often within neutral grasslands.
233 DCM	Ensure that any areas of the soft estate that are known to support orchids are managed to benefit these plants; this includes, for example, cutting areas of grassland at appropriate times of year and removing arisings. Avoid the use of herbicides to control alien and invasive weed species.	Y	Newly created soft estate would be appropriately managed for neutral grassland habitats and subsequently plant group. This would be detailed in a habitat management plan, a requirement of the REAC in the ES.
234 DCM	For all new road schemes and road improvements, seek to avoid any direct impacts on orchid-rich habitats. Ensure ornamental/landscape planting does not encroach onto orchid-rich areas.	Y	An orchid-rich area of neutral grassland at Rhigos roundabout was highlighted at an ELG meeting for the proposed scheme and is directly considered in the ES Chapter 11: Nature Conservation and EMP (ES Volume 4).
235 DCM	Create or restore new orchid-rich areas, either using seed of local provenance in appropriate locations, or through restoration management at 10 sites.	Y	Species-rich grassland would be created on the proposed soft estate as part of mitigation for the proposed scheme and managed to encourage natural establishment and subsequent seeding by such plants as orchids. Soil salvage would be used in orchid-rich areas to encourage orchids to

Action name	Action	Applicable (Y / N)	Compliance of proposed scheme with action
			regenerate on newly-created verges and specifically, at the new Rhigos roundabout (see EMP, ES – Volume 4).
236 DCM	Avoid introducing, as part of maintenance operations, inappropriate species (trees, shrubs and seed mixes) in areas that support or have the potential to support orchids.	Y	Landscape design in areas that support, or have potential to support, orchids would avoid the planting of inappropriate species in these areas. The CEMP will outline the methods for avoiding the spread of inappropriate species including invasive species.
237 FRM	Set up a system to review the success of management of areas to benefit orchids.	Y	The success of grassland creation and management would be monitored as part of the proposed scheme's aftercare in a habitat management plan (a requirement of the REAC in the ES)
238 CP	Develop training materials on best management practice for orchids.	N	N/A
239 CP	Raise public awareness of the conservation value of habitats containing orchids	N	N/A
Spreading Bellflower (*Campanula patula*)			
240 PGA	Provide guidance on the management of roadside verges for the benefit of the spreading bellflower, if populations are found.	N	N/A
241 SUR	Survey areas of the network which may be suitable.	N	Species not recorded during extended Phase 1 habitat surveys and no records exist within a 1 km wide corridor centred on the proposed scheme.
242 SUR	Set up system for reporting of potential areas of suitable habitat.	N	N/A
243 DCM	Where colonies are found on the soft estate, avoid impacting the species through road construction.	N	N/A
244 DCM	Where impacts on the species cannot be avoided, provide appropriate mitigation and consider habitat recreation/translocation as a last resort.	N	N/A
245 DCM	Manage network verges to be favourable to spreading bellflower, in existing and potential areas of colonisation close to known sites.	N	N/A
246 FRM	Monitor known existing colonies of spreading bellflower on the soft	N	N/A

Action name	Action	Applicable (Y / N)	Compliance of proposed scheme with action
	estate.		
Wood Bitter-vetch (*Vicia orobus*)			
247 PGA	Publish advice on management of areas on the soft estate known to contain wood bitter-vetch in WTRMM.	N	N/A
248 DCM	If new road construction or road improvements impact areas of grassland containing wood bitter-vetch, ensure that road verges are subsequently planted with a suitable species mix, including wood bitter-vetch. Consider translocation as a last resort.	N	Species not recorded during extended Phase 1 habitat surveys and no records exist within a 1 km wide corridor centred on the proposed scheme.
249 DCM	Manage of highway verges in a manner that controls scrub development and promotes this species' growth.	N	N/A
250 FRM	Monitor the success of seeding areas with wood bitter-vetch to ascertain the factors necessary for successful growth on the soft estate.	N	N/A
251 CP	Include details on appropriate landscape management for the conservation of wood bitter-vetch within the training of Managing Agents and Transport Directorate staff.	N	N/A

4. Conclusion

This report has considered each action under the TREBAP and concludes that the proposed scheme would fulfil objectives for all relevant species and habitats.

The proposed scheme would, therefore, comply with WG's responsibility to limit the impact of the development of the proposed scheme on biodiversity.

Executive Summary

Jacobs UK Ltd was commissioned in 2007 by the Welsh Government, to undertake annual baseline ecological monitoring of marsh fritillary *Euphydryas aurinia*. As part of the ecological scoping work in 2007 Jacobs concluded that the A465 Sections 5 and 6 may have a significant effect on the Blaen Cynon Special Area of Conservation (SAC) in terms of the marsh fritillary feature. The monitoring programme which started in 2008, aims to collect sufficient baseline to allow a robust Assessment of Implications on European Sites (AIES) to be produced for the A465 Section 5 and 6 scheme.

This report sets out the marsh fritillary baseline monitoring results for 2016 (year 9). In 2016 sites 3 and 7 were not habitat mapped or surveyed for adults due to land access restrictions. Site 4a was surveyed for adults only due to access restrictions.

Webs were recorded on four sites (2, 2a, 4 and 6). Sites 2 and 4 both supported high numbers of webs, with webs recorded for only the second time on site 6 since monitoring began in 2008. Site 6a had no webs recorded in 2016 for the first time since 2009 due to excessive grazing by ponies on the site.

Adult marsh fritillaries were recorded on three sites in 2016 (2, 4 and 7a). High numbers were recorded on sites 2 and 4 in comparison to other sites, although numbers are lower than those recorded in 2015. No marsh fritillaries have been recorded on site 5 since monitoring began in 2008. NRW did not carry out adult surveys on site 1 in 2016.

The habitat types and extents in the Blaen Cynon SAC were considered by Natural Resources Wales (NRW) not to have significantly changed since 2010 so have not been mapped between 2010 and 2016. Of the monitoring sites surveyed in 2016, site 5 had the most habitat classified as unsuitable condition, 68.5 %. Site 2a had the highest percentage of good condition habitat, 38.3 %, followed by site 6a with 22.5 %. Site 4 had the highest percentage of suitable but overgrazed habitat type, 44.4 %.

1. Introduction

1.1 Terms of Reference

Jacobs UK Ltd was commissioned in 2007 by the Welsh Government, to undertake annual baseline ecological monitoring of marsh fritillary butterfly *Euphydryas aurinia*. The monitoring programme aims to collect sufficient baseline to allow a robust Assessment of Implications on European Sites (AIES) to be produced for the A465 Section 5 and 6 schemes.

As part of the ecological work in 2007 Jacobs concluded that the A465 Sections 5 and 6 may have a significant effect on the Blaen Cynon Special Area of Conservation (SAC) in terms of the marsh fritillary feature. Figure 1 (Appendix A) shows the location of the Blaen Cynon SAC in relation to the proposed A465 scheme. Although the Blaen Cynon SAC has a definitive boundary, the population of marsh fritillary butterflies for which it is designated live across a wider area, forming a metapopulation (Upper Cynon Valley Functional Landscape Area); this is shown in Figure 2 (Appendix A). Further information on the Blaen Cynon SAC is set out in Appendix B.

1.2 Objectives

The monitoring programme aims to enhance the existing information currently held on the marsh fritillary population adjacent to the A465 Sections 5 and 6. The existing information was previously reported in the following survey reports as part of the 1997 Environmental Statement that covered the entire 40km dualling project between Abergavenny and Hirwaun. The 1997 ES supported the Line Order for the 40km dualling project.

- Abergavenny to Hirwaun Dualling: Invertebrate survey and assessment. Report No. SW263 (d)/V1/12-95, SGS Environment Ltd.
- Abergavenny to Hirwaun Dualling: Invertebrate survey and assessment. Report No. SW263 (D)/V3/10-97 SGS Environment Ltd.
- A465 Abergavenny to Hirwaun Dualling. Marsh Fritillary Larval Web Survey. Report No. 531/0263(AI)/V1/11-99. December 1999, SGS Environment Ltd.

The monitoring programme was completed in order to provide information to allow a Statement to Inform the Appropriate Assessment (SIAA) to be completed prior to the Publication of Draft Orders.

The baseline monitoring programme has been designed to fit in to an overall marsh fritillary monitoring programme which is likely to be structured as follows; the proposed timescales for each section of the programme have been based on the Welsh Government proposals:

- baseline monitoring (2008 - 2019);
- construction monitoring (2019 - 2022); and
- post construction monitoring (2022 – 2027).

The purpose of this report is to set out the results of the 2016 baseline monitoring visit and to summarise the changes noted since the start of the monitoring in 2008.

2. Background Information

2.1 Description of the Proposed A465 Scheme

The A465 forms part of the strategic Trans European Road Network and is included in the Welsh Government's National Transport Plan 2010. Together with the M4, it provides one of the two corridors linking south and west Wales to the Republic of Ireland, the Midlands and the North of England. The A465 is also the only major east-west route linking the communities along the heads of the South Wales valleys.

The proposed scheme forms part of a series of proposals to improve the entire route between Abergavenny and Hirwaun and runs along the heads of the South Wales valleys, known as "The Heads of the Valleys road". The proposed scheme will consist of mainly on-line widening of existing three-lane road to a dual carriageway, with construction being undertaken in sections.

The proposed scheme commences at Abergavenny and terminates at Hirwaun, and has been divided into six Sections.

- Section One Abergavenny to Gilwern.
- Section Two Gilwern to Brynmawr.
- Section Three Brynmawr to Tredegar.
- Section Four Tredegar to Dowlais Top.
- Section Five Dowlais Top to A470 Junction.
- Section Six A470 Junction to Hirwaun.

The Line Order for the whole scheme and Compulsory Purchase and Side Road Orders, under the Highways Act, 1980 (as amended) for Sections 1 and 4 were published in 1997, with an Environmental Statement (ES). These orders were considered at Public Inquiry in 1998 and were subsequently made. Section 4 was completed in 2004, Section 1 was completed in 2008, and Section 3 was completed in 2015. Section 2 is currently under construction.

2.2 A465 Sections 5 and 6

The A465 is currently an undulating three lane road between Hirwaun and Dowlais Top, two lanes in the uphill direction and one lane in the downhill. The road passes through a variety of habitat types and many of these were considered to be of South Wales / Local importance in the 1997 ES (Babtie, 1997). Section 5 and Section 6 pass through the unitary authorities of Merthyr Tydfil and Rhondda Cynon Taf (Figure 1, Appendix A).

Section 6 extends from the western edge of the suburban area of Hirwaun, eastwards to the junction of the A470 and the A4102 to the north-east of Merthyr Tydfil. The proposed scheme will follow the existing line of the A465 to the west of Jah – Jireh Care Home (formerly Baverstock Hotel) passing through open countryside.

At the westernmost extent of the proposed scheme the A465 the Hirwaun roundabout would be redesigned to become a grade separated junction. The road will run off line from the southern edge of the Hirwaun recreational ground and join the Trewaun Roundabout further to the east. The proposed scheme would continue eastwards over Nant Hir Reservoir and through a mainly rural area to the west of Jah – Jireh Care Home, Continuing westwards towards Section 5. .

Section 5 extends from the junction of the A470 and the A465, eastwards along the northern edge of Merthyr Tydfil to the junction of the A4060 (Dowlais Top Roundabout) in the east. Within this section, most of the proposed scheme would follow the line of the existing A465, with minor deviations east of Taf Fechan. ..

3. Marsh Fritillary

3.1 Species Biology

Adult marsh fritillaries emerge in early to mid-May and are on the wing until late June although individuals rarely live for more than 5-8 days (Hobson, et al., 2002). Within the United Kingdom the adults breed in two distinct types of unimproved habitats:

- damp neutral or acid grasslands “rhos pasture”; and
- dry chalk and limestone grasslands.

The adults mate on a single occasion during this period, with the female laying a batch of over 300 eggs on the underside of large devil’s bit scabious *Succisa pratensis* leaves (Porter & Ellis, 2011). The eggs hatch in August to September, with the brown / black spiny caterpillars feeding upon the scabious leaves inside a silken web. The larvae move together from one leaf to the next, spinning a new web each time (Butterfly Conservation, 2004).

Larger prominent *Succisa* plants are mainly present in habitats subjected to light grazing by ponies or cattle, which are often dominated by Molinia or Juncus tussocks. Sheep are considered to be an unsuitable grazing stock as they selectively graze *Succisa* (Butterfly Conservation, 2004).

The hibernation period starts in September / October, with the caterpillars spinning a small, dense web which is hidden in the grass tussocks low to the ground. The larvae emerge in February to early March to bask communally, during sunny periods, allowing their body temperatures to increase and them to grow rapidly before dispersing. Fifth and sixth instar larvae will move several metres to find fresh leaves of *Succisa*. In late April and May, larvae undergo pupation, emerging as adults after 16 to 26 days.

The natural pattern of the marsh fritillaries existence is in metapopulations whose survival is dependent upon having a network of nearby patches within which there is periodic extinction and re-colonisation i.e. areas where not all the habitat is occupied by the butterfly all of the time (Warren, 1994). This natural pattern is now broken throughout most of its UK range and the butterfly is often restricted to single habitat patches, or ineffectual groupings of small patches.

Modelling simulations, based upon real landscapes, indicate that marsh fritillaries require the minimum total area to range from 80 to 142 ha, for 95 % persistence after 100 years, depending upon spatial location of the habitat (Bulman, et al., 2007). Many of the present colonies exist as isolated entities, not only from other nearby colonies but also from potentially habitable sites.

3.2 Protection, Status and Distribution

The marsh fritillary is fully protected under Schedule 5 of the Wildlife and Countryside Act 1981.

The marsh fritillary is listed on Annex II of the Council Directive 92/43/EEC [8] on the conservation of natural habitats and of wild fauna and flora (Habitats Directive). Annex II lists the habitats and species considered to be of outstanding international significance and therefore of importance to the maintenance of biodiversity in the European Union. The regulations require the creation of a coherent ecological network of protected areas across the EU - known as NATURA 2000 for these species and habitats. The Blaen Cynon SAC is one of these sites. Its purpose is to maintain or restore the habitats and species at a favourable conservation status in their natural range. In order to avoid deterioration to Natura 2000 sites, bodies are required to review those consents, permissions or authorisations which have an effect upon these sites.

The marsh fritillary is also listed on Appendix II of the Bern Convention. The Bern Convention requires the UK to take appropriate and necessary legislative and administrative measures to ensure the special protection of the wild fauna species specified in Appendix II. The species listed in Appendix II of the Bern Convention are primarily protected in the UK by the Wildlife and Countryside Act (1981) as amended.

In accordance with the Environment (Wales) Act 2016, Welsh ministers must prepare and publish a list of the living organisms and types of habitat which in their opinion are of principal importance for the purpose of maintaining and enhancing biodiversity in relation to wales. A such, the marsh fritillary is a species of principal importance in Wales. Throughout almost every country in Europe the marsh fritillary is declining and is now extinct in northern Belgium. The Atlantic seaboard influences the distribution of marshy grassland, the major habitat of the marsh fritillary, with strongholds in the south-west England, south and west Wales and western Scotland (Asher, et al., 2001). However even in the UK which is now believed to be one of the major European strongholds for the species, its numbers has declined significantly over the last 150 years.

Throughout the UK, the percentage occurrence change 1976 – 2014 of marsh fritillary has declined by 79 % (Fox, et al., 2015). These declines are due to changes in habitat availability as a result of agriculture, forestry and development that has led to habitat loss, fragmentation and isolation (Warren, 1994), (Bulman, 2001), (Smee, *et al.*, 2011), (Fox, *et al*., 2015).

3.3 Location and Distribution

The Blaen Cynon SAC is situated within the Upper Cynon Valley (Figure 2, Appendix A) and a number of surveys have previously been carried out by others to assess the marsh fritillary population levels and habitat conditions in the Upper Cynon Valley area.

- Strategic assessment of the marsh fritillary butterfly and its habitat in Rhondda Cynon Taf. Smith, R. Earth Science Partnership. May 2005.
- Habitat quality mapping for marsh fritillary populations. Fowles, A.P. Staff Science Report. 05/5/1. Countryside Council for Wales 2005.
- Population Survey of the Marsh Fritillary in the vicinity of Hirwaun, Cynon Valley. Wheeler, A.J. et al. CCW Contract Science No. 374. 2000.
- Marsh Fritillary records in the Hirwaun area (Brecon Beacons National Park).
- A465 Abergavenny to Hirwaun Dualling. Marsh Fritillary Habitat Survey 1997. The Welsh Office. SGS Environment 1997.

Smith (Smith, 2005) noted that significant declines in marsh fritillary populations have occurred throughout Wales, from 191 populations recorded in 1990-2000, to 132 in mid-2000. The marsh fritillary is found mainly in the south and west of Wales, with Glamorgan (now predominantly Rhondda Cynon Taf) maintaining strong populations in Tonyrefail, Hirwaun, and Aberbargoed. Rhondda Cynon Taf (RCT) contains at least 12 % of known marsh fritillary sites in Wales and 30 % of sites in Glamorgan (Smith, 2005).

The relatively high numbers of marsh fritillary populations in Wales is correlated with the large amount of suitable habitat found throughout the country. Phase 1 surveys carried out during the 1990's by Countryside Council for Wales (Howe, et al., 2005); revealed that Wales contained a high percentage of suitable habitat for marsh fritillary butterfly including marshy grassland, wet heath and wet heath / acid grassland.

Rhos pasture is a generic term that includes marshy grassland, purple moor grass and rush pasture and wet heath. Wales contained 63 % (35,000 hectares) of the UK's rhos pasture, with RCT containing 27 % of Glamorgan's rhos pasture and 4 % of the total rhos pasture in Wales (Countryside Council for Wales, 2003). RCT has the highest density of purple moor grass and rush pasture within Wales at 4 hectares per square kilometre (Smith, 2005).

The RCT marsh fritillary butterfly biodiversity action plan states that "the butterfly is known to survive in 'meta-populations' where several sites contribute to the long-term viability of a single colony. Over generations individual sites may temporarily become unsuitable (for example short-term over grazing), but when management is returned the butterfly is able to re-colonise from neighbouring sites".

Meta populations are associated with groups of suitable habitat patches (referred to as clusters) on which the butterfly is reliant to breed. Clusters are defined as collections of closely positioned patches of suitable habitat. Smith (Smith, 2005) identified a number of clusters of sites in the upper Cynon Valley based upon CCW marsh fritillary records (Wheeler, *et al*., 2000) (Figure 2, Appendix A).

The Upper Cynon Valley cluster has been considered by Smith (Smith, 2005) to consist of three sub clusters.

Penderyn/Hirwaun cluster

The cluster extends from Werfa farm west to Hirwaun sports ground, south of Hirwaun. In 2003 the cluster contained 117.37 hectares of suitable habitat, with at least 11.70 hectares in good condition.

DderiHir/Tir Mawr/Bryncarnau cluster

The cluster extends from the Jah – Jireh Care Home (formerly Baverstock Hotel) on the A465 near Merthyr Tydfil south to fields of the mineral railway at Penywaun, and to the north by wet heath of Nantmoel Farm. The clusters include populations from both Bryncarnau Grasslands SSSI and Dderi Hir farm, and contain 53.3 hectares of suitable habitat, with 8.83 hectares in good condition.

West Merthyr cluster

The cluster is found north of Swansea Road in Merthyr Tydfil and extends south and east through the village of Heolgerrig and the area of Winchfawr, through to Cwm Glo and into Abercanaid in the south.

Fowles (Fowles & Smith, 2006) set out a methodology for evaluating the landscape for the marsh fritillary butterfly which involved setting criteria for the definition of landscapes and habitat quality categories. This has set the standard for marsh fritillary habitat mapping to allow further evaluation of the habitat clusters and better determine the significance of the landscape for the conservation of the butterfly metapopulations.

To better define the areas of the landscape that should be included in any habitat quality mapping process Fowles (Fowles & Smith, 2006) set about defining core and functional landscapes. The core landscape comprises areas within a 1 km radius of any marsh fritillary records. This radius was defined based on work carried out by Wahlberg et al (Wahlberg, et al., 2002) which suggested that the maximum dispersal for female butterflies is 510 m. The functional landscape is defined as the areas within a 2 km radius of recorded marsh fritillary populations. The upper Cynon Valley Functional Landscape Area contains marsh fritillary clusters from Penderyn / Hirwaun (including Blaen Cynon SAC), Dderi Hir / Ty Mawr / Bryncarnau clusters and the West Merthyr cluster. Figure 2 in Appendix A shows the updated core and functional landscape areas using data collected in previous years.

4. Methodology

4.1 Monitoring Sites

The monitoring programme, since 2008, is made up of the following sites.

- Site 1: Blaen Cynon Special Area of Conservation.
- Site 2: Dderi Hir.
- Site 3: North Crematorium.
- Site 4 Bryncarnau Grasslands.
- Site 5 Near playing field.
- Site 6 Heol-Y-Graig.
- Site 7 Mount Road.

Following the first year of monitoring in 2008, the furthersites were added to the monitoring program in 2009. This was in order to enhance the baseline dataset by including other locations in the area which supported suitable habitat for marsh fritillary. These additional sites are at distance from the A465 and could give indication of population and habitat changes independent of potential impacts from the existing road and proposed scheme.

- Site 2a: Ger-y-bont, Croesbychan.
- Site 4a: South Bryncarnau Grasslands.
- Site 6a: Halt Road.
- Site 7a: East of Mount Road.

The locations of the all of the sites are shown in Figure 3 (Appendix A).

4.2 Field Survey

The highly variable nature of the marsh fritillary population dynamics makes it difficult to only adopt one monitoring approach, particularly as there are regular localised extinctions and reappearances of the species at any one site. Following discussion with both NRW and Butterfly Conservation a three part approach to the long term monitoring baseline was considered to be the most robust method.

The baseline monitoring programme aims to record trends in the metapopulation through:

- habitat quality mapping;
- larval web counts; and
- adult counts.

4.2.1 Habitat quality

The habitat quality of each site is assessed once every year and is based upon the monitoring methods currently used by NRW to assess marsh fritillary populations within the Blaen Cynon SAC itself. The habitat quality surveys were carried out in September 2016 and the exact survey dates for each site are in Table 8.3 in Appendix C.

Within each of the survey sites a grid based recording method was used. The grid was set up using geographic information system (GIS) software (ArcGIS) in advance of the field visit. The sample points were set out on a 10 x 10 m grid and were surveyed using a hand held computer (Mobile Mapper) with a global positioning system (GPS). The use of fixed grid system allows a temporal assessment of changes in habitat quality at fixed points. Each year the survey team returns to the same points using the GPS. At each sample point the habitat

quality for the 10 x 10 square around the point was categorised according to habitat quality definitions below (Fowles & Smith, 2006) and recorded on the mapper. The presence of *Succisa pratensis* was recorded as per the DAFOR scale.

- **Good Quality Habitat (GC)**: Grassland where, for at least 80 % of the quadrat, the vegetation height is within the range of 12 to 25 cm, and *Succisa pratensis* is present within a 1 m radius. Scrub (>1 metre tall) Cover <5 %.
- **Suitable (Under-Grazed) Habitat (SU)**: Grassland where vegetation height is above 25 cm and *Succisa pratensis* is occasional / frequent / abundant. Or in which sward height is between 12-25 cm and *Succisa* at least occasional, but Scrub (>0.5 metres tall) covers >5 % of area.
- **Suitable (Over-Grazed) Habitat (SO)**: Grassland with frequent-abundant *Succisa* but which is currently over-grazed such that the sward is below 12 cm on average.
- **Suitable (Sparse) Habitat (SS)**: Grassland with sparse (occasional or rare) *Succisa* and vegetation height is less than 25 cm on average.
- **Potential (Rank) Habitat (PR)**: Grassland with rare *Succisa* but which is currently under-grazed or neglected such that the sward is above 25 cm on average and *Succisa* occurs as scattered plants in a rank, tussocky sward.
- **Scrub (SC)**: Scrub up to 3 m height.
- **Secondary Woodland (SW)**: Scrub, young trees etc. established to > 3 m height.
- **Not Suitable (NS)**: All other unsuitable habitat, not containing *Succisa*.

The DAFOR scale that has been used for recording the presence of *Succisa pratensis* is:

- dominant (D) - >75 % cover;
- abundant (A) – 51-75 % cover;
- frequent (F) – 26-50 % cover;
- occasional (O) – 11-25 % cover; and
- rare (R) – 1-10 % cover.

The habitat mapping for 2008 highlighted the need to differentiate between unsuitable habitats, secondary woodland and scrub which although are all essentially unsuitable habitat for marsh fritillary the more detailed categorisation has provided a better overview of each of the sites.

4.2.2 Larval web counts

Each year, areas of available suitable habitat located within monitoring sites, were surveyed for marsh fritillary webs. *Succisa pratensis* plants were examined for larvae and larval webs. The location and number of webs were recorded using the mobile mapper. Target notes were also taken which included the type of management practices that were evident within each site.

The web count surveys were carried out across all the sites in September 2016 with exact survey dates set out in Table 8.3 in Appendix C.

4.2.3 Adult counts

Each year a survey of adults was carried out at each of the monitoring sites between mid-May and late June. The location and number of adults was recorded using the mobile mapper. The adult surveys were conducted in June 2016 with exact survey dates set out in Table 8.3 in Appendix C.

4.2.4 Survey limitations

All of the sites were surveyed for numbers of larval webs, adults and an assessment of habitat quality. The size of the study area meant that sites were surveyed over a period of two to four weeks. Localised weather conditions can affect the suitability of the survey period when carrying out the adult and web surveys.

Site 1: The Blaen Cynon SAC is surveyed by NRW as part of their monitoring programme. No adult counts were carried out in 2016 nor was it habitat mapped. NRW carried out a larval web survey in 2016.

Site 7 and site 3 were not surveyed in 2016 due to land access restrictions. Site 4a was not habitat mapped or surveyed for webs due to the presence of cattle.

5. 2016 Survey Results

5.1 Habitat Quality

The monitoring sites (except site 1, site 3 and site 7) were all visited in 2016. The descriptions of each site are set out in the following paragraphs and the habitat quality results are shown on Figures 5 -14.

5.1.1 Site 1: Blaen Cynon SAC

The Blaen Cynon SAC was not habitat mapped by NRW in 2016.

5.1.2 Site 2: Dderi Hir

The triangular area of the site north of the A465 was predominately heavily grazed by cattle and/or sheep with only tussocks of *Juncus* and *Molinia* present, with no *Succisa pratensis*.

The large section of Site 2, south of the A465 consisted of a mosaic of different habitats including scrub, woodland and wet and dry areas containing predominately *Juncus sp*. and *Molinia sp*. with varying cover of *Succisa pratensis*. In previous years (2008 and 2009) horses have been recorded grazing the area but a change in land management in 2010 has resulted in all livestock being removed. At the time of the adult surveys in 2016 there were no livestock present and the area was undisturbed.

In September when the habitat surveys were conducted some areas had been lightly grazed and others still undisturbed. The western fields are very overgrown in places, and although still mostly classed as Good Condition habitat, the area will become under grazed soon. The wetter sections and the fenced area around a large pond have remained unchanged. Most of this area was recorded in the categories Suitable (Sparse) or Good Condition with an increase in Potential Rank category (Figure 5, Appendix A).

The southern protruding part of Site 2 consisted of a mosaic of woodland and grassland containing predominately *Juncus sp* and *Molinia sp*. with varying amounts of *Succisa pratensis*. The habitat remains in a similar condition to 2015, with Good Condition habitat throughout the central and southern part of this section with secondary woodland bordering the southern edge (Figure 5, Appendix A).

5.1.3 Site 2a: Ger-y-bont, Croesbychan

Site 2a at Ger-y-bont, Croesbychan consisted of small round field with a stable block in north east corner. The site was grazed by ponies at the time of survey along with the adjacent field in 2016.

Light grazing in certain areas of the site has meant that the habitat has remained the same as in 2015; a mosaic of both suitable under grazed and suitable over grazed areas with patches of good condition habitat, bordered by potential rank and not suitable habitat (Figure 6, Appendix A).

5.1.4 Site 3: North Llwydcoed Crematorium

Site 3 was not habitat mapped in 2016 due to land access restrictions.

5.1.5 Site 4: Bryncarnau Grasslands

The Bryncarnau Grasslands SSSI continues to be managed under a Tir Gofal scheme. The grass is cut annually, late in the year after flowering has taken place. At the time of the adult survey in June most of the site had been cut recently apart from the south western fields.

The majority of the site area was classed as Suitable (Over-grazed) or Suitable (Sparse) habitat depending on the abundance of *Succisa pratensis*. The northern most field bordering the road has mainly been classified as Not Suitable with some sparse records of *Succisa pratensis* (Figure 8, Appendix A).

5.1.6 Site 4a: South Bryncarnau Grasslands

Site 4a was not surveyed in September 2016 due to access restrictions. The site was being crazed by cattle at the time of the survey.

5.1.7 Site 5: Near the Playing Field

In 2016 site 5 comprised a mosaic of habitats separated by field boundaries including fences / hedges and ditches. The majority of the site has been recorded as unsuitable, particularly to the south and the west. The middle and eastern sections of the site are a mosaic of Suitable (Over grazed), Suitable (Sparse) and Potential (Rank) habitat with a central area of Good Condition habitat with both varying amounts of *Succisa pratensis* and sward height. Three ponies were grazing the eastern and central sections at the time of the web and habitat surveys in September 2016. The fields in the west and south parts of the site recorded no *Succisa pratensis* (Figure 10, Appendix A).

5.1.8 Site 6: Heol-y-Graig

Some areas of site 6 were grazed throughout 2016, particularly the western section. This has resulted in an increased in Suitable (Over grazed) habitat. A large proportion of the site was still classed as Suitable (Over grazed) in 2016, with an increase in Good Condition habitat through southern and central sections of the site (Figure 11, Appendix A).

5.1.9 Site 6a: Halt Road

Site 6a was a small poorly drained sloping field with a stream running along the south boundary. *Succisa pratensis* was recorded frequently throughout the site. The site had been heavily grazed by ponies during the adult counts in June, whilst the *Succisa pratensis* was still present the overall sward height was very low and the site had become fairly poached. By September the whole field had been heaving grazed producing a severely reduced sward height, though selective grazing meant patches of *Succisa pratensis* were still present although very exposed (Figure 12, Appendix A).

5.1.10 Site 7: Mount Road

Site 7 was not habitat mapped in 2016 due to land access restrictions.

5.1.11 Site 7a: East of Mount Road

Site 7a was being grazed by cattle during the web surveys of 2016. The field predominantly comprised *Juncus sp* with *Succisa pratensis* patches throughout. The combination of this grazing and the burning noted in 2015 has resulted in some areas being classed as Suitable (Under grazed) (Figure 14, Appendix A).

5.1.12 Summary of all sites

Table 5.1 sets out the results of the habitat quality assessment as percentage cover per category for each site in the Jacobs 2016 habitat quality survey. Figures 5 to 14 in Appendix A show detailed maps of habitat quality distribution and location at each site.

Table 5.1 : Habitat Quality Assessment- Percentage Cover for each Category 2015 (NS= No Survey)

Habitat Type	Percentage Cover									
	Site 2	Site 2a	Site 3	Site 4*	Site 4a	Site 5	Site 6	Site 6a	Site 7	Site 7a

*Unable to access whole of site 4 to map habitats but the inaccessible area has generally been classified as Not Suitable and Secondary Woodland in previous years (See Figure 8, Appendix A).

5.2 Web counts

Two hundred and eighty webs were recorded across six of the Jacobs surveyed sites in 2016. This is the second time since 2009 that webs have been recorded at site 6 (also in 2014) however this is the first year since 2009 that webs have not been recorded at site 6a. One hundred and ninety six webs were recorded in the Site 1 Blaen Cynon SAC by NRW, with a good number of webs distributed evenly across the main block of Cors Bryn-y-gaer. The distribution of webs was as set out in Figures 5-14. Meta data for surveys listed in Appendix C, Table 8.3.

Table 5.2 : Web Count Results 2015 (NS= No Survey)

Site	Number of webs recorded
1	196

2a	2
3	NS
4	117
4a	NS
5	0
6	1
6a	0
7	NS
7a	0

5.3 Adult Counts

Twenty four adults were recorded across six sites in the 2016 Jacobs survey. An adult has been recorded at site 7a for the first time since 2012; however this is the first year since 2009 that adults have not been recorded at site 6a. Meta data for surveys listed in Appendix C, Table 8.3.

5.4 2016 Weather

The records shown in Table 5.4 are data from the UK climate network of observing stations. They represent the Met Office's assessment of weather conditions experienced across the South Wales and SW England region during the 2016 monitoring season. It also sets out a comparison with the 1981 to 2010 long term average. The columns headed 'Anom' (anomaly) show the difference (+ / -) from, or percent of the 1981-2010 long term average (Met Office, 2016).

Table 5.4 : Met Office weather data for south Wales region (amended from (Met Office, 2016))

Month	Max temperature		Min temperature		Mean temperature		Sunshine		Rainfall	
	Actual (°C)	Anom (°C)	Actual (°C)	Anom (°C)	Actual (°C)	Anom (°C)	Actual (hrs)	Anom (%)	Actual (mm)	Anom (%)
Winter (Dec-Feb)	9.0	2.6	3.7	2.6	6.4	2.6	139.2	92	778.2	186
Spring (Mar-May)	12.0	1.0	4.1	0.5	8.0	0.7	509.9	117	295.5	103
May	16.2	2.1	7.4	1.6	11.8	1.8	221.3	120	88.4	102
June	18.1	1.2	10.9	2.3	14.5	1.7	149.0	84	139.6	167
July	18.7	0.0	11.8	1.3	15.2	0.6	161.2	92	82.7	99
August	19.3	1.0	11.9	1.4	15.6	1.2	169.7	104	108.9	99

Winter 2015 / 2016 produced record rainfall totals and severe flooding throughout December in the north and west of the UK. The exceptional warmth resulted in the third warmest winter since 1910, although also the second wettest on record. This resulted in an unsettled January and February, although February was a sunny month for most, with some bright, sunny spells particularly during the second half of the month.

The temperature and rainfall for spring were close to the seasonal average, although there were some stormy exceptions. March produced two weeks of fine and settled weather, leading to a cooler April with some late frosts in the north. May was warm and dry, with sunshine hours above average for all three spring months. March was generally a wet month for the south with some areas receiving over 150 % of the average rainfall for the month.

The summer of 2016 was altogether changeable, beginning with a cloudy and wet June. Sunshine totals for this month were low producing a dull June in the south. July and the first half of August were characterised by a changeable westerly Atlantic flow with a succession of fronts crossing the UK, although rainfall amounts were often small in the south. A heat wave in the third week of July led to a more settled and hot second half of August (amended from (Met Office, 2016)).

5.4.1 Potential Effect of Weather on the Marsh Fritillary Population

The number of adults recorded in 2016 has decreased on every site with the exception of site 7a. Sites 6a and 4 in particular have seen a marked decrease in adults recorded, going from 148 to 0 and 435 to 3 respectively.

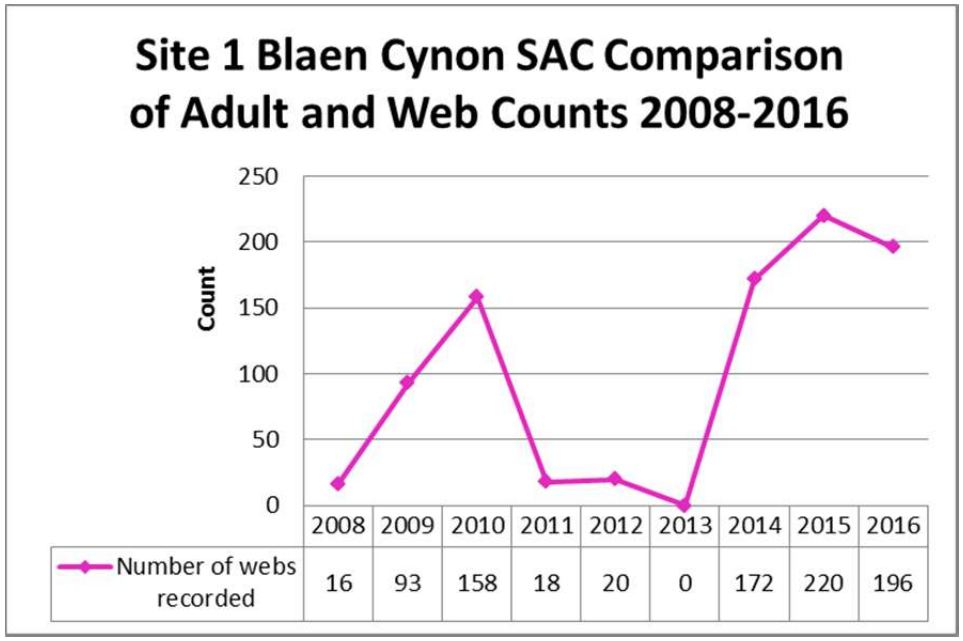
The wet winter of 2015 / 2016 could have resulted in lower winter survival rates of marsh fritillary larvae which could account for the decrease in number of marsh fritillary adults recorded across all sites from 2015 to 2016. The stormy spring would have disrupted the basking time for the caterpillars and reduced the flight period for the adults resulting in a decreased marsh fritillary population.

6. 2016 Results Discussion

This section provides an illustration and short discussion regarding the variation in the marsh fritillary survey results since the Jacobs baseline monitoring surveys started in 2008.

6.1 Site 1 – Blaen Cynon SAC

Graph 6-1: Site 1 Comparison of Web Counts 2008-2016



Web counts at the Blaen Cynon SAC in 2016 were carried out by NRW. Adult counts and habitat mapping have not been carried out by NRW since the Jacobs surveys begun as the habitat was not considered to have changed between survey years.

6.2 Site 2 – Dderi Hir

Graph 6-2: Site 2 Comparison of Adult and Web Counts 2008-2016

	2008	2009	2010	2011	2012	2013	2014	2015	2016
Number of adults recorded	2	4	12	62	15	16	316	333	20
Number of webs recorded	0	0	16	9	32	137	361	355	160

Graph 6-3: Site 2 Change in % Habitat Cover 2008-2016

	2008	2009	2010	2011	2012	2013	2014	2015	2016
Good Quality Habitat	1.0	0.5	3.2	4.1	7.2	6.5	8.8	8.4	8.3
Suitable (Undergrazed) Habitat	3.8	0.0	0.0	0.1	0.6	0.4	0.7	1.0	1.4
Suitable (Overgrazed) Habitat	23.0	10.8	9.7	4.5	1.9	3.2	3.1	2.7	2.7
Suitable (Sparse) Habitat	12.8	27.1	24.7	27.7	24.8	26.5	23.6	22.9	22.6

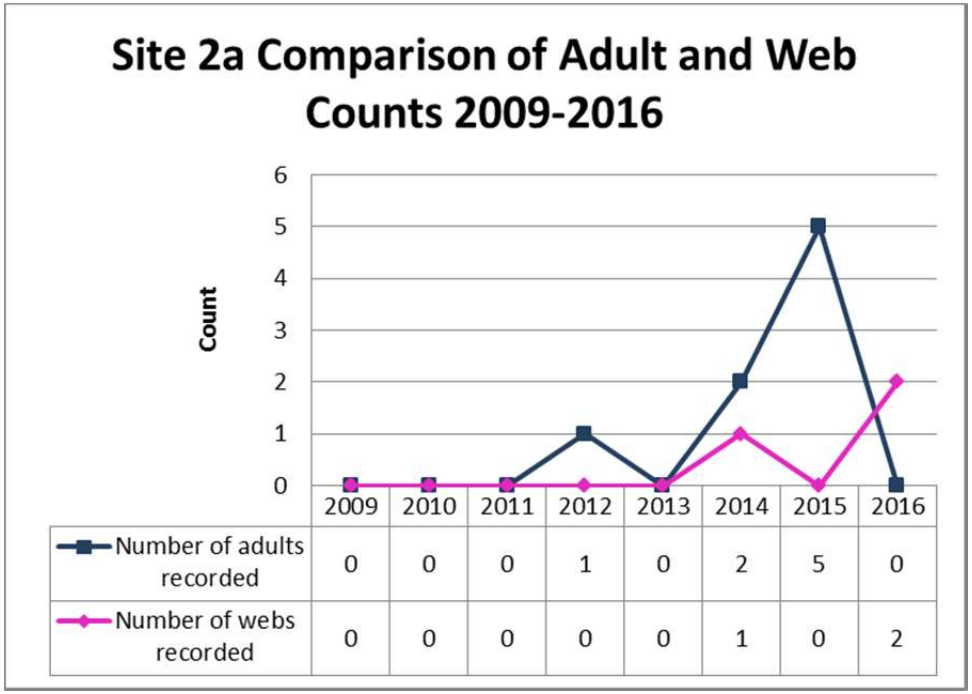
Scrub	10.0	7.5	7.6	8.4	8.9	9.0	8.9	8.9	8.9
Secondary Woodland	15.6	9.8	10.2	10.0	10.4	10.4	10.4	10.4	10.4
Not Suitable	29.3	39.2	42.8	42.1	41.9	42.0	41.8	41.7	41.7

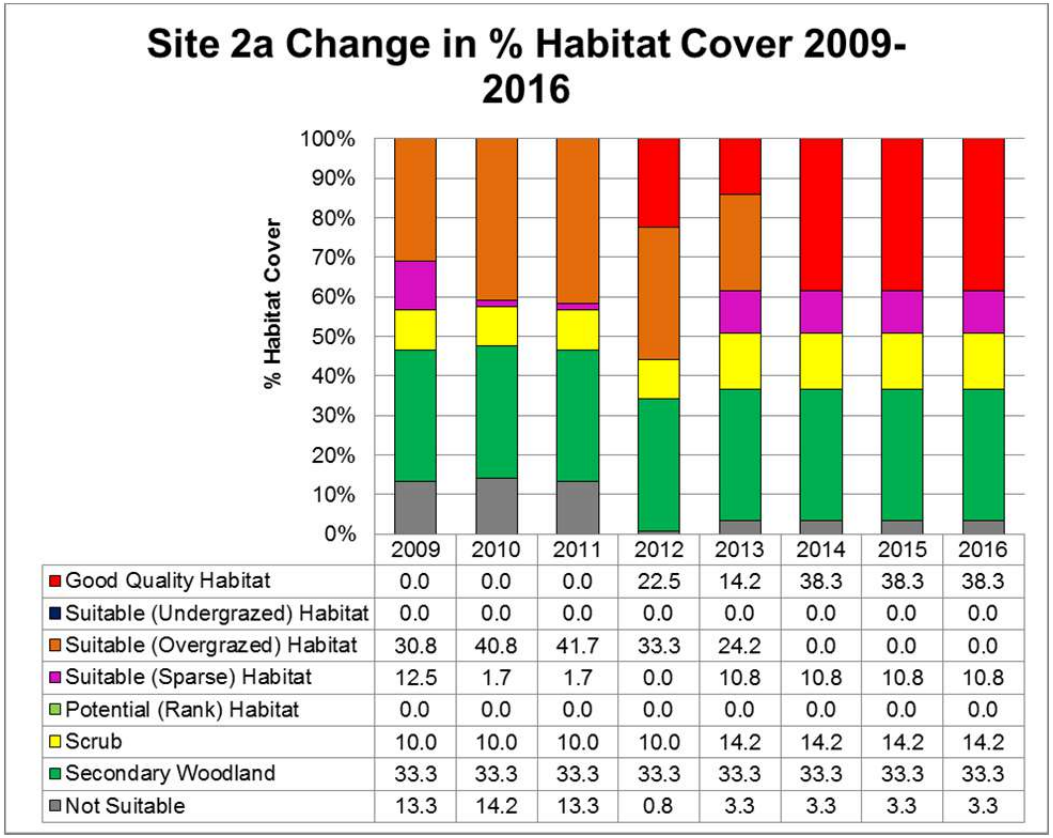
Dderi Hir was one of the original sites identified for monitoring in 2008. Graph 6-2 shows the adult and web count data and Graph 6-3 illustrates the changes in % habitat cover at Dderi Hir between 2008 and 2016. Site 2 saw a marked decrease in both adults and webs recorded in 2016.

6.3 Site 2a – Ger-y-bont, Croesbychan

Graph 6-4: Site 2a Comparison of Adult and Web Counts 2009-2016



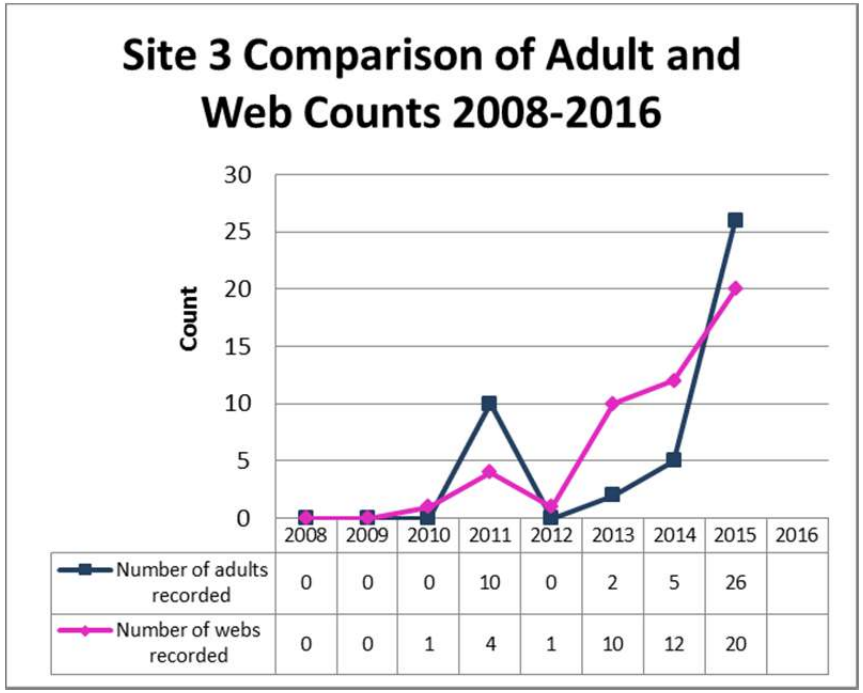
Graph 6-5: Site 2a Change in % Habitat Cover 2009-2016



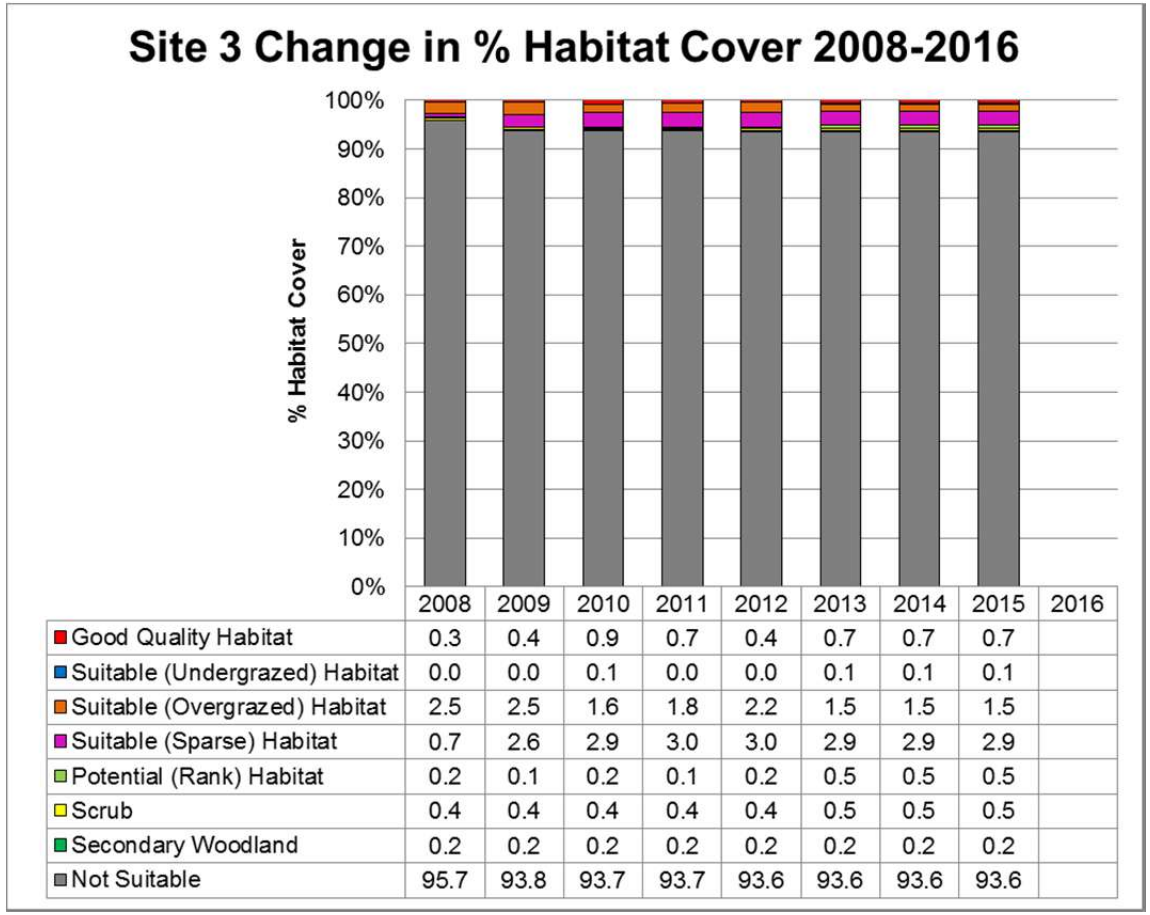
Ger-y-bont was one of the additional sites identified and added to the Jacobs baseline monitoring survey in 2009. Graph 6-4 shows the adult and web count data and Graph 6-5 illustrates the change in percentage habitat cover at Ger-y-bont between 2009 and 2016. Although web numbers increased in 2016, adults recorded and habitat types remained the same as recorded in 2015.

6.4 Site 3 – North Llwydcoed Crematorium

Graph 6-6: Site 3 Comparison of Adult and Web Counts 2008-2016



Graph 6-7: Site 3 Change in Habitat Cover 2008-2016



Graph 6-6 shows the adult and web count data and Graph 6-7 illustrates the changes in % habitat cover at site 3 between 2008 and 2015. Site 3 was not surveyed in 2016.

6.5 Site 4 – Bryncarnau Grasslands

Graph 6-8: Site 4 Comparison of Adult and Web Counts 2008-2016

	2008	2009	2010	2011	2012	2013	2014	2015	2016
Number of adults recorded	0	13	70	84	2	28	296	435	3
Number of webs recorded	0	1	31	0	6	2	122	433	117

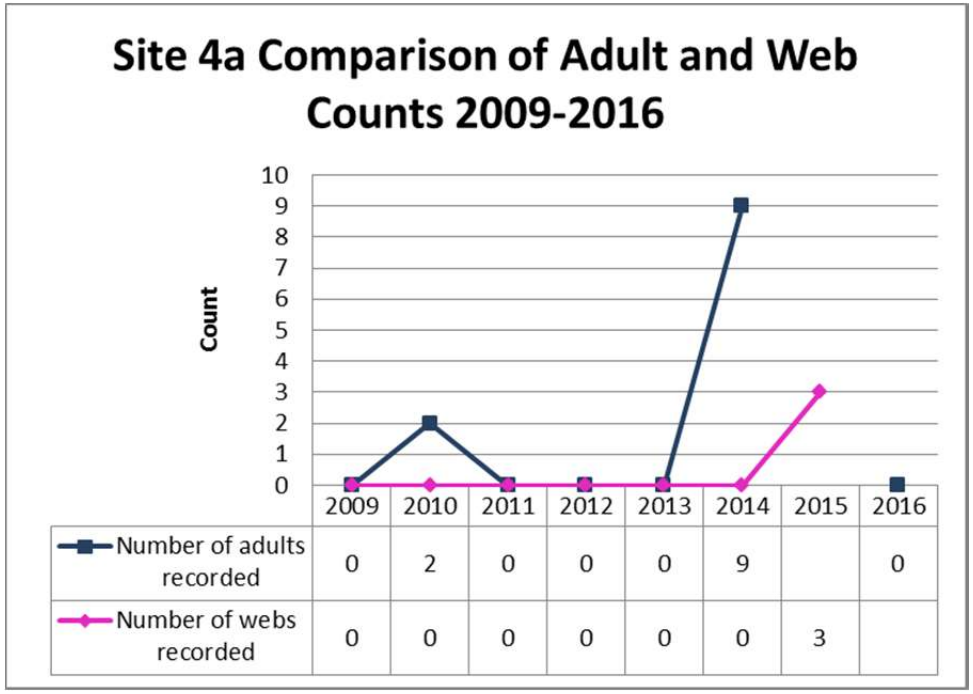
Graph 6-9: Site 4 Change in % Habitat Cover 2008-2016

	2008	2009	2010	2011	2012	2013	2014	2015	2016
Good Quality Habitat	2.5	0.8	1.6	0.4	1.0	0.9	1.7	2.4	2.4
Suitable (Undergrazed) Habitat	0.1	0.0	0.0	0.0	0.0	0.0	0.0	0.1	0.1
Suitable (Overgrazed) Habitat	29.3	28.9	33.5	33.5	33.8	33.9	33.0	44.4	44.4
Suitable (Sparse) Habitat	19.2	22.7	20.5	20.2	18.3	18.3	18.3	19.2	19.2
Potential (Rank) Habitat	0.7	5.2	0.1	0.1	0.1	0.0	0.0	0.1	0.1
Scrub	6.5	6.4	6.6	6.4	6.4	6.4	6.4	5.6	5.6
Secondary Woodland	10.0	10.0	10.0	10.0	10.2	10.2	10.2	5.6	5.6
Not Suitable	31.9	25.9	27.7	29.4	30.2	30.2	30.2	22.7	22.7

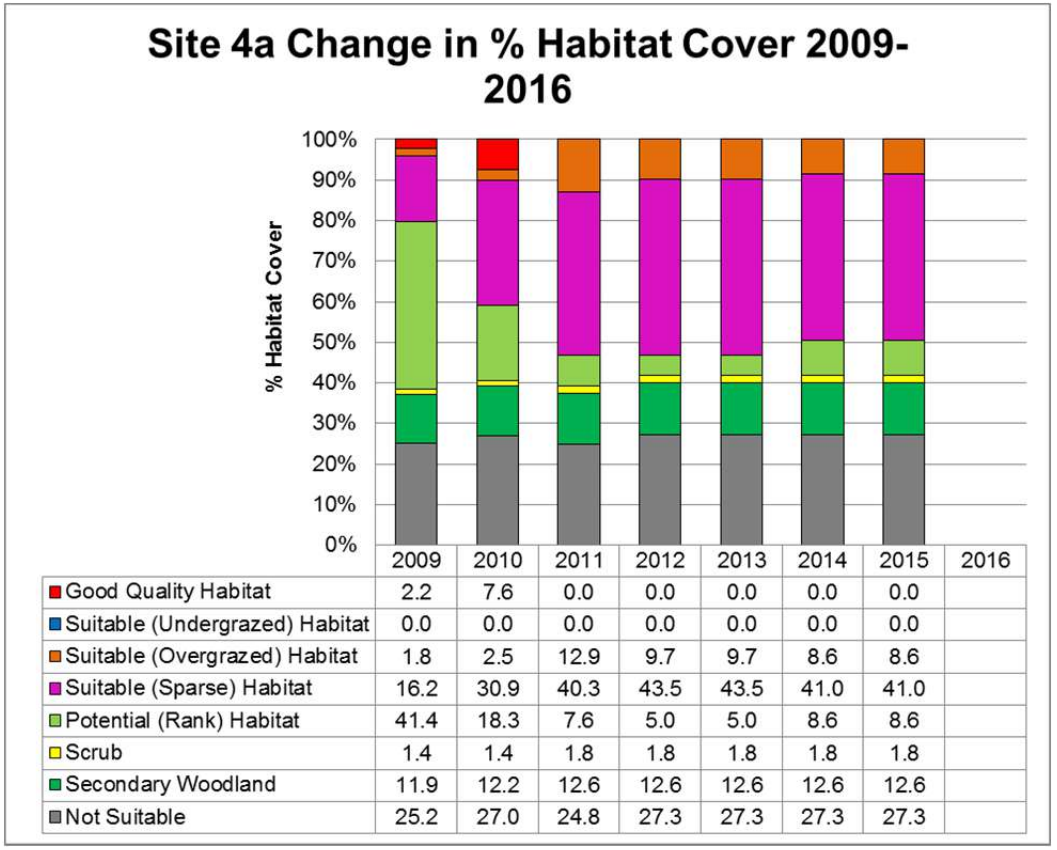
Graph 6-8 shows the adult and web count data and Graph 6-9 illustrates the changes in % habitat cover at Bryncarnau Grasslands between 2008 and 2016. The numbers of adults and webs recorded in 2016 has dropped since 2015, although the condition of the habitat has remained the same.

6.6 Site 4a – South Bryncarnau Grasslands

Graph 6-10: Site 4a Comparison of Adult and Web Counts 2009-2016



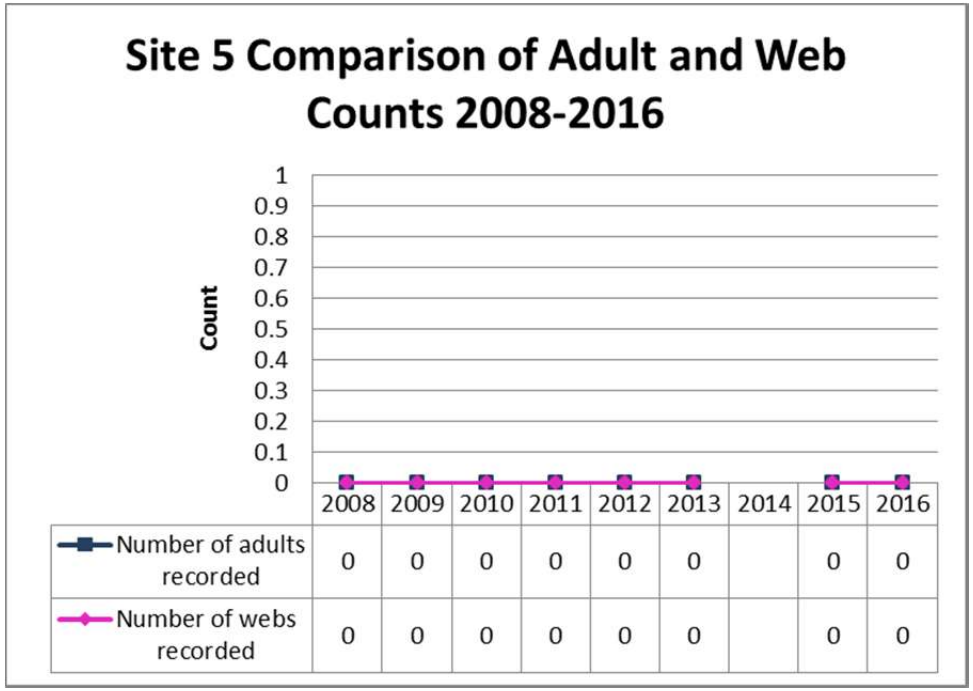
Graph 6-11: Site 4a Change in % Habitat Cover 2009-2016



Graph 6-10 shows the adult and web count data and Graph 6-11 illustrates the changes in % habitat cover at South Bryncarnau Grasslands. The site was not surveyed for adults in 2015 or webs and habitat in 2016.

6.7 Site 5 – Near the Playing Fields

Graph 6-12: Site 5 Comparison of Adult and Web Counts 2008-2016



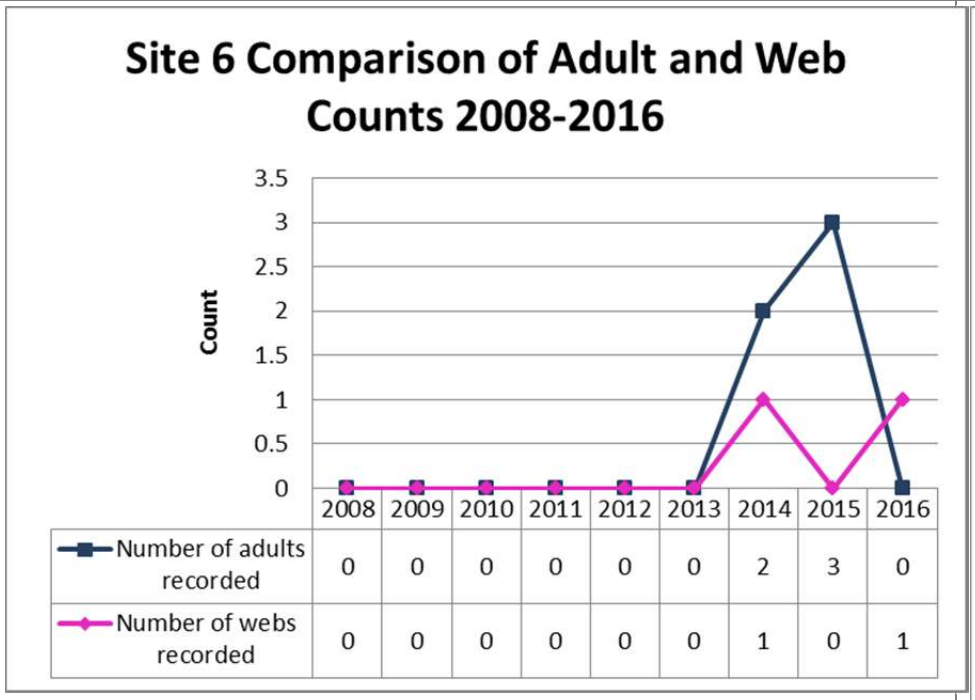
Graph 6-13: Site 5 Change in % Habitat Cover 2008-2016

	2008	2009	2010	2011	2012	2013	2014	2015	2016
Good Quality Habitat	2.8	1.2	2.4	4.3	3.4	2.4		3.1	3.4
Suitable (Undergrazed) Habitat	0.1	0.0	0.2	0.2	0.9	0.4		1.4	1.4
Suitable (Overgrazed) Habitat	16.8	8.3	13.7	4.3	4.4	5.8		5.8	6.0
Suitable (Sparse) Habitat	8.3	10.1	11.0	12.2	11.8	11.6		11.9	11.4
Potential (Rank) Habitat	1.0	12.5	4.7	6.3	5.4	5.5		5.5	5.5
Scrub	3.0	2.9	3.0	3.3	3.5	3.5		3.5	3.5
Secondary Woodland	0.3	0.3	0.3	0.3	0.3	0.3		0.3	0.3
Not Suitable	67.8	64.8	64.8	69.1	70.3	70.4		68.5	68.5

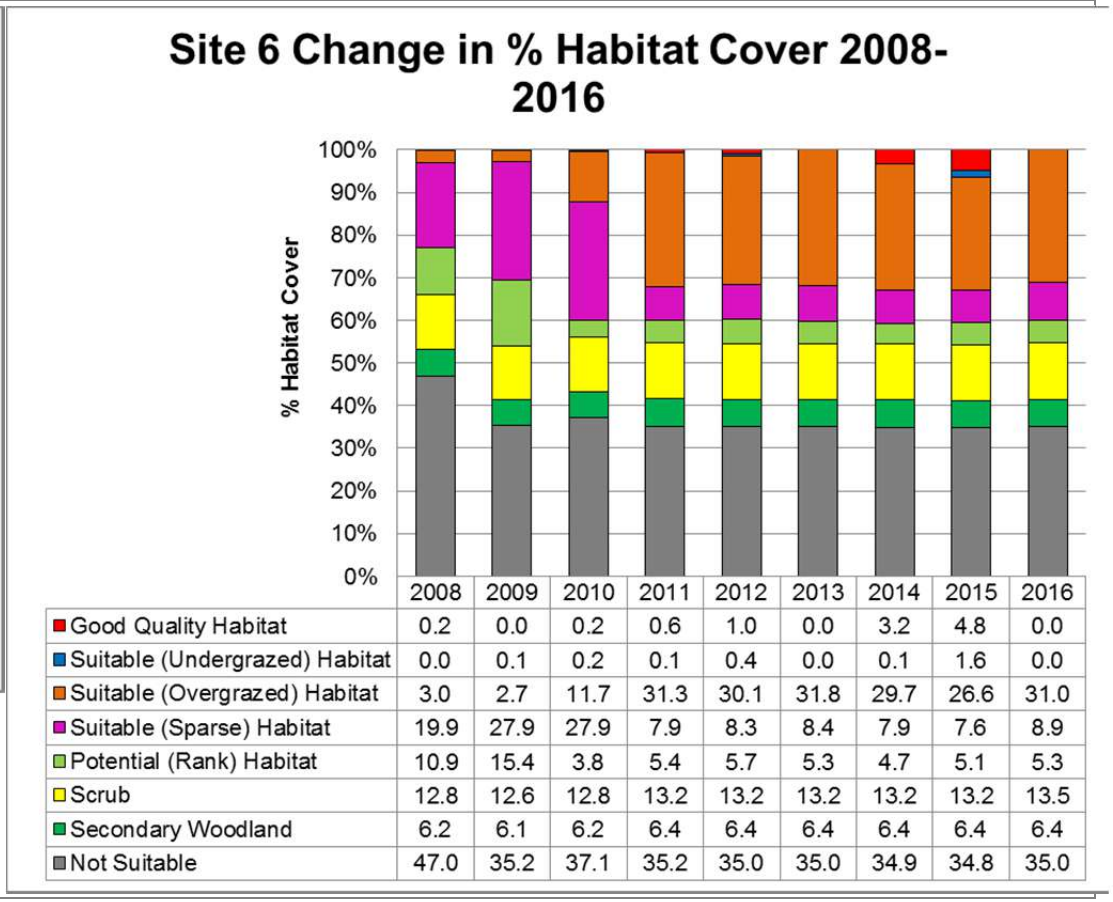
Graph 6-12 shows the adult and web count data and Graph 6-13 illustrates the change in % habitat cover at site 5 between 2008 and 2016. The site was not surveyed in 2014.

6.8 Site 6 – Heol-y-Graig

Graph 6-14: Site 6 Comparison of Adult and Web Counts 2008-2016



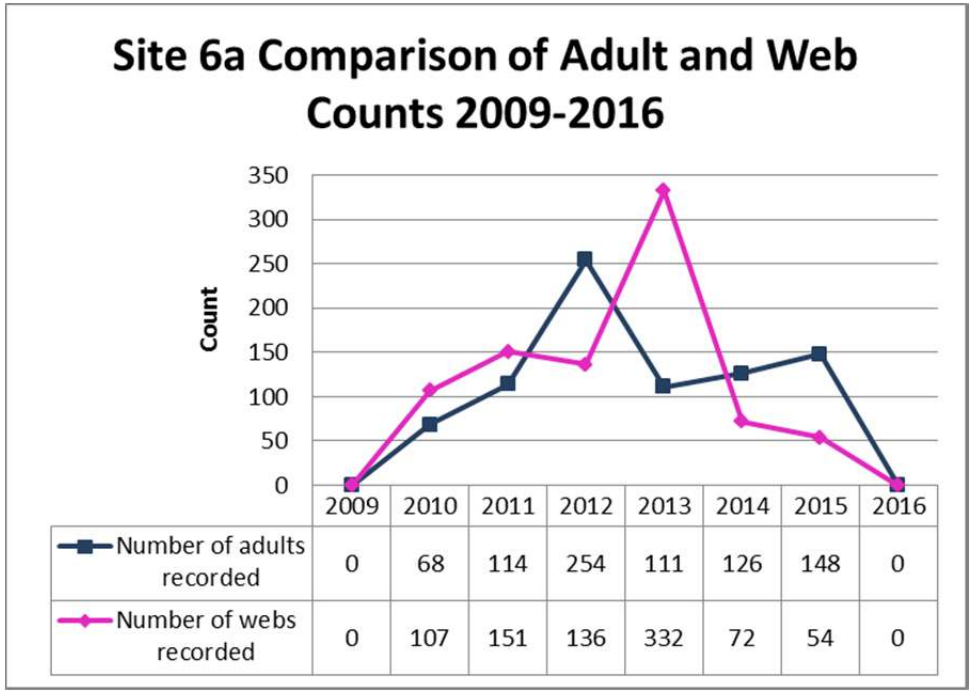
Graph 6-15: Site 6 Change in % Habitat Cover 2008-2016



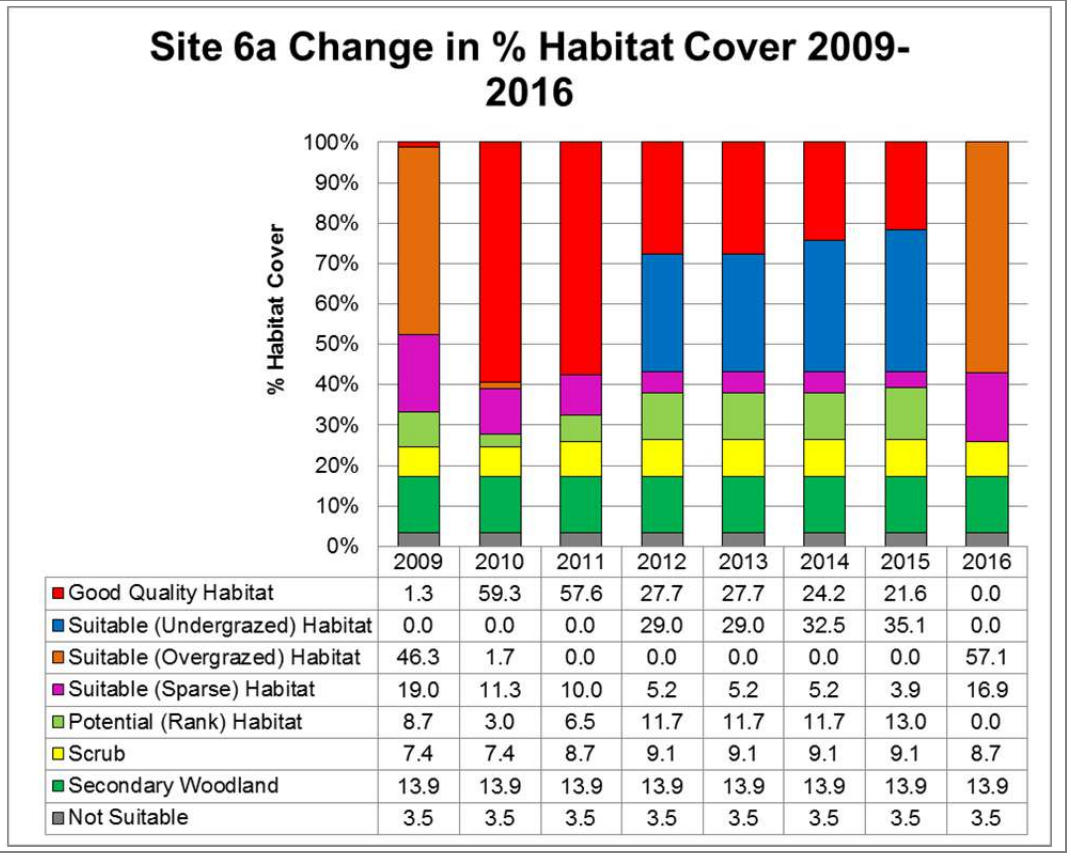
Graph 6-14 above shows the adult and web count data and Graph 6-15 illustrates the changes in % habitat cover at site 6 between 2008 and 2016. There has been a decrease in the good quality habitat recorded on the site, along with a drop in adults recorded.

6.9 Site 6a – Halt Road

Graph 6-16: Site 6a Comparison of Adult and Web Counts 2009-2016



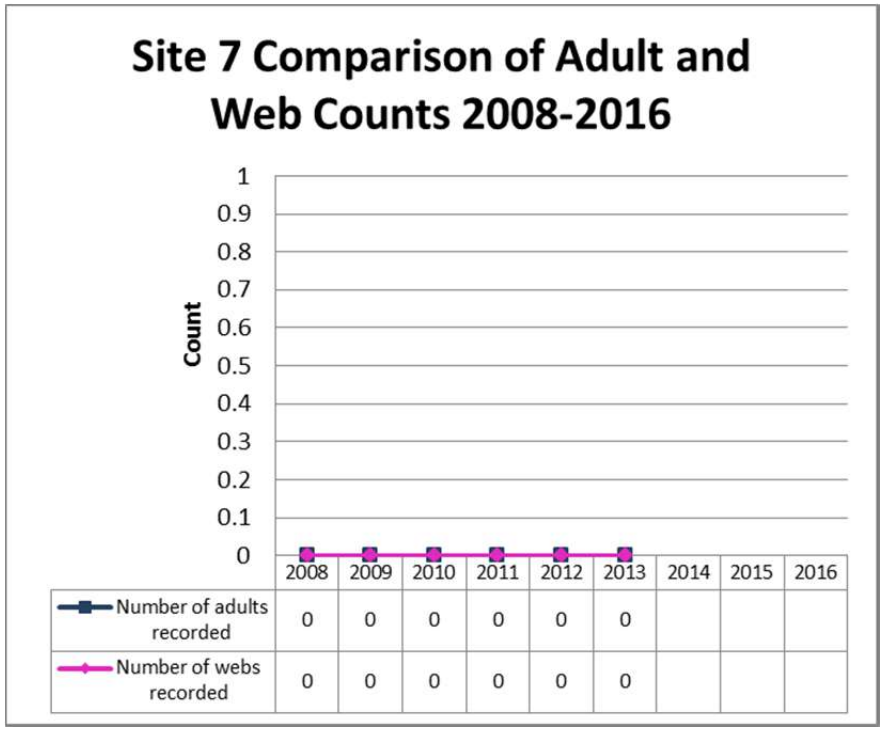
Graph 6-17: Site 6a Change in % Habitat Cover 2009-2016



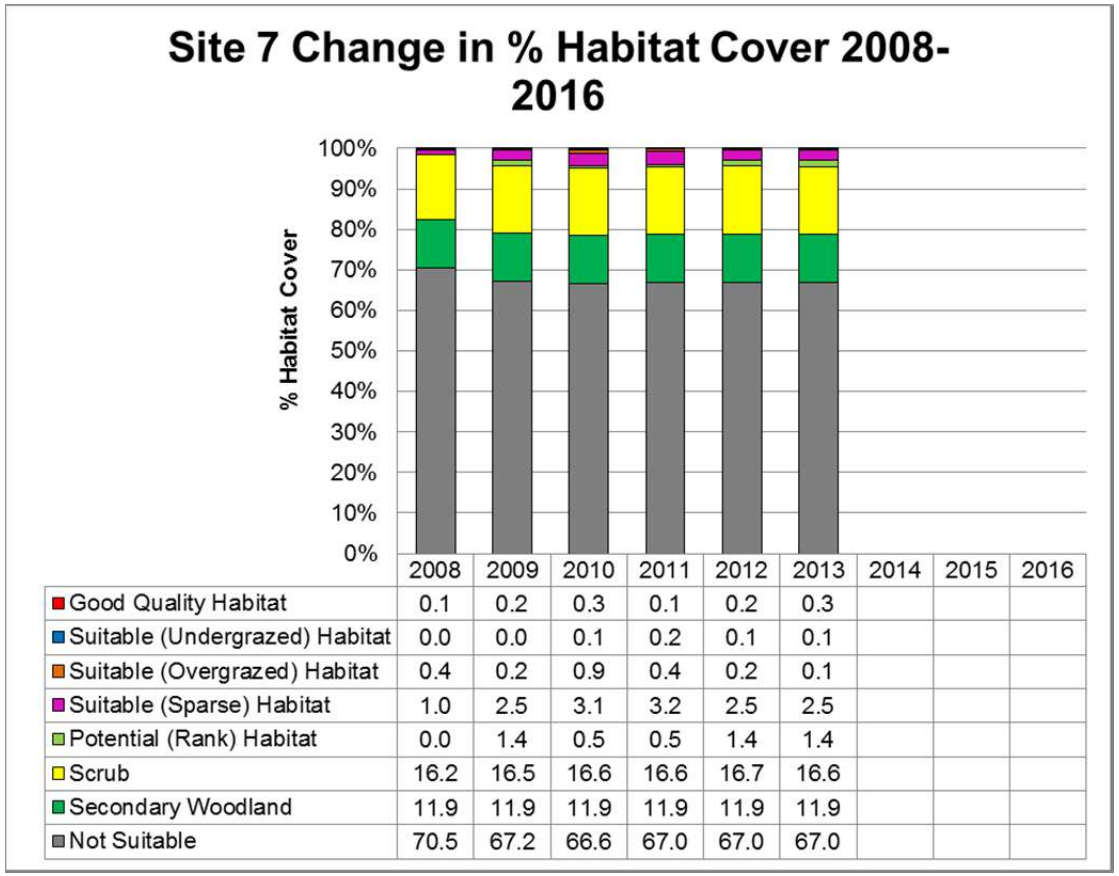
Halt Road was one of the additional sites identified and added to the Jacobs baseline monitoring survey in 2009. Graph 6-16 shows the adult and web count data and Graph 6-17 illustrates the changes in percentage habitat cover at Halt Road between 2009 and 2016. Due to increased grazing at site 6a, numbers of both webs and adults recorded have dropped. There was also no good quality or suitable (undergrazed) habitat recorded at the site.

6.10 Site 7 – Mount Road

Graph 6-18: Site 7 Comparison of Adult and Web Counts 2008-2013 (No survey in 2014, 2015 or 2016)



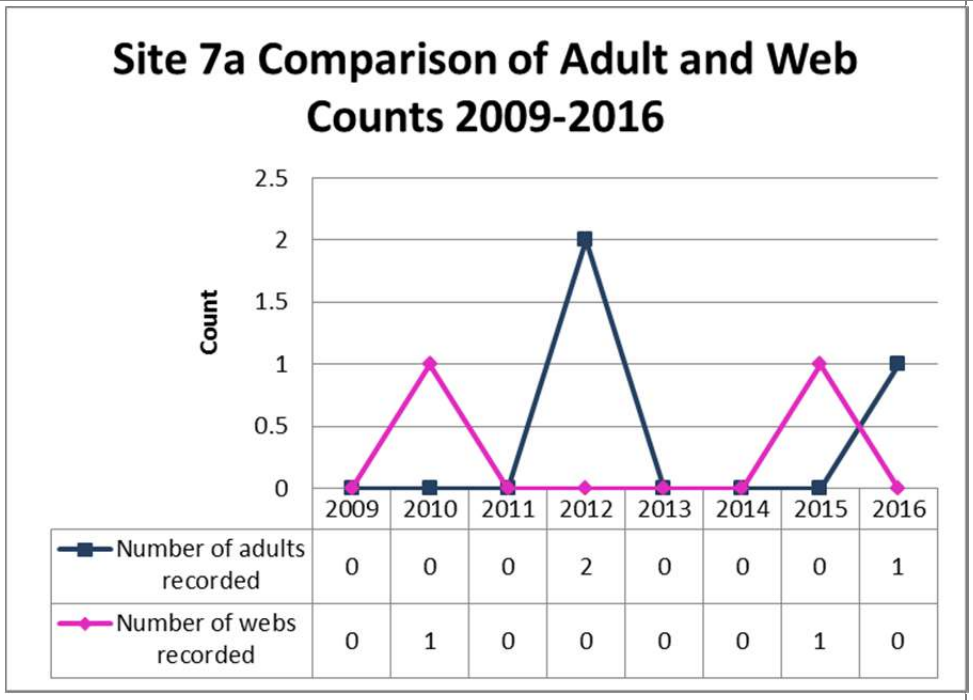
Graph 6-19: Site 7 Change in % Habitat Cover 2008-2013 (No survey in 2014, 2015 or 2016)



There were no surveys in 2016 at Mount Road.

6.11 Site 7a – East of Mount Road

Graph 6-20: Site 7a Comparison of Adult and Web Counts 2009-2016



Graph 6-21: Site 7a Change in % Habitat cover 2009-2016

	2009	2010	2011	2012	2013	2014	2015	2016
Good Quality Habitat	0.0	2.9	0.0	0.0	0.0	0.4	1.8	1.8
Suitable (Undergrazed) Habitat	0.0	0.4	0.0	0.0	0.0	1.8	1.8	1.8
Suitable (Overgrazed) Habitat	7.5	12.2	13.6	14.3	14.3	11.5	3.2	3.2
Suitable (Sparse) Habitat	24.7	15.4	20.1	19.4	19.4	20.1	27.6	27.6
Potential (Rank) Habitat	1.8	2.2	0.0	0.0	0.0	0.0	0.0	0.0
Scrub	5.7	5.7	5.7	5.7	5.7	5.7	5.7	5.7
Secondary Woodland	6.1	6.1	6.1	6.1	6.1	6.1	6.1	6.1
Not Suitable	54.1	55.2	54.5	54.5	54.5	54.5	53.8	53.8

The site East of Mount Road was one of the additional sites identified and added to the Jacobs baseline monitoring survey in 2009. Graph 6-20 shows the adult and web count data and Graph 6-21 illustrates the changes in percentage habitat cover at site 7a between 2009 and 2016.

7. Conclusion

In 2016, all sites were surveyed for adults, webs and habitat condition apart from site 7, site 3 and site 4a (adults only) due to access issues. The habitat types in Site 1, Blaen Cynon SAC, were considered by NRW not to have significantly changed since 2010 so were not mapped in 2016. For the other monitoring sites, site 5 had the most habitat classified as unsuitable condition, 68.5 %. Site 2a had the highest percentage of good condition habitat, 38.3 %, followed by site 6a with 22.5 %. Site 4 had the highest percentage of suitable but overgrazed habitat type, 44.4 %.

Webs were recorded on four sites in 2016 (2, 2a, 4 and 6). Sites 2 and 4 both supported high numbers of webs, with webs recorded for only the second time on site 6 since monitoring began in 2009. Site 6a had no webs recorded in 2016 for the first time since 2009 due to excessive grazing by ponies on the site.

Adult marsh fritillaries were recorded on three sites in 2016 (2, 4 and 7a). High numbers were recorded on sites 2 and 4 in comparison to other sites, although numbers are lower than those recorded in 2015. No marsh fritillaries have been recorded on site 5 since monitoring began in 2008. NRW did not carry out adult surveys on site 1 in 2016.

Appendix B. Blaen Cynon SAC

B.1 The Site

The Blaen Cynon SAC is situated within the Upper Cynon Valley and it consists of two SSSI's (Cors Bryn –y–Gaer SSSI, Woodland Park and Pontpren SSSI). It is made up of five separate parcels of land, which extend from the north of Hirwaun to the southern sections of Penderyn (see Figure 1).

- *Grid Reference: SN946066.*
- *Unitary Authority: Rhondda Cynon Taf.*
- *Area: 66.83ha.*
- *Annex I habitats that are a primary reason for selection of this site: Not applicable.*
- *Annex I habitats present as a qualifying feature, but not a primary reason for selection of this site: Not applicable.*
- *Annex II species that are a primary reason for selection of this site: 1065 Marsh fritillary butterfly Euphydryas (Eurodryas, Hypodryas) aurinia. Blaen Cynon contains an extensive complex of damp pastures and heaths supporting the largest metapopulation of marsh fritillary Euphydryas aurinia on the southern edge of the Brecon Beacons National Park.*
- *Annex II species present as a qualifying feature, but not a primary reason for site selection: Not applicable.*

B.2 Conservation Objectives

The following information on the Conservation Objectives for the Marsh Fritillary have been taken directly from the Countryside Council for Wales (now NRW) Core Management Plan for the Blaen Cynon SAC (Countryside Council for Wales, 2008).

Conservation Objective for Feature 1: Marsh fritillary butterfly *Euphydryas (Eurodryas Hypodryas) aurinia* (EU Species Code: 1065).

B.3 Vision for feature 1

The vision for this feature is for it to be in a favourable conservation status, where all of the following conditions are satisfied.

- *The site will contribute towards supporting a sustainable metapopulation of the marsh fritillary in the Penderyn/Hirwaun area. This will require a minimum of 50 ha of suitable habitat, of which at least 10 ha must be in good condition, although not all is expected to be found within the SAC. Some will be on nearby land within a radius of about 2 km.*
- *The population will be viable in the long term, acknowledging the extreme population fluctuations of the species.*
- *A minimum of 30 % of the total site area will be grassland suitable for supporting marsh fritillary. (As the total area of the SAC is 66.62 ha, 30 % represents approximately 20 ha.).*
- *At least 40 % of the suitable habitat (approximately 8 ha) must be in optimal condition for breeding marsh fritillary.*
- *Suitable marsh fritillary habitat is defined as stands of grassland where Succisa pratensis is present and where scrub more than 1 metre tall covers no more than 10 % of the stands.*
- *Optimal marsh fritillary breeding habitat will be characterised by grassland where the vegetation height is 10-20 cm, with abundant purple moor-grass Molinia caerulea, frequent "large-leaved" devil's-bit scabious Succisa pratensis suitable for marsh fritillaries to lay their eggs and only occasional scrub. In peak years, a density of 200 larval webs per hectare of optimal habitat will be found across the site.*

B.4 Performance indicators for feature 1

The performance indicators form part of the conservation objective and the assessment of plans and projects must be based on the entire conservation objective, not just the performance indicators.

Table 8.1 : Performance indicators for feature condition

Attribute	Attribute rationale and other comments	Specified limits
A1. Density of larval webs	Larval web density in a 'good' year for marsh fritillary has been identified as a measurable performance indicator of the population. During peaks in the population cycle a density of 200 webs per hectare of suitable habitat is an appropriate target to set as defining favourable condition for strong populations. Wide fluctuations in abundance occur, with dramatic crashes in population size occurring every ten years or so. Recovery from these crashes may take 4 or 5 yrs.	Upper limit: not required Lower limit: in one year in six the number of larval webs is estimated to be 200 per hectare of Good Condition habitat.

Table 8.2 : Performance indicators for factors affecting the future

Factor	Factor rationale and other comments	Operational limits
F1. Extent and quality of the marshy grassland as habitat for marsh fritillary.	The marsh fritillary is a highly localised and sedentary butterfly that inhabits unimproved Molinia grassland in the lowlands. It has an annual life-cycle and feeds as a larva on Succisa pratensis, especially on large-leaved plants that are growing amongst vegetation that is between 10 and 20 cm tall in late summer / autumn. The larvae over-winter communally amongst litter in such situations and the shelter provided by leaf litter and tussocks is considered to be important. Approximately 50 ha of habitat is required to maintain the population in the long term, with at least 10 ha is good condition. Not all is expected to be within the SAC. The operational limits reflect the minimum contribution of the Blaen Cynon SAC towards the favourable conservation status of the species in the Hirwaun / Penderyn area. Definition of Good Condition marsh fritillary habitat Grassland, with Molinia abundant where, for at least 80 % of sampling points, the vegetation height is within the range of 10 to 20 cm (when measured using a Boorman's disc) and Succisa pratensis is present within a 1 m radius. Scrub (>0.5 metres tall) covers no more than 10 % of area Definition of Suitable marshy grassland Stands of grassland where Succisa pratensis is present at lower frequencies but still widely distributed (>5 % of sampling points) throughout the habitat patch and in which scrub (>0.5 metre tall) covers no more than 25 % of area. Alternatively, Succisa may be present at high density in close-cropped swards. [note: Available habitat is the total of Good Condition and Suitable habitat]	20 hectares of Available marshy grassland, including: 8 hectares of Good Condition marsh fritillary habitat Within Areas 1, 2, 3 and 4 (Cors y Gaer SSSI) 50 % of the vegetation meets the following criteria: Within a 50 cm radius: Molinia is present. AND The cover of Succisa is 10 % or greater. AND The vegetation height is between 10- 20 cm when measured using a Boorman's disc. AND The cover of Juncus spp. does not exceed 50 %.

Appendix 11J - Statutory Designated Site Citations

Rev 0

July 2017

Final

Summary

This technical report provides the citation references for the statutory designated sites for nature conservation located within the respective study areas of the proposed scheme.

Two Special Areas of Conservation (SAC) are located within 2 km of the proposed scheme (ES Volume 3 Figure 11.1): the Blaen Cynon SAC; and the Coeddydd Nedd a Melte SAC.

One SAC designated for bat species is located within 30 km of the proposed scheme (ES Volume 3 Figure 11.1): Usk Bat Sites SAC.

Eleven Sites of Special Scientific Interest (SSSI) are located within 2 km of the proposed scheme (ES Volume 3 Figure 11.1):

- Dyffrynoedd Nedd a Mellte a Moel Penderyn;
- Cors Bryn-y-Gaer (part of Blaen Cynon SAC);
- Woodland Park and Pontpren (part of Blaen Cynon SAC);
- Tir Mawr a Dderi Hir, Llwydcoed;
- Bryncarnau Grasslands, Llwydcoed;
- Cwm Glo a Glyndyrys;
- Penmoelallt;
- Daren Fach;
- Cwm Taf Fechan Woodlands;
- Nant Glais Caves; and
- Lower House Stream Section.

The citations for these sites are presented in order of importance and then running west to east, following chainage direction.

Annex I habitats that are a primary reason for selection of this site

91A0 Old sessile oak woods with Ilex and Blechnum in the British Isles

Coedydd Nedd a Mellte is a very large and diverse example of **old sessile oak wood** in south Wales. The woods extend along a series of deeply incised valleys and ravines, and contain complex mosaics of sessile oak *Quercus petraea* woodland, ash *Fraxinus excelsior* woodland (some of which is referable to Annex I type **9180** ***Tilio-Acerion*** **forests of slopes, screes and ravines**), and transitions to lowland woodland types. The whole site is biologically rich, with many woodland plant communities represented and rich bryophyte and lichen assemblages. Notable higher plant species include wood fescue *Festuca altissima* and the ferns *Dryopteris aemula*, *Hymenophyllum tunbrigense* and *Asplenium viride*.

Annex I habitats present as a qualifying feature, but not a primary reason for selection of this site

9180 Tilio-Acerion forests of slopes, screes and ravines * Priority feature

Annex II species that are a primary reason for selection of this site

Not applicable.

Annex II species present as a qualifying feature, but not a primary reason for site selection

Not applicable.

2. Blaen Cynon SAC

DYFFRYNNOEDD NEDD A MELLTE, A MOEL PENDERYN

Date of Notification: 1954, 1965, 1978, 1979, 1999

National Grid Reference: SN 907100, SN 921090, SN 937088

O.S. Maps: 1:50,000 Sheet number: 160
1:10,000 Sheet number: SN 80 NE, SN 90 NW, SN 91 SW

Site Area: 421.1 ha

Description:

Dyffrynnoedd Nedd a Mellte, a Moel Penderyn is of special interest for its extensive and diverse semi-natural woodland, important populations of several flowering plants and supporting outstanding assemblages of mosses, liverworts and lichens. The site includes a range of geological features, well-exposed in the cliffs and rocky river beds. These include exposures at Moel Penderyn, Craig y Ddinas and Bwa Maen and geomorphological features within parts of the valleys of the Hepste and Mellte are also of special interest.

This site includes the wooded valleys of the rivers Nedd and Mellte, and their tributaries above Pontneddfechan, as they pass through a Millstone Grit and limestone plateau, and Moel Penderyn, which lies to the east. The plateau lies at about 300 m, the rivers having eroded deep, narrow valleys with gorges, river cliffs, block scree and waterfalls.

GEOLOGY

The old quarry faces and rock outcrops at Craig y Ddinas and Moel Penderyn provide important exposures of geological structures formed during the Variscan Orogeny, late in the Carboniferous and early in the Permian periods of geological history. The Carboniferous Limestone layers are steeply tilted on Craig y Ddinas, as a result of folding, and small tight folds can be seen in the banks of the River Sychryd. The exposed Dinas fault, a major dislocation of the crust, is marked by a belt of shattered limestone associated with several minor fractures. Numerous other small structures occur, including faults, fractures, veins and folds. This complex assemblage of structures makes up a narrow belt called the Neath Disturbance, which extends from the Welsh Borders to the Gower Peninsula. The Disturbance probably lies above an ancient line of weakness in the deep crust reactivated during the Variscan Orogeny. These localities provide the best exposures of this important feature of the geological structure of South Wales.

The best exposure in South Wales of the rock strata of the *Gastrioceras subcrenatum* Marine Band (below the Farewell Rock) in its full development occurs in the valley of the Nedd Fechan. The full range of environment types is represented in the marine band section, including brackish

water with a restricted fauna and off-shore marine environments with a goniatite-rich fauna. The site is important in understanding how this brief marine incursion occurred, which, in turn, is important because the marine band, the expression of this event in the rocks, is taken to indicate the start of the Westphalian Epoch of Carboniferous time.

The Nedd, Mellte and Sychryd, forming the headwaters of the Afon Nedd, provide key exposures of Carboniferous rocks. These include extensive and spectacular exposures of the whole Namurian of the North Crop. In particular, the Basal Grits are well exposed and present the best available section in the Main South Wales Basin. The predominantly shaley sequences of the higher Namurian are also well exposed here and their study has been of great importance in the elucidation of the stratigraphy of the Namurian. Additional importance attaches to the presence of a varied and abundant Basal Grit flora. These are outstanding, nationally important sections of the Carboniferous.

The river system is exceptional in showing the combined effects of geological controls and changing sea levels in river landform development. Faulting has juxtaposed rocks of varying resistance and influenced the form and evolution of waterfalls. Thus the landforms of this area reflect a variety of interacting controls, and both the total assemblage as well as the individual features are important.

BIOLOGY

This site supports one of the most extensive and diverse areas of semi-natural woodland in Wales. The predominant woodland vegetation communities are characteristic of the uplands of north and western Britain, with extensive areas of oak *Quercus spp*. woodland, and smaller areas of ash *Fraxinus excelsior* woodland. The distribution of the particular communities reflects the distribution of soils of low, moderate and high base status, respectively. More locally, however, the aspects and microclimate have allowed the development of the southern and eastern lowland counterparts of these free-draining oak, birch *Betula spp*. and ash-dominated woodlands.

Large areas of the site have a woodland canopy dominated by oak intermediate in character between the sessile oak *Quercus petraea* and the pedunculate oak *Q. robur*, with a little downy birch *Betula pubescens* and small-leaved lime *Tilia cordata* in places. Here, the shrub layer is absent or sparse with a little hazel *Corylus avellana* or rowan *Sorbus aucuparia*. The field layer is typically dominated by wavy hair-grass *Deschampsia flexuosa*, with bilberry *Vaccinium myrtillus* present and, where grazing is relatively light, quite abundant. The ground layer has a very high cover of mosses, including *Rhytidiadelphus loreus*, *Polytrichum formosum*, *Dicranum majus*, *Plagiothecium undulatum*, *Hypnum cupressiforme*, *Mnium hornum* and *Sphagnum quinquefarium*. Elsewhere, large stands of similar canopy and shrub layer composition have a ground layer typically dominated by wavy hair-grass with common bent *Agrostis capillaris* and some sweet vernal-grass *Anthoxanthum odoratum*. Purple moor-grass *Molinia caerulea* is present occasionally and is sometimes abundant, while bilberry is absent or very rare except on inaccessible ledges and cliffs. The ground layer often has carpets of the bryophytes mentioned above.

Another woodland community that occurs extensively in some parts of the site is dominated by sessile oak and forms intermediate with pedunculate oak, or downy birch, or a mixture. Other canopy trees are rare and the shrub layer is typically sparse, but in some areas dense hazel and scattered hawthorn *Crataegus monogyna* are present. The field layer is grassy, with common bent, sweet vernal-grass and creeping soft-grass *Holcus mollis* often abundant with patchy wavy

hair-grass. Other species that occur here are wood-sorrel *Oxalis acetosella*, bluebell *Hyacinthoides non-scripta*, bracken *Pteridium aquilinum* and heath bedstraw *Galium saxatile* and the mosses *Rhytidiadelphus squarrosus* and *Polytrichum formosum*.

Small stands of woodland, particularly along steep tributary stream valleys are dominated by ash with a dense shrub layer of hazel, a little hawthorn and locally frequent rowan. No single species is dominant in the field layer, but wood-sorrel, false brome *Brachypodium sylvaticum*, common bent, lady-fern *Athyrium filix-femina* and rough meadow-grass *Poa trivialis* are all locally frequent. In the ground layer, mosses and liverworts are prominent, with *Plagiomnium undulatum*, *Mnium hornum*, *Atrichum undulatum*, *Pellia* sp., and *Ctenidium molluscum* all frequent and often abundant. The ground flora in these areas can be extremely rich and includes species that are scarce in mid and south Wales, such as wood fescue *Festuca altissima*.

The canopy in one area of the site is composed mainly of intermediate oak, with a little downy birch in places. The shrub layer is sparse, with only scattered hazel and holly *Ilex aquifolium*. The field layer is a carpet of wavy hair-grass with few other species present, although bracken occurs in places. Mosses are sometimes quite prominent in scattered tufts, especially *Polytrichum formosum* and *Mnium hornum*.

In another area, the canopy mostly comprises intermediate oak and occasional ash with a relatively dense shrub layer, primarily of hazel, but with scattered holly and rowan. The field layer is dominated by three species: bramble *Rubus fruticosus*, bracken and creeping soft-grass with frequent wavy hair-grass.

Small patches of woodland on open, steep cliffs and screes, particularly of limestone, are dominated by ash and are relatively species-rich, with many calcicoles. On shadier steep cliffs, similarly ash-dominated patches are relatively species-poor, with abundant ivy *Hedera helix* and some calcicoles. In small areas of woodland at the base of shadier steep cliffs, scattered field maple *Acer campestre* occurs in the shrub layer, beneath a canopy of ash. The field layer includes species such as dog's mercury *Mercurialis perennis*, herb-Robert *Geranium robertianum*, common nettle *Urtica dioica*, cleavers *Galium aparine* and, where bouldery, hart's-tongue *Phyllitis scolopendrium*.

Elsewhere, soils with impeded drainage or flushing support an extensive area of alder *Alnus glutinosa*-dominated woodland, in a range of topographical situations. Wet flushes within this type of woodland provide the most southerly known locality in Britain for marsh hawk's-beard *Crepis paludosa*. There are small patches of woodland where alder is dominant, with a little ash and downy birch over a shrub layer of hazel. Here, the field layer is generally dominated by remote sedge *Carex remota* with many other species present in small amounts. Elsewhere, extensive stands of alder-dominated woodland have a relatively dense shrub layer, primarily composed of hazel but often with ash saplings, hawthorn and downy birch saplings. The ground layer is dominated by tufted hair-grass *Deschampsia cespitosa*, with wood-sorrel and lady-fern. Further areas have a canopy mostly of alder with occasional downy birch and little of a shrub layer except scattered ash saplings. The field layer is a mixture of meadowsweet *Filipendula vulgaris*, creeping buttercup *Ranunculus repens*, false brome, soft-rush, great horsetail *Equisetum telmateia* and bramble. In the ground layer, the mosses *Eurhynchium praelongum* and *Thuidium tamariscinum* are frequent.

Locally, where woodland extends onto the drift-covered plateau, stands of a community dominated by alder with occasional downy birch, rowan and ash are present. There is no shrub

layer and the field layer is dominated by purple moor-grass, with frequent bramble, soft-rush *Juncus effusus* and broad buckler-fern *Dryopteris dilatata*. Scattered, relatively small patches of a similar type of woodland have the same canopy trees and a typically sparse or absent shrub layer. The field layer here is always dominated by purple moor-grass, with soft-rush, tormentil *Potentilla erecta*, creeping soft-grass, tufted hair-grass and common bent typically present. In the ground layer, bog moss *Sphagnum recurvum* and hair moss *Polytrichum commune* are usually present.

The overall botanical diversity is outstanding, with more than 600 species of plant having been recorded from the site. This includes a very large proportion of the bryophyte flora of mid and south Wales.

The high humidity of much of the woodland has a strong influence on its botanical diversity. Trees and rocks support a diverse assemblage of plant species largely confined in their distribution to the Atlantic Seaboard of Europe. These Atlantic species include green spleenwort *Asplenium viride*, Tunbridge filmy-fern *H. tunbridgense*, hay-scented buckler-fern *Dryopteris aemula*, all of which are rare in south Wales, liverworts, such as *Bazzania trilobata*, *Jubula hutchinsiae* and the scarce *Anastrophyllum hellerianum*, *Colura calyptrifolia*, *Jamesoniella autumnalis* and *Sphenolobopsis pearsonii*, mosses, such as *Isothecium holtii*, *Dichodontium denudatum* and the scarce *Bartramia hallerana* and *Seligera acutifolius*, lichens, such as *Enterographa hutchinsii*, *Micarea alabastrites*, the rare *Micarea hedlundii*, and the scarce *Micarea stipitata* and *Phyllopsora roseii*. These contrast with the local abundance of more continental species such as, on logs, the scarce moss *Dicranum flagellare*, on gritstone cliffs, the scarce lichen *Chrysothrix chlorina* and, on bark, the scarce lichen *Micarea pycnidiophora*.

Boulder screes, cliff faces, springs, seepages, decaying logs and mature and overmature trees provide some of the specific habitats required by several scarce lower plants demanding conditions that are subject to little change with time, including the lichens *Leptogium plicatile* and *L. subtile*, and the liverwort *Cephalozia catenulata*. Despite recent high levels of atmospheric pollution, the epiphytic <u>*Lobarion*</u> lichen community persists in these sheltered valleys and includes species such as *Lecanactis premnea*, *Biatora sphaeroides*, *Parmeliella triptophylla* and *Dimerella lutea*.

The rivers, with their fine waterfalls, are an integral part of the site with the splash zones and spray providing wetness and humidity necessary for many species. River courses support a notable riparian flora dominated by liverworts, and mosses, including the nationally scarce *Fissidens rufulus* and *F. rivularis*, and *Tetrodontium brownianum*, which is threatened in Europe.

The woodland in the valleys is interspersed with several more open habitats that provide additional interest. As well as the cliffs, screes and rivers there are extensive areas of grassland dominated by common bent and sheep's fescue *Festuca ovina*. There are also patches of less acidic grassland in the valley bottoms and, at Craig y Ddinas and Moel Penderyn, the limestone supports calcareous grassland. Wet grassland dominated by purple moor-grass or rushes (*Juncus* spp.) occurs in a series of flushes along the valley sides and bracken-dominated glades are widespread. Patches of dry heath and wet heath characterised by deergrass *Scirpus cespitosus* and cross-leaved heath *Erica tetralix* can be found in Hepste valley.

Other habitats of interest include areas of beech *Fagus sylvatica* plantation, grey willow *Salix cinerea* and bramble scrub and nutrient-rich ponds.

The fauna of these valleys is well developed, and includes birds such as breeding dipper, grey wagtail, goosander, pied flycatcher, redstart, wood warbler, woodcock, buzzard and sparrowhawk.

Remarks:

Part of this site lies within the Brecon Beacons National Park.

The Forestry Commission and the Brecon Beacons National Park Authority own parts of this site.

CYNGOR CEFN GWLAD CYMRU
COUNTRYSIDE COUNCIL FOR WALES

SITE OF SPECIAL SCIENTIFIC INTEREST CITATION

RHONDDA CYNON TAFF **CORS BRYN-Y-GAER**

Date of Notification: 2002

National Grid Reference: SN 945065

O.S. Maps: 1:50,000 Sheet number: 160
1:10,000 Sheet number: SN 90NE and NW

Site Area: 52.1 ha

Description:

Cors Bryn-y-gaer is of special interest for its lowland bog and for areas of soligenous flush, marshy grassland, dry neutral grassland and lowland acid grassland. These habitats occur in a complex with wet heath, swamp and semi-improved grassland. The site is also of special interest for the marsh fritillary butterfly *Eurodryas aurinia*.

The site is located immediately north-west of Hirwaun and south of the Brecon Beacons National Park. Cors Bryn-y-gaer is situated at the northern edge of the South Wales Coalfield, on glacial boulder clay, with areas of deep peat on lower ground. Several small water courses and springs are associated with the site, which is in the catchment of the Afon Cynon. The altitude varies from 205 to 220m. The main part of the site comprises several drumlins (smooth oval hills of glacial drift) interspersed with lower lying flat ground. A series of enclosed fields form the northern margin. Also included within the site are two small level fields situated 500 m to the south of the main block of land; these fields are bisected by the A4059 Hirwaun-Penderyn road.

The lowland bog at Cors Bryn-y-gaer is actively peat forming. The vegetation is characterised by a carpet of bog moss *Sphagnum cuspidatum*, together with species such as deergrass *Trichophorum cespitosum*, hare's tail cottongrass *Eriophorum vaginatum* and round-leaved sundew *Drosera rotundifolia*. In slightly drier areas cross-leaved heath *Erica tetralix* becomes more abundant and there is a greater range of bog moss species *Sphagnum spp*., whilst in the wettest areas common cottongrass *Eriophorum angustifolium* is frequent.

Areas of acidic soligenous flush (under the influence of slow flowing mineral-rich ground or surface waters) cover most of the remaining deep peat between the drumlins. Here the vegetation is dominated by sharp-flowered rush *Juncus acutiflorus* over a carpet of bog moss. Associated species include purple moor-grass *Molinia caerulea*, heath wood-rush *Luzula multiflora* and tormentil *Potentilla erecta*. More sedge-rich flushes, with abundant carnation sedge *Carex panicea*, frequent bog asphodel *Narthecium ossifragum* and common cottongrass occur locally.

Marshy grassland is common on sloping ground on drumlins throughout Cors Bryn-y-gaer. Much of this grassland is dominated by purple moor-grass together with species such as sheep's

fescue *Festuca ovina* and tormentil. In places, this grassland is slightly heathy with frequent heath rush *Juncus squarrosus* and occasional cross-leaved heath. Elsewhere grasses are more prominent, including sweet vernal-grass *Anthoxanthum oderatum* and heath grass *Danthonia decumbens*. Small patches where the soil is slightly less acidic are distinguished by the presence of meadow thistle *Cirsium dissectum*.

Areas of marshy grassland dominated by rushes such as soft rush *Juncus effusus* and sharp-flowered rush are also present throughout Cors Bryn-y-gaer. Associated species include frequent marsh bedstraw *Galium palustre*, devil's-bit scabious *Succisa pratensis* and greater bird's-foot-trefoil *Lotus pedunculatus*.

Other habitats found at Cors Bryn-y-gaer include dry acid and neutral grassland. The neutral grassland is characterised by a range of grasses including common bent *Agrostis capillaris*, red fescue *Festuca rubra* and crested dog's tail *Cynosurus cristatus*, together with common knapweed *Centaurea nigra* and common bird's-foot trefoil *Lotus corniculatus*. On the lower slopes of the drumlins this community often grades into the more extensive acid grassland community, containing frequent sheep's fescue *Festuca ovina* and bird's-foot trefoil. Several small areas of wet heath also occur in association with marshy grassland and acid flush. These typically include frequent purple moor-grass, along with deergrass, cross-leaved heath and a range of mosses.

Many of the plant communities are closely juxtaposed, with well displayed transitions between them. Other habitats present on the site include small patches of swamp, inundation vegetation and scrub which add to the ecological and structural diversity of the site.

The nationally scarce marsh fritillary butterfly is associated with the marshy grassland, in which its larval food plant, devil's bit scabious, is frequent and widespread.

Cors Bryn-y-gaer also supports a population of cruet collar moss *Splachnum ampullaceum*, a nationally declining species, scarce in south Wales. This moss occurs mainly in lowland wet pastures, where it grows on decaying cattle and sheep dung.

Remarks:

Cors Bryn-y-gaer SSSI and the nearby Woodland Park/Pontpren SSSI support one of the largest metapopulations of marsh fritillary in South Wales. These two sites comprise the Blaen Cynon candidate Special Area of Conservation (cSAC).

Cors Bryn-y-gaer supports the following UK Biodiversity Action Plan priority habitats: lowland raised bog, purple moor-grass and rush pasture, fen, lowland acid grassland and lowland meadow.

The marsh fritillary is included on Annex IIa of the EC Habitats and Species Directive (Directive 92/43/EEC on the Conservation of Natural Habitats and of Wild Fauna and Flora) and Schedule 5 of the Wildlife and Countryside Act 1981 (as amended) and is a Biodiversity Action Plan species.

CYNGOR CEFN GWLAD CYMRU
COUNTRYSIDE COUNCIL FOR WALES

SITE OF SPECIAL SCIENTIFIC INTEREST CITATION

RHONDDA CYNON TAFF **WOODLAND PARK AND PONTPREN**

Date of Notification: 2000, 2002

National Grid Reference: SN 946077, SN 952075, SN 948071

O.S. Maps: 1:50,000 Sheet number: 160
1:10,000 Sheet number: SN90NW, SN90NE

Site Area: 14.5 ha

Description:

Woodland Park and Pontpren is of special for the interest for the marsh fritillary butterfly *Eurodryas aurinia*. Additional special interest is provided by its mixture of habitat types, including marshy grassland, dry acid and neutral grassland, heathland and woodland, which add to the ecological and biodiversity interest of the site and which also provide food and shelter necessary for the survival of the marsh fritillary.

This site consists of three separate blocks of land, approximately 1km south of the village of Penderyn. The underlying geology is of Namurian and Westphalian sandstones, overlain by stagnohumic gleyed soils. Drainage is impeded across most of the site. The altitude ranges from 210 to 265m.

A variety of purple moor-grass *Molinia caerulea*-dominated communities are present at the site. The largest stands, in the north-western block, were planted with trees in 1995 and are rather tussocky and species-poor. Smaller areas of tussocky vegetation with an abundance of tall herbs such as wild angelica *Angelica sylvestris*, are present in the southern block. Scattered throughout the site are small, grassier stands, with species such as sheep's-fescue *Festuca ovina*, sweet vernal-grass *Anthoxanthum odoratum*, small sedges *Carex spp.* and tormentil *Potentilla erecta*. Heathier areas have cross-leaved heath *Erica tetralix* and bog mosses *Sphagnum spp.*.

Small patches of fen-meadow, with abundant meadow thistle *Cirsium dissectum*, tawny sedge *Carex hostiana* and flea sedge *C. pulicaris*, occur scattered in all three blocks of land and, more locally, there are base-enriched flushes with a high cover of bryophytes such as *Bryum pseudotriquetrum* and *Campylium stellatum*.

Marshy grassland with a high cover of sharp-flowered rush *Juncus acutiflorus* and soft-rush *J. effusus* occurs in the eastern and southern blocks, where it sometimes grades into tall-herb fen dominated by meadowsweet *Filipendula ulmaria* or damp grassland dominated by tufted hair-grass *Deschampsia cespitosa*.

On better drained soils there are small areas of acid and neutral grassland and bracken. The acid grassland is characterised by species such as common bent *Agrostis capillaris*, sheep's-fescue,

heath bedstraw *Galium saxatile* and tormentil. Common species in the neutral grassland include crested dog's-tail *Cynosurus cristatus*, common bird's-foot-trefoil *Lotus corniculatus* and red clover *Trifolium pratense*.

Devil's-bit scabious *Succisa pratensis*, the larval food plant of the marsh fritillary, is widespread and abundant in most of the wet and dry pasture at the site. It is also common in ditches in planted areas in the north-west of the site. Flowers of plants such as meadow thistle, provide a nectar source for the adult marsh fritillary.

Stands of broadleaved woodland and scrub occur throughout the site. On wetter ground, the main species are alder *Alnus glutinosa* and willow *Salix spp*., with oak *Quercus spp*. and birch *Betula pubescens* common on more free-draining soils.

Remarks:

Woodland Park and Pontpren SSSI and the nearby Cors Bryn-y-gaer SSSI support one of the largest metapopulations of marsh fritillary in south Wales. These two sites comprise the Blaen Cynon Special Area of Conservation (cSAC).

The marsh fritillary is included on Schedule 5 of the Wildlife and Countryside Act 1981 (as amended) and Annex IIa of the EC Habitats Directive (Directive 92/43/EEC on the Conservation of Natural Habitats and of Wild Fauna and Flora) and is a priority Biodiversity Action Plan species.

The site, apart from the most southerly field, lies within the Brecon Beacons National Park.

COUNTRYSIDE COUNCIL FOR WALES

SITE OF SPECIAL SCIENTIFIC INTEREST CITATION

RHONDDA CYNON TAF **TIR MAWR A DDERI HIR, LLWYDCOED**

Date of Notification: 12 September 2012

National Grid Reference: SN 984048 & SN 983062

OS Maps: 1:50,000 Sheet number: 160, 170
1:10,000 Sheet number: SN 90 SE, NE

Site Area: 49.85 ha

Description:

Tir Mawr a Dderi Hir, Llwydcoed is of special interest for its species-rich neutral grassland and for its marshy grassland, some of which is heathy fen-meadow.

Tir Mawr a Dderi Hir, Llwydcoed is made up of two separate blocks of land, 620 m apart. Both are situated 2 km east of Hirwaun, between the A4059 and the A465 roads. The altitude ranges from 150 to 240 m. Both blocks of land are drained by tributaries of the River Cynon.

The bedrock beneath the northern block of fields, around Deri Hir, comprises sandstones and some mudstones which are Carboniferous in age. The southern fields are underlain by sandstones, siltstones, mudstones and coals, which are also Carboniferous in age. Throughout the site, bedrocks are buried beneath a covering of boulder clay of Pleistocene age. The main soils are slowly permeable gleys with a distinct topsoil of dark slightly stony clay loam. There are also brown earths that are more free-draining and drier as a result. The embankment of an old dismantled railway intersects the site and here the soils are even better drained.

Species-rich neutral grassland occurs on free-draining ground, most of which is in the southern part of the site. Here, common knapweed *Centaurea nigra* and common bird's-foot-trefoil *Lotus corniculatus* occur, together with grasses such as common bent *Agrostis capillaris*, sweet vernal-grass *Anthoxanthum odoratum*, crested dog's-tail *Cynosurus cristatus* and red fescue *Festuca rubra*. Other herbs include ribwort plantain *Plantago lanceolata*, meadow buttercup *Ranunculus acris* and red clover *Trifolium pratense*, with rough hawkbit *Leontodon hispidus* and smooth lady's mantle *Alchemilla glabra*. A particular feature of the neutral grassland here is the frequent occurrence of great burnet *Sanguisorba officinalis* in some stands. Plentiful great burnet in high quality vegetation is confined in Glamorgan to a handful of sites in the north of the county.

Some of this grassland, in both parts of the site, contains plants that are tolerant of nutrient poor, slightly acidic conditions, such as devil's-bit scabious *Succisa pratensis*, sheep's-fescue *Festuca ovina*, heath-grass *Danthonia decumbens* and tormentil *Potentilla erecta*. More locally, betony *Betonica officinalis* and bitter-vetch *Lathyrus linarifolius* can be found.

Where the drainage is impeded and the soils are mildly base-rich, areas of fen-meadow occur. These are mostly in the northern part of the site. Here, purple moor-grass *Molinia caerulea* is prominent with meadow thistle *Cirsium dissectum* and devil's-bit scabious. Some areas also show signs of more acidic conditions and here saw-wort *Serratula tinctoria*, bog asphodel *Narthecium ossifragum* and bog-mosses *Sphagnum* spp. occur.

Other areas of wet ground throughout the site, where the conditions are less base–rich, support rush-pasture dominated by sharp-flowered rush *Juncus acutiflorus*. This is associated with greater bird's-foot-trefoil *Lotus uliginosus*, devil's-bit scabious and Yorkshire fog *Holcus lanatus,* cuckooflower *Cardamine pratensis*, meadowsweet *Filipendula ulmaria* and common marsh-bedstraw *Galium palustre.*

In the wetter, northern part of the site around Deri Hir other plant communities are present, including areas of purple moor-grass pasture that lack any base-enrichment and in which the common associated herbs are tormentil and devil's-bit scabious. There are also small areas of acid flush and significant areas of wet heath, distinguished by deergrass *Trichophorum cespitosum*, which is present in continuous blocks and also amongst stands of purple moor-grass dominated vegetation. A population of petty whin *Genista anglica* occurs in areas of wet heath and purple moor-grass mire.

Some of the fields are bounded by woodland and scrub which adds to the interest of the site. Some of the woodland is situated on steep slopes.

The northern part of the site provides habitat suitable for the marsh fritillary butterfly. Larval webs and adult butterflies have been recorded in the north western fields.

Uncommon plants which occur at Deri Hir include petty whin. The closely-related dyer's greenweed *Genista tinctoria* has been recorded at the site in the past, as has whorled caraway *Carum verticillatum*. Wood bitter-vetch *Vicia orobus* occurs in the southern part of the site.

Remarks:

The site supports the following UK biodiversity action plan (BAP) priority habitats: purple moor-grass and rush pastures; lowland fen; lowland meadows.

Marsh fritillary butterflies have been recorded at the site in several years since 1993.

Gamlyn Viaduct is a Scheduled Ancient Monument.

Part of the site is within the Brecon Beacons National Park

CYNGOR CEFN GWLAD CYMRU
COUNTRYSIDE COUNCIL FOR WALES

SITE OF SPECIAL SCIENTIFIC INTEREST CITATION

RHONDDA CYNON TAFF **BRYNCARNAU GRASSLANDS, LLWYDCOED**

Date of Notification: 1993

National Grid reference: SN995061

O.S. Maps: 1:50,000 Sheet number: 160
1:25,000 Sheet number: SN90, SO 00

Site Area: 24.8 ha

Description:

Bryncarnau Grasslands are situated on a west-facing hillside at the head of the Cynon Valley, to the north of Aberdare. They range from 270 to 320m in altitude, and are bounded by small tributaries of the River Cynon which, towards the western end of the site, occupy deeply incised wooded valleys. The soils are derived from boulder clay over Coal Measures. The site represents a particularly good example of a gradation from lowland mesotrophic grassland to pasture of a more upland character. A range of plant communities are present and these include 2 of very high nature conservation value. A number of plants which are rare in the Glamorgans occur here.

The western part of the site and the isolated south western field both support a mosaic of lowland grassland types including plant communities typical of both well and poorly drained ground. The drier areas are typified by grasses such as common bent *Agrostis capillaris,* sweet vernal-grass *Anthoxanthum odoratum*, crested dog's-tail *Cynosurus cristatus* and red fescue *Festuca rubra* with a range of broad-leaved herbs including common knapweed *Centaurea nigra*, rough hawkbit *Leontodon hispidus,* common bird's-foot-trefoil *Lotus corniculatus* and great burnet *Sanguisorba officinalis*. Other species which occur more locally in this community include smooth lady's-mantle *Alchemilla glabra,* common spotted-orchid *Dactylorhiza fuchsii* and betony *Stachys officinalis*. The wetter areas include some which are dominated by rushes and others typified by meadow thistle *Cirsium dissectum*, purple moor-grass *Molinia caerulea* and carnation sedge *Carex panicea*. In terms of the National Vegetation Classification, most of the drier grassland may be ascribed to the *Centaurea nigra - Cynosurus cristatus* neutral grassland and substantial areas of the wetter ground to the *Molinia caerulea - Cirsium dissectum* fen meadow. The upper, eastern part of the site includes an extensive area of dry, acidic grassland typified by common bent and sheep's-fescue *Festuca ovina*. Also present is a smaller area of more poorly drained grassland dominated by purple moor-grass with tormentil *Potentilla erecta* and cross-leaved heath *Erica tetralix*.

A number of unusual plants occur within the site. Greater butterfly-orchid *Platanthera chlorantha* and wood bitter-vetch *Vicia orobus* both have a very restricted distribution in the dry neutral grassland within the site pale sedge *Carex pallescens* is more widely distributed in the same community. Springs and flushes areas towards the upper end of the site support round-leaved

sundew *Drosera rotundifolia*, few-flowered spike-rush *Eleocharis quinqueflora*, fen bedstraw *Galium uliginosum* and common butterwort *Pinguicula vulgaris*.

CYNGOR CEFN GWLAD CYMRU
COUNTRYSIDE COUNCIL FOR WALES

SITE OF SPECIAL SCIENTIFIC INTEREST CITATION

MERTHYR TYDFIL **CWM GLO**

Date of Notification: 2003

National Grid Reference: SO 034054

O.S. Maps: 1:50,000 Sheet number: 160
1:10,000 Sheet number: SO 00 SW

Site Area: 29.1 ha

Description:

Cwm Glo is of special interest for its wet pastures and species-rich neutral grassland, and for the association of these habitats with others including acid grassland and wet heath.

The site is located approximately 1.5km to the south west of the centre of Merthyr Tydfil, on an east facing slope at an altitude of between 250m and 350m. The site comprises a series of small enclosures surrounded by woodland, together with more open land with scattered mature trees. This open area includes remnant spoil tips between one hundred and two hundred years old.

In the north east of the site there are a series of small enclosures, sheltered by mixed woodland. Drainage is mainly impeded across this area, which supports base-rich fen-meadow communities characterised by meadow thistle *Cirsium dissectum*, devil's bit scabious *Succisa pratensis* and a number of sedge species, including glaucous sedge *Carex flacca*, carnation sedge *C. panicea*, common sedge *C. nigra*, tawny sedge *C. hostiana*, common yellow sedge *C. demissa* and flea sedge *C. pulicaris*.

In places this fen-meadow community grades into drier species-rich neutral grassland. Typical species here include bird's-foot-trefoil *Lotus corniculatus*, black knapweed *Centaurea nigra* and a range of grasses including common bent *Agrostis capillaris* and sweet vernal-grass *Anthoxanthum odoratum*. A slight acid nature to the soil is suggested by the presence of heath-grass *Danthonia decumbens* and tormentil *Potentilla erecta*, whilst, in places flushing is indicated by quaking-grass *Briza media* and great burnet *Sanguisorba officinalis*.

Elsewhere on the site, the landscape is more open, with pastures separated by steep, wooded streams and the remnants of former field boundaries. The fen-meadow community is present here also, but has a conspicuous heathy element with cross-leaved heath Erica tetralix and heather *Calluna vulgaris*. Other wet pasture communities also occur in this area, dominated by purple moor-grass *Molinia caerulea*, sweet vernal grass, sheep's fescue *Festuca ovina* and mat-grass *Nardus stricta*, with lousewort *Pedicularis sylvatica*, tormentil and heath wood-rush *Luzula multiflora*. In places, cross-leaved heath and heather are frequent, and where these two species become dominant, the vegetation grades into wet heath. Here deergrass *Trichophorum cespitosum* and bilberry *Vaccinium myrtillus* occur, together with the moss *Pleurozium schreberi*.

Where springs reach the surface, there are small areas of flush dominated by a carpet of *Sphagnum auriculatum* and sedge species.

In the drier areas, and on the remnant spoil heaps, two types of grassland have developed. Species-rich neutral grassland occurs where the soils are not too acidic. Typical grass species here include common bent, crested dog's tail *Cynosurus cristatus* and red fescue *Festuca rubra*. Bird's foot trefoil, black knapweed, autumn hawkbit *Leontodon autumnalis*, common cat's ear Hypochaeris radicata, eyebright *Euphrasia sp*., and, locally, wild thyme *Thymus praecox*, are all present, together with spring sedge *Carex caryophylla*, glaucous sedge *C. flacca*, and pill sedge *C. pilulifera*. In places, there is also an abundant carpet of Cladonia lichens.

In places, this neutral grassland grades into vegetation more associated with dry acid conditions. The main grass species are common bent and sheep's fescue. A number of herb species also occur. Bird's foot trefoil and devil's bit scabious are still present, but are here joined by species such as heath bedstraw *Galium saxatile*, tormentil, common sorrel *Rumex acetosa*, heath speedwell *Veronica officinalis* and saw-wort *Serratula tinctoria*.

Cwm Glo is host to a number of uncommon species, including whorled caraway *Carum verticillatum*, petty whin *Genista anglica* and adder's tongue *Ophioglossum vulgatum*. In addition, a number of scarce or declining animal species have been recorded in the area. The marsh fritillary butterfly *Eurodryas aurinia* has been noted in the marshy grassland areas, where its foodplant, devil's bit scabious occurs. Both great crested newts *Triturus cristatus* and water voles *Arvicola terrestris* have been recorded in ponds on the site.

Remarks:

Cwm Glo lies within the Merthyr Tydfil landscape of outstanding historic interest, identified on the CCW/Cadw/ICOMOS Register of Landscapes of Outstanding Historic Interest in Wales and noted for its evidence of industrial activity that dates back to about 1750.

SITE OF SPECIAL SCIENTIFIC INTEREST CITATION

MERTHYR TYDFIL **DAREN FACH**

Date of notification: 1960, 1983

National Grid Reference: SO019105

O.S. Maps 1:50,000 Sheet number: 160
1:25,000 Sheet number: S0 01

Site Area: 12.1 ha

Description:

The site consists of an open scrub on low limestone cliffs with screes and woodland on the gentler slopes. The latter are dominated by ash inter-mixed with wych elm together with a well developed understorey of hazel and hawthorn. Field maple is present and a group of small-leaved lime lies at the northern end. The primary interest lies in a concentration of Sorbus spp. on the southern end of the Darren Fach crags. This is the type locality for the rare Ley's Whitebeam *Sorbus leyana* . Several shrubs of *S. leyana* together with a specimen of *S. rupicola* grow in association with ash, yew and holly.

Remarks:

Within the Brecon Beacons National Park

CYNGOR CEFN GWLAD CYMRU
COUNTRYSIDE COUNCIL FOR WALES

SITE OF SPECIAL SCIENTIFIC INTEREST CITATION

MERTHYR TYDFIL **NANT GLAIS CAVES**

Date of Notification: 1963, 1985

National Grid Reference: SO 040105

O.S. Maps 1:50,000 Sheet number: 160
1:25,000 Sheet number: S0 00/10, SO 01/11

Site Area: 15.7 ha

Description:

The site covers the limestone gorge of the Nant Glais and two vadose cave systems which lie parallel to it and under each bank. Both caves are formed at the contact of the oolitic and dolomitic facies within the Carboniferous Limestone and the contrasting solutional properties of the two lithologies have spectacularly influenced the passage morphology. The caves are also important for their unusually large populations of white trout.

Remarks:

The site is within the Brecon Beacons National Park and is in part a Glamorgan Trust for Nature Conservation Reserve.

CYNGOR CEFN GWLAD CYMRU
COUNTRYSIDE COUNCIL FOR WALES

SITE OF SPECIAL SCIENTIFIC INTEREST CITATION

CAERPHILLY **LOWER HOUSE STREAM SECTION**

Date of Notification: 1965, 1986

National Grid Reference: ST 104101

O.S. Maps: 1:50,000 Sheet number: 170
1:25,000 Sheet number: SO 11

Site Area: 0.11 ha

Description:

This site yields the most diverse *Gastrioceras cancellatum* Marine Band fauna known in southern Britain, including goniatites, brachiopods, bivalves and crinoids. It is an horizon of considerable stratigraphical importance, since it is used to locate the boundary between the Marsdenian and Yeadonian stages of the Namurian, and a full understanding of its faunal composition is vital to its correct identification. The site thus plays an important role in establishing detailed correlations with other areas of Namurian deposition, particularly in the Pennines, Belgium and the Ruhr.

Welsh Government

A465 Heads of the Valleys Dualling - Sections 5 and 6 - Dowlais Top to Hirwaun

Appendix 11K - Non Statutory Designated Sites Citations

Rev 0

July 2017

Final

Summary

This technical report provides the citation references for the non-statutory designated sites for nature conservation located within the study area of the proposed scheme. These sites namely consist of Sites of Importance for Nature Conservation (SINCs), designated by local authorities.

The proposed scheme crosses through four local planning authorities; Rhondda Cynon Taf County Borough Council (RCTCBC); Brecon Beacons National Park Authority (BBNPA); Merthyr Tydfil County Borough Council (MTCBC); and Caerphilly County Borough Council (CCBC).

SINCs that are located within 500 m of the proposed scheme are:

Rhondda Cynon Taf

- Hirwaun Industrial Estate;
- Hirwaun Ponds;
- Hirwaun Common;
- Hirwaun Ponds North;
- Hirwaun Iron Works;
- Upper Cynon Floodplain;
- Nant Hir Valley and Reservoir;
- Llwydcoed Slopes;
- Bryn-defaid Heath;
- Aberdare Mountain;

Merthyr Tydfil

- Bryn-du and Ty'n-y-coedcae;
- Winchfawr West;
- Cwm Ffrwd;
- Coed Meirig Pastures;
- Gellideg North Fields;
- Cwm Taf Fields and Cefn Coed Tip;
- Cwm Taf Fawr;
- Cilsanws Common South;
- Cwm Taf Fechan;
- Y Graig;
- Cyfartha Park;
- Gyrnos Wood;
- Bryniau;
- Morlais Hill;
- Blaenmorlais;
- Merthyr Common North; and

Caerphilly

- Pan March and Traed y Milwyr, Llechryd.

Additional SINCs within 200m of affected roads included in the assessment of air quality impacts are listed below:

- Coed Wernhir
- Werfa Farm
- Nant Hir Gwyddel
- East Llwydcoed
- Cwm Glo
- Afon Taf
- River Rhymney
- Butetown, Llechryd and Rhymney Grasslands

There are no SINC within 500 m of the proposed scheme within BBNPA.

The citations for each of these sites are presented in order running west to east following chainage direction. The location of each site is shown in Environmental Statement Volume 3 Figure 11.2.

Table 11K.1 : SINC Citations

(*http://www.sewbrec.org.uk/content/attachments/Mid%20Valley%20SINCs%20Introduction%20Section%201.pdf)

Local Authority	SINC No.	Site Name	Description	Meets or Exceeds the following Mid Valleys SINC Criteria*
RCTCBC	1	Coed Wernhir	A large mosaic SINC. Coed Wernhir is semi-natural deciduous woodland, part of which is ancient woodland. It supports mixed woodland, characterised by oak, birch, alder and ash with under storey including hazel, rowan, holly and willows. Alder predominates on wetter flushed areas. The woodland is mainly open, with some areas approaching wood pasture in nature. There are significant elements of an ancient woodland ground flora. Within open areas there are associated areas of marshy and semi-improved acid grassland. The woodlands represent good breeding bird habitat, including pied flycatcher. Lesser horseshoe bats occur in the wider area and Coed Wernhir is potentially important foraging habitat. The SINC also includes extensive areas of marshy grassland. These include areas of purple moor-grass and rush pasture (M25), which represent potential marsh fritillary butterfly habitat. Elsewhere large areas of marshy grassland are rush dominated, and unmanaged with encroaching scrub, and bramble. These areas, although in poor condition, support wetland grassland habitat, which justifies inclusion in the SINC as part of an extensive habitat mosaic. There are also a few areas of standing water, with stands of reed mace and other emergent species. Based largely upon habitat potential, these have a high potential as amphibian habitat.	Primary Woodlands Woodpasture, Parklands, Orchards and Veteran Trees Marshy Grassland Mosaic Habitats and Common Land Secondary Neutral Grassland Ffridd Communities Fens, Reedbeds and Other Swamps Watercourses Standing Open Water Hedgerows Mammals Birds Amphibians Invertebrates
RCTCBC	2	Werfa Farm	An extensive area of marshy and acid grassland (rhos pasture) with smaller areas of associated habitat. At its southern end the SINC represents a good example of lowland, species rich marshy grassland (National Vegetation Classification of M24 and M25), particularly notable for a large population of whorled caraway. The main part of the SINC is sheep-grazed marshy grassland with a complex mosaic of purple moor-grass and rush pasture with wet heath and acid flushes (sphagnum bog moss) and large areas of wet acidic grassland. The eastern boundary of the SINC is the deeply incised valley of the Cwm Wylfa, with a fast flowing upland stream and an oak and alder dominated wooded gorge. Although, areas of the site are in relatively poor habitat condition, the size and continuity of habitats, represents an important wet grassland and heath mosaic. The SINC is an important area of marsh fritillary butterfly habitat which lies close to the Blaen Cynon SAC.	Primary Marshy Grassland Heathlands and Grass-heath Communities Mosaic Habitats and Common Land Invertebrates Secondary Woodland Neutral Grassland

Local Authority	SINC No.	Site Name	Description	Meets or Exceeds the following Mid Valleys SINC Criteria*
				Acid Grassland Bog Habitats and Flushes Watercourses
RCTCBC	7	Hirwaun Industrial Estate	Large mosaic site which at its heart includes an ancient peat bog, and around its edges a mosaic of 'brown field' grassland and scrub habitats. The peat bog is a continuation of the deep peat of the closely adjacent Cors Bryn-y-Gaer SSSI (part of the Blaen Cynon SAC). It is unmanaged peat land with extensive areas of rank purple moor-grass, with varying amounts of associated cross-leaved heath, deer-grass, heather, common and hares-foot cotton-grass. There are numerous peat pools (possibly associated with old peat diggings) and these have associated sphagnum moss communities. At its fringes the peat bog grades into marshy grassland (in National Vegetation Classification terms mainly M25) with areas of tufted hair grass and rush pasture. This grades further into long derelict brown field grasslands, which are species rich mosaics of marshy grassland and drier neutral grassland (National Vegetation Classification of MG5). The site has a raised central 'tump', which supports a large area of gorse and associated dry heath. The habitat mosaic supports good invertebrate habitat, which includes the mountain bumblebee *Bombus monticola*, and has a high potential for green hairstreak and dingy skipper. The peat bog supports keeled skimmer dragonflies with amphibian and reptile habitat, and diverse breeding bird habitat (including linnet, stonechat and warblers) and potential (in the peat bog) for breeding snipe.	<u>Primary</u> Scrub Communities Neutral Grasslands Marshy Grasslands Heathland and Grass-Heath Communities Bog Habitats and Flushes Mosaic Habitats and Common Land <u>Secondary</u> Acid Grasslands Fens, Reedbeds and Other Swamps Birds Reptiles Amphibians Invertebrates
RCTCBC	9	Hirwaun Ponds	A species rich area of marshy grassland, swamp and ponds occupying low-lying land between A465 and A4061, and part based on old colliery spoil. The marshy grassland supports purple moor-grass, rush and tufted hair-grass and although unmanaged is very diverse. It is best characterised as a mosaic of marshy grassland habitats (National Vegetation Classification M23 and M25) and tall fen communities, which includes meadow thistle, angelica, marsh bedstraw and whorled caraway. This marshy grassland/fen grades into swamp dominated by reed mace and willow scrub. Royal fern has been recorded on the site. At the western end Tower Colliery manage and maintain a number of fishing pools, which contain a rich emergent flora including sea club-rush, common reed and lesser water parsnip. The pools support very species rich dragonfly populations and the site is one of the best recorded sites in RCT with 14 species recorded, including small blue-tailed damselfly, broad bodied chaser, black-tailed skimmer, and keeled skimmer. The mosaic of wetland vegetation offers excellent invertebrate, amphibian (frogs and toads have been recorded) and nesting bird habitat including reed bunting, grasshopper warbler, reed warbler, water rail, redpoll and sedge warbler. Barn owl and kestrel both breed on or close to the SINC.	<u>Primary</u> Scrub Communities Marshy Grasslands Fens, Reedbeds and Other Swamps Standing Open Water Mineral Spoil Tips and Other Post-industrial Land Mosaic Habitats and Common Land <u>Secondary</u> Neutral Grasslands Acid Grasslands Heathland and Grass-Heath Communities

Local Authority	SINC No.	Site Name	Description	Meets or Exceeds the following Mid Valleys SINC Criteria*
			Coal spoil areas support a mosaic of thin open grassland (with silver hair-grass, carline thistle, pearly everlasting, thyme leaved sandwort, marsh cudweed, and rats tail fescue) and emerging heath (with some lichen heath). Grayling and small copper butterflies occur on the site.	Birds Invertebrates Vascular Plants
RCTCBC	10	Hirwaun Common	Upland parts of this large SINC support an extensive upland mosaic characterised as upland marshy grassland and acid grassland with significant areas of dry heath (heather, bilberry and western gorse) and areas of flushed wet heath. The Upland Survey of Glamorgan listed a number of rare or local species recorded from Hirwaun Common (which includes part of this SINC) these included Newman oak fern (*Gymnocarpium dryopteris*), fir clubmoss (*Huperzia selago*), mossy saxifrage (*Saxifraga hypnoides*), cowberry (*Vaccinuim vitis-idaea*), beech fern (*Phegopteris connectilis*), and ivy-leaved bellflower (*Wahlenbergia hereracea*). A large area of bilberry dominated dry heath includes a small area of western gorse heath. Upland bird communities include skylark and wheatear. The lower slopes of Hirwaun Common represent an expanse of M25 marshy grassland, which includes, sphagnum flushes, wet heath and acid grassland and heather and bilberry dry heath on old spoil. Whorled caraway occurs in the grassland on the lower slopes. Ivy-leaved bellflower is abundant together with bog asphodel and round-leaved sundew. Skylark, wheatear and stonechat nest. Pools have potential for great crested newt. Marsh fritillary butterfly habitat occurs and an adult has recently been recorded. Small pearl-bordered fritillary and grayling have also been recorded. Dark green fritillary and green hairstreak are all likely to occur.	<u>Primary</u> Acid Grasslands Marshy Grasslands Ffridd Communities Heathland and Grass-Heath Communities Mineral Spoil Tips and Other Post-industrial Land Mosaic Habitats and Common Land Rock Exposures <u>Secondary</u> Neutral Grasslands Watercourses Birds Reptiles Amphibians Invertebrates Vascular Plants
RCTCBC	12	Hirwaun Ponds North	The SINC includes a mosaic of wetlands, ponds and drainage channels on the north side of the A465. The complex of water features supports excellent aquatic and emergent flora. The ponds and channels also support diverse dragonfly populations, which includes keeled skimmer. The ponds have a high potential for breeding amphibians. Breeding frogs have been recorded and the habitat represents good quality grass snake habitat. The water bodies support breeding coot and moorhen, with potential for water rail. Reed bunting and sedge warbler occur in areas of reed bed. Small areas of marshy grassland occur, and these have potential as marsh fritillary butterfly habitat (the Site is immediately adjacent to the marsh fritillary colony of Blaen Cynon SAC). Barn owls use the site. The ponds and channels represent otter and possibly water vole habitat. The SINC includes areas of willow scrub together with stunted grassland on the coal spoil. This area of open grassland traditionally supported an important lapwing breeding colony. Base rich flushes, emerge from the very	<u>Primary</u> Fens, Reedbeds and Other Swamps Standing Open Water Mineral Spoil Tips and Other Post-industrial Land Mosaic Habitats and Common Land Birds <u>Secondary</u> Scrub Communities

Local Authority	SINC No.	Site Name	Description	Meets or Exceeds the following Mid Valleys SINC Criteria*
			acid tip, and these support interesting floras, including the base loving marsh arrow-grass.	Neutral Grasslands Acid Grasslands Marshy Grasslands Bog Habitats and Flushes Mammals Reptiles Amphibians Fish Invertebrates
RCTCBC	13	Hirwaun Iron Works	A largely post-industrial SINC, which lies on the banks of the River Cynon close to the centre of Hirwaun. The Site includes the famous Iron Works Site with areas of slag and spoil. A very diverse assemblage of habitats occurs, which includes species rich neutral grassland (National Vegetation Classifications MG1, MG5 and MG10) and smaller areas of wetter, marsh grassland (National Vegetation Classifications M23, M24 and M25). Grassland species include lady's mantle (*filicaulis susp vestita*), pale sedge, black knapweed, bird's-foot trefoil, greater bird's-foot trefoil, lady's bedstraw, marsh bedstraw, rough hawkbit, ragged robin, purple moor-grass, rushes, tormentil, greater burnet, common spotted orchid, southern marsh orchid, devil's bit scabious, marsh speedwell, meadowsweet, and lesser reed mace (*Typha angustifolia*). Areas of shorter turf support potentially wax cap fungi habitat. Grayling butterfly has been recorded. The extensive areas of mixed scrub and a wet alder-willow carr represent particularly good songbird and invertebrate habitat. Seasonal standing water is important for breeding colonies of frog and palmate newt. The mixture of grassland and scrub represents good reptile habitat with slowworm and common lizard both recorded. The site is good bat foraging habitat with a high potential for roost sites within the iron works site and riverbank walls. Hobby has been recorded hunting over the site. The SINC includes a section of the River Cynon, with its riparian woodland, and generally good water quality. Brown trout have been recorded within this section, together with dipper and grey wagtail, and evidence of otter. The SINC includes the wide floodplain grassland, scrub and pool of Parc Hensol. The swamp supports areas of reed mace and wood club-rush and with scattered alder trees and willow scrub.	<u>Primary</u> Woodlands Scrub Communities Neutral Grasslands Watercourses Mineral Spoil Tips and Other Post-industrial Land <u>Secondary</u> Mammals Birds Reptiles Amphibians Fish Invertebrates
RCTCBC	15	Upper Cynon Floodplain	A very large SINC, which is comprised of a network of damp and marshy grassland, semi-natural woodland and the meandering course of the River Cynon. The SINC supports an exceptional resource of species rich semi-improved grasslands. These include species rich damp pastures (National Vegetation Classifications MG5, MG6 and MG10) with crested dog's-tail, common	<u>Primary</u> Woodland Scrub Communities

Local Authority	SINC No.	Site Name	Description	Meets or Exceeds the following Mid Valleys SINC Criteria*
			bent, sweet vernal grass, Yorkshire fog, red fescue, cock's-foot, bird's-foot trefoil, black knapweed, yarrow, greater burnet, bulbous buttercup, red clover, cuckoo flower, pignut and burnet saxifrage. Areas of old coal workings (e.g. SN990044) support similar species rich neutral grassland communities. The wetter floodplain, and flushed slopes, support marshy grassland (National Vegetation Classifications M23, M24, M25 and M27), with purple moor-grass, soft rush, tufted hair-grass, Yorkshire fog, greater bird's-foot trefoil, meadowsweet, tormentil, bulbous buttercup, marsh bedstraw and occasional meadow thistle. Devil's-bit scabious occurs within a number of the marshy grassland and damp neutral grassland pastures and marsh fritillary butterflies have been recorded. The uncommon upright vetch (Vicia orobus) and upright brome have both been recorded. There are significant areas of wet alder woodlands, drier oak woodland and areas of mixed scrub and swamp all within the floodplain of the Afon Cynon. The woodlands are species rich with alder, oak, wych elm, hawthorn, birch, willow, ash and dog rose, and ground floras which include bluebell, dog violet, lesser celandine, wood speedwell, male fern and broad buckler fern. The River Cynon meanders its way through the SINC via a series of typical riffle/pool sequence, with gravel banks exposed at times of low flow, undercut banks and bank side woodland and pastures. Dipper, grey wagtail, goosander and kingfisher, brown trout and otter all occur. A very species rich habitat, supporting one of the largest areas of unimproved lowland grassland and floodplain woodland in the Cynon Valley. The mixture of wet, unimproved pastures, and mature woodland represents excellent invertebrate, bird and bat habitat. Barn owl, which nest locally, will hunt through the wet grassland of the SINC.	Marshy Grassland Watercourses Mineral Spoil Tips and Other Post-industrial Land Mosaic Habitats and Common Land Secondary Mammals Birds Reptiles Amphibians Fish Invertebrates
RCTCBC	16	Nant Hir Valley and Reservoir	The wooded valley of the Nant Hir supports ancient woodland of oak, alder, ash, birch, rowan, and hazel. Much of the wooded bank of the stream is essentially ancient woodland with associated ancient woodland ground flora, and songbird communities. The Nant Hir is a fast flowing upland stream, with good water quality, and supports habitat for otter, brown trout, dipper and grey wagtail. The SINC includes the Nant Hir Reservoir, a large water body with bank side oak and larch woodland. The banks of the reservoir include areas of quite diverse neutral grassland with sweet vernal grass, common bent, crested dog's-tail, ribwort plantain, bird's-foot trefoil, and black knapweed. The SINC, and the reservoir, extends north under the A465 and includes further areas of oak, birch, rowan, alder and hazel woodland (and a purple hairstreak butterfly colony) with acid grassland (sheep's fescue, common bent, sweet vernal grass, tormentil and heath bedstraw). The acid grassland grades into areas of heather and purple moor-grass marshy grassland with willow scrub. Although unmanaged and rank, the marshy grassland includes elements of species rich grassland with heather, greater burnet, green ribbed sedge, tufted hair-grass, heath	Primary Woodlands Acid Grasslands Ffridd Communities Watercourses Standing Open Water Secondary Mammals Birds Reptiles Amphibians

Local Authority	SINC No.	Site Name	Description	Meets or Exceeds the following Mid Valleys SINC Criteria*
			bedstraw, and tormentil all present. The purple moorgrass extends into an extensive larch plantation. Although rank, the marshy grassland is in National Vegetation Classification terms M25 and lies within a well-established marsh fritillary butterfly meta-population.	Fish Invertebrates
RCTCBC	17	Nant Hir Gwyddel	The SINC includes the wooded valley of the Nant Gwyddel. Nant Gwyddel is a typical upland stream, with pool/riffle sequences, and a rocky/gravel bed. Along much of its length the Nant Gwyddel supports mature woodland with elements of an ancient woodland groundflora. Good woodland breeding bird habitat occurs and otter will use the stream. The SINC includes a section of the wooded disused railway line of the Llwydcoed/Abernant cycle track. This hazel, ash, oak woodland forms an obvious habitat corridor which links the woodlands of Nant Gwyddel with SINCs further south along the line. The SINC includes areas of mature semi-nature woodland associated with disused quarries in Lwydcoed. These support mixed oak, ash, hazel, alder, holly and willow woodland, with areas of associated acid and neutral grassland (National Vegetation Classifications U4 and MG6). The mosaic of habitats represents good songbird and bat habitat.	Primary Woodland Scrub Communities Neutral Grassland Watercourses Mosaic Habitats and Common Land Secondary Mammals Birds Fish
RCTCBC	18	Llwydcoed Slopes	A large area of species rich marshy grassland (National Vegetation Classifications M23 and M25 with small areas of M24) on the upland edge with purple moorgrass, soft rush, compact rush, tormentil, heather, bilberry, cross-leaved heath, and deer-grass. Heather occurs on drier ground. Flushed areas support yellow sedge, carnation sedge, lousewort, and bog asphodel. In places the flushing is base-rich with flea sedge, carnation sedge, common sedge and meadow thistle. Areas of drier acid grassland (National Vegetation Classification U4) include sweet vernal grass, mat grass, common bent, sheep's fescue, heath grass, tormentil, heath bedstraw and devil's-bit scabious and again where there is evidence of more base rich soil, bird's-foot trefoil, lady's mantle and quaking-grass are locally frequent within the acidic turf. The site has a high potential as marsh fritillary habitat. The southern end of the SINC includes the upper reaches of the valley of the Nant y Gwyddel (see SINC 17).	Primary Neutral Grasslands Acid Grasslands Marshy Grasslands Heathland and Grass-Heath Communities Watercourses Secondary Scrub communities Mammals Birds Reptiles Amphibians Fish Invertebrates
RCTCBC	19	Bryn-defaid Heath	The SINC supports a large area of well-established dry lichen heath (which primarily occurs on old colliery tips), together with acid grassland, conifer plantations and areas of associated marshy grassland.	Primary

Local Authority	SINC No.	Site Name	Description	Meets or Exceeds the following Mid Valleys SINC Criteria*
			The dry heath supports heather, bilberry, wavy hair -grass and *Cladonia* lichens, with areas of associated acid grassland (including sheep's fescue, sweet vernal grass, mat grass, common bent, heath bedstraw sheep's sorrel and tormentil). There are associated of marshy grassland, which can be characterised as purple moor-grass and rush pasture (National Vegetation Classifications M23 and M25). The SINC is immediately adjacent to the species-rich grasslands of Bryncarnau Grasslands SSSI. The conifer plantations form part of the habitat complex. They are primarily included as part of the overall habitat mosaic, and for their value as conifer bird habitat. The plantations also have potential for habitat restoration to heath and acid grassland. The SINC represents excellent invertebrate habitat with grayling and green hairstreak butterflies present and a high potential for reptiles. Areas of gorse scrub and conifer plantation offer nesting sites for a range of birds including potential stonechat and nightjar habitat. The site lies close to a great crested newt colony and any areas of standing water have potential as amphibian habitat.	Woodlands Acid Grasslands Heathland and Grass-Heath Communities Mineral Spoil Tips and Other Post-industrial Land Mosaic Habitats and Common Land <u>Secondary</u> Birds Reptiles Amphibians Invertebrates
RCTCBC	20	East Llwydcoed	A complex mosaic of grasslands, woodland, heath and scrub on the eastern flank of Llwydcoed. The SINC includes a complex of semi-natural habitat with areas of species rich grassland (National Vegetation Classification MG5), with locally frequent bird's foot-trefoil, black knapweed, greater burnet and devil's-bit scabious. The majority of the drier grassland represents a large area of relatively unmodified neutral grassland (National Vegetation Classification MG6). The large area of semi-improved grassland is a feature of the SINC and is designated as an important linking habitat. Small, but diverse areas of base flushed marshy grassland occur with meadow thistle a feature (National Vegetation Classifications M23 and M24). The old mineral-spoil habitat, supports areas of dry heath (with heather), neutral grassland (with kidney vetch), acid grassland (National Vegetation Classification U4) and large areas of emerging willow, birch, hawthorn, elm, hazel and gorse scrub. The Nany-y-derlwyn stream is included in the SINC and supports mature oak, ash and birch woodland. To the south, the SINC includes a small area of ancient woodland (oak, sycamore, and birch). The SINC includes a section of the Llwydcoed to Abernant Cycle track. This disused railway forms a wooded corridor, with oak, birch, alder, hazel, and ash woodland. This woodland links through to Abernant, and the wooded valley of the Nant Yr Wenallt. The mosaic of woodland, scrub and grassland habitat represents very diverse breeding bird habitat. Survey work in part of the SINC has recorded 34 bird species, which amongst a large number of breeding species included wood warbler and tree pipit. The site is also good invertebrate habitat with 18 recorded butterfly species important species including dingy skipper and green hairstreak. The site also has 7 species of recorded dragonfly including scarce blue-tailed damselfly.	<u>Primary</u> Woodland Scrub Communities Neutral Grassland Ffridd Communities Heathlands and Grass-heath Communities Mineral Spoil Tips and Other Post-Industrial Land Mosaic Habitats and Common Land <u>Secondary</u> Birds Reptiles Invertebrates
RCTCBC	29	Aberdare Mountain	Extensive areas of natural land and old coal and mineral spoil, which supports a complex mosaic of dry and wet	<u>Primary</u>

Local Authority	SINC No.	Site Name	Description	Meets or Exceeds the following Mid Valleys SINC Criteria*
			heath, acid grassland, upland marshy grassland, acid flushes, conifer plantation, bracken and areas of open water. Dry heath is an important feature of the SINC with extensive areas of heather, bilberry and wavy-hair grass with western gorse. This intergrades with areas of wet heath with cross leaved heath, heather, deer grass, purple moor-grass and occasional common cotton grass. On coal/mineral spoil the dry heath includes significant lichen communities. Thirteen species of *Cladonia* lichen occur, including the nationally scarce *Cladonia azorica*, three further species which are scare or uncommon in Glamorgan (Vice County 41): *Cladonia cervicornis ssp.verticillata, Cladonia glauca*, and *Cladonia ramulosa*. The lichen species list includes 5 further notable lichens: *Arthrorhaphis grisea, Aspicilia grisea, Bachmanniomyces uncialicola, Cercidopora epipolytropa* and *Trapeliopsis gelatinosa*. The heath communities grade into acid grassland communities characterised by common bent, sheep's fescue, mat grass, matt grass, green-ribbed sedge, tormentil, heath bedstraw, heath speedwell, heath milkwort, and sheep's sorrel. On coal spoil the drier grassland supports a more varied composition, with neutral grassland with common bird's-foot trefoil, rough hawkbit, thyme-leaved sandwort, glaucous sedge and squirrel-tail fescue. Bare ground is an important feature within this mineral spoil habitat. The SINC includes areas of purple moor-grass and rush pasture with larger stands of bracken/ffridd, often associated with acid grassland. There are also some old quarries. The large quarry at S0 023042 supports heather and bilberry heath with bell heath, and colonies of both stag's-horn clubmoss and fir clubmoss. The conifer plantations support lodgepole pine, with sitka spruce and occasional larch. While much of the groundflora under these plantation is sparse, open areas and track sides support diverse marshy grassland communities dominated by purple moor-grass and rushes (including hard rush, and sharp flowered rush) but with glaucous sedge, common sedge, marsh thistle, and greater bird's-foot trefoil. Locally significant species including marsh valerian (a calcicole), lesser skullcap and creeping willow. Stag's head clubmoss (*Lycopdium clavatum*) has been recorded in these plantation rides. There is a network of ponds within the SINC (some of which are associated with coal workings). These support important amphibian populations including great crested newt and the site forms an extension of a meta-population area, which occurs on Winch Fawr West, Merthyr Tydfil. Palmate newt, toad and common frog occur in good numbers. The ponds support dragonfly communities with 11 species recorded, including scarce blue-tailed damselfly and black darter. Within or immediately adjacent to the SINC (including survey work for the Winch Fawr West site, in Merthyr) a number of uncommon and rare moths have been recorded, including Devon carpet (a nationally notable/Nb) plain wave (Local in Great Britain), Welsh wave (Local in GB), small engrailed (Local in GB), red necked footman (notable/Nb), neglected rustic (Local in GB), glaucous shears (Local in GB) and the confused (Local in GB). 			least 14 butterfly species include dark green fritillary butterfly, green hairstreak and dingy skipper have been recorded. 11 species of dragonfly and damselfly, including the National Notable scarce blue-tailed damselfly. Thirty one breeding species have been recorded holding territories. The list of birds includes open hill species (wheatear, skylark, meadow pipit, stonechat) and woodland birds (lesser redpoll, siskin, willow warbler, chaffinch etc). The high density of nesting songbirds is reflected in the presence of cuckoo territories (cuckoo is an increasingly scarce breeding bird in the County Borough. The site supports summering (and possibly nesting) lapwing.	
MTCBC	8	Bryn-du & Ty'n-y-coedcae	Extensive upland moorland area of mainly marshy grasslands with wet heathlands and smaller areas of blanket bog, acid flush, valley mire and unimproved acid grassland, forming a mosaic. The marshy grasslands are dominated by purple moor-grass and grade into wet heathland supporting abundant cross-leaved heath and deergrass. The boggy habitats of the site support numerous species of interest, including round-leaved sundew, bogbean, sneezewort, bog asphodel, narrow buckler-fern, lesser skullcap, ivy-leaved bellflower and hare's-tail cottongrass. Several uncommon dragonflies have been recorded along with grayling butterfly.	Acid Grassland Marshy Grassland Heath & Grass-Heath Habitats Fens, Reedbeds & Other Swamps Bog Habitats & Flushes Watercourses Mosaic Habitat Invertebrates
MTCBC	9	Winchfawr West	Very extensive area of mostly upland habitats, comprising a complex mosaic of moorland and 'ffridd' habitats supporting many species of interest. Of particular note are the wet and dry heathlands, partly developed on old colliery spoil tips, which are the most extensive in the county borough. Other habitats of note include marshy and acid grasslands, acid flushes and grassheaths. Numerous small pools are present, particularly in the north. These support a colony of great crested newt which extends over the hilltop into the adjacent Aberdare Mountain pSINC in Rhondda Cynon Taff County Borough. Several other amphibian species occur in the ponds, and common lizard is a characteristic species of the heathland areas. The ponds also support diverse dragonfly assemblages, including uncommon species such as black darter, scarce blue-tailed damselfly and emerald damselfly. A range of other localised invertebrate species has been recorded from the site, including dark green fritillary butterfly and a strong population of grayling butterfly. Other fauna species of interest include breeding skylark, which nests at a high density on the site, and brown hare. Plant species of interest include regionally scarce species such as shoreweed, alternate-leaved water milfoil, spiked water-milfoil, unbranched bur-reed and long-stalked yellow sedge. Other noteworthy plant species include saw-wort, ivy-leaved bellflower, flea sedge and white sedge. Several nationally scarce lichens have been recorded from the heathland areas. 				Vascular Plants Lichens
MTCBC	7	Cwm Ffrwd	Valley habitats along the course of the Nant Ffrwd, which forms part of the boundary with the Brecon Beacons National Park. This is a large stream draining from the uplands in a largely unmodified course, passing through narrow gorges in places. Adjacent habitats include mainly broadleaved semi-natural woodlands with some marshy grasslands. The riverine woodland is dominated by ash, alder and hazel, giving way to sessile oak woodland on the valley sides. The woodlands have a rich ground flora supporting many ancient woodland indicator species, including wild garlic, sanicle, tutsan, sweet woodruff, hairy brome, giant fescue, wood melick and common cow-wheat, as well as regionally scarce species including beech fern, oak fern, toothwort and stone bramble. Several nationally scarce bryophytes and lichens have also been recorded. The site also includes a series of riverside fields between the river and the Heads of the Valleys Road. These support marshy grasslands, acid flushes, wet woodland and acid grasslands, with localised species including heath-spotted orchid and lousewort. Small pearl bordered fritillary occurs on the site, and otter ranges along the river system.	Woodlands Acid Grassland Marshy Grassland Bracken Communities Bog Habitats & Flushes Watercourses Mosaic Habitat Rock Exposures Mammals Fish Invertebrates Vascular Plants Mosses & Liverworts Lichens
MTCBC	60	Coed Meirig Pastures	Small group of horse-grazed fields supporting semi-improved acid grassland with areas of marshy grassland. The marshy areas support sneezewort, bog asphodel, lousewort, cross-leaved heath and devil's-bit scabious. An area of fen meadow in the east of the site supports the regionally scarce fen bedstraw, as well as other localised species including meadow thistle and marsh valerian.	Neutral Grassland Acid Grassland Marshy Grassland Watercourses Mosaic Habitat Other Features
MTCBC	12	Cwm Glo	Extensive mosaic of 'ffridd' (valleyside) habitats supporting a complex mosaic of semi-upland and lowland vegetation, in large part developed on old spoil heaps and colliery tips. Mainly unimproved acid grasslands but with extensive areas of wet and dry heathland. Other habitats of note include marshy grasslands with acid flushes, bracken slopes, small ponds and streams, the latter typically lined by semi-natural broadleaved woodlands mostly of oak and alder. The SINC contains the Cwm Glo SSSI. Plant species of interest include regionally scarce species such as fen bedstraw, soft-leaved sedge, intermediate lady's-mantle, alternate leaved water milfoil and moonwort, as well as local species such as meadow thistle, whorled caraway, saw-wort, petty	Woodlands Neutral Grassland Acid Grassland Marshy Grassland Bracken Communities

			whin and marsh arrow-grass. The Cwm Glo / Rhydycar West larger area isof international significance for waxcap fungi and is collectively the joint 13th most significant waxcap grassland site in the British Isles. The Cwm Glo cSINC itself contains 13 known waxcap grasslands which collectively support at least 24 species of waxcap as well as many other associated species of fungi. Great crested newt occurs in small ponds together with a range of other common amphibians and reptiles. Otter is thought to occur along the watercourses, and water vole has been recorded in the past. The site contains at least one known bat roost, and there is a good nesting bird fauna which includes redstart, wood warbler, reed bunting and linnet. Marsh fritillary butterfly has been recorded from the SSSI, and other local species such as grayling and dingy skipper are also present. Up to 11 species of Nationally Scarce invertebrates have been recorded, mainly associated with wetlands.	Heath & Grass- Heath Habitats Bog Habitats & Flushes Standing Open Water Post-industrial land Mosaic Habitat Other Features Mammals Birds Amphibians Invertebrates Vascular Plants Fungi
MTCBC	10	Gellideg North Fields	Series of fields containing acid grasslands, marshy grasslands, neutral grasslands and areas of bracken and scrub, together with sections of oak and alder woodland alongside small streams. Characteristic plant species of interest in the species-rich grasslands include devil's-bit scabious, heath spotted orchid, burnet saxifrage, pignut, saw-wort and bitter vetch. Greater butterfly orchid, a regionally scarce plant, was recorded from the woodland margin. 		Cefn Coed Tip	southern marsh orchid, common restharrow and pignut. The woodlands are variable in character, including areas of wet willow woodland, acid oak woodland and some ash woodland near the calcareous tip. The latter type supports brittle bladderfern, a regionally scarce plant, and many ancient woodland indicator species. The tip itself consists of limestone slag from the nearby ironworks, and overhangs the adjacent river in places. The thin soils on the tip plateau support an unusual type of calcareous grassland, the vegetation being dominated by heathgrass and supporting many localised plant species including moonwort, blue fleabane, small cudweed, hairy rockcress and wild thyme. Dark green fritillary occurs on the site.	Calcareous Grassland Acid Grassland Bracken Communities Heath & Grass- Heath Habitats Post-industrial land Mosaic Habitat Other Features Invertebrates
MTCBC	16	Cwm Taf Fawr	Section of major river tributary of the Afon Taf. The river extends into Brecon Beacons National Park and takes on an upland character to the north. cSINC includes adjacent woodlands, which are relatively undisturbed in the upper reaches and more urban in character further downstream. The upper reaches in particular are of high ecological value, comprising limestone gorge woodland dominated by oak and ash, with a rich ground flora including abundant wood anemone and bluebell. Numerous rare plant species occur here, including the nationally scarce grasses lesser hairy-brome and mountain melick, and the regionally scarce herb Paris, water avens and common twayblade. Further south the riverside woodland is more acid in character, but nevertheless supports a relatively diverse ground flora including localised species such as common cow-wheat and bitter vetch. The site also includes some adjacent areas of species-rich calcareous, neutral and acid grasslands. The calcareous grasslands in particular support numerous species which are scarce in the county borough, including salad burnet, common restharrow and field scabious. Otter ranges along the Afon Taf Fawr, and small pearl bordered fritillary butterfly is present on the site.	Woodlands Neutral Grassland Calcareous Grassland Acid Grassland Bracken Communities Watercourses Mammals Fish Invertebrates Vascular Plants
MTCBC	14	Cilsanws Common South	Area of semi-upland and upland common land, part of which is used as a golf course. The site represents a section of a much larger area of common land which is included within the adjacent Brecon Beacons National Park. The larger common is of key biodiversity interest in the county borough. The habitats of the site include dry heathland and acid grassland mosaics, acid flushes, wet heathlands, extensive bracken slopes with scattered trees, and small areas of calcareous grassland and scrub bordering the National Park. Noteworthy plant species include bog asphodel and round-leaved sundew in the wet habitats of the site, and carline thistle, blue fleabane, wild thyme, common milkwort and downy oat-grass in the calcareous grasslands. Common rock-rose, a regionally scarce plant, occurs at the margins of the calcareous scrub. Common lizard and slow worm also occur on the site.	Scrub Communities Calcareous Grassland Acid Grassland Bracken Communities Heath & Grass- Heath Habitats Bog Habitats & Flushes Mosaic Habitat Rock Exposures

Local Authority	SINC No.	Site Name	Description	Meets or Exceeds the following Mid Valleys SINC Criteria*
				Other Features
MTCBC	15	Cwm Taf Fechan	A long linear site based on the valley of the Afon Taf Fechan and containing the Cwm Taf Fechan Woodlands SSSI. The cSINC covers a more extensive area of adjacent habitats supplementary to those of the SSSI. The valley of the Afon Taf Fechan passes through limestone geology, giving rise to habitats on the steep valley slopes which are either not or only poorly represented elsewhere in the county borough. These include limestone woodlands, calcareous grasslands, species-rich neutral grasslands, heathlands and limestone scrub. It is probably the single most important biodiversity resource in the county borough. Much of the woodland is ancient semi natural ash, with some oak. This is of an upland character on the highest slopes to the north. Alder dominated wet woodlands occur on the valley floor. Many species of interest have been recorded from the woodlands, including the nationally scarce limestone fern, which also occurs on a wall outside the SSSI area. The grasslands of the valley slopes and bottom are typically species rich and support species such as meadow saxifrage and adder's-tongue fern, which are of restricted occurrence in the county borough. The cSINC additionally includes heathlands, acid and calcareous grasslands, bracken slopes, calcareous flushes and calcareous scrub woodland habitats. Many regionally rare and scarce plant species occur in these habitats, including soft-leaved sedge, brittle bladder fern, intermediate lady's-mantle, upright brome, butterwort, limestone bedstraw, water avens, dwarf thistle, mountain melick and common rock-rose. Otter ranges along the Afon Taf Fechan. Birds of interest on the river include kingfisher, grey wagtail and dipper. Many rare and scarce invertebrate species have been recorded from the SSSI, including small pearl-bordered and silver-washed fritillary butterflies, and many of these are likely to occur in the habitats outside the SSSI.	Woodlands Scrub Communities Neutral Grassland Calcareous Grassland Bracken Communities Bog Habitats & Flushes Watercourses Mosaic Habitat Rock Exposures Other Features Mammals Fish Invertebrates Vascular Plants
MTCBC	58	Afon Taf	The major river in the county borough. cSINC includes areas of bankside and floodplain habitats, particularly towards the south of the county borough where the river corridor is less urbanised than further north. Associated habitats are chiefly semi-natural woodland (including areas of ancient semi-natural oak woodland and linear wet woodlands dominated by alder), neutral and marshy grasslands, bracken and scrub. Notable features of the river course include shingle banks which support localised plant species such as water chickweed, bearded couch and giant fescue. Otter occurs throughout the length of the cSINC, and the river is known to be of value to a wide variety of birds of interest, including kingfisher, grey wagtail, sand martin and dipper, as well as fish species including salmon, brown trout and bullhead and a range of foraging bat species.	Woodlands Neutral Grassland Watercourses Other Features Mammals Reptiles Fish
MTCBC	17	Y Graig	Area of 'ffridd' habitats mainly dominated by bracken, with patches of acid grassland and dry heath, particularly around rocky outcrops, and scattered birch trees. Also includes species-rich neutral and marshy grasslands to the west and areas of wet willow woodland. Plant species of interest include the regionally rare stag's-horn clubmoss, the regionally scarce heath dog-violet, climbing corydalis and grass vetchling, and other localised species such as yellow rattle and southern marsh orchid. Dark green fritillary butterfly occurs on the site.	Woodlands Neutral Grassland Acid Grassland Marshy Grassland Bracken Communities

MTCBC	18	Cyfartha Park	Area of ornamental parkland within Merthyr Tydfil. The cSINC includes an area of semi-natural woodland and several enclosures of neutral grassland in the eastern half of the park. Also includes small areas of secondary broadleaved plantation woodland and several small woodland ponds. The woodlands are of mixed composition, mainly oak, ash, beech and alder, with a ground flora including bluebell, giant fescue and yellow archangel. The majority of the grassland enclosures support species-rich flowery grassland with common knapweed, yellow rattle, eyebright and common spotted orchid.	Woodlands Neutral Grassland Standing Open Water Amphibians
MTCBC	19	Gyrnos Wood	Small area of wet woodland and an adjacent field supporting marshy grassland, acid grassland and bracken stands, immediately to the north of the Heads of the Valleys Road. There are also some gritstone outcrops and scattered mature trees. The wet woodland is dominated by alder, grey willow and downy birch, with a ground flora including hairy brome, giant fescue, bluebell, meadowsweet and marsh marigold. The acid grasslands support heath-grass and wavy hair-grass, while devil's-bit scabious and wild angelica occur in the marshy areas. The regionally scarce climbing corydalis is present in the bracken stands.	Woodlands Acid Grassland Marshy Grassland Bracken Communities Mosaic Habitat Rock Exposures
MTCBC	2	Bryniau	Semi-upland site comprising a complex mosaic of many habitats, partly associated with disused quarries (Bryniau Quarries) and spoil tips. Main habitats are acid grasslands with bracken stands, intermixed with numerous areas of acid flush and marshy grassland. Also present are areas of semi-natural woodland, including wet woodland areas dominated by grey willow, neutral grassland, ponds and streams, a small reedbed and some small areas of calcareous grassland. Species of interest include the regionally scarce royal fern and climbing corydalis, along with numerous localised plant species, including heath spotted orchid, southern marsh-orchid, bog asphodel, common milkwort and wild thyme. The ponds of the site support good populations of common amphibian species and great crested newt has also been recorded. MTCBC	1	Morlais Hill	Complex semi-upland area of limestone influenced habitats, partly derived from old limestone quarries (Morlais Castle Quarries) and quarry spoil tips. Part of the site is currently in use as a golf course. Extensive calcareous grasslands and screes supporting numerous rare and characteristic species, including the nationally scarce plants mossy saxifrage, soft-leaved sedge and limestone fern, as well as regionally scarce species including limestone bedstraw, brittle bladder-fern, dwarf thistle, common rockrose, common cudweed and green spleenwort. Also includes areas of neutral grassland and some small areas of acid grassland. Other habitats include limestone outcrops with ledge communities, small pools and limestone scrub. Many of the calcareous habitats are of extremely limited occurrence in the county borough. Grayling butterfly occurs in the quarries.	Scrub Communities Neutral Grassland Calcareous Grassland Acid Grassland Marshy Grassland Bracken Communities Standing Open Water Mosaic Habitat Rock Exposures Other Features Invertebrates Vascular Plants Mosses & Liverworts
MTCBC	3	Blaenmorlais	A large area supporting a mosaic of upland habitats at the western edge of Merthyr Common. Mainly acid grasslands with some acidic flushes, grass-heaths, dry heathlands, marshy grasslands and smaller areas of wet heathland. The flushes are particularly rich and hold populations of round leaved sundew, bog asphodel, lesser skullcap and common cotton-grass. The site also contains small disused quarries (Garth Quarries) and acid screes. A section of the Nant Morlais within the site has steep valley sides with rocky outcrops. A large pond in the south of the site supports floating bur-reed, a regionally rare plant, and several uncommon dragonflies. Grayling butterfly is present in the quarries and the site is likely to be important for a range of ground-nesting birds. To the north the site contains an area of limestone spoil tips supporting unimproved upland calcareous grassland, as well as some limestone outcrops and scree. These habitats are species rich, and support a population of the nationally rare mossy saxifrage as well as many regionally rare and scarce species, including limestone	Calcareous Grassland Acid Grassland Marshy Grassland Heath & Grass- Heath Habitats Bog Habitats & Flushes Watercourses Standing Open Water Post-industrial land Mosaic Habitat

			bedstraw, brittle ladder-fern, dwarf thistle and green spleenwort	Rock Exposures Invertebrates Vascular Plants
MTCBC	39	Merthyr Common North	Very extensive area of upland common land supporting a mosaic of both wet and dry moorland habitats. These include extensive areas of unimproved acid grassland, marshy grassland, dry heathland and grass-heath, together with areas of wet heath, acid flush, bracken patches, scree and exposed gritstone bedrock. Tracts of modified blanket bog occur on the highest ground in the northeast of the site; these are often wet with abundant bog-mosses, although sometimes drier where drainage channels have been cut. These moorland habitats are variously dominated by wavy hair-grass, mat grass, green-ribbed sedge, deer-grass and purple moorgrass, with ling heather, bilberry, crossleaved heath and crowberry dominating the heathlands. Localised plant species in these habitats include round-leaved sundew, butterwort and long-stalked yellow sedge. Numerous small ponds and streams are present, including the headwaters of the Nant Morlais. Several ponds support floating bur-reed, a rare species in Glamorgan. In the north-west of the site, in contrast, there are areas of outcropping limestone, scree and extensive disused quarries (Twynau Gwynion) supporting calcicole grassland and ledge communities of very restricted occurrence in the county borough. These areas are characteristically species rich, and support many regionally rare and scarce species, including mossy saxifrage, limestone bedstraw, brittle bladder-fern, dwarf thistle and green spleenwort. Numerous other localised plant species also occur in these habitats. Breeding populations of skylark, meadow pipit and snipe are present, and numerous other bird species of interest have been recorded, including hen harrier, merlin, peregrine, red kite, red grouse and golden plover. Other species of interest include grayling butterfly and a range of localised moths. Several uncommon dragonflies have been recorded, including scarce blue-tailed damselfly, keeled skimmer, black darter and golden-ringed dragonfly. 1. Introduction....1
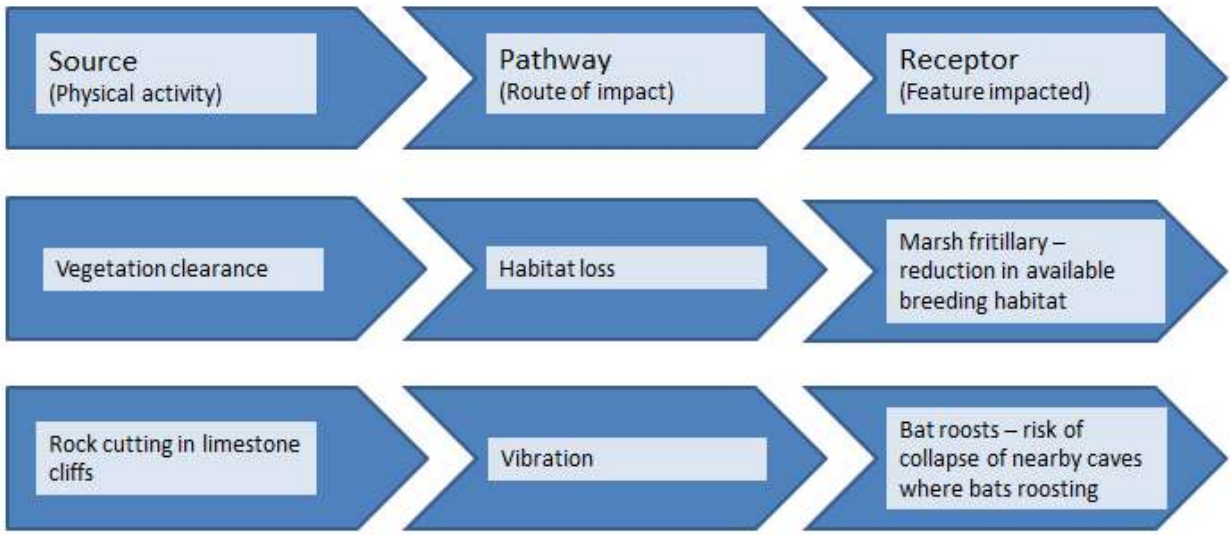
2. Scoping matrix....3

1. Introduction

The source-pathway-receptor approach was used to understand the mechanisms by which the proposed scheme could result in likely significant effects on ecological resources. The approach started by identifying potential sources of effects, defined the zone of influence, and then mapped the progression of the effect along potential migration pathways. Where it was observed that an effect was potentially connected, via such a pathway, to an ecological resource, an analysis was undertaken to assess the implications for the resource including the likely sensitivity of the resource. This approach is shown in Plate 1 below.

Plate 1 : Source-pathway-receptor approach



Embedded measures are an integral part of the proposed scheme and as such are also taken into account. The measures include (full details provided in Appendix 11M and in Chapter 5: Scheme Description):

- alignment changes to avoid or reduce the potential for likely significant effects, specifically to minimise land take of key sites and habitats;
- design of new or modified culverts for safe mammal passage;
- lighting design to reduce spill on surrounding environments;
- use of clear span structures to cross larger watercourses;
- design and construction of a road drainage system to collect and attenuate the road drainage prior to discharge;
- construction commitment to create a Construction Environmental Management Plan (CEMP) which will include details of the measures to be employed to minimise effects on air quality, noise and vibration, traffic and water quality; and
- a construction commitment to comply with best practice guidelines on environmental protection, for example CIRIA C741 - Environmental Good Practice on Site (4th Edition) (CIRIA, 2015a), CIRIA C532 - Control of Water Pollution from Construction Sites (CIRIA, 2001) and CIRIA C648 - Control of Water Pollution from Linear Construction Projects (CIRIA, 2006).

Where embedded measures mitigates any potential likely significant effects,

Where embedded measures prevented effects from occurring, or reduced them to a level where no significant effect could be reasonably predicted, the effects were scoped out; the respective effect without mitigation is acknowledged but is 'greyed out' in Table 2.1. Impacts and effects were also scoped out if the ecological resource was:

- outside the zone of influence;
- not sensitive to the impact; or
- there was no pathway to an effect.

Any impacts to ecological resources that could not be ruled out in the scoping matrix were considered to have the potential to be significant and taken forward to the impact assessment, as reported in the main body of the assessment chapter.

2. Scoping matrix

Table 2.1 : Scoping matrix for likely significant effects

Ecological resource	Land take / habitat loss	Severance / fragmentation	Direct mortality (during construction)	Direct mortality (during operation i.e. road collisions)	Changes to hydrology (construction)	Changes to hydrology (operation)	Invasive species	Water pollution (construction)	Water pollution (operation)	Air pollution (dust during construction)	Air pollution (during operation)	Disturbance (construction noise / vibration)	Disturbance (construction – lighting)	Disturbance (operation and maintenance visits)
Statutory Designated Sites														
SAC – Coeddydd Nedd a Melte	None – Outside zone of influence	None – Outside zone of influence	None - Feature not sensitive	None - Feature not sensitive	No pathway to effect	No pathway to effect	None – Outside zone of influence	None - No pathway to effect	None - No pathway to effect	None – Outside zone of influence (200 m)	Yes – Proposed scheme could result in habitat degradation due to a change in air quality as a result of vehicular emissions	None - Feature not sensitive	None - Feature not sensitive	None - Feature not sensitive
SAC – Blaen Cynon Marsh fritillary butterfly (within SAC meta-population)	Yes – Loss of suitable habitat within the Blaen Cynon Valley Functional landscape area – approximately 7.96 ha	Yes - Potential for severance / fragmentation of suitable habitat at new offline section at Hirwaun. Functionality of this habitat for marsh fritillary butterfly would likely be lost due to isolation effects	Yes – Potential for the direct mortality of eggs and caterpillars (webs)	Yes – Potential for (increased) road collisions to occur due to the wider road to cross	Yes – Proposed scheme could result in hydrological changes of the habitat due to soil compaction and site compounds / soil storage areas	Yes – Proposed scheme could result in hydrological changes of the habitat due to the presence of new physical structures	Yes – Proposed scheme could result in introduction of alien species to the supporting habitat	None – No pathway to effect	None - No pathway to effect	None - Feature not sensitive	Yes – Proposed scheme could result in habitat degradation due to a change in air quality as a result of vehicular emissions	None - Feature not sensitive	None - Feature not sensitive	None - Feature not sensitive
SAC – Usk bat sites Annex I habitats only	None – Outside zone of influence	None - Outside zone of influence	None – Feature not sensitive	None – Feature not sensitive	None – Outside zone of influence	None – Outside zone of influence	None – Outside zone of influence	None – No pathway to effect	None - No pathway to effect	None – Outside zone of influence (200 m)	None – Outside zone of influence	None – Feature not sensitive	None – Feature not sensitive	None - Feature not sensitive

Ecological resource	Land take / habitat loss	Severance / fragmentation	Direct mortality (during construction)	Direct mortality (during operation i.e. road collisions)	Changes to hydrology (construction)	Changes to hydrology (operation)	Invasive species	Water pollution (construction)	Water pollution (operation)	Air pollution (dust during construction)	Air pollution (during operation)	Disturbance (construction noise / vibration)	Disturbance (construction – lighting)	Disturbance (operation and maintenance visits)
SAC – Usk bat sites Annex II species only – Lesser horseshoe bats	Yes – Reduction of / potential loss of suitable bat roosting and foraging habitat and commuting routes across the proposed scheme outside of the SAC – roosting features within Taf Fechan and Taf Fawr and approximately 64 ha of woodland habitats	None	Yes – Potential for death or injury of individuals if roosts damaged outside of the SAC	Yes - Bats may be forced to cross road into pathway of traffic if existing safe crossing points are removed / routes altered	None – Feature not sensitive	None – Feature not sensitive	None – Feature not sensitive	None – Feature not sensitive	None – Feature not sensitive	None – Feature not sensitive	None – Feature not sensitive	Yes – Noise and vibration caused by excavation or rock cutting works adjacent to bat roosts could disturb bats and cause them to abandon their roosts. It can also disorientate and reduce efficacy of echolocation during foraging outside of the SAC.	Yes – Lighting near a bat roost access point or commuting and foraging habitat could delay bats from emerging and shorten the amount of time available to them for foraging outside of the SAC	Yes - Disturbance during operation and maintenance at the new permanent structures from presence of people, noise, lighting and vehicular movements. New lighting design may cause bats to abandon roosts, avoid flight lines and feeding areas.
SSSI – Dyffrynoedd Nedd a Mellte a Moel Penderyn	None – Outside zone of influence	None – Outside zone of influence	None - Feature not sensitive	None - Feature not sensitive	No pathway to effect	No pathway to effect	None – Outside zone of influence	None – No pathway to effect	None – No pathway to effect	None – Outside zone of influence (200 m)	Yes – Proposed scheme could result in habitat degradation due to a change in air quality as a result of vehicular emissions	None - Feature not sensitive	None - Feature not sensitive	None - Feature not sensitive

Ecological resource	Land take / habitat loss	Severance / fragmentation	Direct mortality (during construction)	Direct mortality (during operation i.e. road collisions)	Changes to hydrology (construction)	Changes to hydrology (operation)	Invasive species	Water pollution (construction)	Water pollution (operation)	Air pollution (dust during construction)	Air pollution (during operation)	Disturbance (construction noise / vibration)	Disturbance (construction – lighting)	Disturbance (operation and maintenance visits)
SSSI – Cors Bryn-y-Gaer (part of Blaen Cynon SAC)	None – Outside zone of influence	None – Outside zone of influence	None - Feature not sensitive	None - Feature not sensitive	Yes – Proposed scheme could result in hydrological changes of the habitat due to soil compaction and site compounds / soil storage areas	None	None – Outside zone of influence	None – No pathway to effect	None – No pathway to effect	None – Outside zone of influence (200 m)	Yes – Proposed scheme could result in habitat degradation due to a change in air quality as a result of vehicular emissions	None - Feature not sensitive	None - Feature not sensitive	None - Feature not sensitive
SSSI – Woodland Park and Pontpren (part of Blaen Cynon SAC)	None – Outside zone of influence	None – Outside zone of influence	None - Feature not sensitive	None - Feature not sensitive	No pathway to effect	No pathway to effect	None – Outside zone of influence	None – No pathway to effect	None – No pathway to effect	None – Site is located over 200 m from the proposed scheme	None – Outside zone of influence	None - Feature not sensitive	None - Feature not sensitive	None - Feature not sensitive
SSSI – Tir Mawr a Dderi Hir, Llwydcoed	Yes – Approximately 1.34 ha along its northern boundary with the existing A465	None – Outside zone of influence	None - Feature not sensitive	None - Feature not sensitive	Yes – Proposed scheme could result in hydrological changes of the habitat due to soil compaction and site compounds / soil storage areas	None	Yes – Proposed scheme could result in introduction of alien species	Yes – Proposed scheme could result in water pollution pathways during construction.	Yes - Beneficial impacts are predicted due to implementation of currently absent pollution prevention systems	Yes – Proposed scheme could result in dust / air pollution	Yes – Proposed scheme could result in habitat degradation due to a change in air quality as a result of vehicular emissions	None - Feature not sensitive	None - Feature not sensitive	None - Feature not sensitive

Ecological resource	Land take / habitat loss	Severance / fragmentation	Direct mortality (during construction)	Direct mortality (during operation i.e. road collisions)	Changes to hydrology (construction)	Changes to hydrology (operation)	Invasive species	Water pollution (construction)	Water pollution (operation)	Air pollution (dust during construction)	Air pollution (during operation)	Disturbance (construction noise / vibration)	Disturbance (construction – lighting)	Disturbance (operation and maintenance visits)

Standing water (lakes, ponds and reservoirs)	Yes – approximately 0.49 ha loss of standing water at two locations, including one pond and one reservoir	None	Feature not sensitive	Feature not sensitive	Yes – proposed scheme could result in hydrological changes of the habitat due to soil compaction and site compounds / soil storage areas	None	Yes – proposed scheme could result in introduction of alien species	Yes – proposed scheme could result in water pollution pathways during construction	Yes - Beneficial impacts are predicted due to implementation of currently absent pollution prevention systems	None - Feature not sensitive	Feature not sensitive	Feature not sensitive	Feature not sensitive	Feature not sensitive
Other habitats valued at Local or below	Yes – Approximately 62 ha	None	Feature not sensitive	Feature not sensitive	Yes – Proposed scheme could result in hydrological changes of the habitat due to soil compaction and site compounds / soil storage areas	None	Yes – Proposed scheme could result in introduction of alien species	Yes – Proposed scheme could result in water pollution pathways during construction	Yes - Beneficial impacts are predicted due to implementation of currently absent pollution prevention systems	None - Feature not sensitive	Feature not sensitive	Feature not sensitive	Feature not sensitive	Feature not sensitive

Ecological resource	Land take / habitat loss	Severance / fragmentation	Direct mortality (during construction)	Direct mortality (during operation i.e. road collisions)	Changes to hydrology (construction)	Changes to hydrology (operation)	Invasive species	Water pollution (construction)	Water pollution (operation)	Air pollution (dust during construction)	Air pollution (during operation)	Disturbance (construction noise / vibration)	Disturbance (construction – lighting)	Disturbance (operation and maintenance visits)
Species														
Bats (excluding lesser horseshoe bats) Greater horseshoe Common pipistrelle Soprano pipistrelle Myotis spp. Noctule Brown long-eared	Yes – Reduction of suitable bat roosting and foraging habitat and commuting routes across the proposed scheme	Yes - Loss of connectivity between bat roosts and feeding grounds where hedgerows that provide commuting routes have been bisected by the construction works – could result in changes in movements and increased use of energy	Yes - Tree felling, demolition of buildings and construction work on caves and structure containing bat roosts may cause direct mortality of bats present	Yes - Bats may be forced to cross road into pathway of traffic if existing safe crossing points are removed / routes altered	None – Feature not sensitive	None – Feature not sensitive	None – Feature not sensitive	None – Feature not sensitive	None - Feature not sensitive	None – Feature not sensitive	None – Feature not sensitive	Yes - Noise and vibration caused by excavation or rock cutting works adjacent to bat roosts could disturb bats and cause them to abandon their roosts, and could also disorientate and reduce efficacy of echolocation during foraging	Yes - Lighting near a bat roost access point or commuting and foraging habitat could delay bats from emerging and shorten the amount of time available to them for foraging	Yes - Disturbance during operation and maintenance at the new permanent structures from presence of people, noise, lighting and vehicular movements. New lighting design may cause bats to abandon roosts, avoid flight lines and feeding areas.
Great Crested Newts (GCN)	Yes – Terrestrial habitat to be lost within the proposed scheme footprint and areas of work, approximately 4 ha of terrestrial habitat	None - Mo pathway to effect. Linking habitat between ponds of confirmed GCN presence and terrestrial habitat maintained	Yes - Terrestrial habitat to be cleared as part of the construction woks	None – No pathway to effect	None - No loss or change in number, distribution or water levels of ponds	None	Yes – Potential to introduce invasive species to ponds	Yes – Proposed scheme could result in water pollution pathways during construction	Yes - Beneficial impacts are predicted due to implementation of currently absent pollution prevention systems	None - Feature not sensitive	None – Feature not sensitive	None – Feature not sensitive	None - Feature not sensitive	None – No pathway to effect

Ecological resource	Land take / habitat loss	Severance / fragmentation	Direct mortality (during construction)	Direct mortality (during operation i.e. road collisions)	Changes to hydrology (construction)	Changes to hydrology (operation)	Invasive species	Water pollution (construction)	Water pollution (operation)	Air pollution (dust during construction)	Air pollution (during operation)	Disturbance (construction noise / vibration)	Disturbance (construction – lighting)	Disturbance (operation and maintenance visits)
Otter	No – No otter holts identified within the proposed scheme footprint and working areas	Yes – Severance could be caused if any existing culverts are removed or altered in a way to make unsuitable for mammal passage or if none are provided in offline sections	Yes - Mortality possible if fall into or become trapped in excavations / works compounds	Yes – Road Traffic Accident (RTA) – Blocking or removal of existing underpasses / culverts could prevent safe passage under road, and force individuals up on to the road causing RTA	None - No loss or change in flow of watercourses - Main watercourses to remain open and undisturbed and terrestrial habitat connectivity is retained for safe passage	None	None - Feature not sensitive	Yes – proposed construction methods could result in pollution event/decrease in water quality causing decreased food source, or decreased fecundity	Yes - proposed scheme could result in pollution event/decrease in water quality causing decreased food source, or decreased fecundity. However, beneficial impacts are predicted due to implementation of currently absent pollution prevention and control systems	None - Feature not sensitive	None – Feature not sensitive	Yes – Noise and vibrations may disturb otters lying up in the nearby area and also commuting routes	Yes – lighting of watercourses has the potential to effect otter commuting movements	None – no lighting near watercourses is proposed. All operational traffic is at height from major water features (clear span structures) and therefore unlikely to generate likely significant effects.
Lapwing	Yes – Loss of breeding habitat at Dowlais Top – currently supports twelve breeding pairs	None - Habitat severance already occurs where this species has been recorded.	Yes - There is the potential for mortality or injury of lapwing eggs and chicks during the construction of the proposed scheme	Yes - There is the potential for mortality or injury of lapwing chicks due to collision with traffic on the proposed scheme if breeding adults return to a reduced Dowlais Top	None - Feature not sensitive	None - Feature not sensitive	None - Feature not sensitive	None - Feature not sensitive	None - Feature not sensitive	None - Feature not sensitive	None – Feature not sensitive	Yes - There is the potential for disturbance of breeding lapwing at locations adjacent to the construction footprint	Yes - There is the potential for disturbance of breeding lapwing by construction lighting at locations adjacent to the construction footprint	None – No pathway to effect
Badger	No – No loss of setts	None – No pathway to effect	None – No pathway to effect	None – No pathway to effect	None - Feature not sensitive	None - Feature not sensitive	None - Feature not sensitive	None - Feature not sensitive	None - Feature not sensitive	None - Feature not sensitive	None – Feature not sensitive	None – No pathway to effect	None – No pathway to effect	None – No pathway to effect

Ecological resource	Land take / habitat loss	Severance / fragmentation	Direct mortality (during construction)	Direct mortality (during operation i.e. road collisions)	Changes to hydrology (construction)	Changes to hydrology (operation)	Invasive species	Water pollution (construction)	Water pollution (operation)	Air pollution (dust during construction)	Air pollution (during operation)	Disturbance (construction noise / vibration)	Disturbance (construction – lighting)	Disturbance (operation and maintenance visits)
Reptiles	Yes – Suitable habitat to support reptiles is located within the proposed scheme footprint – approximately 17 ha of high suitability habitat, 42 ha of moderate suitability habitat and 37 ha of low suitability habitat	No – Habitats for reptiles are already severed in locations. Landscape connections at the wider scale are not affected	Yes – During vegetation clearance and clearance of verge habitat	None – No pathway to effect	None - Feature not sensitive	None - Feature not sensitive	None - Feature not sensitive	None - Feature not sensitive	None - Feature not sensitive	None - Feature not sensitive	None – Feature not sensitive	None - Feature not sensitive	None - Feature not sensitive	None – No pathway to effect
European eel, Atlantic Salmon,	Yes - There is the potential for injury or mortality of freshwater fish species during the construction phase of structures within watercourses. Limited to areas of in-channel working or percussive piling in riparian areas	Yes - Freshwater habitats capable of supporting migrating fish may be lost due to dewatering in-channel modification of bed and bank structures, or the insertion of culverts and bridge infrastructure which could form physical barriers or changes in-channel habitat	Yes - Freshwater habitats capable of supporting migrating fish may be lost due to dewatering in-channel modification of bed and bank structures, or the insertion of culverts and bridge infrastructure which could form physical barriers or changes in-channel habitat	Yes - Pollution events could cause potential mortality during operation	Yes - Construction related discharges, and dewatering could influence the flow type/habitat of the watercourses and the fish communities. Additional surface water discharge has the potential to increase flow in receiving waterbodies, affecting the distribution of habitats and flow of sensitive species	None	Yes - Potential to introduce invasive species to watercourses	Yes – Proposed scheme could result in water pollution pathways during construction causing mortality	Yes - Beneficial impacts are predicted due to implementation of currently absent pollution prevention systems	None - Feature not sensitive	None – Feature not sensitive	Yes - Construction activities undertaken within the channel and adjacent riparian zones have the potential to disturb migratory fish species. Noise and vibration can create behavioural and physical avoidance, preventing migration through the area and reducing feeding and spawning behaviours	Yes - Construction activities undertaken within the channel and adjacent riparian zones have the potential to disturb migratory fish species. Noise and vibration can create behavioural and physical avoidance, preventing migration through the area and reducing feeding and spawning behaviours	None - Feature not sensitive

4.4 Ensuring Mitigation is achieved by Adopting Standard Post Construction Management and Maintenance Protocols 9
Annex A. Outline Strategy for Management Plans 10

1. Introduction

Environmental mitigation achieved by the proposed scheme design is considered embedded within the design and a feature of the proposed scheme. This report summarises the process of achieving that embedded mitigation.

2. Principles Adopted During Proposed Scheme Design

The environmental design principals provided in Table 2.1 formed part of the proposed scheme design process which had an overall aim of minimising land take and environmental impact, on important ecological resources. These also included minimising any secondary impacts due to changes in the environmental conditions for key designated sites and habitats.

Table 2.1 : Environmental design principals

A465 Sections 5 & 6 design principles
Principle 1 – Minimise impact on existing marshy grassland habitats by minimising risk of drying out, whilst considering whole life cost of the scheme
Principle 2 – Minimise impact on Ancient Woodland in close proximity of the scheme
Principle 3 – Where technically feasible and not entailing excessive cost, consider opportunities to enhance existing ecological connectivity
Principle 4 – Aim to achieve an earthworks balance and make use of exposed geology, where suitable in terms of slope stability and safety, to create drama and reduce land take when compared with typical engineering batters
Principle 5 – Minimise habitat loss from Sites of Importance for Nature Conservation in close proximity to the scheme
Principle 6 – Adopt a "Simple and Elegant" approach for structures
Principle 7 – Minimise lighting on scheme as a whole, particularly viaducts over Taf Fawr and Taf Fechan
Principle 8 – Ensure structures design, facing and finishes provides integration to current vernacular balanced by whole life cost
Principle 9 – Maintain existing underpasses to maintain connectivity for wildlife and minimise habitat severance
Principle 10 – Provide linear landscape strips in areas where they currently exist, if appropriate, to re-integrate proposed scheme as per the existing highway planting
Principle 11 – Where appropriate, minimise tree and shrub planting to create open, outward views from the scheme and integrate with existing upland landscape character
Principle 12 – Minimise flooding and water quality impacts

3. Important Ecological Resources

Mitigation measures have been incorporated into the proposed scheme and are relevant to a range of valued ecological resources. The important ecological resources include, but are not limited to:

- statutory and non-statutory designated sites for nature conservation: SACs; SSSIs; SINCs and Ancient Woodland Inventory (AWI) sites;
- habitats suitable for marsh fritillary *Euphydryas aurinia*, a qualifying Annex II species for the Blaen Cynon SAC, within the landscape functional area;
- woodland and hedgerows;
- semi-improved, species rich grasslands and heath;
- rivers and streams;
- terrestrial and aquatic mammals and under-road crossing points;
- bats and their roosts, commuting routes and under-road crossing points;
- lapwing;
- great crested newt *Triturus cristatus* habitats;
- otter *Lutra lutra*, their commuting and foraging locations and their laying up places; and
- reptile species.

4. Environmental Mitigation Achieved by Proposed Scheme Design

Following the development of the environmental design principles in December 2015, an initial environmental constraints plan was provided to the design team to facilitate further environmental mitigation within the design. This constraints plan was a live document that was continuously refreshed as additional baseline environmental data were gathered, and feedback received from stakeholders, so that the design team was aware of all emerging issues and constraints that needed to be addressed in the design development. This fed into all aspects of the design including alignment, junction strategy, structures, drainage design, temporary land take for construction, lighting proposals etc.

Mitigation for the proposed construction phase was detailed by requiring specific process or methods of work during the proposed construction phase, that were added to the Register of Environmental Actions and Commitments (REAC), or by influencing the proposed construction programme in key sensitive areas to avoid sensitive periods for the wildlife known to be present. In addition there was close dialogue between the Environment and Buildability team in consideration of likely location of temporary working areas and likely storage compounds

Finally a series of post-construction outline management and maintenance protocols were specified to ensure land acquired for mitigation develops into the required habitat type set out in the Environmental Masterplan (EMP). These features are individually discussed in the following sections (Sections 4.1 to 4.4).

4.1 Mitigation by Design

Table 4.1 details the process and activities undertaken in order to mitigate effects on specified ecological resources during the design development to date of the proposed scheme. In summary, alignment, choice / design of structures and characteristics of new and existing culverts was influenced by the (potential) presence of valued ecological resources. Features are shown in the EMP ES Volume 4. Specified standards in design that minimise noise and vibration, control lighting and limit dispersal of pollutants were referenced at this stage. It should be emphasised that the provision of new road culverts and improvement of existing road culverts is an embedded mitigation measure for road drainage and water quality only. In terms of the nature conservation assessment, road culverts are considered as enhancements rather than mitigation. In the table below, the influence on the road drainage design is described with the aim of achieving this enhancement for nature conservation.

Table 4.1 : Mitigation achieved by proposed scheme design

Summary of activity	Proposed measure adopted	Resource
Development of proposed scheme design		
Consider changes in alignment	Avoid and protect existing woodland and ancient woodland wherever practicable.	Ancient woodland
Consider changes in alignment	Minimise habitat loss from SSSI, Special Areas of Conservation (SACs) and SINCs.	Designated sites
Consider changes in alignment	Retain all existing great crested newt breeding ponds.	Great crested newt
Consider changes in alignment	Minimise impact on existing marshy grassland habitats.	Marshy grassland
Maximise size of culverts where possible	Size of new culverts are a minimum 1.5 m x 1.5 m, where practicable to provide flight space for commuting bats and / or ‘dry’ mammal ledges	Enhancement - increased wildlife permeability
Retain culverts on existing	New culverts have, in the main, been designed to facilitate	Enhancement -

Summary of activity	Proposed measure adopted	Resource
watercourse alignments where possible	existing watercourse alignment. Where possible, they would also provide opportunities for improved permeability for wildlife under the road.	increased wildlife permeability
Minimise hydrological change	Minimise realignment and changes to watercourse hydromorphology so far as is possible. Outfalls have been designed to prevent significant change to hydrological conditions. Hydrological continuity would be maintained throughout construction, with measures to maintain water flows during and post-construction.	Fish / otter
Sensitive drainage design	Drainage design, as much as practical, has avoided sensitive receptors, for example designated sites, habitats important in supporting protected species and freshwater habitats; to avoid potential impacts. The specification of gully pots has been avoided, to remove the risk of amphibians becoming trapped in the drainage system.	All Amphibians
Attenuate drainage	All road drainage would be held in attenuation ponds that would act as a filtering system before being discharged road run-off into local waterways.	
Pollution prevention	Pollution Prevention and Control systems have been designed into the proposed scheme and include features such as filter drains, attenuation ponds, infiltration trenches and oil separators. These would be used to reduce and treat pollution incidents before runoff were to reach watercourses and susceptible habitats.	All
Use appropriate species in planting	Landscape planting would use stock of local provenance.	All

4.2 Mitigation Achieved During Proposed Scheme Construction Phase

Table 4.2 details the process and activities undertaken in order to mitigate effects on specified ecological resources during the construction phase of the proposed scheme. In summary, resource specific management plans / method statements and protocols would be prepared in advance of all works. An Ecological Clerk of Works (EcCoW) would be present on site throughout the construction phase and build awareness of ecological resources present with those on site. Protection of retained habitats is fundamental at this stage while habitat creation on the new soft estate would be essential embedded mitigation. This embedded mitigation would be delivered by contract documentation which would include the REAC and a Construction Environmental Management Plan (CEMP). The current REAC is available on request. The REAC is a live document updated throughout future key project stages. An outline CEMP is provided as a standalone document (available on request) which details the likely processes that will be adopted during the construction phase to minimise impacts on the environment.

Requirements of legal documents (such as European Protected Species licencing) or methods in order to avoid contravention of wildlife legislation are also considered as embedded measures in the proposed scheme. Outline management / method statement strategies for specific ecological resources are included in Annex A.

Table 4.2 : Mitigation achieved by scheme design during the construction phase

Summary of activity	Proposed measure	Resource
Liaison and consultation		
Environmental Clerk of Works and Ecological clerk of works	ECoW and EcCoW to provide advice on site	All
Provision / implement of management plans / method statements / protocols		
Invasive species management plan	An invasive species management plan would be prepared and adhered to throughout the construction works phase	Invasive species
Avoid key fish migration periods	Construction works in or near watercourses are not required. Where minor culvert works or minor watercourse realignments are required they would be undertaken in times that avoid the key fish migration periods.	Fish
Temporary culverting	Temporary culverting of watercourses to be minimised. Where unavoidable, the design would meet current best practice design (for example, DMRB Volume 10, Section 4 Nature Conservation, Parts 1-7) to minimise impact on the watercourse and maximise suitability to provide safe passage for fish species.	All
Fish rescue ahead of dewatering	Fish within dewatered areas would be captured and release into adjacent waters.	Fish
Sensitive stockpiling of materials	No stockpiling of material would be permitted within 10 m of any watercourse.	Fish, otter
Minimise noise and vibration near ecological resources	All generators / pumps would be baffled / screened to reduce noise and located as far away as practicable from known ecologically sensitive resources. For example, a buffer zone of at least 50 m radius would be provided around bat roosts within retained trees and structures.	Fish, birds, bats, otter, badger
Control of lighting	No night time working is proposed. However, if temporary lighting is required it would be controlled and follow guidance on lighting including the use of directional lighting or preventative measures such as installation of shields, hoods or limiting the height of lighting columns. The following guidance would be followed: • CIRIA C741 – Environmental Good Practice on Site (4th Edition); • Institute of Lighting professionals (2011) Guidance Notes for the reduction of obtrusive lighting (GN01:2011); and • CIE 150: 2003 Technical Report, Guide to the Limitation of the Effects of Obstructive Light from Outdoor Lighting Installations. Mitigation for temporary lighting would be directed and approved by the EcCoW prior to works commencing.	Bats, otter
Control of pollution	Best practice pollution prevention guidelines to treat run-off in relation to routine pollution and major spillages to reduce or avoid impacts to the water quality of watercourses would be employed. Measures to manage different types of water pollution (such as sedimentation, nutrients from wastewater, surface water pollution, and	All

Summary of activity	Proposed measure	Resource
	chemical pollution from vehicles) would be specified where required. The following industry standards would be adhered to: • CIRIA guidance, in particular CIRIA C741 - Environmental Good Practice on Site (4th Edition) (CIRIA, 2015); • CIRIA C532 - Control of Water Pollution from Construction Sites (CIRIA, 2001); and • CIRIA C648 - Control of water pollution from linear construction projects (CIRIA, 2006). Waterbodies would be monitored during and post construction where necessary.	
Document ecological constraints	All ecological constraints would be clearly marked on all construction drawings, including the Series 100, Series 200 and Series 3000 specifications, and detailed in the EMP and CEMP.	All
Document ecological incidents	An ecological incident recording and response plan would be implemented in order to document information and detail appropriate procedures to be implemented in response to potential incidents.	All
Awareness building		
Ecological toolbox talks	Ecological toolbox talks would be provided to all contractors working on the proposed scheme by the EcCoW immediately prior to the start of works. This would include a description of ecologically valuable resources and constraints, the legislative protection and the procedures for reporting. All contractors working on the proposed scheme would be required to read and sign the toolbox talk and agree to comply with the methods of working.	All
Protection of habitats and resources		
Fence retained vegetation	All retained vegetation and ecologically valuable would be appropriately fenced to protect them from damage or disturbance from construction activities. To avoid / reduce the effects of local compaction of ground within the root protection zones of retained trees and hedgerows, or other accidental damage, appropriate tree protection measures would be implemented in accordance with (find relevant BS 5837:2012- 'Trees in relation to design, demolition and construction. Recommendations') and additional arboricultural advice.	All
Demarcate exclusion zones for sensitive resources	Exclusion zones around sensitive resources in the form of fencing would be erected to protect retained habitats, sites and species (for example SSSI, SINC and marsh fritillary habitat), immediately adjacent to construction works.	All
Demarcate working areas	Clearly defined working areas and haul routes would be marked out. Plant and personnel would be constrained to a prescribed working corridor through the use of temporary barriers, thereby minimising unnecessary damage to	All

Summary of activity	Proposed measure	Resource
	habitats and potential direct mortality and disturbance to species. Barriers should be erected prior to works commencing on site and shall aim, in particular, to protect the river corridor, woodland, or any other sensitive habitats from unnecessary disturbance.	
Provision of effective Stock proof fencing	Effective highway boundaries and fencing to standard specifications to protect designated sites and habitat creation sites would be provided where grazing is an important part of management, to avoid cattle escaping onto the road.	Designated sites – Tir Mawr a Dderi Hir SSSI and Llwydcoed Slopes.
Sensitive location of temporary works areas	Site compounds, soil storage areas, haul roads would be located appropriately to minimise land take of key sites and habitats and disturbance to species and their places of rest.	All
Avoid bird breeding season	Site clearance would be undertaken outside the bird breeding season (March to August, inclusive).	Birds
Prevent wildlife becoming trapped	All construction excavations would either be covered (with plywood), fenced or have an escape ramp put in them overnight to prevent wildlife from falling into them and becoming trapped. Actions in adherence to (CIRIA) C741 would be implemented.	All
Habitat creation		
Soft estate planting	This includes planting around culverts, structures and other features for bats, badgers and otters, and planting of food / nectar plants for marsh fritillary.	All
Provision of roosting / nesting opportunities	Replacement of opportunities for bats to roost and birds to nest through the provision of artificial roosting and nesting boxes / features.	Bats, birds
Monitoring		
Implementation of control measures and ecological mitigation during construction	ECoW and EcCoW to monitor implementation of control measures and construction phase ecological mitigation.	All
Reporting		
Ecological monthly report	An ecological progress report would be produced monthly during construction to provide a review of ecological issues and recommendations for remedial action if required. Issues in the monthly progress report (to be defined in agreement with the contractor and NRW) would likely include topics such as water quality testing at selected locations and top soil monitoring.	All
Annual ecological monitoring report during construction	An annual ecological monitoring report would be compiled during the construction phase. Ecological monitoring would be defined in agreement with the contractor and NRW but would likely include: • bat roost surveys: maternity roosts in buildings and structures; hibernation cave surveys; • marsh fritillary habitat assessment and adult and larval web count of the continued long-term	

Summary of activity	Proposed measure	Resource
	monitoring and of the mitigation site as it develops; • breeding lapwing surveys and monitoring of mitigation habitat establishment and development; • great crested newt survey of ponds in Winchfawr SINC; and • surveys to monitor success of INNS control.	

4.3 Mitigation Achieved by Regulation of the Contractor's Compound Locations

Table 4.3 details the process and activities that would be undertaken in order to mitigate effects on specified ecological resources during the construction phase of the proposed scheme, specifically in relation to temporary working areas and site compounds. In summary, the location of these areas, including soil storage areas, would be specified to avoid sensitive habitats and valuable ecological resources.

Table 4.3 : Mitigation achieved by scheme design with regulation of contractor's compound

Summary of activity	Proposed mitigation and offsetting	Resource
Protection of habitats and resources		
Location of works compounds and soil storage mounds	Works compounds would not be located in designated or other sensitive areas of habitat. If works compound areas needed to be enlarged, the EcCoW would need to be consulted prior to disturbance occurring and these adjacent areas would need to be re assessed to confirm the presence / absence of any ecological constraints. Works compounds would not be situated where a likely significant effect would be expected to occur. Specifically, temporary works would not be situated on any designated site, or on suitable marsh fritillary habitat, lapwing breeding habitat, or ancient woodland. Contractor's compounds would be sited away from known bat roosts to minimise disturbance from noise / light / vibration.	All
Fencing of works compounds	Works compounds, storage sites and access roads would be suitably fenced to prevent the trapping of mammals. Fencing specification would need to be post and rail to let animals use the site during construction (allow them to access and leave without becoming trapped).	Badgers, otters
Specified standards		
Safe storage of all materials and machinery	Safe storage of all materials and machinery within compound to prevent injury to mammals. Any areas that need to be used for storage outside the proposed scheme construction boundary would need to be re-assessed for ecological impact.	Badgers, otters

4.4 Ensuring Mitigation is Successfully Delivered by Adopting Standard Post Construction Management and Maintenance Protocols

Table 4.4 details the post-construction management plans and monitoring programmes that would be required. Monitoring is an essential part of the mitigation process allowing, where required, management plans to be modified in respect to dynamic habitat change and species presence / absence. This would be a requirement of planning and contract documentation and its implementation would be the responsibility of the 'appointed DBFO company. Outline management strategies for marsh fritillary, lapwing and ancient woodland habitats are provided in Appendix 11N; Appendix 11P and Appendix 11O, respectively in Volume 2 of the ES.

Table 4.4 : Mitigation achieved by Post-Construction Managements

Summary of Activity	Proposed mitigation	Resource
Provision / implement of management plans / method statements / protocols		
Post construction – short term (between Year 1 and year 5 post construction)	Bat roost surveys: maternity roosts in buildings and structures; hibernation cave surveys; and bat boxes and pipe roosts.	Bats
	Marsh fritillary habitat assessment and adult and larval web count of the continued long-term monitoring and of the mitigation site as it develops.	Marsh fritillary
	Great crested newt survey of ponds in Winchfawr SINC.	GCN
	Survey of habitat suitability and breeding lapwing at mitigation site.	Lapwing
	Ancient woodland mitigation site.	Ancient woodland
	EcCoW to monitor success of ecological planting up to five years post planting to ensure target habitat achieved for: • Woodland habitats; • Grassland habitats; and • Marginal planting of attenuation ponds.	All
	EcCoW to monitor waters at risk of pollution and discharges to them.	Watercourses, fish
Post-construction – long term (between year 6 and year 25 post construction)	Compilation of an Environmental Management Plan outlining detailed prescriptions for the long term management, maintenance and aftercare of habitats and species within the new soft estate and land acquired for mitigation.	All sites, habitat, species

Annex A. Outline Strategy for Management Plans

A.1 – Invasive and Non-Native Species (INNS)

- Pre-construction surveys to identify the location of INNS species.
- All personnel on site to receive Tool box talks on identification of INNS and adhering to protocol.
- Areas of INNS identified should be isolated and demarcated and clearly sign posted (warning signs for site workers specifying location, type and reason for installation) prior to works to avoid immediate spread of material.
- Appropriately timed in situ herbicide treatment and / or physical removal of large areas as controlled waste to landfill, if required.
- Biosecurity protocols will be developed to avoid the introduction and spread of INNS between sites.

A.2 – Bats

- Pre-construction surveys to identify / confirm status location of bat roosts.
- All personnel on site to receive Tool box talks on adhering to protocol and legislation with regards to bats.
- No working during dusk, dawn or night time has been proposed during the indicative construction programme and, therefore, no disturbance to roosting, commuting or feeding bats is anticipated.
- Timing of construction works at particularly sensitive locations (Taf Fawr and Taf Fechan) would be programmed to cause minimum disturbance to roosting lesser horseshoe bats. Works are to occur when lesser horseshoes are not present / less active in the affected caves of the Taf gorges. No works are permitted on the gorge crossings between the dates of the 15 December and the 31 March with no working during dusk, dawn or night time.
- A Karst protocol would be developed in consultation with NRW to minimise effects on limestone features and define responses to unexpected findings during construction.
- Areas sensitive to disturbance will be demarcated and clearly sign posted (warning signs for site workers specifying location, type and reason for installation) prior to works to avoid disturbance.
- The construction site would not be lit around watercourses.
- All generators / pumps would be baffled / screened to reduce noise and located as far away as practicable from known ecologically sensitive resources. For example, at least 50 m radius would be provided around bat roosts within retained trees and structures.

A.3 - Marsh fritillary

- Pre-construction surveys to identify the location of larval webs, caterpillars and suitable turves for translocation.
- All personnel on site to receive Tool box talks on protocol and legislation with regards to marsh fritillary.
- Sensitive retained vegetation will be fenced and demarcated where possible and clearly sign posted (warning signs for site workers specifying location, type and reason for installation) prior to works to avoid potentially killing, injuring or disturbing marsh fritillary and to avoid the damage of habitats of the larval and adult life stages of the species.
- Larval webs, the devil's-bit scabious plant upon which they are found feeding and their immediate turf will be translocated from the proposed scheme footprint to a suitable and prepared receptor at the land acquired for ecological mitigation at Llwydcoed Slopes under specific method statement, developed in consultation with NRW. This would occur between August and October (prior to vegetation clearance) when the caterpillars are gregarious and above ground and can be easily located. These activities would be undertaken in accordance with a detailed method statement agreed with NRW.

A.4 – Otters

- Pre-construction surveys to identify the location of otter holts and hovers.
- No working during dusk, dawn or night time during the construction programme.
- The construction site would not be lit around watercourses.
- All generators / pumps would be baffled / screened to reduce noise and located as far away as practicable from known otter holts / hovers.
- Works compounds, storage sites and access roads would be suitably fenced to prevent the trapping of mammals. Fencing specification would need to be post and rail to let animals use the site during construction (allow them to access and leave without becoming trapped).
- No oils, chemical, soil or other storage areas would be located within 10 m of a watercourse.
- All excavations will be covered at night to prevent the trapping of otter. Where this is not practicable means of escape should be provided.
- All watercourses and adjacent riparian habitat would maintain an undisturbed route of passage to allow otters to move freely.
- An emergency response protocol to set out the appropriate course of action in the unlikely event should a water pollution incident occur would be developed.
- Under-road crossing points will be retained and kept open for commuting badger.

A.5 – Great Crested Newt (GCN)

- Pre-construction surveys to identify the location of GCN, including waterbodies and terrestrial habitat.
- Erection of exclusion fencing to prevent the movement of GCN into areas of works (northern boundary of Winchfawr West SINC).
- Biosecurity protocols will be developed to avoid the introduction and spread of aquatic INNS and pathogens between sites.
- All excavations will be covered at night to prevent the trapping of amphibians. Where this is not practicable means of escape should be provided.
- Retained waterbodies and sensitive terrestrial habitat will be fenced and demarcated where possible and clearly sign posted (warning signs for site workers specifying location, type and reasons for installation) prior to works to avoid potentially killing, injuring or disturbance of GCN and to avoid the damage of terrestrial habitat.
- An emergency response protocol to set out the appropriate course of action in the unlikely event should a water pollution incident occur will be developed.
- The landscape proposals of the proposed scheme have incorporated beneficial features for amphibians: marginal vegetation planting around attenuation ponds and provision of artificial refugia / hibernacula in retained areas.

A.6 – Reptiles

- Pre-construction surveys to identify the location of reptiles.
- Seasonally and directionally appropriate vegetation clearance techniques.
- Deployment of exclusion fencing where suitable to prevent the movement of reptiles into areas of works.
- All excavations will be covered at night to prevent the trapping of reptiles. Where this is not practicable means of escape should be provided.
- Retained reptile habitat will be fenced and demarcated and clearly sign posted (warning signs for site workers specifying location, type and reasons for installation) prior to works to avoid potentially killing, injuring or disturbing reptiles and to avoid the damage of habitat.

- Receptor sites and retained habitat suitable for reptiles would be fenced and demarcated and clearly sign posted (warning signs for site workers specifying location, type and reasons for installation) to avoid entry by construction machinery where they are contiguous with the proposed scheme.

A.7 - Fish

- Where minor culverting is required this would be undertaken in times that avoid the key fish migration periods.
- Fish within dewatered areas would be captured and release into adjacent waters.
- No stockpiling of material would be permitted within 10 m of any watercourse.
- All generators / pumps would be baffled / screened to reduce noise and located as far away as practicable from watercourses.
- An emergency response protocol to set out the appropriate course of action in the unlikely event should a water pollution incident occur will be developed.
- Watercourse bed material would be retained and returned to new culverted locations in accordance with The River Restoration Manual (RRM, 2013).

A.8 – Badgers

- Pre-construction surveys to identify the location of badger setts within 30 m of the construction footprint.
- Works compounds and soil storage areas within the location of badger setts will be avoided and will not obstruct any likely badger pathways.
- All generators / pumps would be baffled / screened to reduce noise and located as far away as practicable from known badger setts.
- Works compounds, storage sites and access roads would be suitably fenced to prevent the trapping of mammals. Fencing specification would need to be post and rail to let animals use the site during construction (allow them to access and leave without becoming trapped).
- All excavations will be covered at night to prevent the trapping of badgers. Where this is not practicable means of escape should be provided.
- Under-road crossing points will be retained and kept open for commuting badger.

A.9 – Birds

- Pre-construction surveys to identify the location of Schedule 1 breeding birds.
- Vegetation removal should be undertaken outside of the breeding bird season (March to August, inclusive). Any variation in the dates for specific species will be included in the management plan. If works cannot be avoided during the breeding season, it is recommended that an inspection should be undertaken by a suitably experienced ecologist immediately prior to works commencing to ensure there are no active birds' nests present in the vicinity of the works. Should an active bird nest be found, it would be necessary to establish a buffer zone around the nest and leave it undisturbed until the chicks have fledged.
- The areas of vegetation and structures scheduled to be cleared each day would be walked by a suitably qualified and experienced ecologist or ECoW prior to the arrival on site of clearance contractors to avoid the risk of disturbance to birds from excessive movement of vehicles / people or through the noise of the hand tools used in the clearance works.
- Retained vegetation will be fenced and demarcated where possible and clearly sign posted (warning signs for site workers specifying location, type and means of installation) prior to works prevent accidental incursion or clearance.
- Schedule 1 breeding birds would be dealt with so not to contravene wildlife legislation. This may include provision of alternative breeding sites and suitable timed construction works.

A.10 – General

- An Environmental Clerk of Works, supported by an Ecological Clerk of Works, would be present on site throughout the construction phase.
- All personnel on site to receive Tool box talks on protocol and legislation with regards to relevant ecological features.

1. Introduction

An outline management strategy for the long term management of the land acquired for mitigation at Llwydcoed Slopes is provided here as an indication of the content required for the final version to be agreed in consultation with Natural Resources Wales (NRW).

Management for this mitigation area would be specifically designed in relation to creating marsh fritillary *Euphydryas aurinia* habitat and botanical features consistent with that contained within habitat loss at the Tir Mawr a Dderi Hir Site of Special Scientific Interest (SSSI). The management strategy would be phased into three main stages:

- 2017 to 2019 – Pre-construction;
- 2019 to 2022 – Construction;
- 2022 to 2027 – Five year post –construction; and
- 2027 to 2042 – Twenty five year operational and maintenance.

The structure of the management strategy would be in accordance with Clause 11 of BS 42020:2013 and include the elements stated. Section 2 provides indicative headings and information required in the finalised management strategy. The objectives of the finalised management strategy would be to provide clarity and certainty over what is to be provided and enable sufficient resources to be identified and allocated.

Section 3 provides some sources of useful reading to inform the finalised management strategy.

2. Outline Strategy Structure

2.1 Ecological resources

This section of the management strategy would describe the habitat requirements and latest survey information and ecological information for marsh fritillary. Baseline habitat information on the Tir Mawr a Dderi Hir SSSI and the mitigation site would also be provided. An evaluation should be made of individual elements as required.

2.2 Issues affecting marsh fritillary and SSSI feature habitat

The most recent local and UK ecological / population trends would be detailed here and the issues affecting marsh fritillary, its specific habitat and the species rich grasslands, generally.

2.3 Aims and objectives of management

Clear aims and objectives including specific success criteria would be set out for each ecological receptor (habitat and species).

The mitigation measures could be considered successful if the monitoring programme demonstrates the following:

- the majority of land at Llwydcoed Slopes is in suitable condition for marsh fritillary by the end of the fifth summer post construction;
- a stable management regime at Llwydcoed Slopes has been established by the end of the fifth summer post construction; and
- that the management measures are in place and secured to develop high quality, diverse habitats within the Llwydcoed Slopes.

Additional success criteria would be developed where necessary for different stages through the post construction period in agreement with NRW in relation to percentage of ground cover, botanical species diversity and suitable / good condition marsh fritillary habitat.

2.4 Management options for achieving aims and objectives

As the Llwydcoed Slopes mitigation site is to be managed for the benefit of multiple ecological resources, the influences of different management options should be considered in relation to each of the different ecological features. Options for different management techniques would be discussed and detailed in this section.

2.5 Prescriptions for management options

Prescriptions for management of the Llwydcoed Slopes mitigation site are likely to include the following. Please note that this list is not exhaustive and that the final management strategy would be agreed in consultation with NRW and the relevant nature conservation interests.

- Consultation with local authority ecologists, Butterfly Conservation and PONT to discuss management and grazing options of the site but also what management already occurs / planned in the local area is a specified requirement of planning documentation.
- Preparation of the mitigation could include:
  - grazing;
  - burning;
  - mowing;
  - tree and scrub clearance; as well as

  - the devil's-bit scabious *Succisa pratensis* planting and turf translocation required as part of the planning documentation.
- Long term management will include site specific grazing by either cattle or ponies. Grazing should be extensive in nature and should be limited to spring and summer on wetter sites, although autumn/winter grazing or all-year grazing can also be suitable, particularly on drier sites. In general, a low stocking rate over a longer period is preferable. As the habitat varies between sites and over time stocking rates may also need to vary to reflect prevalent conditions but as a general rule stocking rates should not exceed 0.2 - 0.3 livestock units / ha / year. On seasonally grazed sites, roughly 1 cow every hectare (2.5 acres) for three months per year is recommended (Butterfly Conservation, 2016). Detail on species, number of animals, duration of grazing as well as any other actions (e.g. new stock fencing, natural regeneration areas or scrub control) would be provided.
- Provisions would also be made for any necessary remedial action to address any issues identified through monitoring.

2.6 Work schedule

Table 2.1 outlines potential management actions for the Llwydcoed Slopes mitigation site. Additional detail and timings would be necessary within the finalised version.

Table 2.1 : Indicative works schedule

Key Stage	Phase	Estimated date	Indicative management actions
Key Stage 4 (Public Local Inquiry and Minister Decision)	Pre-construction	July 2017 to July 2018	Harvest and propagate devil's-bit scabious plants at plant / garden nurseries
Key Stage 5 (Procurement of the DBFO Contractor)	Pre-construction	July 2018 to September 2019	Continue to propagate devil's-bit scabious plants
Key Stage 6 (Construction phase)	Construction – Pre vegetation clearance	Nov 2019 to Oct 2022	Identify and translocate larval webs present, with their immediate turves, in the footprint of the proposed scheme from August to October, to the land acquired for mitigation under a detailed method statement agreed with NRW
			Acquire land for mitigation (Lwydcoed Slopes) under the Highways Act 1980 (as amended) process (to manage in the long-term) to mitigate for loss of habitat suitable to support marsh fritillary and SSSI habitat loss
			Mark out turves for later translocation to mitigation site
	Construction – Post vegetation clearance	Nov 2019 to Oct 2022	Plant nursery grown devil's-bit scabious into the mitigation site
			Translocate turfs to mitigation site under a detailed method statement.
			Monitor mitigation habitats and marsh fritillary presence thereon as part of the ongoing monitoring programme.
			Engage / revise management as per monitoring results annually
5 year post construction phase	Post construction	Nov 2022 to Nov 2027	Development and implementation of a long-term extensive cattle grazing management system. Likely to be at approximate stocking rates that should not exceed 0.2 - 0.3 livestock units/ha/year.
			Monitoring programme to be agreed in consultation with NRW.
			Engage / revise management as per monitoring results annually.
25 year operational and maintenance phase	Post construction	Dec 2027 to Dec 2042	Continue grazing plan. Likely to be at approximate stocking rates that should not exceed 0.2 - 0.3 livestock units/ha/year. Modify as per revised monitoring programme.

2.7 Delivery

Funding resources and mechanisms and responsible parties would be detailed here to show how sustainable long-term delivery of the proposed management would be implemented. Specific actions / deliverables, related timeframes for that delivery and the responsible person / lead (with contact details) would be detailed in this section.

2.8 Monitoring and remedial measures

Monitoring of the mitigation site should be undertaken to establish the success and effectiveness of measures undertaken to mitigate for the impacts on marsh fritillary and the botanical aspects of the habitat lost at Tir Mawr a Dderi Hir SSSI.

A complete monitoring programme, as an essential component of the management strategy (in agreement with NRW) would be devised and should include the following:

- purpose, aims and objectives of monitoring;
- identification and provision of data describing the baseline condition prior to the start of the proposed scheme;
- appropriate success criteria;
- methods for data gathering and analysis;
- locational details;
- timing and duration;
- responsible person and lines of communications;
- reporting and review of outcomes; and
- provision for adaptive management (e.g. contingencies and remedial actions) that would be undertaken if monitoring showed that proposed management measures were not effective or not reaching their stated aims and objectives.

1. Introduction

An outline management strategy for the long term management of woodland habitats created at Croesbychan is provided in this document as a guide to the content required for the final version to be agreed by the Design Build Finance Operate (DBFO) Contractor in consultation with Natural Resources Wales (NRW).

Management for this mitigation area would be specifically designed in relation to creating new woodland habitat with ancient woodland characteristics and enhancement of retained ancient woodland plots. The management strategy would be phased into three main stages:

- 2017 to 2019 – Pre-construction;
- 2019 to 2022 – Construction;
- 2022 to 2027 – Five year post –construction; and
- 2027 to 2042 – Twenty five year operational and maintenance.

The structure of the management strategy would be in accordance with Clause 11 of BS 42020:2013 and include the elements stated. Section 2 provides indicative headings and information required in the finalised management strategy. The objectives of the finalised management strategy would be to provide clarity and certainty over what is to be provided and enable sufficient resources to be identified and allocated.

Section 3 provides some sources of useful reading to inform the finalised management strategy.

2. Outline Management Strategy Structure

2.1 Introduction

This section would describe the background to the selection and justification for the long term management of the mitigation site. A map of the mitigation site should also be presented.

The proposed scheme would result in the loss of sensitive habitats including ancient woodland. The adverse effects of the proposed scheme are to be mitigated as far as is practicable through replacement woodland planting and enhancement of retained ancient woodland habitat at Croesbychan (see Environmental Masterplan in Volume 4 of the Environmental Statement).

2.2 Ecological Resources

Baseline woodland habitat information would be detailed here. This would include the baseline conditions of the retained woodland habitats, the woodland to be lost and the existing habitat where woodland creation is proposed.

2.3 Issues Affecting Ancient Woodland Habitats

The most recent UK and local habitat trends and status would be detailed here and the issues affecting its sustainable management discussed.

2.4 Aims and Objectives of Management

Clear aims and objectives including specific success criteria would be set out. These would be agreed in consultation with NRW and the local authority ecologists.

Objectives for new and enhanced habitats could include:

- at least 95% of both canopy and shrub layer should consist of native species;
- removal of non-native invasive species from newly created and retained woodland habitats;
- 80% of ground flora to correspond with a targeted National Vegetation Classification (NVC) community;
- approximately 10% of woodland habitat to comprise open space; and
- increase levels of deadwood within woodland habitat.

2.5 Management Options for Achieving Aims and Objectives

Options for different management techniques would be discussed and detailed in this section. Additional specific aims and objectives at different times would be developed such as objectives and resulting specific necessary actions during the creation, establishment and management stages. Indicative actions are provided below in terms of their timeframe in relation to the proposed scheme. Table 2.1 provides further detail.

2.5.1 Pre-Construction

This section would detail measures to be undertaken prior to the onset of construction works and could include:

- collection of seeds from veteran and mature trees within local ancient woodland habitats, to be propagated and planted in habitat creation areas post construction;
- assessment of the retained ancient woodland habitat and habitat to be lost to classify the woodland in line with National Vegetation Classification (NVC) habitats;
- identify retained ancient woodland (any veteran and mature trees within retained woodland) to be protected during construction and enhanced post construction;

- translocation of deadwood from areas of woodland to be lost, into retained habitat for enhancement;
- identify biodiversity and cultural features within retained woodland to be protected, maintained or enhanced; and
- assess threats from grazing / browsing animals on the new and retained woodland habitats.

2.5.2 During Construction

This section would detail indicative measures and techniques which could be employed during the construction phase of the works, to prevent damage to retained habitats and to create new woodland habitat and could include the following.

2.5.2.1 Retained ancient woodland

- Protection of retained trees / woodland habitat during construction with fencing, incorporating root protection zones;
- Protection of the soil profile of retained ancient woodland habitat from damage or changes in structure;
- Diversifying the structure of the woodland through thinning and clearing regimes, targeting non-native species;
- Retention of vegetation felled during the clearance works for the provision of refugia and dead wood within retained ancient woodland habitat.

2.5.2.2 Creation of new woodland habitat

- Planting of seeds / propagated saplings collected from veteran and mature trees during pre-construction phase;
- Planting of native saplings from horticultural stock of local provenance;
- Translocation of top soil (containing ground flora seed bank) from lost woodland habitats to areas of new woodland habitat creation;
- Translocation of coppiced stumps and scrub from cleared areas of woodland to new woodland habitat creation;
- Buffering / screening of newly created habitat from adjacent habitats to increase structural and biodiversity.

2.5.3 Post Construction

2.5.3.1 Retained ancient woodland

- Gradual (‘Halo’) thinning around veteran and mature trees;
- Creation of open spaces such as rides and glades within the retained woodland;
- Management and removal of invasive species;
- Removal of any fly tipped material where possible;
- Enhancement of woodland for additional species, for example by provision of bat and bird boxes.

2.5.3.2 New woodland habitat

- Watering, supplementary planting and undesirable species management.
- Long term management to aid establishment.

2.6 Prescriptions for management options

The specified prescriptions for specified locations would be provided here.

2.7 Work schedule

Specified prescriptions would be at specified times. A works schedule would be required and presented so it should be easily interpreted by those actioning the management strategy.

2.8 Delivery

Funding resources and mechanisms and responsible parties would be detailed here to show how sustainable long-term delivery of the proposed management would be implemented. Specific actions / deliverables, related timeframes for that delivery and the responsible person / lead (with contact details) would be detailed in this section.

2.9 Monitoring and remedial measures

Monitoring of both the retained ancient woodland habitat, and newly created woodland habitats could be undertaken annually for the first five years. Post construction monitoring will need to be agreed with NRW but could be and in years 10, 15, 20 and 25. Monitoring of the mitigation site should be undertaken to establish the success and effectiveness of measures undertaken to mitigate for the impacts.

A complete monitoring programme, as an essential component of the management strategy (in agreement with NRW) would be devised and should include the following:

- purpose, aims and objectives of monitoring;
- identification and provision of data describing the baseline condition prior to the start of the proposed scheme;
- appropriate success criteria;
- methods for data gathering and analysis;
- locational details;
- timing and duration;
- responsible person and lines of communications;
- reporting and review of outcomes; and
- provision for adaptive management (e.g. contingencies and remedial actions) that would be undertaken if monitoring showed that proposed management measures were not effective or not reaching their stated aims and objectives.

Indicative methods of monitoring could include:

- fixed point quadrat survey;
- fixed point photography;
- additional random quadrats;
- assessment of overall site condition; and
- species list for the entire area.

2.9.1 Monitoring of enhancement features

Bird nest boxes and bat roosting boxes deployed in the retained ancient woodland habitats could also be monitored.

Table 2.1 : Indicative management options

Construction Phase	Indicative management to be undertaken
Pre-construction	**Collection of seeds from veteran and mature trees within the ancient woodland** • Prior to construction works, seeds would be collected from veteran and mature trees within the area of habitat that is to be cleared. These should be retained or propagated for planting within the new habitat being created post construction; • Seeds would be collected from as many suitable trees as possible to maximise genetic diversity in the replanted woodland and to maintain local provenance of species. **Assessment of the retained ancient woodland habitat to classify the woodland in line with NVC guidelines** • The ancient woodland habitat marked for enhancement, that to be lost and the grassland habitat where new woodland habitat is to be created would be surveyed prior to the start of construction works to classify the habitats present. This will inform the enhancement measures employed in this habitat in terms of species structure. **Identification of any veteran and mature trees within retained woodland** • Suitable veteran and mature trees within the ancient woodland habitat being retained would be identified to ensure protection throughout the works and for enhancement during post construction works. **Identify biodiversity and cultural features within retained woodland** • Any biodiversity or cultural features within the ancient woodland habitat being retained should be identified to ensure protection throughout the works and for enhancements during the post construction works. **Translocation of deadwood** • Dead wood present within areas of woodland that are to be lost to the proposed scheme would be translocated into retained areas to enhance this habitat. **Assess threats from grazing / browsing animals on the new and retained woodland habitat** • An assessment should be made of the potential of both retained ancient woodland, and the woodland habitat to be created to be impacted by grazing / browsing animals. If this is deemed to be a potential threat, then steps should be taken to mitigate this impact for example through the provision of fencing.

Construction Phase	Indicative management to be undertaken
During Construction	**Tree protection during construction** • Retained trees / woodland would be fenced prior to any construction works taking place to prevent damage to habitats. Fencing should extend either to the calculated root protection zones; • These fenced areas would be signed and identified for all workers on site; • No excavations, tracking of machinery or storing of equipment should occur within fenced areas; • Works should follow appropriate guidelines outlined in the Environmental Good Practice Site Guide, 4th edition. **Grubbing up of coppiced stumps and scrub to be translocated** • Coppiced stools and scrub should be 'grubbed up' to be translocated into newly created habitat areas. Trees identified for translocation should be coppiced immediately prior to translocation. This coppicing should only be undertaken on species known to benefit from such woodland management; • Coppiced stumps and scrub should be stored appropriately and regularly monitored prior to translocation to ensure the health of plants to maximise the likelihood of the translocation to new habitat being successful. **Salvage of top soil during clearance works and protection of the soil profile** • Top soil will be salvaged during the construction works for use in new planting areas to mimic ground conditions of the lost ancient woodland. Dependent on the results of pre-construction detailed botanical surveys, the top layer of soil may not be translocated to the new woodland areas as it could contain the seeds of species which may impede the growth of trees and ground flora associated with ancient woodlands and is likely to comprise more ruderal and scrub species; • Soil should only be translocated in autumn and early winter, in suitable weather conditions to minimise damage to the soil and plants that may start to grow as early as December; • Compaction of this soil after translocation to new planting areas should be avoided, particularly that relating to heavy machinery, as this may impact the hydrology of the soil and thus there species of plant that are able to grow there. • Works should avoid the use of herbicides / pesticides, to prevent the accumulation of chemicals in the soil strata, thus impacting the soil profile. **Use of cleared vegetation for enhancement** • Some vegetation cleared during the construction works would be retained for use in creating artificial refugia. These would form part of the enhancement of retained ancient woodland habitat providing potential refugia and suitable habitat for a range of species.

Construction Phase	Indicative management to be undertaken
	Woodland planting • Planting to create a new woodland habitat would combine the planting of the seeds and saplings from veteran / mature trees and the coppiced stumps collected prior to site clearance, alongside the planting of saplings from local provenance horticultural stock; • Dense planting should be avoided as this would rapidly shade out desirable ground flora; • New planting should seek to increase the core area of woodland, whilst maintaining the amount of 'edge habitat' present; • New planting should incorporate areas of open space to provide structural diversity; • Any deadwood identified during the pre-construction should be translocated to retained ancient woodland habitat (as stated above) to increase biodiversity and be spread across the habitat to increase diversity.
Post Construction	**Thinning and clearing of retained woodland and creation of open spaces within the retained woodland** • Thinning and clearing would be undertaken within the retained ancient woodland. This would increase the structural diversity of the woodland. Any thinning should target non-native species where possible. • Areas of open space within retained ancient woodland would also be created, or if present maintained, to aid structural and biodiversity. **'Halo' thinning around veteran and mature trees** • Thinning should be undertaken around veteran and mature trees to increase structural diversity within the woodland. This work should release the tree gradually, to reduce the risk of damage to the tree through sudden exposure. This management allows for surviving trees, ground flora and epiphytes to develop into more robust communities. **Management and removal of invasive species** • Where invasive species are identified within the area, they should be managed, or where possible removed, in line with the appropriate guidelines for the relevant species. **Removal of fly tipped material** • Any fly tipped material should be removed from the area, where safe to do so. **Enhancement of woodland for additional species** The retained ancient woodland habitat would also be manged to improve biodiversity through the provision of refugia / resting places for other species. This could include the following:

Construction Phase	Indicative management to be undertaken
	• The use of felled logs from the construction phase of the works to create log piles, suitable for use my invertebrate, amphibians and reptiles. • Translocated deadwood from the clearance area would also provide similar habitat. • Management should seek to increase the levels of deadwood within enhancement areas, both stranding and fallen. Where safe to do so, fallen vegetation should be left in situ. Standing dead wood could be created as part of the thinning process by felling stumps at a range of heights. Further standing dead wood could also be created through the ring barking of selected trees. This ring barking should be targeted at non-natives wherever possible. • Provision of bird boxes for a range of species could be installed within the enhancement ancient woodland areas. These should be of varying construction, to provide suitable habitat for a range of species. • Provision of bat boxes to provide additional roosting opportunities for bats within the retained ancient woodland habitat. 'Self-clean' bat boxes could be installed to remove the need for annual management to ensure boxes could be used. Boxes installed should be suitable for species that were recorded during field surveys in the area. The bat conservation trust gives guidelines on the placement of bat boxes on trees; installation of boxes should aim to match the criteria given in this document (see BCT Bat box information pack).

1. Introduction

An outline management strategy for the long term management of the land acquired for mitigation at Blaencarno is provided here as an indication of the content required for the final version to be agreed in consultation with Natural Resources Wales (NRW).

Management for this mitigation area would be specifically designed in relation to creating breeding habitat for lapwing *Vanellus vanellus*. The management strategy would be phased into three main stages:

- 2017 to 2019 – Pre-construction;
- 2019 to 2022 – Construction;
- 2022 to 2027 – Five year post –construction; and
- 2027 to 2042 – Twenty five year operational and maintenance.

The structure of the management strategy would be in accordance with Clause 11 of BS 42020:2013 and include the elements stated. Section 2 provides indicative headings and information required in the finalised management strategy. The objectives of the finalised management strategy would be to provide clarity and certainty over what is to be provided and enable sufficient resources to be identified and allocated.

Section 3 provides some sources of useful reading to inform the finalised management strategy.

2. Outline Management Strategy Structure

2.1 Introduction

This section would describe the background to the selection and justification for the long term management of the mitigation site. Plans / Figures of the mitigation site should also be presented. Habitat requirements for the species would be discussed.

2.2 Ecological Resources

Latest survey information and ecological data for lapwing would be provided. Baseline habitat information on the existing breeding habitat that would be lost to the proposed scheme and that of the proposed mitigation site (before management) would also be provided.

2.3 Issues Affecting Lapwing

The most recent local and UK ecological / population trends would be detailed here and the issues affecting lapwing and its specific habitat requirements.

2.4 Aims and Objectives of Management

Clear aims and objectives including specific success criteria would be set out for lapwing and the establishment of suitable habitat.

The mitigation measures could be considered successful if the monitoring programme demonstrated the following:

- the majority of land at the Blaencarno mitigation site was in suitable condition for lapwing by the end of the fifth summer post construction; and
- a stable management regime at Blaencarno had been established by the end of the fifth summer post construction.

Alternative or additional success criteria would be developed where necessary for different stages through the pre and post construction and long term operational and maintenance periods in agreement with NRW. This could include percentage of ground cover and presence of lapwing.

2.5 Management Options for Achieving Aims and Objectives

Options for different management techniques would be discussed and detailed in this section. A review of existing lapwing mitigation programmes for lapwing elsewhere in the wider A465 Dualling project area would be reviewed and lessons learned.

2.6 Prescriptions for Management Options

Prescriptions for management of the Blaencarno mitigation site are likely to include the following. Please note that this list is not exhaustive and that the final management strategy would be agreed in consultation with NRW and the relevant nature conservation interests.

- Consultation with local authority ecologists and RSPB to discuss site preparation, management and potential long term grazing options of the site.
- Preparation of the mitigation could include:
    - tree and scrub clearance;
    - creation of ponds and scrapes;
    - creation of bare earth patches;

- corvid control;
- ground predator control;
- removal of all but essential fence lines;
- suitable and appropriate fencing of the mitigation site boundary; and
- habitat translocation from the existing breeding habitat at Dowlais Top.

- Long term management could include site specific grazing by either cattle or ponies. Grazing levels should not exceed one head of cattle per hectare between mid-March and the end of June. Heavy grazing from late summer onwards will provide a short sward for nesting lapwings the following spring.
- Provisions would also be made for any necessary remedial action to address any issues identified through monitoring.

2.7 Work Schedule

Table 2.1 outlines potential management actions for the Blaencarno mitigation site. Additional detail and timings would be necessary within the finalised version.

Table 2.1 : Indicative works schedule

Key stage	Phase	Estimated date	Indicative management actions
Key Stage 5 (Procurement of the DBFO Contractor)	Pre-construction	July 2018 to September 2019	Surveys to inform mitigation and management strategy: • Lapwing • Existing breeding habitat at Dowlais Top • Proposed mitigation area at Blaencarno
Key Stage 6 (Construction phase)	Construction – Pre vegetation clearance	Nov 2019 to Oct 2022	Acquire land for mitigation (Blaencarno) under the Highways Act 1980 (as amended) process to manage in the long-term to mitigate for loss of breeding habitat.
			Preparation of mitigation site prior to proposed work at Dowlais Top: • tree and scrub clearance; • creation of ponds and scrapes; • creation of bare earth patches; • removal of all but essential fence lines; and • habitat translocation, if required, from the existing breeding habitat at Dowlais Top.
	Construction – Post vegetation clearance	Nov 2019 to Oct 2022	Translocate suitable habitats, if required, to mitigation site under a detailed method statement during appropriate period (i.e. not breeding season – March – July, inclusive).
			Monitor mitigation habitats and lapwing presence thereon as part of the ongoing monitoring programme.
			Engage / revise management as per monitoring results annually
5 year post construction phase	Post construction	Nov 2022 to Nov 2027	Development and implementation of a long-term extensive grazing or other management system. If grazing option selected, specific stocking densities and occupancy periods to be specified.
			Monitoring programme to be agreed in consultation with NRW.
			Engage / revise management as per monitoring results annually.
25 year operational and maintenance phase	Post construction	Dec 2027 to Dec 2042	Continue grazing or other management strategy. Modify as per revised monitoring programme.

2.8 Delivery

Funding resources and mechanisms and responsible parties would be detailed here to show how sustainable long-term delivery of the proposed management would be implemented. Specific actions / deliverables, related timeframes for that delivery and the responsible person / lead (with contact details) would be detailed in this section.

2.9 Monitoring and Remedial Measures

Monitoring of the mitigation site should be undertaken to establish the success and effectiveness of measures undertaken to mitigate for the impacts on breeding lapwing.

A complete monitoring programme, as an essential component of the management strategy (in agreement with NRW) would be devised and should include the following:

- purpose, aims and objectives of monitoring;
- identification and provision of data describing the baseline condition prior to the start of the proposed scheme;
- appropriate success criteria;
- methods for data gathering and analysis;
- locational details;
- timing and duration;
- responsible person and lines of communications;
- reporting and review of outcomes; and
- provision for adaptive management (e.g. contingencies and remedial actions) that would be undertaken if monitoring showed that proposed management measures were not effective or not reaching their stated aims and objectives.

0. FOREWORD

The following Conditions and Notes on Site Investigation Procedures should be read in conjunction with this report.

0.1. General

Recommendations made and opinions expressed in the report are based on the strata observed in the excavations, together with the results of site and laboratory tests. No responsibility can be held for conditions which have not been revealed by the Exploratory Holes or which occur between Exploratory Holes. Whilst the report may suggest the likely configuration of strata, both between Exploratory Holes and below the maximum depth of investigation, this is only indicative and liability cannot be accepted for its accuracy.

Unless specifically stated, no account has been taken of possible subsidence due to mineral extraction below or close to the site.

0.2. Investigation Procedures

Cable percussive borehole drilling, trial pitting, and window sampling techniques for ground investigation have been employed within the project. All Exploratory Hole operations, sampling and logging of soils, rocks and in-situ testing complies with the recommendations of the British Code of Practice BS 5930 (2015), 'Site Investigations' as superseded in part by BS EN ISO 14688-1 (2002) and 14688-2 (2004), British Code of Practice BS 10175 (2011) 'Investigation of Potentially Contaminated Sites' and BS 1377: 1990, 'Methods of Test for Soils for Engineering Purposes'.

0.3. Routine Sampling

Representative bulk, disturbed and environmental samples of the different strata are taken following completion of logging. These samples are sealed and labelled in clear plastic bags and 2kg plastic tubs. Soil samples obtained for environmental testing are sampled and sealed in borosilicate amber jars or in specialist vessels where required. All samples were sent to the appropriate laboratory within 24 hours of sampling to await test scheduling/requirements. Geoenvironmental samples were stored in sealed cool boxes along with ice packs for transit to I2 Analytical. Geotechnical samples were returned to QG's laboratory.

0.4. In-Situ Testing

In-situ testing comprised:
- Standard Penetration Tests in Boreholes

0.5. Groundwater

Where possible, the depth of entry of any influx of groundwater is recorded during the course of excavation or boring operations. The rate of inflow into the excavation or borehole is monitored during the course of the excavation or during boring procedures. Upon encountering any water strikes, work is temporarily halted and the water levels monitored for a standard twenty minute period recording the change in water level at the end of the twenty minutes.

Groundwater conditions observed in the excavations are those appertaining to the period of investigation. It should be noted, however, that groundwater levels are subject to diurnal, seasonal and climatic variations and can also be affected by drainage conditions or other causes.

0.6. Retention of Samples

After satisfactory completion of all the scheduled laboratory tests on any sample, the remaining material is discarded. Further to notifying the Engineer/ Client with one week's notice all soil and/or rock samples will be discarded 28 days after submission of the approved final report.

1. INTRODUCTION

1.1. General

Upon the instructions of the client, Costain Limited, Quantum Geotechnical Limited (QG) was commissioned to undertake a ground investigation across a variety of locations along and nearby the existing A465 Heads of the Valleys Road between Hirwaun and Dowlais. The specification for ground investigation, titled *Geotechnical and Geoenvironmental Ground Investigation Specification (2016)*, was provided by Jacobs UK Limited.

The purpose of this investigation (as detailed by the specification) was to identify the presence of any contaminants across the site region, quantify their nature and extent, and characterise the quality of the soils.

This report presents a factual account of the fieldwork carried out, the strata encountered, groundwater observations and details in-situ testing and subsequent laboratory testing of samples obtained from the investigation and post fieldwork monitoring.

Other available sources of information that have been consulted include the published geological maps for the area.

General notes on the techniques employed by QG are described in the Foreword together with the limitations inherent in carrying out site investigation work.

2. SITE DETAIL

2.1. Site Description

The ground investigation was undertaken predominantly along the route of the current A465 road, with a number of positions road side. Areas offline include farmers' fields and nearby moorland.

The route spans a distance approximately 9 miles long between the start/end of the dual carriageway at Hirwaun (National Grid Reference: E294988 N205534) and the roundabout at Dowlais Top (National Grid Reference: E307770 N208269). Chainage is measured from Hirwaun to Dowlais where it finishes at 15500.

Access to exploratory holes are via the A465 itself (roadside positions), and via Hirwaun recreation grounds and Swansea Road for the offline locations. Due to the proximity of live traffic, traffic management was required at a number of locations along the route.

A Site Location Plan presented as Figure 1, Appendix 1.

2.2. Statutory Service Information

All service information was held by Costain Ltd with the relevant plans and information made available to QG prior to commencement of the intrusive works. Standard QG procedures for breaking ground were followed and all areas were CAT scanned for presence of buried services. Costain Ltd issued a Permit to Work system for all exploratory holes.

2.3. Published Geology

The British Geological Survey (BGS) online database shows the majority of the site is underlain by superficial deposits of Glacial Till (Diamicton).

Bedrock geology underlying the proposed development route is shown to be a number of sedimentary rock formations from the South Wales Coal Measures and Marros Groups (Carboniferous Period). These include occasionally coal-bearing mudstones, siltstones and sandstones from the South Wales Lower Coal Measures, Bishopston Mudstone, and Twrch Sandstone formations. Limestone units from the Oxwich Head and Dowlais Limestone formations occupy a couple of minor sections towards the west side of Methyr Tydfil.

3. FIELDWORK

3.1. General

The fieldwork was carried out between the 1st March and 7th April 2016. Full time on site supervision and attendance by an Engineering Geologist from Quantum was undertaken on all aspects of the site works. Due to various access and setup constraints, a number of exploratory positions were changed from trial pits (initially specified) to window sample boreholes.

Various aspects of the scope as set out in the Geoenvironmental Ground Investigation Specification differ from the fieldwork that was completed. This includes a number of trial pits converted to window samples, hand-held window samples changed to (rig-driven) windowless sample boreholes and two less ground-gas/groundwater installations.

A summary of the fieldworks carried out is as follows:

- 3 No. Cable percussive boreholes (including a re-drill),
- 3 No. Hand excavated trial pits,
- 13 No. Machine excavated trial pits,
- 22 No. Window sample boreholes,
- Installation and monitoring of 8 gas and groundwater standpipes,
- In-situ Standard Penetration Testing,
- Geotechnical and geo-environmental sampling and subsequent laboratory testing,
- Geo-environmental sample headspace testing.

3.2. Exploratory Hole Locations

The exploratory hole locations were set out by Costain and agreed on site by QG in liaison with Jacobs. Final positions were surveyed to National Grid and Ordnance Datum (Newlyn), and provided to QG by Costain.

Exploratory Hole Location Plans are presented as Figures 2 to 9 in Appendix I. Approximate chainages (as given by the initial schedule), coordinates and levels are presented on the corresponding exploratory hole logs.

3.3. Cable Percussive Boreholes

Boreholes were specified at two locations along the scheme route (positions CP110 and CP117). Position CP117 encountered an obstruction at 3.0 metres below ground level (mbgl) and was therefore re-drilled, approximately 2m to the east (CP117A). Hand-dug inspection pits were dug (to 1.20m) at both borehole locations.

Light cable percussive drilling techniques were utilised to sink the boreholes to depth and recover representative bulk disturbed and small disturbed samples for geotechnical and geoenvironmental characterisation of the underlying ground conditions. Where possible, U100 samples were taken alternating with in-situ testing (detailed in section 3.7.).

Table 1 details the strata and depths at which the cable percussive boreholes were terminated. Strata descriptions and sampling depths are presented on the engineering geologist's logs in Appendix II.

Table 1: *Cable percussive boreholes termination details*

Exploratory Hole ID	Termination Depth (mbgl)	Terminating Strata	Notes/Reason for Termination
CP110	10.0	Glacial Till	Slow progress/hard drilling due to stiff cohesive and dense granular till. Terminated upon instruction by Jacobs.
CP117	3.0	Glacial Till	Refusal on large boulder, unable to progress, moved about 2m east to CP117A
CP117A	4.7	Sandstone	Bedrock reached

Boreholes CP110 and CP117A had monitoring wells installed (see section 3.6.). CP117 was backfilled with bentonite.

3.4. Trial Pits

The investigation method of trial pitting allows direct sampling of the near surface deposits for identification purposes, as well as assessment of any Made Ground or disturbed ground. Bulk, disturbed and environmental samples were taken within the soils for strata identification and laboratory testing purposes. A water sample was also taken from TP107 for laboratory testing.

The trial pits were supervised at all times by an Engineering Geologist from QG, and logged in accordance with BS 5930:2015; BS EN ISO 14688-1:2002 BS EN ISO 14688-2:2005 and BS 10175:2011. All trial pits were completed during the day with none left open overnight.

3.4.1. Hand excavated

Three trial pits (OP111, OP112, and OP113) were dug using a variety of small hand-tools beside the A465 (north side) on a stretch of road between Hirwaun and Merthyr Tydfil. All reached their target depths of 0.75, 1.00, and 1.20mbgl respectively. Strata descriptions and sampling depths are presented on the engineering geologist's logs in Appendix III.

3.4.2. Machine excavated

Thirteen trial pits were dug using a JCB 3CX at a range of locations across the site as shown by the exploratory hole location plan. These include eight on the (east-bound) stretch of dual carriageway west of Hirwaun (TP101-108); one on the north edge of the A465 between Hirwaun and Merthyr Tydfil (TP114); two on the moorland off Swansea Road (TP122 and TP125); and two off-line in farmers' fields near Hirwaun (TP157 and TP159).

Positions TP115-116, TP133-134, TP136-137, TP139-140, TP143, TP146-147, TP154, TP162, and TP165 originally specified as trial pits were converted to window sample boreholes.

Table 2 summarises the termination strata and depths for all machine excavated trial pits. Strata descriptions and sampling depths for trial pits are presented on the engineering geologist's logs in Appendix III.

Table 2: *Machine excavated trial pit terminated details*

Exploratory Hole ID	Termination Depth (mbgl)	Terminating Strata	Notes/Reason for Termination
TP101	3.4	Made Ground	Specified depth achieved
TP102	3.5	Made Ground	Specified depth achieved
TP103	3.2	Made Ground	Specified depth achieved
TP104	3.0	Made Ground	Specified depth achieved
TP105	3.1	Made Ground	Specified depth achieved
TP106	3.0	Made Ground	Specified depth achieved
TP107	2.8	Made Ground	Water ingress and unstable
TP108	3.0	Made Ground	Specified depth achieved
TP114	0.8	Sandstone	Refusal on bedrock
TP122	2.0	Glacial Till	Specified depth achieved
TP125	4.5	Glacial Till	Specified depth achieved
TP157	3.1	Glacial Till	Specified depth achieved
TP159	3.5	Made Ground	Unstable

3.5. Window Sample Boreholes

Window Sampling utilises dynamically driven sampling tubes, nominally 116mm in diameter to start with. The diameter is generally reduced with increasing depth to reduce the risk of holes self-collapsing. This technique allows a relatively undisturbed sample of soil to be taken in a plastic liner. Within competent granular-

cohesive soils the portable equipment used for Windowless Sampling is limited by the nature of the ground and robustness of the driving tool. The recovered sample liners were subsequently split, logged, and sampled in accordance with BS 5930:2015; BS EN ISO 14688-1:2002 BS EN ISO 14688-2:2005 and BS 10175:2011 by QG's Engineering Geologist.

All window sample boreholes were progressed until refusal (unless specified depth was achieved), except for the TP116 (WS) which was collapsing below 5.0m. A summary of the depths at which the window samples refused is shown in Table 3. Engineer's logs are presented in Appendix IV.

Table 3: *Window sample borehole termination details*

Exploratory Hole ID	Termination Depth (mbgl)	Terminating Strata	Notes/Reason for Termination
TP115 (WS)	2.7	Made Ground	Refusal (unknown*)
TP116 (WS)	5	Peat	Hole collapsing
TP133 (WS)	1.3	Made Ground	Refusal (unknown*)
TP134 (WS)	1.1	Glacial Till	Refusal (unknown*)
TP136 (WS)	1.1	Made Ground	Refusal (unknown*)
TP137 (WS)	1.2	Made Ground	Refusal (unknown*)
TP139 (WS)	0.8	Sandstone	Refusal (unknown*)
TP140 (WS)	1.2	Made Ground	Refusal on cobbles and boulders at 1.2mbgl
TP143 (WS)	1.3	Made Ground	Refusal (unknown*)
TP146 (WS)	1.2	Made Ground	Refusal (unknown*)
TP147 (WS)	2	Made Ground	Specified depth achieved
TP154 (WS)	1.95	Glacial Till	Refusal (unknown*)
TP162 (WS)	2.2	Glacial Till	Refusal (unknown*)
TP165 (WS)	3.6	Glacial Till	Refusal (unknown*)
WLS109	4	Sand	Specified depth achieved
WS138	1.2	Made Ground	Refusal (unknown*)
WS141	1.7	Made Ground	Refusal (unknown*)
WS144	3	Made Ground	Specified depth achieved
WS145	2	Made Ground	Specified depth achieved
WS149	1.8	Glacial Till	Refusal on suspected bedrock
WS150	1.2	Made Ground	Refusal (unknown*)
WS151	2	Made Ground	Specified depth achieved

**where window sample boreholes refuse without evidence of bedrock or an obstruction, it is likely a result of the limitation of window sampling within granular soils; particularly in dense gravels, cobbles and boulders.*

All window samples were backfilled with bentonite and surfaces replaced with topsoil/arisings, unless a monitoring well was installed (see section 3.6.).

3.6. Land Gas & Groundwater Borehole Installations

Gas and groundwater standpipes were installed within boreholes CP110, CP117A, WLS109, WS138, WS141, WS144, WS145, and WS149 (see Table 4). Return visits for monitoring were undertaken on the 21st April and 5th May 2016, the results of which are presented within Appendix V.

Table 4: *Monitoring well details*

Exploratory Hole ID	Depth to base (m)	Response Zone depth (mbgl)
CP110	10.00	2.00 – 10.00
CP117A	4.70	1.00 – 4.70
WLS109	4.00	0.50 – 4.00
WS138	1.20	0.50 – 1.20
WS141	1.70	0.50 – 1.70
WS144	3.00	0.50 – 2.25
WS145	2.00	0.50 – 2.00
WS149	1.80	0.50 – 1.80

Monitoring wells at CP110 and CP117A were also developed (by purging 3x the well volume) before water samples were taken. Bailers were used to purge the boreholes on the 12/04/16, the details of which are presented in Table 5. Water from both wells ran clear during purging.

Table 5: *Purging details*

Exploratory Hole ID	Depth to base (m)	Water level (mbgl)	Well Volume*		x3	Volume of water purged (litres)
			(m^3)	(litres)	(litres)	
CP110	10.00	2.69	0.014353	14.35	43.06	44
CP117A	4.70	0.43	0.008384	8.38	25.15	26

**well diameter assumed as width of standpipe (50mm)*

3.7. In-Situ Testing

3.7.1. Standard Penetration Testing

Standard penetration tests (SPTs) were undertaken throughout the made ground and superficial deposits within the cable percussive boreholes. Tests were alternated with U100 samples (where possible) at 1.00m intervals increasing to 1.50m intervals below 5.00mbgl.

This is a dynamic test as described in BS EN ISO 22476-3:2005 and is a measure of the density of the soil or rock. Within fine grained or cohesive soils, the test incorporates a small diameter tube (650mm length, 50mm external diameter and 35mm internal diameter) with a cutting shoe known as the 'split barrel sampler'. The sampler is forced into the soil dynamically using blows from a 63.5kg hammer dropped through 760mm. The sampler is initially advanced 150mm into the soil with seating blows, then the number of blows required to advance the sampler each 75mm increment up to a depth of 300mm is recorded. This cumulative total number of blows over the 300mm test is referred to as the "N" value. For coarse gravels and bedrock the split barrel is replaced by a 60° cone.

Results of the SPTs are detailed on the corresponding borehole logs which can be found along with the SPT calibration certificate in Appendix II.

3.8. Photoionization Detector

To assist with the scheduling of laboratory testing, the headspace for all environmental samples were tested using a MiniRAE Photoionization Detector (PID). The PID measures the concentrations of volatile organic compounds and other gases in the air (units are parts per million, ppm). Soil samples were sealed in plastic bags including room for air (headspace) and left to develop for a minimum of 20 minutes. Testing was carried out in accordance with the Geotechnical and Geoenvironmental Ground Investigation Specification, where a detailed methodology is presented.

Results of the PID testing are presented along with the logs in appendices II, III, and IV.

4. LABORATORY TESTING

4.1. General

The laboratory testing was scheduled by Jacobs and comprised a number of geotechnical and geo-environmental test suites on selected soil samples obtained during the investigation.

4.2. Geotechnical Laboratory Testing

All the geotechnical soil and chemical testing work was carried out in accordance with the procedures stipulated in the various sections of BS 1377:1990 Parts 1 - 9 *Methods of test for soils for civil engineering purposes* and to UKAS accreditation where applicable.

Two suites of geotechnical chemical testing were set out in the Geotechnical and Geoenvironmental Ground Investigation Specification (Suites 8 and 9), however less tests were scheduled than initially specified (15 and 26 no. respectively). Table 6 details parameters testing and the number of tests in each suite.

Table 6: *Geotechnical chemical testing suites*

Suite	Type of Test	Standard	Number of Tests
Suite 8 (BRE SD1)	pH of 2.5:1 water/soil extract	BS1377:1990 Part 3	70
	Water Soluble Sulphate in 2:1 water/soil extract		
	Magnesium Ion Content (if water soluble sulphate SO4 > 3.7 g/l)		
Suite 9 (supplementary – if mudstone or coal measure encountered)	Total Sulphate Content (acid soluble method)	BS1377:1990 Part 3	19
	Total Sulphur present	BS1047:1983	

Geotechnical soil testing was also scheduled by Jacobs in addition to that set out in the Geoenvironmental Ground Investigation Specification. The details of these tests, including the number of samples tested, are presented in Table 7.

Table 7: *Geotechnical soil testing*

Type of Test		Standard	Number of Tests
Moisture Content		BS1377:1990 Part 2	21
4 Point Liquid Limit and Plastic Limit		BS1377:1990 Part 2	15
Particle Size Distribution by Wet Sieve		BS1377:1990 Part 2	16
Dry Density/Moisture Content Relationship (2.5kg hammer)		BS1377:1990 Part 4	5
Calirfonia Bearing Ratio	(remoulded at 2% OMC)	BS1377:1990 Part 4	2
	(remoulded at NMC)		1
Oedometer		BS1377:1990 Part 5	1

A full set of geotechnical laboratory test certificates are provided within Appendix VI.

4.3. Geo-environmental Laboratory Testing

Various geo-environmental testing was carried out on selected soil, soil leachate, and groundwater samples obtained during the ground investigation, to enable assessment of any risks posed to human health, environment and construction materials. This varied from the initial specification with 2 more tests (each) on the groundwater suites (Suites 3 and 7), and less testing on soil and leachate suites (between 9 and 37 no. less than specified). Tables 8 (soils), 9 (leachate), and 10 (groundwater) detail the test suites undertaken.

Table 8a: *Geo-environmental soil test suite 1*

APPENDIX II – CABLE PERCUSSIVE BOREHOLE LOGS

KEY TO BOREHOLE AND TRIAL PIT LOGS

m.A.O.D. metres Above Ordnance Datum.

SAMPLE AND TEST TYPES

U	Undisturbed driven tube sample - 102mm diameter, 450mm long.
P	Undisturbed pushed piston sample - 102mm diameter, 1000mm long.
TW	Undisturbed thin walled push in sample - 100mm diameter, 750mm long.
B	Bulk disturbed sample.
BLK	Block Sample
CBR	Heavy duty undisturbed sample - 154 mm diameter (CBR mould).
D	Small disturbed sample.
LB	Large Bulk disturbed sample (for earthworks testing)
C	Core sample
W	Water sample
G	Gas sample
ES	Environmental sample (soil)
j	Jar sample
t	Tub sample
p	Pot sample
s	Small sample
v	Vial sample
S	Standard Penetration Test using split spoon sampler. (See Note).
C	Standard Penetration Test using a solid 60 degree cone. (See Note).

NOTE: Where a single value is quoted this is the N value for 300 mm penetration following a seating drive of 150 mm. Where this full penetration is not achieved the number of blows is quoted for the penetration below the seating drive eg. 63/160 mm.
Where total penetration is less than the seating drive this is indicated by a + and the number of blows for total penetration is quoted eg. +50/75 mm.

HV	Hand Vane Test. Vane undrained shear strength, c_u, quoted in kPa.
V	Borehole Vane Test. Vane undrained shear strength, c_u, quoted in kPa.
FHT/RHT	Falling / Rising Head Permeability Test.

CORE RUN DETAILS

TCR	Total Core Recovery, %
SCR	Solid Core Recovery, %
RQD	Rock Quality Designation, %
FI	Fracture Index. NI - Non intact where > 25 No. per metre length.

WATER COLUMN SYMBOLS

First water strike, second water strike etc.

Standing water level after first strike, second strike etc.

Seepage.

Quantum Geotechnical

APPENDIX VI – GEOTECHNICAL LABORATORY TEST RESULTS

Laboratory Report

2788

GEO Site & Testing Services Ltd

Contract Number: 30755

Client's Reference: **G791 - GEO3**

Report Date: **17-05-2016**

Client **Dawnus Construction Limited C/O Quantum Geotechnic**
Ty Berwig
Bynea
Llanelli.
Carmarthenshire.
SA14 9ST

Contract Title: **A465 Section 5&6**

For the attention of: **Gareth Morris**

Date Received: **26-04-2016**

Date Commenced: **26-04-2016**

Date Completed: **17-05-2016**

Test Description	Qty
Moisture Content 1377 : 1990 Part 2 : 3.2 - * UKAS	21
4 Point Liquid & Plastic Limit (LL/PL) 1377 : 1990 Part 2 : 4.3 & 5.3 - * UKAS	15
PSD Wet Sieve method 1377 : 1990 Part 2 : 9.2 - * UKAS	16
Dry Den/MC (2.5kg Rammer Method 1 Litre Mould) 1377 : 1990 Part 4 : 3.3 - * UKAS	5
CBR: Remoulded Specimen and tested at top only 1377 : 1990 Part 4 : 7 - * UKAS	3
One-dimensional Consolidation 75mm or 50mm diameter specimens (5 days) 1377 : 1990 Part 5 : 3 - * UKAS	1
Disposal of Samples on Project	1

Notes: **Observations and Interpretations are outside the UKAS Accreditation**
*** - denotes test included in laboratory scope of accreditation**
 # - denotes test carried out by approved contractor
@ - denotes non accredited tests

This certificate is issued in accordance with the accreditation requirements of the United Kingdom Accreditation Service. The results reported herein relate only to the material supplied to the laboratory. This certificate shall not be reproduced in full, without the prior written approval of the laboratory.

Approved Signatories:
Alex Wynn (Associate Director) - Benjamin Sharp (Contracts Manager) - Emma Sharp (Office Manager)
Paul Evans (Quality/Technical Manager) - Vaughan Edwards (Managing Director)

Combined Report : Sections 5 & 6 of the A465

Replaces Combined Report : Sections 5 & 6 of the A465 issue 1

Project / Site name:	A465 - Section 5&6	**Samples received on:**	04/03/2016
Your job number:	G791	**Samples instructed on:**	07/03/2016
Your order number:		**Analysis completed by:**	15/03/2016
Report Issue Number:	2	**Report issued on:**	18/05/2016
Samples Analysed:	72 leachate samples - 73 soil samples & 3 water samples		

Signed:

Rexona Rahman
Reporting Manager
For & on behalf of i2 Analytical Ltd.

Standard Geotechnical, Asbestos and Chemical Testing Laboratory located at: ul. Pionierów 39, 41 -711 Ruda Śląska, Poland.

Accredited tests are defined within the report, opinions and interpretations expressed herein are outside the scope of accreditation.

Standard sample disposal times, unless otherwise agreed with the laboratory, are :

soils	- 4 weeks from reporting
leachates	- 2 weeks from reporting
waters	- 2 weeks from reporting
asbestos	- 6 months from reporting

Excel copies of reports are only valid when accompanied by this PDF certificate.

This certificate should not be reproduced, except in full, without the express permission of the laboratory.
The results included within the report are representative of the samples submitted for analysis.

Your Order No:

Certificate of Analysis - Asbestos Quantification

Methods:

Qualitative Analysis

The samples were analysed qualitatively for asbestos by polarising light and dispersion staining as described by the Health and Safety Executive in HSG 248.

Quantitative Analysis

"The analysis was carried out using our documented in-house method A006 based on HSE Contract Research Report No: 83/1996: Development and Validation of an analytical method to determine the amount of asbestos in soils and loose aggregates (Davies et al, 1996) and HSG 248. Our method includes initial examination of the entire representative sample, then fractionation and detailed analysis of each fraction, with quantification by hand picking and weighing.

The limit of detection (reporting limit) of this method is 0.001 %.

The method has been validated using samples of at least 100 g, results for samples smaller than this should be interpreted with caution.

Both Qualitative and Quantitative Analyses are UKAS accredited.

Sample Number	Sample ID	Sample Depth (m)	Sample Weight (g)	Asbestos Containing Material Types Detected (ACM)	PLM Results	Asbestos by hand picking/weighing (%)	Total % Asbestos in Sample
553599	WS138	0.50	145	Loose Fibres	**Chrysotile**	< 0.001	**< 0.001**
553600	WS138	1.00	149	Loose Fibres	**Chrysotile**	< 0.001	**< 0.001**
555914	TP146 (WS)	0.10	132	Loose Fibres	**Amosite**	< 0.001	**< 0.001**

Opinions and interpretations expressed herein are outside the scope of UKAS accreditation

This certificate should not be reproduced, except in full, without the express permission of the laboratory.
The results included within the report are representative of the samples submitted for analysis.

* These descriptions are only intended to act as a cross check if sample identities are questioned. The major constituent of the sample is intended to act with respect to MCERTS validation. The laboratory is accredited for sand, clay and loam (MCERTS) soil types. Data for unaccredited types of solid should be interpreted with care.

Stone content of a sample is calculated as the % weight of the stones not passing a 10 mm sieve. Results are not corrected for stone content.

Lab Sample Number	Sample Reference	Sample Number	Depth (m)	Sample Description *
545000	TP125	0.50	None Supplied	Brown clay and sand with vegetation.

Combined Report : Sections 5 & 6 of the A465

Project / Site name: A465 - Section 5&6

Water matrix abbreviations: Surface Water (SW) Potable Water (PW) Ground Water (GW)

Analytical Test Name	Analytical Method Description	Analytical Method Reference	Method number	Wet / Dry Analysis	Accreditation Status
Ammoniacal Nitrogen as N in leachate	Determination of Ammonium/Ammonia/Ammoniacal Nitrogen by the colorimetric salicylate/nitroprusside method.	In-house method based on Examination of Water and Wastewater 20th Edition: Clesceri, Greenberg & Eaton	L082-PL	W	NONE
Ammoniacal Nitrogen as N in soil	Determination of Ammonium/Ammonia/Ammoniacal Nitrogen by the colorimetric salicylate/nitroprusside method,10:1 water extraction.	In-house method based on Examination of Water and Wastewater 20th Edition: Clesceri, Greenberg & Eaton	L082-PL	W	MCERTS
Ammoniacal Nitrogen as N in water	Determination of Ammonium/Ammonia/Ammoniacal Nitrogen by the colorimetric salicylate/nitroprusside method. Accredited matrices SW, GW, PW.	In-house method based on Examination of Water and Wastewater 20th Edition: Clesceri, Greenberg & Eaton	L082-PL	W	ISO 17025
Asbestos identification in soil	Asbestos Identification with the use of polarised light microscopy in conjunction with disperion staining techniques.	In house method based on HSG 248	A001-PL	D	ISO 17025
Asbestos Quantification - Gravimetric	The analysis was carried out using documented in-house method based on references.	HSE Report No: 83/1996, HSG 248, HSG 264 & SCA Blue Book (draft).	A006	D	ISO 17025
Biological oxygen demand of water	Determination of biochemical oxygen demand in water (5 days). Accredited matrices: SW, PW, GW.	In-house method based on standard method 5210B. Samples received > 24 hrs after sampling, data may not be valid and should be interpreted with care.	L086-PL	W	ISO 17025
Boron in leachate	Determination of boron in leachate. Sample acidified and followed by ICP-OES.	In-house method based on MEWAM	L039-PL	W	ISO 17025
Boron in water	Determination of boron in water by acidification followed by ICP-OES. Accredited matrices: SW PW GW	In-house method based on MEWAM	L039-PL	W	ISO 17025
Boron, water soluble, in soil	Determination of water soluble boron in soil by hot water extract followed by ICP-OES.	In-house method based on Second Site Properties version 3	L038-PL	D	MCERTS
BTEX and MTBE in soil (Monoaromatics)	Determination of BTEX in soil by headspace GC-MS.	In-house method based on USEPA8260	L073B-PL	W	MCERTS
BTEX and MTBE in water (Monoaromatics)	Determination of BTEX and MTBE in water by headspace GC-MS. Accredited matrices: SW PW GW	In-house method based on USEPA8260	L073B-PL	W	ISO 17025
Calorific Value of soil	Calorific Value of Soil - Subcontracted Analysis.	Subcontracted Analysis - See Attached Subcon Report.		W	NONE
Cations in soil by ICP-OES	Determination of cations in soil by aqua-regia digestion followed by ICP-OES.	In-house method based on MEWAM 2006 Methods for the Determination of Metals in Soil.	L038-PL	D	MCERTS
Chemical Oxygen Demand in Water (Total)	Determination of total COD in water by reflux oxidation with acidified K2Cr2O7 followed by colorimetry. Accredited matrices: SW, PW, GW.	HACH DR/890 Colorimeter Procedures Manual (48470-22) (Ref 0170.2)	L065-PL	W	ISO 17025
Chloride in water	Determination of Chloride colorimetrically by discrete analyser.	In house based on MEWAM Method ISBN 0117516260. Accredited matrices: SW, PW, GW.	L082 B	W	ISO 17025
Cr (III) in water	In-house method by calculation from total Cr and Cr VI.	In-house method by calculation	L080-PL	W	NONE
D.O. for Gravimetric Quant if Screen/ID positive	Dependent option for Gravimetric Quant if Screen/ID positive scheduled.	In house asbestos methods A001 & A006.	A006-PL	D	NONE

This certificate should not be reproduced, except in full, without the express permission of the laboratory.
The results included within the report are representative of the samples submitted for analysis.

Combined Report : Sections 5 & 6 of the A465

Project / Site name: A465 - Section 5&6

Water matrix abbreviations: Surface Water (SW) Potable Water (PW) Ground Water (GW)

Analytical Test Name	Analytical Method Description	Analytical Method Reference	Method number	Wet / Dry Analysis	Accreditation Status
Dissolved Organic Carbon in water	Determination of dissolved inorganic carbon in water by TOC/DOC NDIR Analyser.	In-house method based on Examination of Water and Wastewater 20th Edition: Clesceri, Greenberg & Eaton	L037-PL	W	NONE
Elemental sulphur in soil	Determination of elemental sulphur in soil by extraction in acetonitrile followed by HPLC.	In-house method based on Secondsite Property Holdings Guidance for Assessing and Managing Potential	L021-PL	D	MCERTS
Free cyanide in leachate	Determination of free cyanide by distillation followed by colorimetry.	In-house method	L080-PL	W	NONE
Free cyanide in soil	Determination of free cyanide by distillation followed by colorimetry.	In-house method based on Examination of Water and Wastewater 20th Edition: Clesceri, Greenberg & Eaton (Skalar)	L080-PL	W	MCERTS
Hexavalent chromium in leachate	Determination of hexavalent chromium in leachate by acidification, addition of 1,5 diphenylcarbazide followed by colorimetry.	In-house method	L080-PL	W	NONE
Hexavalent chromium in soil	Determination of hexavalent chromium in soil by extraction in water then by acidification, addition of 1,5 diphenylcarbazide followed by colorimetry.	In-house method	L080-PL	W	MCERTS
Hexavalent chromium in water	Determination of hexavalent chromium in water by acidification, addition of 1,5 diphenylcarbazide followed by colorimetry.	In-house method by continuous flow analyser. Accredited Matrices SW, GW, PW.	L080-PL	W	ISO 17025
Loss on ignition of soil @ 450oC	Determination of loss on ignition in soil by gravimetrically with the sample being ignited in a muffle furnace.	In-house method based on BS1377 Part 3, 1990, Chemical and Electrochemical Tests	L047-PL	D	MCERTS
Magnesium, water soluble, in soil	Determination of water soluble magnesium by extraction with water followed by ICP-OES.	In-house method based on TRL 447	L038-PL	D	NONE
Metals by ICP-OES in leachate	Determination of metals in leachate by acidification followed by ICP-OES.	In-house method based on MEWAM 2006 Methods for the Determination of Metals in Soil.	L039-PL	W	ISO 17025
Metals in soil by ICP-OES	Determination of metals in soil by aqua-regia digestion followed by ICP-OES.	In-house method based on MEWAM 2006 Methods for the Determination of Metals in Soil.	L038-PL	D	MCERTS
Metals in water by ICP-MS (dissolved)	Determination of metals in water by acidification followed by ICP-MS. Accredited Matrices: SW, GW, PW except B=SW,GW, Hg=SW,PW, Al=SW,PW.	In-house method based on USEPA Method 6020 & 200.8 "for the determination of trace elements in water by ICP-MS.	L012-PL	W	ISO 17025
Metals in water by ICP-OES (dissolved)	Determination of metals in water by acidification followed by ICP-OES. Accredited Matrices SW, GW, PW.	In-house method based on MEWAM 2006 Methods for the Determination of Metals in Soil.	L039-PL	W	ISO 17025
Moisture Content	Moisture content, determined gravimetrically.	In-house method based on BS1377 Part 3, 1990, Chemical and Electrochemical Tests	L019-UK/PL	W	NONE
Monohydric phenols in soil	Determination of phenols in soil by extraction with sodium hydroxide followed by distillation followed by colorimetry.	In-house method based on Examination of Water and Wastewater 20th Edition: Clesceri, Greenberg & Eaton (skalar)	L080-PL	W	MCERTS
Monohydric phenols in water	Determination of phenols in water by continuous flow analyser. Accredited matrices: SW PW GW	In-house method based on Examination of Water and Wastewater 20th Edition: Clesceri, Greenberg & Eaton (skalar)	L080-PL	W	ISO 17025
Nitrate as N in water	Determination of nitrate by reaction with sodium salicylate and colorimetry. Accredited matrices SW, GW, PW.	In-house method based on Examination of Water and Wastewatern & Polish Standard Method PN-82/C-04579.08,	L078-PL	W	ISO 17025

Water matrix abbreviations: Surface Water (SW) Potable Water (PW) Ground Water (GW)

Analytical Test Name	Analytical Method Description	Analytical Method Reference	Method number	Wet / Dry Analysis	Accreditation Status
Nitrate in water	Determination of nitrate by reaction with sodium salicylate and colorimetry. Accredited matrices SW, GW, PW	In-house method based on Examination of Water and Wastewatern & Polish Standard Method PN-82/C-04579.08,	L078-PL	W	ISO 17025
Nitrite in water	Determination of nitrite in water by addition of sulphanilamide and NED followed by colorimetry.Accredited matrices SW, GW, PW.	In-house method based on Examination of Water and Wastewater 20th Edition: Clesceri, Greenberg & Eaton	L077-PL	W	ISO 17025
pH in leachate	Determination of pH in leachate by electrometric measurement.	In-house method based on BS1377 Part 3, 1990, Chemical and Electrochemical Tests	L005-PL	W	ISO 17025
pH in soil (automated)	Determination of pH in soil by addition of water followed by automated electrometric measurement.	In-house method based on BS1377 Part 3, 1990, Chemical and Electrochemical Tests	L099-PL	D	MCERTS
pH in water	Determination of pH in water by electrometric measurement. Accredited matrices: SW PW GW	In-house method based on BS1377 Part 3, 1990, Chemical and Electrochemical Tests	L005-PL	W	ISO 17025

This certificate should not be reproduced, except in full, without the express permission of the laboratory.
The results included within the report are representative of the samples submitted for analysis.

Appendix 12B – Potential Sources of Contamination

Figure reference	Potential source of contamination	Further information	Reference
Sheet 1 of 4			
1	Hirwaun Waste Disposal Site	Historical landfill which accepted waste including liquid sludge.	Groundsure Insights, 2015. Groundsure Report: Historical Maps. Report Reference: GS-1984986. Landmark, 2014. Envirocheck Report. Order Reference: 58812138_1_1.
2	Active Sewage Works	N/A	Groundsure Insights, 2015. Groundsure Report: Historical Maps. Report Reference: GS-1984985.
3	Hirwaun Industrial Estate (South of the A465)	Former Royal Ordnance Factory (1941 - 1945), specialising in small arms ammunition manufacture. The area has been used as an industrial estate since 1945 with activities including clothing and furniture manufacture, production of auromycin, metal works, electronic manufacturing and recovery of waste tyres.	Groundsure Insights, 2015. Groundsure Report: Historical Maps. Report Reference: GS-1984985. Coflein, 2010. Royal Commission on the Ancient and Historical Monuments of Wales: Hirwaun Royal Ordnance Factory, Hirwaun. (http://www.coflein.gov.uk/en/site/308127/details/HIRWAUN+ROYAL+ORDNANCE+FACTORY, +HIRWAUN/). [Accessed on 23/05/2016].
4	Hirwaun Industrial estate (North of the A465)	Industrial estate with activities including shelving manufacturers. The northern area of this site was formally used as military land, potentially associated with the munitions factory in the industrial estate located south of the A465, however, its specific purpose is unknown.	Groundsure Insights, 2015. Groundsure Report: Historical Maps. Report Reference: GS-1984985.
5	Brickworks and Engine House	Historical brickworks (1900 - 1903) and engine house (1877 - 1878).	Groundsure Insights, 2015. Groundsure Report: Historical Maps. Report Reference: GS-1984985.
6	Hirwaun Opencast Mine	Former colliery site for coal and lignite mining with associated historical colliery spoil, engine house and tramway system. Historical uses also include a rifle range. The site is currently an opencast mine, forming part of Tower Regeneration; a project including extraction of remaining surface coal and full restoration of the entire colliery site.	Groundsure Insights, 2015. Groundsure Report: Historical Maps. Report Reference: GS-1984985. Tower Regeneration, 2016. Land Reclamation, Surface Coal Mining and Restoration at the Former Tower Colliery Site. (http://www.towerregeneration.co.uk/) [Accessed on 23/05/2016].
7	Cartref, The Bryn	Historical landfill which ceased to operate following 1983. Maximum input at the site was	Groundsure Insights, 2015. Groundsure Report: Historical Maps. Report Reference:

Figure reference	Potential source of contamination	Further information	Reference
		equal to / greater than 25, 000 t. The site was authorised to accept excavated natural materials, hardcore and rubble and prohibited materials including empty use containers, industrial wastes, sludge wastes and toxic / poisonous wastes.	GS-1984986. Landmark, 2014. Envirocheck Report. Order Reference: 58812138_1_1.
8	Made Ground in the form of Infilled Ponds	The ponds appear to have been infilled between 1968 and 1969. The nature of the made ground is unknown but may comprise material from nearby industrial activities including an iron works, colliery, saw mill and brick works. The infilled ponds extended west; however, this area has since been claimed by opencast.	Groundsure Insights, 2015. Groundsure Report: Historical Maps. Report Reference: GS-1984985.
9	Historical Tank	Historical tank dated 1914.	Groundsure Insights, 2015. Groundsure Report: Historical Maps. Report Reference: GS-1984985.
10	Bryngelli Industrial Estate	Industrial estate with a concrete products works, joinery, bakery and warehouse.	Groundsure Insights, 2015. Groundsure Report: Historical Maps. Report Reference: GS-1984985 Google Maps, 2016. (www.google.co.uk/maps/) [Accessed 04/02/2016].
11	Made Ground	Made ground comprised of unknown materials, likely to be associated with the Iron and Steel Works.	Groundsure Insights, 2015. Groundsure Report: Historical Maps. Report Reference: GS-1984985.
12	Colliery Spoil (Coal)	An area of colliery spoil previously occupied with a saw mill (pre-dates mapping - 1914), smithy (pre-dates mapping - 1900/03), dismantled tramway / railway system (pre-dates mapping to present), and presence of disused levels.	Groundsure Insights, 2015. Groundsure Report: Historical Maps. Report Reference: GS-1984985.
13	Hirwaun Iron & Steel Works	Historical Iron and Steel Works (1884 – 1961 / 1964).	Groundsure Insights, 2015. Groundsure Report: Historical Maps. Report Reference: GS-1984985.
14 & 16	Gravel Pit	Historical gravel pit.	Groundsure Insights, 2015. Groundsure Report: Historical Maps. Report Reference: GS-1984985.
15	Gas Works	Historical gas works (1844 - 1949)	Groundsure Insights, 2015. Groundsure Report: Historical Maps. Report Reference:

Figure reference	Potential source of contamination	Further information	Reference
			GS-1984985.
17	Colliery Spoil (Coal)	Brownfield areas with colliery spoil present.	Groundsure Insights, 2015. Groundsure Report: Historical Maps. Report Reference: GS-1984985.
18	Pentwyn Cynon Farm Landfill	Historical landfill which ceased to operate following 1992. The site deposited various wastes, including inert waste.	Groundsure Insights, 2015. Groundsure Report: Historical Maps. Report Reference: GS-1984986.
19	Sewage Works	Former sewage works, including filter beds (1914 - 1969). The filter bed area is labelled as a tank in 1976 mapping.	Groundsure Insights, 2015. Groundsure Report: Historical Maps. Report Reference: GS-1984985
Sheet 2 of 4			
20	Made Ground	Made ground comprised of unknown materials associated with the construction of the bridge forming part of the A465. The underlying reservoir was previously Aberdare Water Works.	Groundsure Insights, 2015. Groundsure Report: Historical Maps. Report Reference: GS-1984985
21	Colliery Spoil (Ironstone & Coal)	Former coal and ironstone level (pre-dates mapping - 1901) and then a disused tip by 1976/1979. The nature of the ground is unknown but likely to comprise spoil associated with the coal and Ironstone level.	Groundsure Insights, 2015. Groundsure Report: Historical Maps. Report Reference: GS-1984985
22	Made Ground	Made ground in the form of an infilled reservoir. The reservoir was infilled between 1976 and 1979. The nature of the made ground is unknown.	Groundsure Insights, 2015. Groundsure Report: Historical Maps. Report Reference: GS-1984985
23	Colliery Spoil (Ironstone & Coal)	Former ironstone mining and quarry area with some coal levels also present (pre-dates mapping - 1901). A smithy (1875/78 - 1903) and infilled reservoir (1976/79) are also noted. At present, the area is likely to comprise spoil from previous land uses.	Groundsure Insights, 2015. Groundsure Report: Historical Maps. Report Reference: GS-1984985
Sheet 3 of 4			
24	Cefn Coed	Cemetery (pre-dates 1884 / 1885	Groundsure Insights, 2015. Groundsure Report: Historical Maps. Report Reference:

Figure reference	Potential source of contamination	Further information	Reference
	Cemetery	mapping to present).	GS-1984985
25	Ffrwd Quarry Landfill	Historical landfill which ceased to operate in 1992. The site accepted deposited wastes including inert waste.	Groundsure Insights, 2015. Groundsure Report: Historical Maps. Report Reference: GS-1984986.
26	Cefn Coed Cemetery Expansion	Cemetery expansion (1965 - present).	Groundsure Insights, 2015. Groundsure Report: Historical Maps. Report Reference: GS-1984985
27	Lime Kiln	Historical lime kiln (pre-dates 1884 / 85 mapping - 1901).	Groundsure Insights, 2015. Groundsure Report: Historical Maps. Report Reference: GS-1984985
28	Jewish Burial Ground	Jewish burial ground (pre-dates 1884 / 85 mapping - present).	Groundsure Insights, 2015. Groundsure Report: Historical Maps. Report Reference: GS-1984985
29	Historical Tank	Historical tank present in 1884/85 mapping and is no longer marked on historical mapping by 1965.	Groundsure Insights, 2015. Groundsure Report: Historical Maps. Report Reference: GS-1984985
30	Quarry	Historical quarry which pre-dates 1884 / 85 mapping and is no longer marked on historical maps by 1965.	Groundsure Insights, 2015. Groundsure Report: Historical Maps. Report Reference: GS-1984985
31	Fairview Terrace Landfill	Historical landfill which accepted industrial and household waste.	Groundsure Insights, 2015. Groundsure Report: Historical Maps. Report Reference: GS-1984986.
32	Made Ground	Made ground in the form of an infilled reservoir. The reservoir was infilled by 1992. The nature of the made ground is unknown.	Groundsure Insights, 2015. Groundsure Report: Historical Maps. Report Reference: GS-1984985
33	Brewery	Historical brewery present in 1884/85 mapping and is no longer marked on maps by 1965.	Groundsure Insights, 2015. Groundsure Report: Historical Maps. Report Reference: GS-1984985
34	Quarry	Historical quarry workings which pre-date 1884 / 85 mapping and are no longer marked on mapping dated from 1965.	Groundsure Insights, 2015. Groundsure Report: Historical Maps. Report Reference: GS-1984985
35	Dismantled Railway	Former railway, currently dismantled, pre-dates 1884 / 85 mapping - 1976.	Groundsure Insights, 2015. Groundsure Report: Historical Maps. Report Reference: GS-1984985
36	Gravel Pit	Historical gravel pit present from 1903 / 1905, but not marked on	Groundsure Insights, 2015. Groundsure Report: Historical Maps. Report Reference:

Figure reference	Potential source of contamination	Further information	Reference
		1965 historical mapping.	GS-1984985
37	Gurnos Quarry	Former quarry with a smithy at northwestern extent (pre-dates 1875 / 78 mapping - 1901).	Groundsure Insights, 2015. Groundsure Report: Historical Maps. Report Reference: GS-1984985
38	Prince Charles Hospital	Marked on historical maps from 1978 to present.	Groundsure Insights, 2015. Groundsure Report: Historical Maps. Report Reference: GS-1984985
39	Made Ground	Made ground in the form of an infilled pond. The pond was infilled by 1965. The nature of the infilling material is unknown.	Groundsure Insights, 2015. Groundsure Report: Historical Maps. Report Reference: GS-1984985
Sheet 4 of 4			
40	Quarry	Historical quarry workings (present on historical mapping from 1901 to 1948).	Groundsure Insights, 2015. Groundsure Report: Historical Maps. Report Reference: GS-1984985
41	Pant Industrial Estate	Industrial estate with businesses including builders merchants and car garages. The industrial estate has been active from 1975/76 to present. Between 1965 to 1975 / 76, the site operated as Imperial Chemical Industries, producing ammonia.	Groundsure Insights, 2015. Groundsure Report: Historical Maps. Report Reference: GS-1984985 8.
42	Brewery	Historical brewery (pre-dates 1884 / 85 mapping - 1901).	Groundsure Insights, 2015. Groundsure Report: Historical Maps. Report Reference: GS-1984985
43	Gas Works	Historical gas works which pre-dates 1875 mapping and is no longer present on mapping from 1965.	Groundsure Insights, 2015. Groundsure Report: Historical Maps. Report Reference: GS-1984985
44	Made Ground	An area of made ground with unspecified tracks present on maps from 1875 - 1922. By 1948, tracks are no longer present and by 1975, the area is marked as a disused tip. The area is currently used as a park area, named Ifor Park.	Groundsure Insights, 2015. Groundsure Report: Historical Maps. Report Reference: GS-1984985
45	Made Ground	Made ground likely to be associated with adjacent iron works. Named 'Dowlais Great Tip' on historical mapping (pre-dates 1875 - 1965).	Groundsure Insights, 2015. Groundsure Report: Historical Maps. Report Reference: GS-1984985

Figure reference	Potential source of contamination	Further information	Reference
46	British Steel Corporation Landfill	Historical landfill which ceased operation in 1998. The site accepted inert, industrial and commercial wastes in addition to liquid sludge.	Groundsure Insights, 2015. Groundsure Report: Historical Maps. Report Reference: GS-1984986.
47	Dowlais Iron Works	Historical iron works (pre-dates 1875 mapping to 1987), with an area towards the south which previously comprised an engine house, brickworks and railway / tramway network.	Groundsure Insights, 2015. Groundsure Report: Historical Maps. Report Reference: GS-1984985
48	Dismantled Railway	Former railway, currently dismantled, pre-dates 1875 mapping - 1982.	Groundsure Insights, 2015. Groundsure Report: Historical Maps. Report Reference: GS-1984985
49	Dismantled Railway	Former railway, currently dismantled, pre-dates 1875 mapping - 1982.	Groundsure Insights, 2015. Groundsure Report: Historical Maps. Report Reference: GS-1984985
50	Quarry	Former quarry area (pre-dates 1875 mapping) which appears to have extended into the adjacent industrial estate from 1875.	Groundsure Insights, 2015. Groundsure Report: Historical Maps. Report Reference: GS-1984985
51	Fuel Station	Active fuel station (1982 - present).	Groundsure Insights, 2015. Groundsure Report: Historical Maps. Report Reference: GS-1984985
52	Jasonic Landfill	Historical landfill which ceased operation in 1992. The site accepted inert waste.	Groundsure Insights, 2015. Groundsure Report: Historical Maps. Report Reference: GS-1984986.
53	Ffos-Y-Fran Opencast Mine	Active opencast mine which extracts coal. Active since 2007 until present.	Groundsure Insights, 2015. Groundsure Report: Historical Maps. Report Reference: GS-1984985
54	Historical Landfill (Unnamed)	Historical landfill which ceased to operate in 1989.	Groundsure Insights, 2015. Groundsure Report: Historical Maps. Report Reference: GS-1984986. Landmark, 2014. Envirocheck Report. Order Reference: 58812138_1_1.
55	Royal Arms Group Landfill	Historical landfill which ceased operation in 1989. The site accepted industrial, commercial and household waste.	Groundsure Insights, 2015. Groundsure Report: Historical Maps. Report Reference: GS-1984986.
56	Trecatti Council Landfill	Historical landfill which ceased operation in 1993. The site accepts wastes including inert, industrial, commercial, household and special wastes in	Groundsure Insights, 2015. Groundsure Report: Historical Maps. Report Reference: GS-1984986.

Figure reference	Potential source of contamination	Further information	Reference
		addition to liquid sludge. This landfill has since been claimed by the current Trecatti Landfill operated by Biffa.	
57	Trecatti Landfill	The site was formally an ironstone mining area, containing associated spoil deposits. The site was then an opencast from 1982 which expanded to include adjacent opencast. Trecatti landfill, operated by Biffa, has been operational from 1988 to present.	Groundsure Insights, 2015. Groundsure Report: Historical Maps. Report Reference: GS-1984986.
58	Dowlais Top Industrial Estate	Former quarry area (pre-dates 1875 mapping). In 1965, the area is marked as a tipping area until 1982. Currently, the site has several retail buildings and a fuel station residing on it. The current industrial estate is present in 1992 maps and expands north-east by 2002.	Groundsure Insights, 2015. Groundsure Report: Historical Maps. Report Reference: GS-1984985
59	Made Ground	Made ground in the form of an infilled reservoir. The reservoir pre-dates 1875 mapping and is present up until 2010 mapping. The nature of the infilled material is unknown.	Groundsure Insights, 2015. Groundsure Report: Historical Maps. Report Reference: GS-1984985
60	Trecatti North Landfill	Historical landfill which ceased operation in 1989. The site accepted household waste.	Groundsure Insights, 2015. Groundsure Report: Historical Maps. Report Reference: GS-1984985
61	Dismantled Railway	Former railway, currently dismantled, pre-dates 1875 mapping - 1982.	Groundsure Insights, 2015. Groundsure Report: Historical Maps. Report Reference: GS-1984985
62	Quarry	Quarry workings marked on 1875 mapping, labelled old quarry / disused quarry from 1898 / 1901 - present. The southern extent of these quarry workings are also marked as a disused tip area.	Groundsure Insights, 2015. Groundsure Report: Historical Maps. Report Reference: GS-1984986.
63	Colliery Spoil	Area of colliery spoil, previously occupied by ironstone mining pits and associated spoil. The presence of mines and their associated spoil pre-dates 1875	Groundsure Insights, 2015. Groundsure Report: Historical Maps. Report Reference: GS-1984985

Non-Residential Coal Authority Mining Report

A465, RHONDDA CYNON TAFF

This report is based on and limited to the records held by, the Coal Authority, and the Cheshire Brine Subsidence Compensation Board's records, at the time we answer the search.

Coal mining	See comments below
Brine Compensation District	No

Information from the Coal Authority

Underground coal mining

Past

The property is in the likely zone of influence from workings in 13 seams of coal at shallow to 120m depth, and last worked in 1964.

The property is in the likely zone of influence from workings in 8 seams of ironstone at shallow to 170m depth, and last worked in 1900.

Present

The property is not in the likely zone of influence of any present underground coal workings.

Future

The property is not in an area for which the Coal Authority is determining whether to grant a licence to remove coal using underground methods.

The property is not in an area for which a licence has been granted to remove or otherwise work coal using underground methods.

The property is not in an area that is likely to be affected at the surface from any planned future workings.

All rights reserved. You must not reproduce, store or transmit any part of this document unless you have our written permission. --
© The Coal Authority --

However, reserves of coal exist in the local area which could be worked at some time in the future.

No notice of the risk of the land being affected by subsidence has been given under section 46 of the Coal Mining Subsidence Act 1991.

Mine entries

Within, or within 20 metres of, the boundary of the property there are 130 mine entries, the approximate positions of which are shown on the attached plan.

Our records disclose the following information:

308208-035. This mine entry may have been partially or wholly excavated during past opencast mining.

308208-040. This mine entry may have been partially or wholly excavated during past opencast mining.

308208-038. This mine entry may have been partially or wholly excavated during past opencast mining.

308208-026. No treatment details.

296205-001. The entrance to this adit is fitted with a steel grid incorporating an o uter mesh guard.

307207-050. The mouth of the adit has been sealed by a brick wall..

307207-124. This mine entry may have been partially or wholly excavated during past opencast mining.

307207-025. No treatment details.

307207-088. No treatment details.

307208-010. This shaft was capped to an unknown specification in 1973.

300207-008. No treatment details.

301207-010. No treatment details.

301207-011. No treatment details.

307207-094. This mine entry may have been partially or wholly excavated during past opencast mining.

307207-130. No treatment details.

307207-122. No treatment details.

307207-009. No treatment details.

307207-113. No treatment details.

307207-115. No treatment details.

307207-040. No treatment details.

307208-006. No treatment details.

307207-058. No treatment details.

307207-070. This mine entry may have been partially or wholly excavated during past opencast mining.

308207-028. This mine entry may have been partially or wholly excavated during past opencast mining.

308208-012. This mine entry may have been partially or wholly excavated during past opencast mining.

308208-024. This mine entry may have been partially or wholly excavated during past opencast mining.

308208-023. No treatment details.

308208-041. No treatment details.

295204-029. No treatment details.

300206-035. The adit entrance has been fenced with timber posts and a heras panel by contractors acting on behalf of the Authority..

© The Coal Authority

301207-009. No treatment details.
301207-001. No treatment details.
306207-119. No treatment details.
307207-123. No treatment details.
307207-082. This mine entry may have been partially or wholly excavated during past opencast mining.
307207-006. Records indicate that there is a masonary wall at this shaft however there are no details on the method or date of construction..
307207-114. No treatment details.
307207-055. No treatment details.
307207-089. No treatment details.
307207-079. No treatment details.
307207-059. No treatment details.
307207-029. This mine entry may have been partially or wholly excavated during past opencast mining.
307207-027. This mine entry may have been partially or wholly excavated during past opencast mining.
307207-084. This mine entry may have been partially or wholly excavated during past opencast mining.
308208-021. This mine entry may have been partially or wholly excavated during past opencast mining.
308208-042. This mine entry may have been partially or wholly excavated during past opencast mining.
295204-022. No treatment details.
295204-032. No treatment details.
301207-014. No treatment details.
307207-081. No treatment details.
307207-100. No treatment details.
307207-010. This mine entry may have been partially or wholly excavated during past opencast mining.
307207-034. This mine entry may have been partially or wholly excavated during past opencast mining.
307207-093. No treatment details.
307207-090. No treatment details.
307208-001. This shaft has been capped in 1973. There are no details on the construction of the cap..
307207-028. This mine entry may have been partially or wholly excavated during past opencast mining.
308207-029. This mine entry may have been partially or wholly excavated during past opencast mining.
308208-051. This mine entry may have been partially or wholly excavated during past opencast mining.
308208-044. No treatment details.
308208-039. This mine entry may have been partially or wholly excavated during past opencast mining.
301207-003. GA Spacey & Associated supervised the excavation of 3 trenches at approxi 6m centres from the rear building line to the southern boundary fence of the proposed plot 29 Beacon Heights. All 3 trenches proved the presence of undisturbed naturally occurring soils with no indication of ground conditions associated with the presence of existing mine entries..
306207-014. No treatment details.

© The Coal Authority

307207-051. No treatment details.
307207-007. No treatment details.
307207-116. No treatment details.
307207-068. No treatment details.
307207-091. No treatment details.
307207-092. No treatment details.
307207-086. No treatment details.
307207-001. No treatment details.
307207-043. The entry may have been partially or fully removed by opencasting..
307207-044. This mine entry may have been partially or wholly excavated during past opencast mining.
307208-008. No treatment details.
295205-002. No treatment details.
295204-008. No treatment details.
296204-001. This adit is blocked off. Two 0.45m diameter pipes are incorporated in the stopping to provide drainage from the adit..
299206-001. No treatment details.
300206-034. This adit had a brick wall constructed 1.0m inbye of the entrance at some time in the past. There are no details on the method of construction..
300207-005. No treatment details.

308207-030. This mine entry may have been partially or wholly excavated during past opencast mining.

Records may be incomplete. Consequently, there may exist in the local area mine entries of which the Coal Authority has no knowledge.

For an additional fee, the Coal Authority will provide a supplementary Mine Entry Interpretive Report. The report will provide a separate assessment for the mine entry (entries) referred to in this report. It will give details based on information in the Coal Authority's possession, together with an opinion on the likelihood of mining subsidence damage arising from ground movement as a consequence of the existence of the mine entry/entries. It will also give details of the remedies available for subsidence damage where the mine entry was sunk in connection with coal mining.

Please note that it may not be possible to produce a report if the main building to the property cannot be identified from Coal Authority plans (ie. for development sites and new build).

For further advice on how to order this additional information visit www.groundstability.com or telephone 0345 7626 848.

Coal mining geology

The Authority is not aware of any evidence of damage arising due to geological faults or other lines of weakness that have been affected by coal mining.

© The Coal Authority

Opencast coal mining

Past

The property is within the boundary of an opencast site from which coal has been removed by opencast methods.

Present

The property lies within 200 metres of the boundary of the FFOS-Y-FRAN opencast site from which coal is being removed by opencast methods.

The property lies within 200 metres of the boundary of the Tower Colliery Reclamation Site opencast site from which coal is being removed by opencast methods.

Future

The property is not within 800 metres of the boundary of an opencast site for which the Coal Authority is determining whether to grant a licence to remove coal by opencast methods.

The property is not within 800 metres of the boundary of an opencast site for which a licence to remove coal by opencast methods has been granted.

Coal mining subsidence

The Coal Authority has not received a damage notice or claim for the subject property, or any property within 50 metres, since 31st October 1994.

There is no current Stop Notice delaying the start of remedial works or repairs to the property.

The Authority is not aware of any request having been made to carry out preventive works before coal is worked under section 33 of the Coal Mining Subsidence Act 1991.

Mine gas

There is no record of a mine gas emission requiring action by the Coal Authority within the boundary of the property.

Hazards related to coal mining

The property has been subject to remedial works, by or on behalf of the Authority, under its Emergency Surface Hazard Call Out procedures.

Withdrawal of support

The property is not in an area for which a notice of entitlement to withdraw support has been published.

The property is not in an area for which a notice has been given under section 41 of the Coal Industry Act 1994, revoking the entitlement to withdraw support.

Working facilities orders

The property is not in an area for which an Order has been made under the provisions of the Mines (Working Facilities and Support) Acts 1923 and 1966 or any statutory modification or amendment thereof.

Payments to owners of former copyhold land

The property is not in an area for which a relevant notice has been published under the Coal Industry Act 1975/Coal Industry Act 1994.

Comments on Coal Authority information

The attached plan shows the approximate location of the disused mine entry/entries referred to in this report. For reasons of clarity, mine entry symbols may not be drawn to the same scale as the plan.

Property owners have the benefit of statutory protection (under the Coal Mining Subsidence act 1991*). This contains provision for the making good, to the reasonable satisfaction of the owner, of physical damage from disused coal mine workings including disused coal mine entries. A leaflet setting out the rights and the obligations of either the Coal Authority or other responsible persons under the 1991 Act can be obtained by telephoning 0345 762 6848.

If you wish to discuss the relevance of any of the information contained in this report you should seek the advice of a qualified mining engineer or surveyor. If you or your adviser wish to examine the source plans from which the information has been taken these are normally available at our Mansfield office, free of charge, by prior appointment, telephone 01623 637225. Should you or your adviser wish to carry out any physical investigations that may enter, disturb or interfere with any disused mine entry the prior permission of the owner must be sought. For coal mine entries the owner will normally be the Coal Authority.

The Coal Authority, regardless of responsibility and in conjunction with other public bodies, provide an emergency call out facility in coalfield areas to assess the public safety implications of mining features (including disused mine entries). Our emergency telephone number at all times is 01623 646333.

*Note, this Act does not apply where coal was worked or gotten by virtue of the grant of a gale in the Forest of Dean, or any other part of the Hundred of St. Briavels in the county of Gloucester.

In view of the mining circumstances a prudent developer would seek appropriate technical advice before any works are undertaken.

Therefore if development proposals are being considered, technical advice relating to both the investigation of coal and former coal mines and their treatment should be obtained before beginning work on site. All proposals should apply good engineering practice developed for mining areas. No development should be undertaken that intersects, disturbs or interferes with any coal or mines of coal without the permission of the Coal Authority. Developers should be aware that the investigation of coal seams/former mines of coal may have the potential to generate and/or displace underground gases and these risks both under and adjacent to the development should be fully considered in developing any proposals. The need for effective measures to prevent gases entering into public properties either during investigation or after development also needs to be assessed and properly addressed. This is necessary due to the public safety implications of any development in these circumstances.

A site investigation was carried out in September 2012 by ESI Limited on behalf of Biffa Waste Services Limited, Hoods Close, Leicester LE4 2BN.

Information from the Cheshire Brine Subsidence Compensation Board

The property lies outside the Cheshire Brine Compensation District.

Additional Remarks

Information provided by the Coal Authority in this report is compiled in response to the Law Society's Con29M Coal Mining and Brine Subsidence Claim enquiries. The said enquiries are protected by copyright owned by the Law Society of 113 Chancery Lane, London WC2A 1PL. Please note that Brine Subsidence Claim enquiries are only relevant for England and Wales. This report is prepared in accordance with the Law Society's Guidance Notes 2006, the User Guide 2006 and the Coal Authority and Cheshire Brine Board's Terms and Conditions applicable at the time the report was produced.

Executive Summary

The HM Treasury (2013) has identified infrastructure as one of the priority areas to focus the mitigation of greenhouse gas (GHG) emissions for the United Kingdom (UK). Therefore, accurate measurement and identification of opportunities to reduce emissions from infrastructure projects is an essential part of meeting the UK's challenging carbon reduction obligations.

The following report outlines the key GHGs associated with the construction of Sections 5 and 6 of the A465. This report has been prepared at outline design phase, Key Stage 3 (KS3). Reports prepared at later stages of the design process may have access to more finalised quantities, and, therefore, may be more accurate.

This carbon assessment was made using the Highways England Carbon Tool (v1.02). The tool covers GHG emissions from the following sources:

- embodied carbon in raw materials required for the construction phase (including transport of materials to site);
- fuel, electricity and water consumption during the construction phase;
- business and employee transport during the construction phase; and
- waste and waste transport.

Any emissions after the construction phase (such as operation of the street lighting) are excluded from the assessment.

The assessment calculated a carbon footprint for the project of **161,848 tonnes CO_2e (carbon dioxide equivalent)**. Emissions from materials contributed the greatest proportion (representing 73% of emissions), with energy use and transport of materials contributing most of the remaining emissions (Plate 1.1).

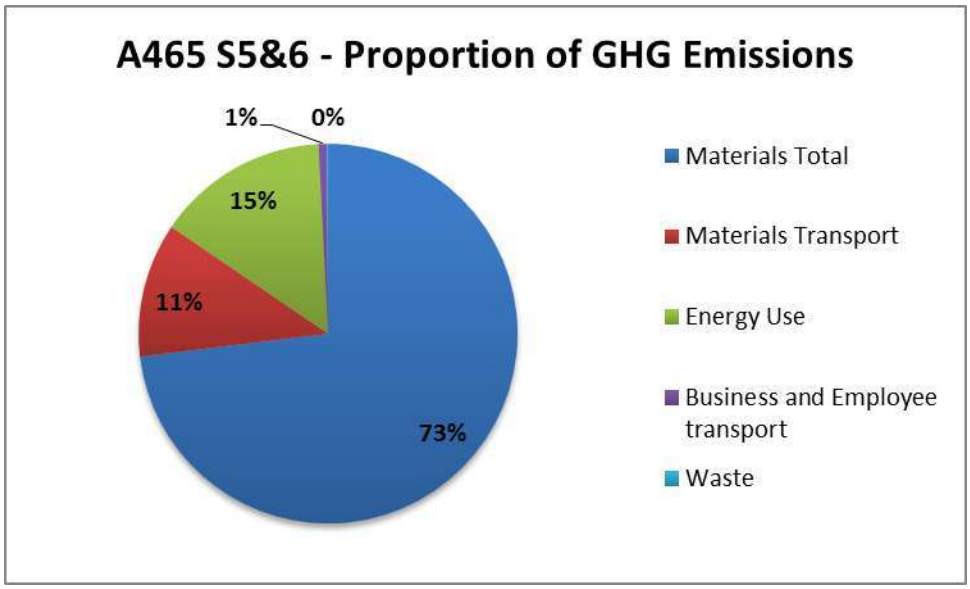

Plate 1.1 : Proportion of total GHG emissions for A465 Sections 5 and 6 Construction Phase

Next Steps

The majority of the data required to make an assessment for the boundaries was available without any significant omissions. The level of accuracy of this assessment is proportionate to its objectives, capturing the most significant emission sources for the project. At the time of this assessment the design was still being finalised and therefore the quantities required may also change. Therefore the carbon assessment should be updated if any significant design changes are made. There would be opportunities for carbon savings through the project, for example by using lower grade concrete (utilising a higher % of Fly Ash) where feasible (such as on footpaths). Such opportunities have not been captured as part of this assessment as the design has not been developed in sufficient detail (as, for example, required grades of concrete are unknown at this stage). High level awareness of these kinds of opportunities is important for exploration when the design develops.

1. Introduction

1.1 Purpose of this Report

This report is used to assess the greenhouse gas (GHG) impact of a proposed infrastructure scheme, which involves the major upgrade of approximately 17.7 km of the A465 in South Wales.

The project is currently at stage Key Stage 3, outline design, with Draft Orders due to be published in summer 2017 under the Highways Act 1980 (as amended). The assessed sections of the dualling project in this report are for Sections 5 and 6 of the carriageway between Hirwaun and Dowlais Top. For context; at the time of this report Section 1 (Abergavenny to Gilwern), Section 3 (Brynmawr to Tredegar) and Section 4 (Tredegar to Dowlais Top) of the 40 km dualling project are complete and open to traffic. Section 2 (Gilwern to Brynmawr) is currently under construction and due for completion in 2018.

This assessment is intended to be a comprehensive carbon assessment of the construction phase of the proposed Section 5 & 6 scheme, based upon the design information available at this stage. The results of this assessment can be used as a benchmark against which to identify options for reducing the carbon impact of the project as the design progresses.

1.2 Units and Definitions

Reporting for the GHG impact of this proposed scheme is carried out using mass of carbon dioxide equivalent (CO_2e) emissions, which allows for the emissions of the six key GHG to be expressed in terms of their equivalent global warming potential in mass of CO_2. The six key GHG are carbon dioxide (CO_2), methane (CH_4), nitrous oxide (N_2O), hydrofluorocarbons (HFCs), perfluorocarbons (PFCs), sulphur hexafluoride (SF_6). The Greenhouse Gas Protocol (Greenhouse Gas Protocol, 2004) is the most widely used accounting system for GHG emissions.

Key definitions in order to determine the boundary of ownership for emissions include:

- direct emissions: originating from sources that are owned or controlled by the reporter; and
- indirect emissions: emissions that are a consequence of the activities of the reporting entity, but occur at sources owned or controlled by another entity.

Further to this, the GHG Protocol (2004) categorises these direct and indirect emissions into three broad scopes, including:

- scope 1: Direct GHG emissions – emissions that occur from sources that are owned or controlled by the project;
- scope 2: Electricity indirect GHG emissions – emissions generated through the purchase of electricity, heat, steam or cooling; and
- scope 3: Other indirect GHG emissions – emissions from sources not owned or controlled by the project, but occur as a consequence of the project and its activities.

Scope 3 emissions include embodied carbon. These are the greenhouse gas emissions associated with a manufactured product or built asset. This includes the emissions generated from the extraction, transportation and processing of raw materials required to create them.

1.3 Climate Change and the Global Context

The need to reduce greenhouse gas emissions is enshrined in UK law; and in December 2015 at the Paris climate conference (COP21), 195 countries adopted the first-ever universal, legally binding global climate deal (European Commission, 2015). The Intergovernmental Panel on Climate Change 5th Working Group report "The Physical Basis" includes summaries of recorded observations of the climatic changes that have already occurred, along with projected future climatic changes (IPCC, 2013). While the global climatic system is incredibly complex, this report presents a clear message that *"continued emissions of greenhouse gases will*

cause further warming and changes in all components of the climate system. Limiting climate change will require substantial and sustained reductions of greenhouse gas emissions."

The ultimate receptor of greenhouse gas emissions is the global climate system, and climate change caused by greenhouse gas emissions will result in social, environmental and economic impacts felt globally. This is the case regardless of where the greenhouse gases are emitted, whether they be released directly from the combustion of fossil fuels, or associated with the extraction and manufacture of materials. It is for this reason that to reduce the carbon footprint of infrastructure, it is important that the greenhouse gases production embodied in the materials used are accounted for, and minimised where possible.

2. Methodology, Assumptions and Notes

2.1 The Highways England Carbon Tool

This assessment uses the Highways England Carbon Tool v1.02. There is no equivalent Wales-specific model and the Highways England Carbon Tool's boundary (Plate 2.1) is sufficient for this report's methodology. Highways England have developed this tool to measure the scope 1, 2 and 3 carbon emissions associated with their construction and maintenance activities across their road schemes.

The tool is used to estimate carbon emissions associated with civil and structural engineering projects, including road, rail and buildings. It is primarily designed for use during the construction process to record actual emissions and actual embodied emissions associated with a project. It can also be used throughout the design process, from outline design to detailed design, allowing for comparison of design options to be made.

Whole life carbon options can be estimated for projects based on the embodied carbon associated with the materials used, the transport of materials and waste, site plant energy consumption, any operational energy and emissions associated with structural maintenance.

2.2 Project Boundary for this Assessment

The Highways England Carbon Tool recommends a boundary that includes embodied materials, emissions from construction equipment and emissions associated with waste; and recommends the exclusion of the transport of materials by third parties, and emissions produced after construction and maintenance has ended. This assessment adopts the boundaries recommended by Highways England. These boundaries are shown in Plate 2.1.

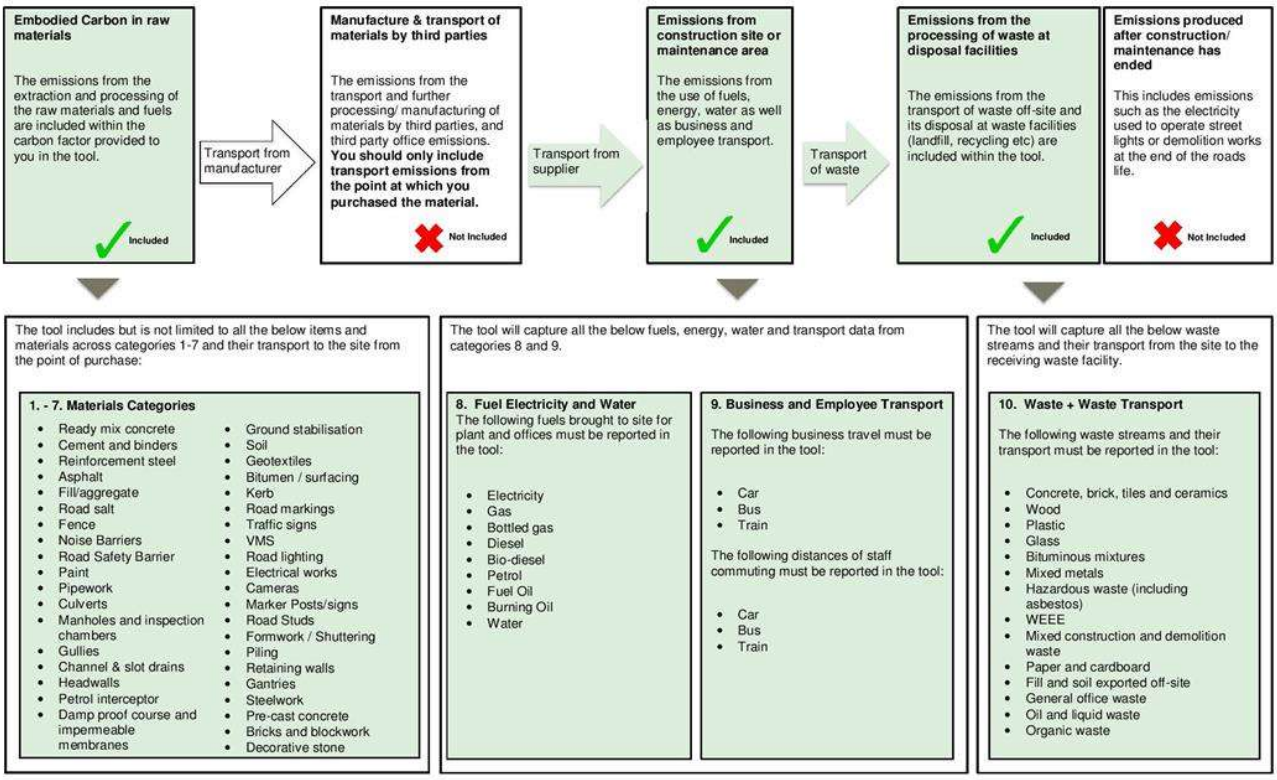

Plate 2.1 : Highways England Carbon Tool Boundary

The initial step towards project carbon management is to identify and map out the emissions sources that can be attributed to the project throughout the project's life cycle; effective management and reduction can only occur after this step.

2.3 Source Data

2.3.1 Information used

Entries into the tool are based on design information available at the time of writing, early 2017. This design quantity information was provided by David Lavin (Jacobs, Principal Engineer, Highways) and the transport and energy use information provided by Matthew Robinson (Jacobs, Construction Manager, PMCM).

This information allowed for the calculation of material use, which is presented in Table 2.1 by broad material type and construction component.

Table 2.1 : Materials consumption during construction phase

Project elements	Material type	Description	Units	Quantity
Fencing / Road Restraint Systems / Barriers	Timber	Fencing (all types)	m	79,560
	Steel	Barriers and wire/chain	m	48,005
	Concrete	Step barriers	m	30,988
Drainage	HDPE	Pipework (various diameters)	m	71,763
	Concrete	Precast manholes, inspection chambers	no.	1,144
	Concrete	Precast Gullies	no.	1,851
Earthworks	Soil	Imported	m3	253,909
	Soil	Site won soil / muck shift	m3	2,871,834
	Polypropylene	Geotextile Matting	m2	164,445
	Soil	Exported	m3	24,308
Road pavement	Concrete	Precast kerb	m	19,119
	Thermoplastic	Road markings	tonnes	203
Street Furniture	Aluminium	Road signs	m2	1,840
	Aluminium	Lighting columns	no.	403
	Copper / plastic	Cable	m	79,579
	Mixed	Cameras, cabinets and pole	no.	54
	Plastic / aluminium	Road Studs	no.	13,752
Civil Structures	Concrete	Structures	m3	2,550
Bulk materials	Concrete	Various structures and road course binder	m3	108,208
	Steel	Reinforcement of concrete	tonnes	25,970
	Asphalt	Road surface	tonnes	157,845
	Aggregate	Fill	tonnes	473,076

Information on utilities consumption during the construction phase was also provided, allowing emissions from this phase of the project to be included within the assessment. A summary of the data used is presented in Table 2.2 by energy source.

Table 2.2 : Utilities consumption during construction phase

Project Elements	Utility Type	Description	Units	Quantity
Site offices, vehicles and plant energy	Electricity	Site offices (power supply)	kWh	437,239
	Gas	Site offices (heating)	kWh	218,619
	Red diesel	Site offices (temporary generator)	litres	120,527
	Bottled Gas	Plant (road markings)	kg	1,128
	Rad diesel	Plant (heavy plant)	litres	6,240,000
	Petrol	Plant (small tools)	litres	390,000
Water	Mains water	Staff welfare, vehicle cleaning	litres	5,987,444
	Tankered water	Staff welfare, vehicle cleaning	litres	583,533

Information on contractors and sub-contractors required during the construction phase was provided, including the distances travelled for each contractor type, number of contractors and the number of days required on site to calculate the total kilometres travelled. This is displayed in Table 2.3.

Table 2.3 : Total distances travelled by employees and contractors during construction phase

Project Elements	Vehicle type	Description	Units	Quantity
Business travel	Private vehicle (any type)	Various contractors (for example Principle contractor, Structures contractor)	km	292,561
	Train	Contractors lead designer	km	9,612
Employee commuting	Private vehicle (any type)	Various subcontractors (for example Earthworks subcontractor, Structures subcontractor)	km	5,629,185
	Bus / Coach	Surfacing subcontractors arriving in minibus	km	165,920

2.3.2 Transport: transport of material to site

A supplier for materials has not yet been selected, and therefore it has been assumed that materials are to be sourced locally, through procurement in Cardiff (approximately 40 km) away, Bristol (approximately 100 km away) or local towns (approximately 3-20 km away). Using the average distances for contractors and sub-contractors, an average transport distance of approximately 60 km can be used to estimate emissions from material transport to various locations along the A465. When further design information is available it may be possible to determine more accurate transport distances, based on individual construction compound locations when these are fully specified.

Where required, the export of surplus fill material has been considered. There is evidence of sufficient capacity for this material to be disposed or re-used within 10 km of the site, so this distance has been used as an estimated upper bound for the disposal of material.

2.3.3 Exclusions due to incomplete or unknown design information:

The following aspects are those that are within the project boundary, as defined in Section 2.2, but for which there is incomplete or unknown design information at KS3:

- cement and binder materials (where applicable in addition to bulk concrete requirements);
- ground stabilisation materials;
- Environmental barrier materials (requirements for these still to be confirmed);

- paint or timber treatment materials;
- bitumen / surface treatment materials (where applicable in addition to bulk asphalt requirements);
- other potential road sign materials (other than those known at KS3);
- formwork or piling materials;
- steelwork, bricks, blockwork and decorative stone materials; and
- maintenance and renewal materials and activities.

As the project progresses into future key stages, more detailed design information would become available and the aspects outline above should be incorporated into the assessment.

In terms of materiality, the majority of the above materials are expected to be relatively small in terms of contribution to the overall scheme carbon emissions due to their smaller volumes and weights relative to the bulk materials, energy and fuel. Maintenance materials could potentially be very significant if the full life-cycle of the road were to be considered (for example materials associated with resurfacing and repair of the road over the next 30-50 years). At this stage details of the required maintenance cycle for the road have not been provided.

2.3.4 Carbon Sequestration

The construction of the road will involve the planting of trees and other vegetation along the route of the carriageway which will sequester carbon dioxide during their lifetime. We have calculated the impact of this sequestration over 40 years. It is assumed that at 40 years there will be some form of clearing to allow new growth. There will also likely be significant maintenance of the carriageway at around 40 years. Landscape impact assessment of the planted area only goes up to 30 years, and therefore there is uncertainty as to what will be present post 30 years.

The land area planted, as well as the density of vegetation has been provided via the landscaping impact assessment team. The assessment has also provided the mixture of species of vegetation within the area planted.

To calculate the carbon impact of the planting, we have used the Woodland Carbon Code Lookup Tables. The tables provide carbon sequestration values per hectare planted for most species of forestry plants native to the UK. Where species are to be planted that do not match the available species, we have used “sycamore, ash, birch (mix or pure species)” as this is the most common type being planted within the project. We have used the inverse of the average number of plants per square meter to select the spacing (in meters) between plants. In most cases, planting will be denser than the available data for the lookup tables – therefore calculations based on these tables will be an underestimate in the first 10 years of growth where the plantings will be at their most dense.

Yield Class applied has assumed to be 6 (options available are 4, 6, 8 and 10) as a conservative mid-point. It is assumed that the trees will be managed and thinned approximately every 5 years – this has the greatest impact from year 15 onwards when the trees are more mature and will need to be cut back, reducing carbon sequestration.

The assessment includes the establishment emissions during year 1. This includes the impact of seedlings, fencing, ground preparations and use of herbicides. Assumptions regarding the use and emissions from fertilisers are not available from the lookup tables, and it is recommended to account for these separately using alternative tools (e.g. the CALM tool, or CoolFarm). However at this stage of the design process, data on fertiliser use is not known, and therefore these emissions are omitted from the assessment.

It is noted that there will be trees and other vegetation present in the project area prior to construction. These existing areas of vegetation will be cleared to make way for the new carriageway and junctions, and there will be reduced sequestration as a result. These will be offset somewhat by new plantings, but the new plantings will not sequester the same amount of carbon dioxide as the existing vegetation during the same period due to

lower sequestration rates during the first few years after establishment. This avoided sequestration is not included within the assessment.

2.3.5 Emissions during KS3

The Jacobs emissions during Key Stage 3 of the project have been calculated. This has been calculated based on the total carbon emissions from Jacobs UK and apportioned based on the billable hours on the project as a percentage of the total UK total billable hours.

3. Results

3.1 Project Emissions Summary

A summary of the total carbon emissions calculated for the proposed scheme is shown in Table 3.1, indicating the source of the emissions by high level category.

Table 3.1 : Total project emissions summary

Carbon source	Emissions (tCO_2e)
Total carbon emissions	**161,848**
Construction: Materials embodied	118,260
Construction: Transport of material	18,497
Construction: Energy Use	23,778
Construction: Business and Employee Transport	1,140
Construction: Waste	173

3.2 Summary of Embodied Carbon Emissions from Construction Materials

The calculated embodied carbon emissions from construction materials are shown in Table 3.2, with a breakdown according to proposed scheme elements.

Table 3.2 : Summary of embodied carbon emissions from construction materials

Carbon source	Emissions (tCO_2e)
Fencing / Road Restraint Systems / Barriers	9,412
Drainage	4,143
Earthworks	10,893
Pavements	1,308
Street Furniture	1,602
Civil Structures	873
Bulk materials	90,028

3.3 Carbon Sequestration

The calculated carbon emissions and sequestration from the vegetation planted within the project are shown in Table 3.3, with a breakdown according period following planting.

Table 3.3 : Summary of carbon emissions and sequestration from trees and other plants

Period	Emissions (tCO_2e)	Sequestration (tCO_2e)
Year 0-5	90	217
Year 5-10	-	677
Year 10-15	-	2,152
Year 15-20	-	5,279

Period	Emissions (tCO_2e)	Sequestration (tCO_2e)
Year 20-25	-	2,759
Year 25-30	-	1,704
Year 30-35	-	1,390
Year 35-40	-	1,725
TOTAL	**90**	**15,903**

The net total sequestration from planting is 15,813 tonnes CO_2e. The sequestered carbon dioxide is additional to the total emissions presented within the rest of the report which include only emissions during construction.

3.4 Emissions during KS3

Total emissions from Jacobs during Key Stage 3 of the project is 303 tonnes CO_2e. These emissions are additional to the total emissions presented within the rest of the report which include only emissions during the construction phase.

4. Recommendations

4.1 Interpretation and Validation of Results

For the proposed scheme, the carbon assessment indicates a footprint of 161,848 tonnes CO_2e, with the majority of emissions coming from the embodied carbon of materials used in construction (118,260 tonnes CO_2e).

It should be acknowledged that there are elements missing from the assessment that could potentially alter the footprint. This assessment does not consider any materials required during maintenance of the road during its lifetime (for example road resurfacing and repairs), and similarly excludes data which were not available for the materials in 2.3.3, albeit their smaller volumes. Some quantities of specific structures have been estimated via correspondence with colleagues in the Highways team. Plate 1.1 is repeated below, providing the proportion of total GHG emissions for A465 Sections 5 and 6.

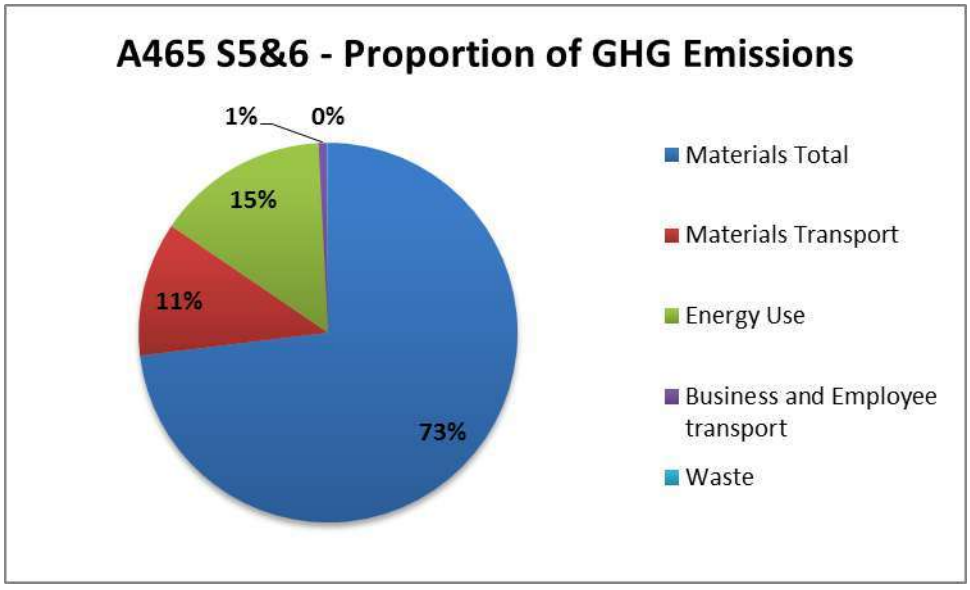

Plate 4.1 : Proportion of total GHG emissions for proposed A465 Sections 5 and 6 Construction Phase

With the majority of the footprint in the bulk materials and their transport to and from site, the footprint is accordingly sensitive to variations in the quantities of these materials. Therefore care has been taken to ensure the accuracy of the estimations provided such that they do not significantly over or underestimate the footprint. Over the lifetime of the project, maintenance requirements would have a large addition to the footprint which should be considered with regard to opportunities for carbon reduction when the maintenance programme is defined.

4.2 Further Work

4.2.1 Future carbon assessments

The requirements for maintenance has been shown (for other schemes) to be a potentially significant emission source, and therefore should be considered for this proposed scheme. This would require an understanding of road maintenance and material replacement requirements over the project lifetime – information which was not available at the time of this assessment.

As the proposed scheme progresses and further design information becomes available, the carbon assessments should be updated to complete the elements currently excluded due to incomplete or unknown design information. It should, however, be noted that while attaining absolute completeness of all scheme components is desirable, it is not necessarily an efficient means of managing project carbon emissions. Many

components would have a negligible impact and offer limited opportunities for mitigation compared to the time, effort and cost involved in determining its carbon impact. Therefore the focus should always be on quantifying (and attempting to reduce) the sources with the greatest carbon impact.

4.2.2 Identifying carbon saving measures

A key outcome of carbon quantification process should be to understand which sources have the greatest carbon impacts for the project to enable opportunities for reducing carbon to be highlighted.

Reporting and guidance, such as the Infrastructure Carbon Review (HM Treasury, 2013) and Building a Sustainable Future (ICE, 2011) indicate that the potential to influence carbon emissions decreases as a project progresses, from the most during the planning stage, to more modest reductions during design and construction.

With this in mind, the key early intervention procedure, as identified in the Infrastructure Carbon Review (HM Treasury, 2013), can be considered to be:

- avoid and / or eliminate or 'build nothing': challenge the need; explore alternative approaches to achieve the desired outcome;
- reduce or 'build less': maximise the use of existing assets, optimise asset operation and management to reduce the extent of new construction required;
- substitute or replace or 'build clever': design in the use of low carbon materials, streamline the delivery process, minimise resource consumption; and
- compensate or 'build efficiently': embrace new construction technologies, eliminate waste.

In the first instance, use of significant quantities of high carbon impact materials, (for example steel), or processes (for example large amounts of excavation), should be avoided where practicable through alternative design specification. If this cannot be done, the amount of material or the length / intensity of the process should be reduced where functional specifications allow. Materials or processes should be substituted with lower intensity replacements, if possible within design standards for strength and safety. Finally, compensatory measures, such as carbon offsetting, should be considered where it is felt they would be cost effective. Some of these measures may be complementary with noise mitigation measures (for example tree planting on road side).

Where it would not significantly impact upon engineering, safety and maintenance characteristics, the principle of substitution requires that low carbon alternatives for materials be considered.

On the basis of this assessment, concrete and steel are a part of the overall carbon footprint of this proposed scheme. Opportunities to reduce the carbon intensity of concrete used in the project (for example through inclusion of fly ash, or use of lower tensile strength grades of concrete) should be maximised where safety and engineering requirements allow.

The transportation of large volumes of materials to site is a significant source of emissions, and efforts to minimise both the volume and distance, would yield reductions the carbon footprint. Using local as opposed to regional suppliers as close to the project site would reduce these emissions

These potential measures along with the carbon management principles set out above should be taken forward into future design stages.

1. Introduction

This document is intended to set out the principles which underlie the management of the materials during the construction of the proposed scheme. These materials would be managed by the appointed Design Build Finance and Operate ('DBFO') Contractor and it is probable that the Contractor would work in accordance with "The Definition of Waste: Development Industry Code of Practice" (Version 3, 2014) published by CL:AIRE. This Code of Practice (CoP) provides a site specific basis for assessing whether excavated materials are classified as waste or not and when treated, excavated materials can cease to be waste and rendered acceptable for a particular use. Given the scale of earthworks associated with the proposed scheme this is a significant consideration in maximising the sustainability of the work.

This outline Materials Management Plan (MMP) provides the framework which would be used as a basis from which the fully developed proposed scheme's MMP would be developed.

Given the quantities of material resources that would be used and likely waste arisings associated with the proposed scheme, a need has been identified for the development of a MMP that details the process of procurement, handling and management of materials in the most efficient and sustainable manner. This outline MMP provides the framework for the appropriate management, on / off-site re-use of materials and to demonstrate that the principles for the use of materials as Non-Waste, as set out in the CoP, are satisfied.

1.1 Principles for the Use of Materials as Non-Waste

In the context of excavated materials used on sites undergoing development the following factors are considered to be on relevance:

- the potential risks to human health and the environment from the material have been considered and assessed and that both human health and the environment are protected;
- the material is suitable for its intended use without further treatment (suitability for use);
- there is a requirement for the material (certainty of use); and
- the quantity of material used is no more than is necessary for the work.

The proposed scheme MMP would also include a specific soils management plan developed using the following voluntary and industry regulated CoP:

- the Construction CoP for the Sustainable Use of Soils on Construction Sites. This provides best practice guidelines for the excavation, handling, storage and final placement of soils; and
- the Definition of Waste Development Industry CoP provides a process whereby contaminated soils can be reused on the site of origin if they are proven through appropriate risk assessment to be suitable for use. It also provides for soils with naturally elevated contamination to be used directly on another site provided that they are suitable for use at that site.

Waste streams that have the potential to be re-used on site or transported off site for re-use / recycling would be segregated. Although every effort would be made to retain and re-use all suitable materials on site, it is possible that some of these materials could not be re-used or recycled during the construction of the proposed scheme. In these situations, the Contractor would seek to identify opportunities for these materials to be redistributed to other suitable sites. This represents the most sustainable alternative to disposal at a landfill.

2. Site Characterisation

2.1 Introduction

Site characterisation is described in the following reports:

- A465 Abergavenny to Hirwaun Dualling Section 3, Factual Report on Ground Investigation (Babtie Group, 1997);
- A465 Heads of the Valley Dualling Sections 5 & 6: Preliminary Sources Study Report (Jacobs, 2015);
- A465 Heads of the Valley Dualling Sections 5 & 6: Preliminary Risk Assessment (Jacobs, 2016) including Annex A;
- A465 Heads of the Valleys Sections 5 & 6 Phase II Ground Investigation Factual Report (Quantum, 2016); and
- A465 Abergavenny to Hirwaun Dualling Sections 5 & 6: Interpretative Report on Phase 1 Land Quality Ground Investigation (Jacobs, 2016).

The different phases of site investigation have characterised geotechnical properties of the soils and geology across the length of the proposed scheme. Chemical characterisation has been carried out to a level where the typical properties of the material types have been identified. Planned further investigations will add detail to knowledge of the material types and the knowledge of the variability within each material group.

2.2 Site Location and Description

Section 5 and 6 of the A465 extends from Hirwaun in the west to Dowlais Top in the east; a total distance of approximately 17.7 km. Further information regarding site location and extent is presented in Sections 4.1 and 4.2 of the Preliminary Sources Study Report (PSSR) completed by Jacobs in 2015 (Jacobs, 2015) and in Chapter 5: Scheme Description of the Environmental Statement (ES).

2.3 Proposed Scheme

The proposed scheme involves the widening of Section 5 and 6 of the existing A465 from a three lane carriageway to a dual two-lane carriageway. Section 5 of the proposed scheme extends from Dowlais Top at ch. 16150, to Nant Ffrwd at ch. 9850, and Section 6 extends from Nant Ffrwd at ch. 9850, to Hirwaun at ch. 900 (National Grid Reference SO 078082 to SN 961051). Chainage 0 to ch. 900 is already a dual carriageway road and no significant improvements are planned there.

The majority of the proposed scheme requires widening of the existing A465 road, considered as “on-line widening”. However, there is a section of the proposed scheme within the current design which extends from approximately ch. 1800 to 3100 and does not follow the existing A465 thereby requiring the construction of a new section of road; this section is therefore considered “off-line”. The location of the proposed scheme is presented in the ES Volume 3 Figure 1.1.

Welsh Government plans to procure the works through a Design, Build, Finance and Operate (DBFO) contract which would include the detailed design, construction and maintenance of the road.

The proposed scheme seeks to provide a highway to modern design standards, including improved vertical and horizontal alignment compared to the existing A465 route that was designed and built to 1960s standards. Where possible the proposed scheme would also seek to increase sustainability by re-using as much excavated material as possible.

2.4 Landowner and Developer

The name of the landowner where excavated materials would be arising from and being used is:

Welsh Government

Cathays Park
Cardiff
CF10 3NQ

The organisation that will design, build, finance and operate the project is not yet confirmed:

2.5 Re-use of Site Derived Material

During the construction phase, the earthworks would include the excavation of cuttings into the existing topography, the largest of which is in the vicinity of the Baverstock junction (ch. 8500). In addition, embankments would be constructed along the proposed scheme, the most significant at the A470 junction to the west of Merthyr Tydfil. The majority of embankments would be required to accommodate structures or support the new proposed highway elevated above existing infrastructure or watercourses.

The approach for the construction phase would be to reuse as much of the site-won materials (cut or excavated materials) within the proposed scheme as possible. This would be achieved through the use of the CL:AIRE Definition of Waste: Development Industry Code of Practice (CL:AIRE, 2014). This aims to amplify the sustainability of the proposed scheme by minimising the amount of material requiring off-site disposal and to reduce the amount of virgin materials imported, preserving mineral resources.

The earthworks would involve the excavation of a number of types of material some of natural origin and some the result of historic industrial and development activity in the study area. Some of that material would be unsuitable for use in the construction works either because of its chemical composition, which may include the presence of hazardous materials within the soil, or because it's strength or physical property makes it unsuitable for use in the construction. The proportion of "unsuitable" material has been estimated at 10% of the volume of excavated made ground and glacial material. Peat deposits and solifluction materials are not considered likely to be suitable for re-use within the proposed scheme without appropriate treatment. Therefore, it is proposed to reuse the peat and solifluction material following appropriate treatment processes, such as stabilising with the addition of lime, optimising the re-use of materials within the proposed scheme and meeting the Welsh Government's targets in this regard.

At this stage, it has been assumed that the majority of excavated site won materials would be reused within the proposed scheme, but the viability of the possible treatment processes would need to be reviewed at the time of construction.

2.6 Acceptability Criteria

The acceptability criteria for the re-use of site-won material would need to satisfy three sets of criteria which are described below.

2.6.1 Geotechnical properties

All the materials to be used in the works need to satisfy the requirements for geotechnical properties which are described in the Works Information and the Contractor's Design.

2.6.2 Chemical properties

The chemical properties of the materials must meet criteria specified in order to protect the environment including the water environment, and to protect human health. These criteria will differ at different locations depending upon a range of factors which will include (but may not be limited to) proximity to surface water, intended surface land use at a specific location, chemical composition and leachability.

2.6.3 Certainty of use

The requirements of the CL:AIRE CoP including certainty of use and necessity for use in the specified quantity.

2.7 Use of Excavated Material as Non-Waste

Excavated natural ground required as General Fill is therefore considered a Non-Waste providing the acceptability criteria are met.

Re-use of natural ground at the site would not undermine the aims of the Waste Framework Directive as the material is certain to be used, is suitable for use (without harming human health, polluting the environment or adversely affecting the countryside or places of special interest) and material would be used in the quantities required for the construction purposes detailed above.

3. Risk Assessment

Current UK guidance on contaminated land assessment requires development of a conceptual site model (CSM) and the completion of a risk assessment including evaluation of all potentially unacceptable risks / significant pollution linkages.

A Preliminary Risk Assessment, covering the area of the proposed scheme and 2016 Intrusive Site Investigation, has been completed by Jacobs. There have also been previous site investigation works undertaken along the proposed scheme, although these have been predominantly geotechnical and have not fed in to the risk assessment.

The CSM developed for the proposed scheme, indicates a moderate risk to some surface waters, construction workers and ecology.

The risks are generally limited to the construction phase as the design eliminates the risks during the operational life of the proposed scheme.

On the basis of the site investigations completed, the majority of site derived materials are anticipated to be considered suitable for use within the proposed scheme. However, it is recommended that further, more extensive, site investigation is undertaken which would provide additional information in support of the MMP for the proposed scheme. This additional site investigation is anticipated to be completed in 2018.

4. Materials Management Plan

At this stage of the proposed scheme and the procurement process through which the proposed scheme would be delivered (DBFO) this MMP can only be an outline document as detailed design cannot be finalised until the DBFO Contractor is appointed. Consequently, no completed MMP form has been included in this document. This section instead sets out the key requirements of the MMP.

The Contractor must put in place a tracking system which records and details materials re-used within the proposed scheme during construction.

The key requirements for the contractor include the following:

- regular inspection of the material for visual / olfactory indications of contamination;
- segregation of material with visual / olfactory indications of contamination and consultation with a suitably qualified Land Quality Specialist who would be able to assess the risks and advise whether the material is unsuitable for re-use, suitable only at certain locations or suitable for re-use anywhere on the site. This is likely to require additional sampling and testing;
- manage segregated material appropriately once advice has been offered by the Land Quality Specialist and remove unsuitable material off-site to an appropriately permitted waste management facility or re-use suitable material on site in accordance with the recommendations;
- collation of appropriate records including the tracking form, dated annotated site drawings showing material movements and temporary stockpiles, photographs, topographical surveys and waste transfer notes for off-site removal of waste;
- record any changes to the MMP during the project; and
- record the presence of any unforeseen material and the contingency arrangements carried out to manage this material.

4.1 Summary of Earthworks

As the proposed scheme is heavily earthworks driven, the current approach set out in the Constructability and Phasing Report (Jacobs, 2017) looks to minimise earthworks movements by establishing clear routes early on and limiting required haulage distance by utilisation of soil storage areas. At this stage, cut / fill locations have been assessed, but are subject to change once a Contractor Organisation has been appointed. As the scheme proposal is 17.7 km long, the works have been split into three distinct sections which are as follows:

- A465 Hirwaun junction to Nant Melyn viaduct (ch. 0 to 6000)
- A465 Nant Melyn viaduct to A470 junction (ch. 6000 to 11000)
- A470 junction to Dowlais junction (ch. 11000 to 16500)

4.1.1 A465 Hirwaun junction to Nant Melyn viaduct

The key quantities of cut and fill materials in this section are set out below:

Cut 590,000 m^3

Fill 760,000 m^3

In this section, the excavation of the large cutting between Hirwaun and Trewaun would take place with the bulk of the usable material transported to the new grade separated junction at Hirwaun. At this point, the mainline would be raised on an embankment over the new roundabout alignment with smaller volumes transported to other minor embankments within this section. Additional cutting would take place for the Trewaun underpass. This phase would produce a shortfall of fill materials, and therefore material from cut areas where there is a

surplus of material would be used, thereby achieving material balance and minimising the import of virgin materials.

4.1.2 A465 Nant Melyn viaduct to A470 junction

The key quantities of cut and fill materials in this section are set out below:

Cut 740,000 m^3

Fill 850,000 m^3

This section would incorporate the largest cutting on the proposed scheme at Baverstock junction. Material from this cutting would be stored at a stockpile close to the coniferous forest to the north of the junction and eventually move to the large embankment structures at the A470 junction. There are other proposed minor cuttings in this section mainly associated with crossings and slip roads. There would be a surplus of cut materials and therefore this material would be moved to construct large embankments at Gurnos and Dowlais.

4.1.3 A470 junction to Dowlais junction

The key quantities of cut and fill materials in this section are set out below:

Cut 820,000 m^3

Fill 630,000 m^3

This section would mainly be raised on embankments up and over the Dowlais junction roundabout below along with approaches / slips, with the mainline then tied in to the existing upgraded A465. There are several embankments that would be constructed as the mainline passes through Pant, with the most significant at Pant Road Viaduct. There would be a short embankment between Pen-y-Dre junction and Prince Charles Hospital junction. There would be a shortfall of cut materials within this section, and therefore materials from Nant Melyn to A470 would likely be transported to and used within this section.

In the phased process of excavated cuttings and constructed embankments, material would be temporarily stockpiled. The management of these stockpiles is covered within the Construction Environmental Management Plan (CEMP) for the proposed scheme.

4.1.4 Overall balance

There is a predicted that there would be an overall balance of materials for the earthworks phase of construction..

4.2 Other Materials

4.2.1 Demolition materials

Demolition works would be required at various sections of the existing highway generating materials. The types and quantities of materials are currently unknown. However, they would likely comprise:

- reinforcement and structural steelwork;
- masonry and brickwork;
- reinforced concrete and concrete;
- fill and landscaping materials;
- aggregate sub-base; and
- bituminous pavement material.

Where possible, these materials would be reused or suitably processed for use within the proposed scheme.

Appendix 14A – Acoustic Context and Definitions

14A.1 Sound and Human Response

A sound wave travelling through the air is a regular disturbance in ambient atmospheric pressure. These pressure fluctuations, when of frequencies within the audible range, are detected by the human ear which passes nerve responses to the brain, producing the sensation of hearing.

The response of the human ear is not constant over all frequencies. It is therefore usual to weight the measured frequency to approximate human response. This is achieved by using filters to vary the contribution of different frequencies to the measured level.

The “A” weighting network is the most commonly used and has been shown to correlate closely to the non-linear and subjective response of humans to sound. The use of this weighting is denoted by a capital A in the unit abbreviation (i.e. LAmax, LAeq, LA90 etc.) or a capital A in brackets after a decibel (dB) level (i.e. 3 dB(A)).

The human ear is sensitive to a wide range of sound levels; the sound pressure level of the threshold of pain is over a million times that of the quietest audible sound. In order to reduce the relative magnitude of the numbers involved, a logarithmic scale of dB based on a reference level of the lowest audible sound is used.

14A.2 Noise

Noise has been defined in a variety of ways and is very much dependent on factors such as the listener’s attitude to the source of the sound and their environment, but is essentially any sound that is unwanted by the recipient.

It is impossible to measure the degree of nuisance caused by noise directly, as this is essentially a subjective response of the listener, but it is possible to measure the “loudness” of that noise. Loudness is related to both the sound pressure (the magnitude of the maximum excursion of the pressure wave around the ambient atmospheric pressure) and the frequency, both of which can be measured.

14A.3 Sound pressure level

The sound pressure level (LP or SPL) is the instantaneous acoustic pressure and is measured in decibels. Since the ear is sensitive to variations in pressure, rather than source power or intensity, the measurement of this parameter gives an indication of the impact on people. The SPL is defined as:

$$SPL = 10\log_{10}\left(\frac{p^2}{p_{ref}^2}\right) \text{ or } SPL = 20\log_{10}\left(\frac{p}{p_{ref}}\right)$$

where:

p is the rms pressure of the sound in question (in pascals)

pref is the reference sound pressure, defined as the limit of human audibility (2 x 10-5 Pa)

Leq: The Leq is defined as the equivalent continuous sound level and is the most widely used parameter for assessing environmental noise. Since this descriptor is a type of average level, it must by definition have an associated time period over which the measurement is referring to. This is often included in the abbreviation in the form Leq, T, where T is the time period (i.e. LAeq, 5 min). The formula for calculating the Leq is:

$$L_{eq} = 10\log_{10}\left(\frac{1}{t_2 - t_1}\int_{t_1}^{t_2}\frac{p^2}{p_{ref}^2}.dt\right)$$

In practice, since most modern sound level meters are digital and hence take periodic samples of the sound pressure level, the Leq will be the logarithmic average of all the SPL samples taken in the measurement period.

Lmax: The Lmax is defined as the maximum rms level recorded during a measurement period.

L10: The L10 refers to the level exceeded for 10% of the measurement period and is widely considered as the standard index to describe traffic noise.

L90: The L90 refers to the level exceeded for 90% of the measurement period and is widely considered to represent background noise, or the underlying noise in an area between noisy events (such as cars passing etc.).

Lnight: The Lnight is a façade noise index derived from the LA10,18h index using TRL conversion method.

Lnight,outside: The Lnight,outside is defined as the free-field A-weighted long-term average sound level of the 8-hour night-time period determined over all nights of a year outside a property.

Façade: The term “façade” refers to noise levels that have been measured or predicted 1 metre in front of the most exposed window or door in a façade.

Free-Field: The term “free-field” refers to noise levels that have been measured or predicted in the absence of any influence of reflections from nearby surfaces. In practice, a measurement is considered to be free-field if it was taken at a distance of over 3.5 m from any reflecting surfaces.

Appendix 14B – Assessment Approach

14B.1 Study Area

14B.1.1 Noise

The study and calculation areas for the noise assessment were defined in accordance with HD 213/11 (Highways Agency, 2011). Firstly, the study area is defined as a 1 km boundary around the start and end points of the physical works associated with the proposed scheme, including any improved or bypassed routes. The calculation area is then defined as all residential dwellings and other noise sensitive receptors within 600 m of the proposed scheme and for those roads (within 1 km of the proposed scheme) on the existing road network that are predicted to result in noise changes of 1 dB in the opening year or 3 dB in the design year.

HD 213/11 (Highways Agency, 2011) requires consideration beyond the "calculation area", to take into account the likely noise impacts on the wider road network (considered in terms of change in basic noise level (BNL)). This is required for such roads where there is a 1 dB increase or decrease in noise in the baseline year and / or a 3 dB increase or decrease in the future assessment year in comparison with the baseline year.

14B.1.2 Vibration

The study area for the vibration assessment was defined as within 40 m of all roads where noise level predictions were undertaken.

14B.2 Noise Assessment

14B.2.1 DMRB Noise Assessment

The assessment of noise levels at noise sensitive receptors has followed the "Detailed Assessment" methodology outlined in HD 213/11 (Highways Agency, 2011). Noise levels have been calculated at all residential dwellings within the Calculation Area (see Figure 14.1 in Volume 3 of the Environmental Statement). Noise levels at dwellings have generally been calculated at first floor level; unless the property is known to only have one floor. For single storey dwelling, and for other sensitive receptors, such as churches, schools, medical facilities and outdoor areas, predictions have been undertaken at 1.5 m above ground level.

Consideration has also been given to likely noise impacts on the wider road network, outside the calculation area. The basic noise level (BNL) changes have been predicted for the affected routes outside the calculation area where there is a 1 dB increase or decrease in noise in the baseline year and / or a 3 dB increase or decrease in the future assessment year in comparison with the baseline year.

The future assessment year is defined as the year within the first 15 years of opening of the proposed scheme where traffic flows are greatest. The future assessment year is therefore usually 15 years after opening, which in this assessment is 2037.

This assessment considers noise level changes at dwellings and other sensitive receptors according to their baseline façade noise levels (reception point 1 m in front of the building facade). The following comparisons are made:

- Do Minimum scenario in baseline year (2022) against Do Minimum in the future assessment year (2037);
- Do Minimum scenario in the baseline year (2022) against Do Something scenario in the baseline year (2022); and,
- Do Minimum condition in baseline year (2022) against Do Something in the future assessment year (2037).

14B.2.2 Noise level predictions

Noise level predictions have been undertaken using the CadnaA noise modelling package, which incorporates the methodology contained in CRTN (Department for Transport and the Welsh Office, 1988). This document is a technical memorandum providing the definitive method of predicting road traffic noise in the United Kingdom. Noise level predictions take account of the following variables:

- typical weekday volumes of traffic during the eighteen hour period from 6 am to midnight (18-hour AAWT flows) – day time assessment;
- typical weekday volumes of traffic during the eight hour period from 11 pm to 7 am – night-time assessment;
- percentage of Heavy Vehicles (vehicles of unladen weight > 3.5 tonnes);
- traffic speeds (banded speed based on Interim Advice Note 185/15 (Highways Agency, 2015);
- road gradient;
- local topography;
- nature of the ground cover between the road and the receptor;
- shielding effects of any intervening structures, including allowances for limited angles of view from the road and any reflection effects from relevant surfaces; and,
- road surfacing type.

HD 213/11 (Highways Agency, 2011) provides updated guidance on the use of CRTN (Department for Transport and the Welsh Office, 1988). This includes guidance on predicting noise from dual carriageways; noise reduction corrections to be applied for low noise surfacing systems; and the prediction of road traffic noise levels to 600 m from a road traffic source (CRTN provides for a prediction distance of 300 m).

For daytime noise levels at dwellings, community facilities and other noise sensitive properties, façade noise levels are predicted whereas night-time noise levels are free-field (in the open, without any nearby noise-reflecting surfaces).

HD 213/11 provides specific guidance in relation to the noise level correction that should be applied when using Low Noise Road Surfaces (LNRS) for existing and new carriageways.

- For existing carriageways, unless alternative RSI measurements for the surface are available, a -2.5 dB surface correction should be used for an existing low noise surface in the baseline year.
- For the future assessment year, a -3.5 dB correction should be applied for a low noise road surface that is expected to be in place on an existing road.

It also states that, “where new carriageways are to be constructed and a thin surfacing system [low noise surfacing] used, or where an existing surface is to be replaced with a thin surfacing system, a -3.5 dB correction should be assumed for the thin surface system [equivalent to a Road Surface Influence (RSI) of -5 dB] unless any information is available regarding the specific surface to be installed. This advice applies where the mean traffic speed is >=75 kph (47 mph). Where the mean speed is <75 kph (47 mph), a -1 dB correction should be applied to a new low-noise surface.”

The assumptions made for this assessment are in line with the guidance provided in HD 213/11 (Highways Agency, 2011).

The following road surface types have been assumed:

DM 2022 – HRA for all roads within the calculation area, with the exception of the following lengths of the A465, which have existing low noise surfaces, according to the SWTRA Pavement Management System. In accordance with HD 213/11, a LNRS correction of -2.5 dB is applied to these sections of carriageway.

- Chainages 8350 to 10700

DM 2037 – The A465 mainline and slip roads will be resurfaced with LNRS before the future assessment year, even if the proposed scheme doesn't go ahead. Therefore a -3.5 dB correction is applied for the entire A465 mainline and slip roads, and standard HRA for the side roads.

DS 2022 – The proposed scheme mainline and slip roads would be laid using LNRS and HRA. Therefore a LNRS correction of -3.5 dB is applied for the following A465 mainline and slip roads, and standard HRA for the side roads.

- Chainages 1500 to 5500
- Chainages 8100 to 17700

DS 2037 – The road surfacing assumptions used in DS 2037 follow those in DS 2022.

It should be noted that LNRS corrections of -2.5 dB and -3.5 dB have only been applied where the traffic speed is greater than 75 kph (47 mph), in line with the guidance contained within HD 213/11 (Highways Agency, 2011).

Where the traffic assessment modelling has predicted 18-hr AAWT traffic flows less than 1000, the lower threshold for the CRTN calculation method, traffic flows have generally been set to 0 within the noise model scenarios affected. However, this approach can lead to artificial noise changes on links where traffic flows are less than 1000 in some scenarios but greater than 1000 in others. On such links, traffic flows of less than 1000 have therefore been set at 1000 to minimise the potential for artificial noise changes.

In line with HD 213/11 (Highways Agency, 2011), a minimum traffic speed of 20 kph (12 mph) has been used in the noise model, where the traffic model predictions provide speeds less than this.

It is considered that all data inputs for this assessment are of an adequate level to support a 'Detailed' level of assessment as defined in HD 213/11 (Highways Agency, 2011).

14B.2.3 Night time noise

An assessment of night-time noise levels has been undertaken in accordance with HD 213/11. Therefore, consideration is given to those receptors that are predicted to experience a noise level change in the long-term and which are exposed to an Lnight,outside noise level of 55 dB or greater in any scenario. Method 3 within TRL report 'Converting the UK traffic noise index LA10,18h to EU noise indices for noise mapping' has been used to determine the night-time levels (Lnight,outside).

For the night-time assessment, the following comparisons are made:

Do Minimum scenario in baseline year (2022) against Do Minimum in the future assessment year (2037); and,

Do Minimum condition in baseline year (2022) against Do Something in the future assessment year (2037).

14B.2.4 Noise nuisance

HD 213/11 (Highways Agency, 2011) defines the level of noise 'nuisance' by reference to the percentage of people in the affected population that are likely to be 'bothered very much or quite a lot' by traffic noise. Gradual increases in noise are expected to produce a gradual and proportionate increase in the nuisance level (i.e. the percentage of the population that is bothered). However, sudden increases in the noise level are expected to result in an initial large increase in the nuisance level. This new level of nuisance appears to persist for several years at least but, in the longer term, nuisance levels tend back towards those expected for a gradual increase in noise.

In this assessment, noise nuisance predictions have been based on the highest nuisance levels expected during the first 15 years after opening for the Do Minimum and Do Something scenario and compared to the nuisance levels of the Do Minimum baseline year (2022). In accordance with the predictive technique presented

in HD 213/11 (Highways Agency, 2011), an assessment of noise nuisance for all properties situated within the calculation area has been undertaken.

14B.2.5 Ground-borne vibration

HD 213/11 (Highways Agency, 2011) provides guidance on ground-borne vibration from highway schemes. It states "If ground-borne vibration on existing routes is considered to be a potential problem, calculations or measurements of vibration at the foundations of typical buildings considered to be at high risk may be taken in order to establish whether increasing vibration levels would be likely to exceed the threshold values".

The document also advises that methods are available to predict ground-borne vibration from roads; however, it does state that this requires detailed knowledge of the ground type, which is unlikely to be readily available. The methodology also requires detailed knowledge of deviations in the road surface (holes, cracks, undulations, etc). For these reasons, this assessment provides a qualitative assessment on the likelihood of perceptible traffic induced ground-borne vibration.

14B.2.6 Vibration nuisance

Where properties are within 40 m of the carriageway, HD 213/11 (Highways Agency, 2011) recommends that, for a given level of noise exposure, the percentage of those 'bothered' by airborne vibration is 10% lower than the corresponding figure for noise nuisance. Where noise levels are below 58 dB LA10,18h, it should be assumed that residents would not be 'bothered' by airborne vibration. Consideration has been given to changes in airborne vibration nuisance at all dwellings within 40 m of roads where noise level predictions have been undertaken.

14B.3 Assessment of the Significance of Effects

14B.3.1 Construction noise

BS 5228-1:2009 +A1:2014 includes example thresholds of 'significant effects'. These thresholds can be based on the 'ABC' method, which takes into account the existing ambient noise levels in the area, along with predicted construction noise levels. It should be noted that the thresholds in BS 5228-1:2009 +A1:2014 are examples and therefore there is scope for them to be adapted, if deemed necessary to local circumstances.

Example thresholds of significant effects (or potential disturbance), using the ABC methodology as set out in Annex E of BS5228-1:2009 +A1:2014, are detailed in Table 14B.1.

Table 14B.1 : Construction Noise Thresholds

Assessment category and threshold value period (L_{Aeq})	Threshold value, in decibels (dB)		
	Category A[A)]	Category B[B)]	Category C[C)]
Night-time (2300 – 0700)	45	50	55
Evenings and weekends [D)]	55	60	65
Daytime (0700 – 1900) and Saturdays (0700 – 1300)	65	70	75
NOTE 1: A potential significant effect is indicated if the l L_{Aeq} noise level, from the site, exceeds the threshold level for the category appropriate to the ambient noise level. **NOTE 2**: If the ambient noise level exceeds the Category C threshold values given in the table (i.e. if the ambient noise level is higher than the above values), then a potential significant effect is indicated if the total L_{Aeq} noise level for the period increases by more than 3dB due to site noise. **NOTE 3**: Applies to residential receptors only			

Assessment category and threshold value period (L_{Aeq})	Threshold value, in decibels (dB)		
	Category A[A)]	Category B[B)]	Category C[C)]
Category A: Threshold values to use when ambient noise levels (when rounded to the nearest 5 dB) are less than these values Category B: Threshold values to use when ambient noise levels (when rounded to the nearest 5 dB) are the same as Category A values Category C: Threshold values to use when ambient noise levels (when rounded to the nearest 5 dB) are higher than Category A values 1900 – 2300 weekdays, 1300 – 2300 Saturdays and 0700 – 2300 Sundays			

14B.3.2 Construction vibration

Vibration is a low frequency disturbance producing physical movement in buildings or to their occupants. Ground-borne vibration is usually measured in terms of peak particle velocity (ppv), which is measured in terms of movement in mm/s. BS 5228-2:2009+A1:2014 (BSI, 2014) contains guidance on vibration levels in structures from construction works. It provides a prediction methodology for mechanised construction works, such as compaction and tunnelling works, and piling works. The Standard also presents guidance for the control of vibration from construction works.

BS 5228-2:2009+A1:2014 (BSI, 2014) provides guidance on the human response to vibration. The Standard provides guidance for predicting human response to vibration in buildings. For construction works, the guidance contained in Table 14B.2 is provided:

Table 14B.2 : Guidance on the Human Response to Vibration Levels from BS5228-2:2009+A1:2014+A1:2014

Vibration Level (ppv)	Effect
0.14 mm/s	Vibration might just be perceptible in the most sensitive situations for most vibration frequencies associated with construction. At lower frequencies, people are less sensitive to vibration
0.3 mm/s/	Vibration might just be perceptible in residential environments
1.0 mm/s	It is likely that vibration of this level in residential environments would cause complaint, but can be tolerated if prior warning and explanation has been given to residents
10.0 mm/s	Vibration is likely to be intolerable for any more than very brief exposure to this level

For building structure response, BS 5228-2:2009+A1:2014 (BSI, 2014) reproduces the advice given in BS 7385-2:1993 (BSI, 1993), which gives guidance on vibration levels which could potentially result in building damage. The response of a building to ground-borne vibration is affected by the type of foundation, underlying ground conditions, the building construction and the state of repair of the building. Table 14 23 reproduces the guidance detailed in BS 5228-2:2009+A1:2014 (BSI, 2014) on building classification and guide values for cosmetic building damage.

Minor damage is possible at vibration magnitudes which are greater than twice those given in Table 14B.3, with major damage at values greater than four times the values in the table. BS 7385-2:1993 (BSI, 1993) also notes that the probability of cosmetic damage tends towards zero at 12.5 mm/s peak component particle velocity.

Table 14B.3 : Guidance on the Effects of Vibration Levels on Building Structures from BS5228-2:2009+A1:2014+A1:2014

Type of building	PPV in frequency range of predominant pulse	
	4 Hz to 15 Hz	15 Hz and above
Reinforced or framed structures	50 mm/s	50 mm/s
Industrial and heavy commercial buildings		
Un-reinforced or light framed structures	15 mm/s at 4 Hz increasing to 20 mm/s at 15 Hz	20 mm/s at 15 Hz increasing to 50 mm/s at 40 Hz and above
Residential or light commercial buildings		

14B.4 Vibration

HD 213/11 (Highways Agency, 2011) advises that should the level of vibration at a receptor be predicted to rise to above a level of 0.3 mm/s, or an existing level above 0.3 mm/s is predicted to increase, then this should be classed as an adverse impact from vibration.

HD 213/11 (Highways Agency, 2011) paragraph A5.26 states, “Significant ground-borne vibrations may be generated by irregularities in the road surface. Such vibrations are unlikely to be important when considering disturbance from new roads and the assessment will only be necessary in exceptional circumstances.” Further to this, Figure 3 from Transport and Road Research Laboratory (TRRL) Report No RR53 – Ground Vibration Caused by Civil Engineering Works provides a summary of measurements taken by the TRRL which indicates the relative effects of various construction related sources. This figure indicates that, for a heavy lorry on a poor road surface at 8 m, a PPV of 0.1 mm/s is expected.

Appendix 14C – Noise Monitoring Results

14C.1 Introduction

This appendix contains the details of the noise monitoring survey that was undertaken during January and February 2016 adjacent to the proposed scheme. The survey was undertaken in accordance with the methodology agreed with Merthyr Tydfil County Borough Council (MTCBC) and Rhondda Cynon Taf County Borough Council (RCTCBC) prior to commencement.

Baseline measurements were undertaken at eleven locations to inform the construction assessment, and for validation and verification of predicted operational noise levels. All noise measurements were undertaken using a Class 1 integrating Sound Level Meter (SLM) that had been laboratory calibrated within the last 12 months (calibration certificates are provided in Appendix 14D in Volume 2 of this Environmental Statement). The measurements consisted of both long and short term measurements, where seven locations were long term (minimum seven day duration) and four locations were short term (three hour duration).

14C.2 Comparison between Measured and Predicted Noise Levels

Table 14C.1 provides a comparison of the LA10,18 hour noise levels measured in 2016 against those predicted in this assessment for the Do Minimum scenario in the opening year (2022). Although traffic would increase slightly between 2016 and 2022, this is not considered to result in significant changes in noise levels, in the context of the variability and uncertainty associated with environmental noise measurements. Both measured and predicted are shown as façade noise levels.

The measured and predicted noise levels are considered to be largely comparable, when taking into account the variability and uncertainty associated with environmental noise measurements, and give a good level of confidence that the noise model is sufficiently accurate to describe the local traffic noise climate.

Table 14C.1 : Comparison between measured and predicted noise levels

Location ID	Location	Measured noise level dB $L_{A10,18hour}$	Predicted noise level dB $L_{A10,18hour}$

ORDER No	- Job No TRAC15/05144/01
DATE OF RECEIPT	26 May 2015
PROCEDURE	AV Calibration Engineer's Handbook section 3
IDENTIFICATION	(0872) Sound level meter Rion type NL-31 serial No 00583275 connected via extension lead type EC-04 and preamplifier type NH-21 serial No 27505 to a half-inch microphone type UC-53A serial No 314015 fitted with a foam windshield type WS-03. Associated calibrator Rion type NC-74 serial No 34257024 with a one-inch housing and adapter type NC-74-002 for half-inch microphone.
CALIBRATED ON	26 May 2015
PREVIOUS CALIBRATION	Calibrated on 03 June 2014, Certificate No. TCRT14/1183 issued by a non accredited calibration laboratory ANV Measurement Systems

The measurements detailed herein are traceable to units of measurement realised at the National Physical Laboratory.
This certificate may not be reproduced other than in full, except with the prior written approval of AV Calibration.

Appendix 15A – Relevant Planning Policy for "All Travellers" Topic

Planning Policy Wales

The Welsh Government under Planning Policy Wales (PPW) (Edition 9) (Welsh Government, 2016a) supports a transport hierarchy in relation to new development that establishes priorities in such a way that, wherever possible, they are accessible in the first instance by walking and cycling, then by public transport and finally by private motor vehicles. Planning can help to achieve the Welsh Government's objectives through:

- reducing the need to travel, especially by private car, by locating development where there is good access by public transport, walking and cycling (Paragraph 8.1.5 of the PPW);
- improving accessibility by walking, cycling and public transport (Paragraph 8.1.5 of the PPW);
- promoting walking and cycling (Paragraph 8.1.5 of the PPW);
- supporting the provision of high quality public transport (Paragraph 8.1.5 of the PPW);
- supporting sustainable travel options in rural areas (Paragraph 8.1.5 of the PPW);
- promoting a more sustainable pattern of development, creating and maintaining networks of facilities and open spaces in places well served by sustainable means of travel, in particular within urban areas (Paragraph 11.1.3 of the PPW); and
- promoting improved health and well-being by ensuring that everyone has easy access to the natural environment and to good quality, well-designed facilities and open space (Paragraph 11.1.3 of the PPW).

Technical Advice Notes

Technical Advice Note (TAN) 18: Transport (Welsh Assembly Government, 2007) advises on how transport provision should be integrated with land use development and other policies. It sets out how routes for walking and cycling should be protected and promoted, and how careful land use planning can reduce the need to travel by private car. In addition, TAN 16: Sport, Recreation and Open Space (Welsh Assembly Government, 2009), encourages local planning authorities to ensure that new development makes adequate provision to meet the recreational needs arising, and opportunities for walking and cycling. TAN 16 also encourages local planning authorities to provide lighting on urban walkways and major cycle routes as this can improve the attractiveness of routes and encourage a modal shift in travel patterns.

National Transport Plan

Reflecting the Welsh Government's commitment to sustainable development, the National Transport Plan (Welsh Government, 2010) strives to make it easier for people to be less reliant on the private car and to use public transport, walking and cycling more frequently.

One Wales: Connecting the Nation

One Wales: Connecting the Nation (Welsh Assembly Government, 2008a) is the transport strategy adopted by the promoting sustainable transport networks in Wales. The strategy supports a greater use of more sustainable and healthy forms of travel in Wales, as well as minimising the demands on the transport system by incorporating walking, cycling and public transport links into new developments.

Road Safety Framework

In regards to safety on the road network, the Welsh Government has adopted the Road Safety Framework for Wales (Welsh Government, 2013a), which aims to reduce the number of incidents on Welsh roads by targeting high-risk road users, such as pedestrians, cyclists and equestrians, through education, engineering and enforcement.

Wales Spatial Plan

In line with the UK Governments drive to reduce greenhouse gas emissions, the Wales Spatial Strategy (Welsh Assembly Government, 2008b) aims to promote low-carbon regions in the country by encouraging more walking and cycling as part of people's daily lives.

Welsh Government Strategy for Sport and Physical Activity

In addition to the Wales Spatial Strategy, the Welsh Government Strategy for Sport and Physical Activity (Welsh Assembly Government, 2005), has a strategic plan to encourage the integration of walking and cycling into everyday life as a means of recreation and transport. One of the initiatives is to ensure 95% of people in Wales have a footpath or cycle-path within a ten-minute walk by 2025.

Active Travel (Wales) Act 2013

In order to improve the health of the nation and make Wales a walking and cycling nation, the Active Travel (Wales) Act 2013 (Welsh Government, 2013b) requires the Welsh Ministers and local authorities to make it easier for people to walk and cycle in Wales by taking reasonable steps to enhance the provision made for walkers and cyclists, as well as promoting active travel journeys and securing new and improved active travel routes and related facilities.

Active Travel Action Plan

The Active Travel Action Plan (Welsh Government, 2016b) complements the Active Travel (Wales) Act 2013 reiterates the Welsh Government vision that for people in Wales, walking and cycling will become the preferred ways of getting around over shorter distances. The plan contains the specific action to "consider and enhance provision for walkers and cyclists whenever we [the Welsh Government] make direct investments in transport infrastructure."

The Environment Strategy for Wales

The Environment Strategy for Wales (Welsh Assembly Government, 2006) endeavours to increase opportunities for access to the Welsh countryside in rural areas.

Well-being of Future Generations (Wales) Act 2015

The Well-being of Future Generations (Wales) Act (Welsh Government, 2015) aims to improve the social, economic, environmental and cultural well-being of Wales. In relation to this chapter, the act will encourage people to participate in recreation and maximise their physicals well-being, as well as live in well-connected and low carbon communities.

Environment (Wales) Act 2016

Improving the health and social equity of the Welsh population is a key driver for the Welsh Government. The Environmental (Wales) Act 2016 will help to achieve this by delivering, in part, improved access to good quality outdoor space (National Assembly for Wales, 2016).

Local Planning Policy

In pursuing the key national policies described in Section 15.3, a number of local strategies have been adopted by local authorities. The Turning Heads…A Strategy for the Heads of the Valleys 2020 (Welsh Government, 2006), promotes healthy living and active lifestyles for the Heads of the Valleys region, by ensuring that paths and cycle routes are accessible and pleasant.

The South East Wales Transport Alliance Regional Transport Plan (SEWTA, 2010) is a statutory plan covering the area, setting out an integrated and sustainable transport strategy for South East Wales. Its stated vision is to provide "a modern, accessible, integrated and sustainable transport system for South East Wales, which

increases opportunity, promotes prosperity for all and protects the environment; where walking, cycling, public transport, and sustainable freight provide real travel alternatives (Paragraph 3.1)."

A South East Wales Valleys Local Transport Plan (2015) is also in place, outlining the local authorities' objectives for the local transport in the area, with a particular emphasis on sustainable forms of transport.

Table 15A.1 sets out specific policies relating to the Effects on All Travellers assessment, set out by the local authorities of Merthyr Tydfil (MTCBC), Rhondda Cynon Taf (RCTCBC) and Caerphilly (CCBC), as well as the Brecon Beacons National Park Authority (BBNPA).

Table 15A.1 : Relevant local planning policy with regards 'Effects on All Travellers'

Planning document	Policy	Key points of policy	How has policy been addressed?
Rhondda Cynon Taf Local Development Plan up to 2021 (adopted March 2011)	CS1 Development in the North	RCTCBC will promote accessibility by securing investment in new roads, public transport improvements, walking and cycling, and reduce daily commuting by private car by promoting sustainable forms of travel.	Approximately 13 km of new NMU facilities would be provided as part of the proposed scheme, whilst bus stops would be maintained or moved to more suitable replacement locations.
	CS8 Transportation	Improvements to the strategic transportation network in RCT will be secured, with provision of additional improvements in the highway network, public transport improvements and walking and cycling provision will be sought.	
	AW5 New Development	Development proposals will be supported where the development would be accessible to the local and wider community by a range of sustainable modes of transport and the layout maximises opportunities to reduce dependence on cars.	
	NSA21 Park and Ride / Park and Share Provision	Provision for park and ride / park and share facilities will be provided within Strategic Site 5: Land South of Hirwaun.	The proposed scheme would enhance access to the strategic site via the offline section south of Hirwaun, whilst NMU provision would be provided through the new Hirwaun junction which could be used to access the site in future.
	NSA22 Rail Network and	Land will be safeguarded	The proposed scheme

Planning document	Policy	Key points of policy	How has policy been addressed?
	Station Improvements	for rail network improvements along the route of; 1. The former rail freight line between Aberdare and the former Tower Colliery, Hirwaun; and For the provision of station improvements at: 2. The former Railway Site, Hirwaun; 3. The former Freight Head, Hirwaun.	would improve access to Hirwaun and any future developments within the town.
	NSA23 Cycle Network Improvements	The existing network of cycle paths and community routes will be extended, improved and enhanced to include the following schemes: • The Heads of the Valley Cycleway and links to Hirwaun Industrial Estate; and • the Cynon Valley Cycle Route.	New cycling provision would be incorporated as part of the proposed scheme to tie in with the existing NCN Routes within the study area.
Out and About: The Rights of Way Improvement Plan for Rhondda Cynon Taf 2007	The strategy aims to protect the current access resource, improve provision for walkers, cyclists and horse riders, and promote walking and cycling as transport options.		The connectivity of PRoW has been maintained on the whole, as well as enhanced, with the provision of new NMU facilities.
Brecon Beacons National Park Authority Local Development Plan 2007-2022 (adopted December 2013)	SP2 Major Development in the National Park – Strategic Policy	The National Park Authority (NPA) will provide an assessment of any detrimental effect to recreational opportunities that a major development in the National Park may cause, and the extent to which these could be moderated.	The NPA have been consulted throughout the design period of the proposed scheme to ensure effects to the National Park are mitigated as far as possible.
	SP17 Sustainable Transport	Planning opportunities will be pursued to improve and promote accessibility and to reduce the need to travel by private car, by permitting facilities to improve public transport and ensuring new development is well	Approximately 13 km of new NMU facilities would be provided as part of the proposed scheme, whilst bus stops would be maintained or moved to more suitable replacement locations.

Planning document	Policy	Key points of policy	How has policy been addressed?
		designed by providing appropriate access for pedestrians, cyclists and encouraging the provision of new pedestrian and cycle infrastructure.	
	Policy 49 Rights of Way and Long Distance Routes	Development that would prevent or adversely affect the use of a public right of way, a route with potential to form a long-distance walking, riding or cycling path, or a promoted path, will only be permitted where an equivalent alternative route can be provided.	Approximately 13 km of new NMU facilities would be provided as part of the proposed scheme.
	Policy 60 Provision for Cycling and Walking	Development will be permitted where it involves the creation of new pedestrian and / or cycle routes, or will enable the implementation of specific measures to make walking and / or cycling safer and more attractive.	
Brecon Beacons National Park Authority Rights of Way Improvement Plan June 2007	The plan aims to promote healthy lifestyles by improving the condition of the existing rights of way network and access provision, and provide opportunities for and promotion of sustainable access to the countryside.		The connectivity of PRoW has been maintained on the whole, as well as enhanced, with the provision of new NMU facilities.
Merthyr Tydfil Local Development Plan 2006-2021 (adopted May 2011)	BW7 Sustainable design and place making	MTCBC will support good quality sustainable design and require new development to contribute to improving accessibility and connectivity to other green infrastructure, footpaths and cycleways.	Appropriate guidance followed by design team, whilst new NMU provision would tie in with the existing local footpath and NCN Route.
	BW11 Transport, cycling and pedestrian proposals	Proposals for new transport, cycling, and pedestrian facilities will be favourably considered where they: • ensure improvements to the frequency, speed and extent of bus and rail services; • improve the integration	Approximately 13 km of new NMU facilities would be provided as part of the proposed scheme, whilst bus stops would be maintained or moved to more suitable replacement locations.

Planning document	Policy	Key points of policy	How has policy been addressed?
		between transport modes; • improve access to the countryside; • ensure an increased amount of attractive, safe and easy-to-use routes; and • reduce traffic congestion.	
	BW12: Development proposals and transport	Where appropriate, MTCBC will expect all development proposals to demonstrate how they will help reduce the need to travel and encourage the use of transport other than the private car.	
	BW16 Protecting / enhancing the network of leisure facilities	MTCBC will protect and support the enhancement of the County Borough's network of PRoW in order to ensure their continued use for recreation and amenity.	Consultation has taken place with MTCBC to ensure alterations to the existing network of PRoW, as well as the provision of new NMU facilities, is adequate.
	AS12 Public transport - road	Development proposals that lead to the improvement of bus services in MTCBC will be supported.	Bus stops would be maintained or moved to more suitable replacement locations.
	TB11 Access, parking and accessibility of local facilities	Proposals should ensure that any new highways are designed and constructed in accordance with the Manual for Streets and the access needs and mobility requirements of all sections of the community, particularly those with special needs and disabilities, are met.	Appropriate guidance followed by design team.
Merthyr Tydfil Rights of Way Improvement Plan 2007	The plan aims to promote opportunities for social, health and economic benefits within the county.		The connectivity of PRoW has been maintained on the whole, as well as enhanced, with the provision of new NMU facilities.
Caerphilly County Borough Local Development Plan	SP6 Place Making	Proposals should contribute to creating sustainable places by	Approximately 13 km of new NMU facilities would be provided as part of the

Planning document	Policy	Key points of policy	How has policy been addressed?
up to 2021 (adopted November 2010)		utilising layouts that reflect sustainable transport and accessibility principles and provide full, easy and safe access for all.	proposed scheme, whilst bus stops would be maintained or moved to more suitable replacement locations.
	SP11 Countryside Recreation	Access to opportunities for enjoyment of the County Borough will be promoted and encouraged where the proposals are sustainable.	The majority of footpaths severed by the proposed scheme have been re-routed to maintain connectivity.
	SP19 Transport Infrastructure Improvement	CCBC will seek to implement improvements to the existing transport infrastructure that promote the most efficient use of the transport network.	The proposed scheme would upgrade the A465 to a road capable of carrying the associated traffic flow on the road, as well as improving opportunities for active travel with approximately 13 km of new NMU facilities.
	CW1 Sustainable Transport, Accessibility and Social Inclusion	Proposals will be supported where walking and cycling are modes of travel which have been actively encouraged for short trips, provision has been made for ease of cycling and the use of Green Travel Plans has been encouraged.	Approximately 13 km of new NMU facilities would be provided as part of the proposed scheme.
	CW3 Design Considerations - Highways	Development proposals must have regard for the safe, effective, and efficient use of the transportation network, as well as promoting the interests of pedestrians, cyclists and public transport before that of the private car.	The proposed scheme would upgrade the A465 to a road compliant with design standards, whilst also maintaining, and where appropriate, enhancing provision for pedestrians, cyclists and public transport opportunities.
Planning document	**Key points**		**How has this policy been addressed?**
Caerphilly County Borough Council - Rights of way improvement plan 2007	CCBC will aim to create and maintain a safe and sustainable network of Rights of Way to suit the needs of different user groups and create an open and accessible network for all users.		The connectivity of PRoW has been maintained on the whole, as well as enhanced, with the provision of new NMU facilities.

Appendix 15B – Non-motorised user survey metadata and results

Metadata for all non-motorised user surveys is described in Table 15B.1, with survey locations shown in Figure 15B.1. Survey report forms for those surveys where NMUs were recorded are shown below. Survey report forms for those surveys listed in Table 15B.1 where no NMUs were recorded have been omitted from this appendix.

Table 15B.1: Non-motorised user survey metadata

Survey location	Survey date	Survey start time	Survey end time	Weather
Footpath HIR/6/1 north of the A465 underpass	Tuesday 8 March 2016	08:00	18:00	Light drizzle throughout most of the day, with periodic dry spells, 11°C.
Footpath HIR/6/1 north of the A465 underpass	Saturday 14 May 2016	08:00	18:00	Cloudy but dry, 9°C.
Footpath HIR/4/2 where it meets the A465 at-grade	Thursday 10 March 2016	08:00	18:00	Dry and sunny, 9°C.
Footpath HIR/4/2 where it meets the A465 at-grade	Sunday 13 March 2016	08:00	18:00	Dry and sunny, 8°C.
NCN Route 46 south of Jah-Jireh Care Home	Tuesday 12 April 2016	08:00	18:00	Sunny spells, 7°C.
NCN Route 46 south of Jah-Jireh Care Home	Saturday 2 April 2016	08:00	18:00	Raining in the AM, sunny in the PM, 9°C.
Footpath 111/45 – south of Cefn Coed subway	Thursday 24 March 2016	08:00	18:00	Cloudy with a light wind, 8°C
Footpath 111/45 – south of Cefn Coed subway	Sunday 10 April 2016	08:00	18:00	Windy with sunny and cloudy spells, 10°C.
Cefn Coed High Street bridge	Monday 21 March 2016	08:00	18:00	Cloudy spells with a light wind throughout the day, no rain, 3-15°C.
Cefn Coed High Street bridge	Sunday 3 April 2016	08:00	18:00	Sunny with short spells of rain, 7°C.
NCN Route 8 (Taff Trail) on the old railway bridge over the A465	Wednesday 23 March 2016	08:00	18:00	Full cloud with a light wind, 7°C.
NCN Route 8 (Taff Trail) on the old	Saturday 9 April 2016	08:00	18:00	Snow in the AM, sunny in the PM, 4-

Survey location	Survey date	Survey start time	Survey end time	Weather
railway bridge over the A465				13°C.
Footpath 102/3 where it meets the A465 at-grade	Wednesday 9 March 2016	05:00	15:00	Snowing the AM, cloudy in the PM, 5-9°C.
Footpath 102/3 where it meets the A465 at-grade	Saturday 16 April 2016	05:00	15:00	Heavy rain from 09:00 – 10:00, mixture of clouds and sun for the rest, 8°C.
Footpath 102/10 where it meets the A465 at-grade	Thursday 31 March 2016	05:00	15:00	Light wind in the morning, cold through the day. Started cloudy but cleared by about 11, 8°C.
Footpath 102/10 where it meets the A465 at-grade	Saturday 23 April 2016	05:00	15:00	Sunny once light, 14°C.
Footpath 102/1 where it meets the A465 at-grade	Monday 14 March 2016	05:00	15:00	Rainy in the AM, sunny in the PM, 10°C.
Footpath 102/1 where it meets the A465 at-grade	Saturday 30 April 2016	05:00	15:00	Cloudy and sunny throughout, 13°C.
Footpath along the western edge of the existing Dowlais Top roundabout	Friday 11 March 2016	05:00	15:00	Dry with sunny spells, 10°C.
Footpath along the western edge of the existing Dowlais Top roundabout	Saturday 26 March 2016	05:00	15:00	Dry with sunny spells, 11°C.
Footpath along the western edge of the existing Dowlais Top roundabout	Wednesday 6 April 2016	05:00	15:00	Cloudy in the AM, sunny in the PM, 10°C.

Appendix 15C – Full Baseline Characterisation for Public Rights of Way and other Non-motorised Users (NMU) Routes

Table 15C.1 Baseline description of footpaths within the study area

Facility	Baseline summary	Sensitivity as NMU route
RHI= Rhigos, HIR= HIrwaun, AUN= Penywaun		
Footpath HIR/15/1	Footpath routed along the southern and eastern border of the Penderyn Reservoir, to the north of Hirwaun industrial estate. On the basis that the Penderyn Reservoir is utilised by fly fishermen, whilst the path may be a popular route for recreational use, a medium sensitivity value has been assigned.	Medium
Footpath RHI/25/2	Footpath RHI/25/2 is orientated south-west / north-east to the south of Hirwaun roundabout. The footpath is routed through the Tower Colliery Regeneration site before connecting with footpath RHI/25/1. On the basis the footpath is routed through the Tower Regeneration Colliery, the route is only likely to be used for a small stretch to the extreme east. Therefore a low sensitivity value has been deemed.	Low
Footpath RHI/25/1	Footpath RHI/25/1 orientates west off footpath RHI/24/1, RHI/24/2 and RHI/24/3, and connects to footpath RHI/25/2. On the basis the route is a popular footpath for dog walkers, a medium sensitivity to modification and / or disruption has been deemed.	Medium
Footpath RHI/24/1, RHI/24/2 and RHI/24/3	A combination of footpaths adjoining footpath HIR/43/1 which run along the southern perimeter of the Hirwaun Welfare Ground. Footpaths RHI/24/1, RHI/24/2 and RHI/24/3 are routed south-west of the Hirwaun Welfare Ground towards the Tower Regeneration Colliery. The area to the south of Hirwaun Welfare Ground is a popular spot for dog walkers. As a result, a medium sensitivity value to disruption has been assigned to the footpaths.	Medium
Footpath 3/11/1	Footpaths 3/11/1 connects Penderyn Road and Richmond Drive to the north-west of Hirwaun, through an area of shrub / scrub. The route is likely to be used to access Hirwaun from the residential properties along Garth Grove. In addition, the route is likely to be popular with dog walkers and individuals wishing to access the Afon Cynon. On this basis a medium sensitivity has been assigned.	Medium
Footpath 3/17/1	Footpath 3/17/1 connects Meadow Lane with Rhigos Road in Hirwaun, passing through a residential area and crossing Briar Way on-route. On the basis the footpath is used to move around Hirwaun, a medium sensitivity has been assigned.	Medium
Footpath HIR/43/1	Footpath HIR/43/1 traverses the southern border of the Hirwaun Welfare ground, connecting footpaths HIR/44/1 and HIR/42/3 with footpaths RHI/24/1, RHI/24/2 and RHI/24/3. The footpath is frequently used by dog walkers and has therefore been assigned a high sensitivity to disruption.	High
Footpath HIR/42/3	Footpath HIR/42/3 runs along the Hirwaun Welfare Ground access road, continuing through the car park before adjoining footpath HIR/43/1. Footpath HIR/42/3 connects with footpath HIR/42/2 along Caswell Close. The footpath is a key route used to access Hirwaun Welfare Ground and has therefore been assigned a high sensitivity to	High

Facility	Baseline summary	Sensitivity as NMU route
RHI= Rhigos, HIR= HIrwaun, AUN= Penywaun		
	modification and / or disturbance.	
Footpath HIR/42/2	Footpath HIR/42/2 connects footpaths HIR/42/1 and HIR/42/3 through housing to the north of the Hirwaun Welfare Ground. A high sensitivity value has been assigned to the footpath, on the basis it is the most direct route to access Hirwaun Welfare Ground.	High
Footpath HIR/42/1	Footpath HIR/42/1 connects footpath HIR/42/2 with Long Meadow Close in Hirwaun. Both footpaths are used to access Hirwaun Welfare Ground which is a popular recreational facility and the network of footpaths that surround the Welfare Ground, which are popular routes for dog walkers. The route is the most direct way to access the Hirwaun Welfare Ground. Therefore, a high sensitivity value has been assigned.	High
Footpath HIR/44/1	Footpath HIR/44/1 orientates directly south from the Hirwaun Welfare Ground car park, connecting footpaths HR/44/4 and HR/42/3. The area to the south of Hirwaun Welfare Ground is a popular area for dog walkers. On this basis, a high sensitivity value has been assigned.	High
Footpath HIR/44/4	Footpath HIR/44/4 is routed along the eastern boundary of the Tower Regeneration Colliery. The footpath adjoins footpath HIR/44/1. The area to the south of Hirwaun Welfare Ground is popular for dog walkers. For this reason, a high sensitivity value has been assigned.	High
Footpath HIR/39/1	Footpath HIR/39/1 is a short footpath, approximately 40 m in length, connecting the western end of Longfield Court with Glannant Street. The footpath is a key route in the community as it provides access to Hirwaun Primary School, with alternative routes providing significantly further distances. Therefore the route has been assigned as very high sensitivity to modification and / or disruption.	Very high
Footpath 3/19/1	Approximately 10 m in length, footpath 3/19/1 links National Cycle Network (NCN) Route 478 and NCN Route 46. The footpath is blocked by a gate and is therefore difficult to access by the public. As a result, a negligible value has been assigned.	Negligible
Footpath HIR/21/1	Footpath HIR/21/1 links Merthyr Road and Tramway in Hirwaun. The route is approximately 100 m in length. The route has been assigned a medium sensitivity value as although it is a popular shortcut for NMU, it does not lead to a key recreational area, whilst other alternative routes exist along pavements on the local road network.	Medium
Footpath HIR/40/4	Footpath HIR/40/4 connects the existing A465 with Johnson Park in Hirwaun. The footpath is approximately 65 m in length. The footpath provides no access to any key community areas and / or facilities and has therefore been assigned low sensitivity.	Low
Footpath HIR/40/1	Footpath HIR/40/1 is routed along the Mynydd Bwlfa Wind Farm access road. The footpath terminates where it meets the current A465 trunk road. On the basis that the footpath runs along an access road, with a significant amount of construction traffic likely, a low sensitivity value has been assigned.	Low
Footpath HIR/23/1	Footpath HIR/23/1 connects with footpath AUN/3/4 along the Trewaun Tramway. The route is likely to be used by school children accessing	Very high

Facility	Baseline summary	Sensitivity as NMU route
RHI= Rhigos, HIR= HIrwaun, AUN= Penywaun		
	Ysgol Gyfun Rhydywaun, as well as individuals moving between Hirwaun and Penywaun. On this basis, a very high value has been assigned.	
Footpath AUN/3/4	Footpath AUN/3/4 is routed alongside NCN Route 46 to the north of Penywaun. The footpath adjoins footpath AUN/3/3 to the east and footpath HIR/23/1 to the west, along the Trewaun Tramway. A very high sensitivity value has been assigned to the footpath on the basis it is likely to be used by school children to access Ysgol Gyfun Rhydywaun.	Very high
Footpath AUN/6/1	Footpath AUN/6/1 is routed south off the A4054, to the east of Roseville Bungalow. The footpath connects with footpaths AUN/7/1 and AUN/10/2. The route is likely to be used occasionally by dog walkers and equestrians wishing to access rural land to the south. On this basis the route has been assigned a low sensitivity.	Low
Footpath AUN/7/1	Footpath AUN/7/1 provides a link between footpaths AUN/6/1 and AUN/10/2 to the west of Fair View Bungalow. The route is likely to be used occasionally for recreational use by individuals wishing to access rural land to the south for. On this basis the route has been assigned a low sensitivity.	Low
Footpath AUN/10/2	Footpath AUN/10/2 connects footpaths AUN/6/1 and AUN/10/1, to the north of Fair View Bungalow. The route is blocked with stock proof fencing at the western extent. Therefore, a negligible value has been assigned.	Negligible
Footpath AUN/10/1	Footpath AUN/10/1 traverses land to the south of Penywaun Industrial Estate, adjoining footpaths AUN/10/2 and 3/35/1. The route is likely to be used occasionally by individuals wishing to access rural land to the south. As a result, a low sensitivity value has been assigned.	Low
Footpath 3/35/1	Footpath 3/35/1 runs to the west of Penywaun Industrial Estate, connecting the A4059 with footpath AUN/10/1. The route is likely to be used infrequently by pedestrians wishing to access rural land to the south. On this basis a low sensitivity value has been assigned.	Low
Footpath AUN/4/1	Footpath AUN/4/1 provides a link from the A4059 to NCN Route 46, through an area of shrub. The route is likely to be used by cyclists accessing NCN Route 46, however alternative routes exist, such as along the Trewaun Tramway and to the north of Penywaun. As a result the route is deemed to have a low sensitivity to disruption.	Low
Footpath AUN/3/3	Footpath AUN/3/3 runs along NCN Route 46, to the north of Penywaun, connecting with footpaths AUN/3/4 at its western extent and AUN/4/1 to the south. The route is likely to be used by individuals moving between the villages of Hirwaun and Penywaun, as well as school children accessing Ysgol Gyfun Rhydywaun, and therefore a very high value has been assigned.	Very high
Footpath HIR/6/1	Footpath HIR/6/1 connects Swansea Road (Hirwaun) to an underpass of the A465, where it adjoins footpath AUN/1/1. The footpath is routed between the residential area of Denbeigh Court and houses along Greenwood Drive, to the east of Hirwaun. NMU surveys revealed relatively little activity along the route, with only two dog walkers noted	Low

Facility	Baseline summary	Sensitivity as NMU route
RHI= Rhigos, HIR= HIrwaun, AUN= Penywaun		
	on a weekday survey and 20 on a weekend. As a result, a low sensitivity to disruption and / or modification has been assigned.	
Footpath AUN/1/1	Footpath AUN/1/1 runs along the northern bank of the Afon Cynon, to the north of Penywaun, connecting footpaths AUN/2/1 and HIR/6/1. The footpath joins footpath HIR/6/1 at an underbridge, to the south of Denbigh Court in Hirwaun. NMU surveys revealed very little activity on the route as it entered the underbridge, with the path used by two dog walkers on a weekday survey and 20 on a weekend. On this basis, a low sensitivity value has been deemed	Low
Footpath HIR/3/1	Footpath HIR/3/1 is routed along the southern end of the Nant Hir Reservoir, before continuing along the local road used to access Nant Moel Reservoir, and then along the southern end of Nant Moel Reservoir. From here the footpath orientates south and adjoins Nant-Y-Moel Lane. The route is a popular frequently used to access the two Reservoirs by anglers, as well as for equestrians. The route also has a high amenity value, offering long distance views down to Hirwaun. On this basis, a high sensitivity value has been deemed.	High
Footpath HIR/5/2	Footpath HIR/5/2 crosses the existing A465 at-grade, connecting footpath HIR/5/1 south of the westbound carriageway, with Nant-Y-Moel Lane. The footpath runs through woodland. NMU surveys on footpath HIR/4/2 observed no users using footpath HIR/5/2 to cross the A465 on both a midweek day and weekend day. The footpath appears to have been severed by the construction of the A465 and is therefore now rarely used. On the basis the footpath crosses the A465 at-grade, whilst NMU surveys recorded no use of the path to cross the trunk road, a negligible sensitivity value has been deemed.	Negligible
Footpath HIR/4/1	Footpath HIR/4/1 runs from the existing A465 where it adjoins at-grade, through woodland to the south of Valley View Bungalow, along Nant-Y-Moel Lane. NMU surveys on footpath HIR/4/2 observed no users utilising footpath HIR/4/1 to cross the trunk road on a weekday or weekend day. The footpath appears to have been severed by the construction of the A465 and is therefore now rarely used. On the basis the footpath crosses the A465 at-grade, whilst NMU surveys recorded no use of the footpath to cross the trunk road, a negligible sensitivity value has been deemed.	Negligible
Footpath HIR/4/2	Footpath HIR/4/2 is routed through agricultural land which borders woodland to the west of Llwydcoed. The footpath connects footpath HIR/4/3 with the westbound carriageway of the A465, where it then connects with footpath HIR/4/1 via an at-grade crossing of the existing A465. NMU surveys recorded no users on a weekday or weekend day. The footpath appears to have been severed by the construction of the A465 and is therefore now rarely used. On the basis the route is rarely used, a negligible sensitivity value has been deemed.	Negligible
Footpath HIR/7/1	Footpath HIR/7/1 runs from the disused mineral railway line to Crematorium Road through agricultural fields. The footpath is routed along the north-east boundary of Gellitarw Farm. The footpath adjoins footpath AUN/2/1 at the disused mineral railway line. A high sensitivity value has been assigned as the route may be used as a long-distance walk, providing a loop from Hirwaun utilising footpaths HIR/6/A,	High

Facility	Baseline summary	Sensitivity as NMU route
RHI= Rhigos, HIR= HIrwaun, AUN= Penywaun		
	AUN/1/1 and AUN/2/1.	
Footpath AUN/2/1	Footpath AUN/2/1 connects footpaths AUN/1/1 and HIR/7/1, through agricultural fields to the north of Penywaun. The footpath connects with HIR/7/1 at the disused mineral railway line. NMU surveys revealed a low number of users utilising footpath HIR/6/1 to access footpath AUN/1/1, whilst the lack of NMU provision along the Crematorium Road is likely to deter users from accessing footpath HIR/7/1. On this basis, a low sensitivity value has been assigned.	Low
Footpath HIR/5/1	Footpath HIR/5/1 connects footpaths HIR/5/2 and HIR/4/3 through agricultural fields, to the west of Llwydcoed. The footpath adjoins footpath HIR/5/2 via an at-grade crossing of the existing A465. NMU surveys on footpath HIR/4/2, observed no users along footpath HIR/5/1 on a weekday or weekend day. The footpath appears to have been severed by the construction of the A465 and is therefore now rarely used. On the basis the route is rarely used, a negligible sensitivity value has been deemed.	Negligible
Footpath HIR/4/3	Footpath HIR/4/3 is routed through woodland and links footpaths HIR/4/2 and HIR/5/1 with Crematorium Road. The route has a low amenity value as it travels through woodland for its duration. NMU surveys on footpath HIR/4/2, observed no users along footpath HIR/4/3 on a weekday or weekend day. As a result, a negligible sensitivity value has been assigned.	Negligible
Footpath OED/6/1	Footpath OED/6/1 is routed along the eastern border of Llwydcoed Crematorium, before terminating at Crematorium Road. This path was highlighted as a key route used by horse riders. On this basis, a high sensitivity value has been assigned.	High
Footpath OED/9/3	Footpath OED/9/3 connects Merthyr road with footpath OED/9/4, through woodland to the south of Baverstock junction. A low sensitivity value has been deemed given the route provides no real means of access and is located a significant distance from any residential areas.	Low
Footpath OED/9/4	Footpath OED/9/4 connects footpaths OED/9/2 and OED/9/3, through woodland to the south of Baverstock junction. A low sensitivity value has been deemed given the route provides no real means of access and is located a significant distance from any residential areas.	Low
Footpath OED/9/2	Footpath OED/9/2 connects Merthyr Road with footpath OED/9/1, through woodland to the south of Baverstock junction. A low sensitivity value has been deemed given the route provides no real means of access and is located a significant distance from any residential areas.	Low
Footpath OED/9/1	Footpath OED/9/1 runs from the Merthyr Tydfil / Rhondda Cynon Taf county boundary, through woodland to the south of Baverstock Junction. The footpath adjoins footpaths OED/9/2 and OED/9/4. A low sensitivity value has been deemed given the route provides no real means of access and is located a significant distance from any residential areas.	Low
Footpath HIR/24/1	HIR/24/1 is orientated through the Brecon Beacons National Park, to	Low

Facility	Baseline summary	Sensitivity as NMU route
RHI= Rhigos, HIR= HIrwaun, AUN= Penywaun		
	the west of the A470. The route is likely to be used occasionally for recreational use by equestrians. On this basis, a lows sensitivity value has been deemed.	
Footpath 111/43	Footpath 111/43 splits in two from footpath 111/45, navigating along the old Taff Trail to the west and along Grawen Lane to the east. NMU surveys of footpath 111/45 recorded nine adult pedestrians on a midweek day and 13 on a weekend day, all of which continued along the old Taff Trail section of the footpath. Given the low number of NMU, a low sensitivity value has been deemed.	Low
Footpath 111/25	Footpath 111/25 connects Grawen Lane with the A4054, approximately 350 m north of Brecon Road bridge. A negligible value has been assigned as the route appears to have fallen into disuse with the northern extent extremely overgrown with vegetation.	Negligible
Footpath 111/45	Footpath which crosses under the A465 in Cefn Coed, connecting Job's Lane to the south with footpath 111/43 to the north. The footpath is used to connect the community of Cefn Coed. NMU surveys recorded nine adult pedestrians on a midweek day and 13 on a weekend day. On the basis the route appears to be rarely used, a low sensitivity value has been deemed.	Low
Footpath 111/27	Footpath 111/27 routes through woodland to the south of Cefn Coed, connecting Cefn Coed Rugby Club with Pontycapel Road, via Wern Road. The route traverses the Afon Taf Fechan and is likely to be used occasionally by dog walkers. On this basis a low sensitivity value has been assigned.	Low
Footpath 111/31	Footpath 111/31 connects Cloth Hall, to the north of Cefn Coed Lane, with the A4054. The footpath passes through moorland to the west of Merthyr Tydfil Golf Club. The route has a high amenity value as it experiences long distance views through the Afon Taf Fawr valley to the north, as well as south over Merthyr Tydfil. As a result it is likely to popular for recreational use, for example with walkers and / or dog walkers, and therefore a high sensitivity value has been assigned.	High
Footpath 111/26	Footpath 111/26 is approximately 30 m in length and orientates eastwards from the A5054, south of Well Street, towards the Afon Taf Fechan. The route is likely to be used to access the Afon Taf Fechan for recreational purposes; however it does not tie in with any other ProW. On this basis, a low sensitivity value to modification has been assigned.	Low
Footpath 111/34	Footpath 111/34 runs alongside the Afon Taf Fechan, commencing to the north of where the river crosses under the A4054. The footpath continues under the Taf Fechan viaduct and north towards the local road that runs through Pontsarn, through an area of woodland. The footpath provides a long distance walk with high amenity value and provides a route into Merthyr Tydfil town centre. It is therefore likely to be popular for recreational use, with a high sensitivity value assigned.	High
Footpath 111/35	Footpath 111/35 routes along the southern bank of the Afon Taf Fechan, from the Taf Fechan viaduct to just south of the local road which runs through Pontsarn, where it adjoins footpath 111/34. The route provides no link into Merthyr Tydfil as it is stopped up by the	Low

Facility	Baseline summary	Sensitivity as NMU route
RHI= Rhigos, HIR= HIrwaun, AUN= Penywaun		
	A465 at the Taf Fechan viaduct, whilst alternative routes exist closer to the Afon Taf Fechan. For this reason, a low sensitivity value has been deemed.	
Footpath 111/23	Footpath 111/23 adjoins footpath 111/33 through woodland to the north of the Afon Taf Fechan. The footpath adjoins Vaynor Road at its most northern extent. Given the high amenity value of the route, it is likely to be popular for recreational use. A medium sensitivity value to disruption has therefore been assigned.	Medium
Footpath 111/33	Footpath 111/33 connects footpath 111/23 with a local road which runs through Pontsarn. The footpath runs north of footpath 111/34, to the north of the Afon Taf Fechan. A medium sensitivity value has been assigned as the route is likely to be used for recreational use, although alternative routes are available.	Medium
Claimed ProW	A network of claimed ProW can be found to the north of the existing A465 near Galon Uchaf and around Morlais Park, with a further claim routed through Dowlais Top. A medium sensitivity has been deemed as the routes are likely to be used infrequently, with alternative definitive routes existing.	Medium
Footpath 102/14	Footpath 102/14 connects Rocky road to Pant industrial estate, crossing the existing A465 at-grade. It would appear that the footpath was subject to historical severance when the existing A465 trunk road was built, however it still remains a definitive footpath. Footpath 102/14 crosses three lanes of carriageway, as well as two slip roads. As a result it has been assumed that usage of the footpath would be low, whilst an alternative route linking Pant Industrial Estate and Rocky Road exists across Bryniau Road. As a result an overall negligible value has been assigned.	Negligible
Footpath 102/13	Footpath 102/13 connects Rocky Road with Balaclava Road, through Ifor Park. A medium sensitivity value has been assigned as the route is likely to be used by NMUs moving between Pen-y-Darren and Dowlais.	Medium
Footpath 105/1	Footpath 105/1 traverses the northern boundary of Pantysgallog Primary School, connecting Heol-y-Bryniau and Pant Road. The footpath is a key route for school children living to the east of Pant Road wishing to access the primary school. On the basis it is a key route, a very high sensitivity value has been assigned.	Very High
Footpath 102/12	Footpath 102/12 is approximately 50 m in length and is routed east off Victoria Street along the southern boundary of Merthyr Motor Auctions. The footpath is used to access barren land on the site of the former British Steel Company Dowlais Works. As the route is still open, but links to an area of land that has fallen into disrepair, a low sensitivity value has been assigned.	Low
Footpath 105/7	Footpath 105/7 runs along the western edge of the northern Dowlais Top Reservoir north of the existing A465. The footpath connects with footpath 105/5 to the south, as well as footpath 105/8 and NCN Route 46 as it orientates north. The route is likely to be used occasionally for recreational use, with more popular routes located closer to the pond. As a result of the alternative, more attractive routes that exist, a low	Low

Facility	Baseline summary	Sensitivity as NMU route
RHI= Rhigos, HIR= HIrwaun, AUN= Penywaun		
	sensitivity value has been assigned.	
Footpath 105/8	Footpath 105/8 runs along the southern edge of the northern Pen-y-wern Pond. The route is likely to be popular for recreational purposes, including anglers, as well as shoppers and workers travelling to the Dowlais Top Retail Park and Pengarnddu Business Park. Therefore a medium sensitivity has been assigned.	Medium
Footpath 102/3	Footpath 102/3 links Upper Row in Dowlais, with the westbound carriageway of the A465, where it provides an at-grade crossing. The footpath links with footpaths 102/2 and 102/6 to the south. NMU surveys recorded 18 pedestrians using the footpath to cross the carriageway on a weekday, and 25 on a weekend, from 05:00 to 15:00. The route is used by shoppers and workers commuting to ASDA and the Pengarnddu Business Park. On this basis, a medium sensitivity value has been assigned.	Medium
Footpath 105/6	Footpath 105/6 is a short footpath, approximately 60 m in length, linking footpaths 105/8 and 105/5 to the north of the existing A465. This route is likely to be used occasionally by NMU for recreational purposes. The route does not provide direct access to the Pengarnddu Business Park or Dowlais Top Retail Park. On this basis a low value has been assigned.	Low
Footpath 102/2	Footpath 102/2 connects footpath 102/3 with footpaths 102/4 and 102/5, and is approximately 100 m in length. Footpath 102/5 also adjoins the footpath to the east. The footpath is located to west of the southern Pen-y-wern Pond. NMU surveys revealed the route is a popular route for dog walkers who loop around the pond. NMU surveys also revealed a small number of individuals who use the path to access Pengarnddu Business Park, and vice versa, with 18 recorded over a 10 hour period. As a result, a medium sensitivity value has been assigned.	Medium
Footpath 105/5	Footpath 105/5 runs from the south-east corner of the northern Pen-y-wern Pond to the existing A465, where it forms an at-grade crossing of the A465. The footpath connects with footpaths 105/4, 105/6, 105/7, 105/8, 105/10 along its extent. The route is predominantly used for recreational purposes around the pond, including by anglers, as well as shoppers and workers accessing the Pengarnddu Business Park and Dowlais Top Retail Park. NMU surveys recorded 18 users utilising the path to cross the trunk road during a midweek day and 25 on a weekend day, from 05:00 to 15:00. On this basis a medium sensitivity value has been assigned.	Medium
Footpath 102/5	Sections of footpath 102/5 can be found on either side of the existing A465. A 35 m section diverts off footpath 102/2 to the east, south of the A465. A longer stretch of the footpath traverses the southern border of the northern Pen-y-wern Pond, providing an at-grade crossing of the A465. The footpath links into the following footpaths to the north of the A465: • Footpath 105/4; • Footpath 105/6; • Footpath 105/7;	High

Facility	Baseline summary	Sensitivity as NMU route
RHI= Rhigos, HIR= HIrwaun, AUN= Penywaun		
	• Footpath 105/8; and • Footpath 105/10. The footpath is likely to be utilised for recreational use, as well as by individuals accessing Pengarnddu Business Park from the south, and has therefore been assigned a high sensitivity rating.	
Footpath 102/6	Footpath 102/6 runs to the south of the southern Penywern Pond, linking to footpaths 102/2 and 102/3 to the west and 102/4 and 102/7 to the east. The footpath is a popular spot for dog walkers. The footpath has therefore has been assigned a high sensitivity value.	High
Footpath 102/4	Footpath 102/4 is routed along the western edge of the southern Pen-y-wern Pond, connecting footpath 102/2 with footpaths 102/6 and 102/7. The footpath is a popular route amongst dog walkers. The route is also popular with anglers, as well as for general recreational use, and therefore has been assigned a high sensitivity value.	High
Footpath 105/10	Footpath 105/10 is orientated north from the existing A465 road to an access road to Merthyr Common, to the east of the northern Penywern Pond. NMU surveys recorded only two users utilising the footpath to cross the A465 on a weekday, and one on a weekend. The footpath is likely to be used occasionally to access bridleway 105/13. On this basis, an overall low sensitivity value has been assigned.	Low
Footpath 105/4	Footpath 105/4 runs from the south-east corner of the northern Penywern Pond, parallel with NCN Route 46, to the A465 where it forms an at-grade crossing of the existing trunk road. The footpaths links with the following footpaths at the south-east corner of the Penywern Pond: • Footpath 105/10; • Footpath 105/5; and • Footpath 105/8. Two NMU surveys, on a weekend and weekday, revealed no use of the path all day to cross the A465. On this basis a low sensitivity value has been deemed.	Low
Footpath 102/10	Footpath 102/10 travels along the eastern edge of the bottom Penywern Ponds, adjoining the existing trunk road through an at-grade crossing. NMU surveys recorded two users utilising the footpath to cross the A465 on a weekday, and one on a weekend, from 05:00 to 15:00. The surveys did however note a small amount of use by dog walkers who use the footpath as part of a loop around the pond. On the basis the footpath is infrequently used, a low sensitivity value has been deemed.	Low
Footpath 102/8	Footpath 102/7 runs from the south-west corner of the southern Pen-y-wern Pond, to Station Terrace in Dowlais. The footpath connects to a number of footpaths around the pond, creating a network of Public Rights of Way (PRoWs). On the basis the footpath is likely to be used by residents of Dowlais for recreational purposes, a medium value has been assigned.	Medium

Facility	Baseline summary	Sensitivity as NMU route
RHI= Rhigos, HIR= HIrwaun, AUN= Penywaun		
Footpath 102/9	Footpath 102/8 is routed north-south from Cross Blanche Street to the south-west corner of the southern Pen-y-wern Pond. A high sensitivity value has been assigned, as the route is likely to be used for recreational use from residents of Dowlais.	High
Footpath 102/7	Footpath 102/6 runs to the south of the southern Pen-y-wern Pond, linking to footpaths 102/2 and 102/3 to the west and 102/4 and 102/7 to the east. The footpath is a popular spot for dog walkers. The footpath has therefore been assigned a medium sensitivity value.	Medium
Footpath 102/1	Footpath 102/1 runs from Station Terrace to the existing A465, where it provides an at-grade crossing of the trunk road. Two NMU surveys, on a weekday and weekend, recorded no users all day using the footpath to cross the trunk road, from 05:00 to 15:00. On the basis the route appears to be rarely used, with more direct crossings across the A465 existing through the Dowlais Top junction and on footpath 102/3, a low sensitivity value has been deemed.	Low
Footpath 102/11	Footpath 102/11 connects footpath 102/7 with Coedcae Row. The footpath is routed along the access road to the stables and the small children's park to the north-west of Dowlais. The route is likely to be used by residents to the north of Dowlais who utilise the southern Pen-y-wern Pond for recreational use and for walking dogs. A safer and more direct route to ASDA supermarket and the Pengarnddu Business Park is located along the existing Dowlais Top roundabout. On this basis a medium sensitivity value has been assigned.	Medium
Footpath 102/22	Footpath 102/22 is routed through the Trecatti landfill site, from the A4060 in the west to the Caerphilly local authority boundary in the east. The footpath adjoins the A4060 via an at-grade stile. The route is likely to be seldom used given the path can only be accessed by an uncontrolled crossing of the A4060, whilst the presence of the landfill reduces the amenity value of the route. On this basis a negligible sensitivity value has been assigned.	Negligible
Footpath 102/34	Footpath 102/34 runs along the north-west boundary of the Trecatti landfill site, from footpath 102/22 to the Caerphilly County Borough boundary. The footpath is currently suspended under the "*Order for the suspension of Public Rights of Way The Opencast Coal Act 1958 The Acquisition of Land (Authorisation Procedure) Act 1946 The Trecatty Rights of Way Order 1975".* The public therefore have no right to walk on the footpath at present and as a result a negligible value has been assigned to the route.	Negligible
Footpath 102/35	Footpath 102/35 runs to the west of Trecatti landfill, before adjoining the A4060 at-grade opposite Dowlais Rugby Club playing fields. The footpath is currently suspended under the "*Order for the suspension of Public Rights of Way The Opencast Coal Act 1958 The Acquisition of Land (Authorisation Procedure) Act 1946 The Trecatty Rights of Way Order 1975".* The public therefore have no right to walk on the footpath at present and as a result a negligible value has been assigned to the route.	Negligible
Footpath 102/36	Footpath 102/36 navigates through the Trecatti landfill site, connecting footpath 102/22 in the west and east. The footpath is	Negligible

Facility	Baseline summary	Sensitivity as NMU route
RHI= Rhigos, HIR= HIrwaun, AUN= Penywaun		
	currently suspended under the "*Order for the suspension of Public Rights of Way The Opencast Coal Act 1958 The Acquisition of Land (Authorisation Procedure) Act 1946 The Trecatty Rights of Way Order 1975".* The public therefore have no right to walk on the footpath at present and as a result a negligible value has been assigned to the route.	
Footpath 102/37	Footpath 102/37 is located to the west of the Trecatti landfill site, connecting with footpath 102/35. The footpath is currently suspended under the *"Order for the suspension of Public Rights of Way The Opencast Coal Act 1958 The Acquisition of Land (Authorisation Procedure) Act 1946 The Trecatty Rights of Way Order 1975".* The public therefore have no right to walk on the footpath at present and as a result a negligible value has been assigned to the route.	Negligible
Footpath 102/38	Footpath 102/38 runs through the Trecatti landfill site, along the western perimeter. The footpath is currently suspended under the *"Order for the suspension of Public Rights of Way The Opencast Coal Act 1958 The Acquisition of Land (Authorisation Procedure) Act 1946 The Trecatty Rights of Way Order 1975".* The public therefore have no right to walk on the footpath at present and as a result a negligible value has been assigned to the route.	Negligible
Footpath 102/39	Footpath 102/39 runs through the north of the Trecatti landfill site up to the Merthyr Tydfil County Borough boundary. The footpath is currently suspended under the *"Order for the suspension of Public Rights of Way The Opencast Coal Act 1958 The Acquisition of Land (Authorisation Procedure) Act 1946 The Trecatty Rights of Way Order 1975".* The public therefore have no right to walk on the footpath at present and as a result a negligible value has been assigned to the route.	Negligible
Footpath 102/40	Footpath 102/40 is a short footpath to the south of the Trecatti landfill site. The footpath is currently suspended under the *"Order for the suspension of Public Rights of Way The Opencast Coal Act 1958 The Acquisition of Land (Authorisation Procedure) Act 1946 The Trecatty Rights of Way Order 1975".* The public therefore have no right to walk on the footpath at present and as a result a negligible value has been assigned to the route.	Negligible
Gelligaer FP95	Gelligaer FP95 is routed across land to the north of the Trecatti landfill site, from Ogilvie Terrace to the existing A465, where it crosses the carriageway at-grade. The route is unlikely to be used regularly given its distance from any areas of population and the lack of controlled crossing of the A465. On this basis a low sensitivity value has been assigned.	Low
Gelligaer FP100	Footpath which connects Gelligaer FP98 with Ogilvie Terrace, in a north-west – south-east orientation. A low sensitivity value has been assigned on the basis the footpath provides no real means of access.	Low
Gelligaer FP107	Gelligaer FP107 is routed off Ogilvie Terrace along an access track leading to Blaen-Carno Farm. Given the rural nature of the area, a low sensitivity value has been assigned.	Low

Facility	Baseline summary	Sensitivity as NMU route
RHI= Rhigos, HIR= HIrwaun, AUN= Penywaun		
Gelligaer FP98	Gelligaer FP98 which crosses Ogilvie Terrace, to the north of the Trecatti landfill site. The route provides no real means of access and has therefore been assigned a low sensitivity value.	Low
Gelligaer FP106	Footpath routed through Blaen-Carno Farm. The route connects to Gelligaer FP105 at its eastern extent. A low sensitivity value has been deemed, given the remote nature of the path.	Low
Gelligaer FP105	Footpath routed east off Ogilvie Terrace, connecting Gelligaer FP104 and Gelligaer FP95. A low sensitivity value has been deemed, on the basis the route is rarely used given the remote nature of the route.	Low
Gelligaer FP104	Gelligaer FP104 orientates through agricultural land to the east of Ogilvie Terrace, opposite Upper Cwm Carno Farm. Given the rural nature of the area, it is unlikely to be used regularly and has therefore been assigned a low sensitivity value.	Low
Gelligaer FP102	Gelligaer FP102 connects to the east of Gelligaer FP104. Given the rural nature of the area, it is unlikely to be used regularly and has therefore been assigned a low sensitivity value to disruption.	Low

Table 15C.2 Baseline description of cycle routes within the study area

Facility	Baseline summary	Sensitivity as NMU route
NCN Route 478	The cycle network enters Hirwaun along Penyard Road from the Brecon Beacons. From here, NCN Route 478 crosses the Afon Cynon, before continuing along Davies Row and Tramway where it adjoins NCN Route 46. Given the cycle route is a national trial, the route is considered to have a high sensitivity to disruption or modification.	High
NCN Route 46	NCN Route 46 traverses the study area in a number of places. In Section 6, the cycle route is routed along Rhigos Road and a 400 m stretch of the existing A465, before cutting through Hirwaun along Tower Road and Tramway and out to the north of Penywaun along the banks of the Afon Cynon. The cycle route then heads north along Cwmynysmintan Road and Crematorium Road and passes through Baverstock junction. A missing link in the route exists between Baverstock junction and Swansea Road (Gellideg), where the route travels along before adjoining NCN Route 8 just south of the Grade II* Cefn Coed Viaduct. From here NCN Route 46 runs along NCN Route 8, before re-entering the study area along Pant Road having branched off from NCN Route 46 to the north of the Brecon Mountain Railway. To the very east of Section 5, NCN Route 46 traverses the top of the northern Pen-y-wern pond and the south of the ASDA superstore, before heading east along a local road towards Gypsy Castle. The stretch of NCN Route 46 which runs along Old Rhymney Road between Dowlais and Gypsy Castle, Rhymney has no segregated provision for cyclists. NMU surveys recorded 10 users on a weekend day, of which six were cyclists, and six on a midweek day,	High

Facility	Baseline summary	Sensitivity as NMU route
	of which four were cyclists. As the cycle route is utilised by all types of NMU, a high sensitivity has been assigned.	
NCN Route 8 (Taff Trail)	NCN Route 8 heads north along the Afon Taf Fawr before crossing the Grade II* Cefn Coed Viaduct and the A465 via an old railway bridge. From here the route orientates north-east along the northern bank of the Afon Taf Fechan, heading towards Pontsticill Reservoir. The old Taff Trail also orientates through the study area, running along the A4054, before heading north-west along Grawen Lane and along the Afon Taf Fawr, where it crosses the existing A470 and heads north through the Brecon Beacons National Park (BBNP). NMU surveys along the old railway bridge, recorded 143 users (a combination of pedestrians and cyclists) on a weekday and 196 on a weekend day. A high sensitivity value has been prescribed, given the national nature of the route and the high user numbers recorded.	High

Table 15C.3 Baseline description of bridleways within the study area

Facility	Baseline summary	Sensitivity as NMU route
HIR/34/3	Bridleway HIR/34/3 runs parallel with the Nant Sych waterbody through the Brecon Beacons National Park, before connecting with Ffrwd Road where it adjoins the A470. The route is likely to be used occasionally for recreational use by equestrians. On this basis, a lows sensitivity value has been deemed.	Low
Bridleway 111/37	Bridleway 111/37 runs parallel to the A470 for approximately 400 m from Ffrwd Road. Ffrwd Road is utilised by equestrian groups who are likely to use the bridleway as an off-road route. On the basis the route is popular with equestrian users, a medium sensitivity value has been assigned.	Medium
Bridleway 111/44	Bridleway 111/44 orientates from Tai Mawr Road in Gellideg to Pontycapel Road in Cefn Coed, crossing under the A470 via an underpass. The route adjoins with NCN Route 46 as it passes under the A470, providing a link to NCN Route 8 and bridleway 113/3. The bridleway is likely to be used occasionally for recreational use and by residents of Gellideg wishing to access Cefn Coed and has therefore been deemed to have low sensitivity value to disruption or modification.	Low
Bridleway 113/3	Bridleway 113/3 follows the same route as NCN Route 8 along the Afon Taf and across the Grade II* Cefn Coed viaduct, from where it adjoins bridleway / byway 113/999 along Station Road. The bridleway commences to the north of Cyfarthfa Retail Park. Given the bridleway is routed along NCN Route 8 and the Grade II* Cefn Coed Viaduct, it is likely to be popular for recreational purposes. On this basis a high sensitivity value has been assigned.	High
Bridleway / byway 113/999	Part of the Taff Trail, bridleway / byway 113/999 is predominantly routed along Old Drill Hall Road. The route links bridleways 113/3 and 111/38. NMU surveys along the Taff Trail / A465 overbridge, recorded 143 users (a combination of pedestrians and cyclists) on a weekday	Very high

Facility	Baseline summary	Sensitivity as NMU route
	and 196 on a weekend day. On the basis the route is likely to be used by members of the community travelling around Cefn Coed, as well as the elderly and young wishing to access Saint John the Baptist Church and the Cefn Community Centre along Old Drill Hall Road respectively, a very high sensitivity value has been assigned.	
Bridleway 111/24	Bridleway 111/24 orientates along Cilsanws Lane through Cefn Coed, connecting Cefn Coed High Street with moorland to the north of Cefn Coed. The route is likely to be used to access footpaths 111/31 and 111/32 which navigate through moorland to the north of Merthyr Tydfil Golf Club and has therefore been assigned a high sensitivity value.	High
Bridleway 111/38	Bridleway 111/38 follows NCN Route 8 from the old railway bridge over the existing A465, to the south of Vaynor Road and Trefechan, and up to the Ponsticill Reservoir. NMU surveys along the Taff Trail / A465 overbridge, recorded 143 users (a combination of pedestrians and cyclists) on a weekday and 196 on a weekend day. Therefore, a high sensitivity to disruption and / or modification has been assigned.	Very high
Bridleway 111/32	Bridleway 111/32 links Somerset Lane with Merthyr Tydfil Golf Club, before orientating north through the grounds of the golf club. The route orientates through moorland through the grounds of the Golf Club. The route has vast long distance views south over Merthyr Tydfil as well as to the north over the Brecon Beacons National Park. On the basis the bridleway has a high amenity value, it is likely to be a popular route for recreational use. As a result, a high sensitivity value has been assigned.	High
Bridleway / byway 103/1	Bridleway / byway 103/1 connects Goitre Lane to the north of the Gurnos Estate, with a local road running to the west of Morlais Castle. This route is an important means of access to the Morlais Trail, an important trail referred to by the Merthyr Valley Ramblers. In addition, Merthyr Tydfil Ramblers confirmed that walkers travel from Gurnos to Morlais Castle and beyond along the Morlais Heritage Trail which follows the current alignment of Goitre Lane along bridleway / byway 103/1. On the basis it is a key connection route to a popular local trail, a high sensitivity value has been assigned.	High
Bridleway 105/9	Bridleway 105/9 traverses the top of the northern Pen-y-wern Pond, connecting NCN Route 46 with footpath 105/10. The bridleway is routed along NCN Route 46. The route is likely to be used frequently by anglers using the pond, dog walkers and / or for other recreational purposes. The route is also likely to be used by residents of Pant wishing to access ASDA, Pengarnddu Retail Park and Pengarnddu Business Park. On this basis a high sensitivity value has been assigned.	High
Bridleway 105/13	Bridleway 105/13 is routed north from a Travellers settlement to the west of Pengarnddu Business Park, past Blaen Morlais Farm. Although the bridleway has a high amenity value with long distance views north over the Brecon Beacons National Park and south over Merthyr Tydfil, it is only likely to be used to access Blaen Morlais Farm and has no other real means of access. On this basis, a low sensitivity value has been assigned.	Low
Gelligaer BR103	Bridleway Gelligaer BR103 connects NCN Route 46 road with Gelligaer FP102 and Gelligaer FP104. The bridleway passes under	Low

Facility	Baseline summary	Sensitivity as NMU route
	the existing A465 trunk road. A low sensitivity value has been assigned given its remote nature.	

Table 15C.4 Baseline description of local roads within the study area

Facility	Baseline summary	Sensitivity as NMU route
Rhigos Road	Rhigos Road is an A road which adjoins the trunk road at Hirwaun roundabout, providing access to Hirwaun Industrial Estate. NCN Route 46 runs along Rhigos Road before crossing Hirwaun roundabout and continuing along the A465. In addition to being used by cyclists, the road has pavements running along a large proportion of the road. On the basis the route is the most direct way to access Hirwaun Industrial Estate from the east and is also used by cyclists utilising NCN Route 46, a high sensitivity value to disruption has been assigned.	High
Hirwaun Road	Hirwaun road runs through Penywaun, connecting with the A465 at the Trewaun roundabout. A pavement running to the north of the road connects with an underpass which provides access under the A465. On the basis the route is a key route taking users into Hirwaun to access key facilities, as well for school children wishing to access Ysgol Gyfun Rhydywaun, the road is deemed to have very high sensitivity to disruption.	Very high
Tower Road	Tower Road is located off the westbound carriageway of the A465 as it approaches the Hirwaun roundabout. The road can be used to access Tower Regeneration Colliery site, however a gate blocks access suggesting alternative access exists. Where the road meets the A465, NCN Route 46 traverses the road for a small section before it orientates back over the trunk road via an overbridge and heads through Hirwaun. On the basis the road is used in part by NCN Route 46 and for other recreational use, a high sensitivity to change has been assigned.	High
Brecon Road	Brecon Road runs through Hirwaun from Trewaun roundabout. The road has pavements along both sides and crosses NCN Route 46 where it adjoins Manchester Place. On the basis the route is a key route through Hirwaun providing a link to community facilities along Hirwaun High Street, the route is deemed to have a very high sensitivity value to modification.	Very high
Crematorium Road	Crematorium Road is a minor road connecting the A465 from Baverstock junction to Court Lodge junction. The road provides direct access to Llwydcoed Crematorium and can be used to access the village of Llwydcoed. NCN Route 46 adjoins the road from Cwmynysminton Road and continues north towards the A465. The road is also a popular route for equestrians moving around the local area, with a number of horses located in the field to the north of the road near Llwydcoed Crematorium. On the basis the route is popular for both cyclist and pedestrians, a high sensitivity has been assigned.	High
Swansea Road	The road connects the A465 westbound carriageway to the east of	High

Facility	Baseline summary	Sensitivity as NMU route
(Gellideg)	Baverstock junction, with the A470 Cyfarthfa Retail Park junction. The road provides access to the villages of Clwydyfagwyr and Gellideg. NCN Route 46 is routed along the road, east of where it adjoins the A465. Pavements exist along both sides of the road on approach to Clwydyfagwyr and Gellideg. Given the route is used by cyclists on the NCN Route 46 as well as by residents moving around the community, a high sensitivity to disruption has been assigned.	
Grawen Lane	Grawen Lane provides on-slip and off-slip access to the eastbound carriageway at Cefn Coed. The lane has a footway to the north, providing NMU access to Fairview Houses. The road forms part of the Taff Trail walking route. On the basis the route is utilised by walkers using the Taff Trail walking route, as well as by pedestrians travelling from Fairview Houses to Cefn Coed High Street, a high sensitivity to disruption has been deemed.	High
Cefn Coed High Street	Cefn Coed High Street is the main road through Cefn Coed, linking the A470 to the north with Brecon Road which runs into Merthyr Tydfil town centre, crossing the A465 via the Brecon Road bridge. The route has pavements along the vast majority of the road and also forms the route of the Taff Trail walking route up to Grawen Lane. NMU surveys along the street recorded 226 users (pedestrians and cyclists) on a midweek day, and 170 on a weekend day, with the majority heading south across the trunk road. A number of school children were also recorded heading to Ysgol-graig and Cyfarthfa High School. The road is a popular route for cyclists heading south to join NCN Route 46, as well as north towards the BBNP. On the basis the route is a key route connecting residents to the north of the A465 with facilities on Cefn Coed High Street, a very high sensitivity value has been assigned.	Very high
Lower Vaynor Road	Lower Vaynor Road connects the westbound carriageway of the A465 with Cefn Coed High Street. The road has footways for the vast majority of its length. A route exists under the Taf Fechan Viaduct, connecting Lower Vaynor Road with NCN Route 8. The route provides a link between the communities of Cefn Coed and is also used by school children from Trefechan travelling to Pen-y-Dre High school. It is considered that this route would have medium sensitivity to NMU disruption or modification.	Medium
Goitre Lane	Goitre Lane links the Gurnos estate with the village of Pontsarn via an underpass. The route is used by bridleway / byway 103/1 to access the Morlais Trail. On the basis it is a key connection route to a popular local trail, the route has been deemed to have a high sensitivity to modification.	High
Bryniau Road	Bryniau Road connects Galon Uchaf with Pant Industrial Estate to the north. The road crosses the A465 trunk road via an overbridge, with footways along both sides. The route is likely to be a key route for commuters, as it provides the most direct access between Galon Uchaf and Pant industrial estate. The route is also likely to be used by school children from Pant travelling to Pen-y-Dre High school. For these reasons the route is recognised as a key NMU route and has therefore been assigned a very high sensitivity value.	Very high
Pant Road	Pant Road links Pant with Dowlais under the trunk road, whilst also providing a link to Pant Industrial Estate. A children's play area is	Very high

Facility	Baseline summary	Sensitivity as NMU route
	located directly south of the A465 where Pant Road crosses under. The route is a key means of access between the two communities and has therefore been judged to have a very high sensitivity to modification.	
Jones Street	Jones Street provides an alternative link between the residential areas of Dowlais and Pant, under the existing trunk road. The road predominantly provides direct access to housing areas with Pant and Dowlais, but can be used to access Pantysgallog Primary School by residents of Dowlais. Pant Road provides a more direct link to community facilities for residents of Pant. On this basis a medium sensitivity to disruption has been assigned.	Medium

Page left intentionally blank.

Appendix 15D – Full Assessment Results for Public Rights of Way and other Non-Motorised User (NMU) Routes

Table 15D.1 Impact assessment of all footpaths within the study area

Facility	Description of change from baseline during the construction and operational phases	Sensitivity as NMU route	Magnitude of change	Significance of effect
RHI= Rhigos, HIR= Hirwaun, AUN= Penywaun				
Footpath HIR/15/1	**Construction:** No impact is predicted during construction.	Medium	Negligible	Neutral
	Operation: No impact is predicted during the operational phase.	Medium	Negligible	Neutral
Footpath RHI/25/2	**Consultation:** There would be a loss of amenity associated with the construction of the off-line section south of Hirwaun.	Low	Minor adverse	Slight adverse
	Operation: A slight loss of amenity is anticipated with the new road alignment south of Hirwaun.	Low	Minor adverse	Slight adverse
Footpath RHI/25/1	**Construction:** There would be a loss of amenity associated with the construction of the off-line section south of Hirwaun.	Medium	Minor adverse	Slight adverse
	Operation: A slight loss of amenity is anticipated with the new road alignment south of Hirwaun.	Medium	Minor adverse	Slight adverse
Footpath RHI/24/1, RHI/24/2 and RHI/24/3	**Construction:** There would be a loss of amenity associated with the construction of the off-line section south of Hirwaun. In addition, access to the network of footpaths to the south of the Hirwaun Welfare Ground would be disrupted.	Medium	Moderate adverse	Slight adverse
	Operation: There would no direct physical impact to the footpaths; however the alignment of the new off-line section south of Hirwaun would prevent NMUs from accessing the network of footpaths to the south of the Hirwaun Welfare Ground.	Medium	Major adverse	Moderate adverse
Footpath 3/11/1	**Construction:** No impact is predicted during construction.	Medium	Negligible	Neutral
	Operation: No impact is predicted during the operational phase.	Medium	Negligible	Neutral
Footpath 3/17/1	**Construction:** No impact is predicted during construction.	Medium	Negligible	Neutral
	Operation: No impact is predicted during the operational phase.	Medium	Negligible	Neutral
Footpath HIR/43/1	**Construction:** Access would be disrupted by the construction of the off-line section to the south of Hirwaun, with temporary diversions put	High	Moderate adverse	Moderate adverse

Facility	Description of change from baseline during the construction and operational phases	Sensitivity as NMU route	Magnitude of change	Significance of effect
RHI= Rhigos, HIR= Hirwaun, AUN= Penywaun				
	in place.			
	Operation: Footpath HIR/43/1 would be diverted by approximately 250 m to adjoin Tower Road. From here it would have access to the de-trunked section of the existing A465. There would no significant change for vulnerable users as the option to turn back on themselves would exist. The diversion is simply an extension of the existing footpath. A loss of amenity would be anticipated with the construction of the new off-line section to the south of Hirwaun.	High	Minor adverse	Slight adverse
Footpath HIR/42/3	**Construction:** There would be an adverse effect on the amenity value towards the southern extent of the footpath, as a result of construction traffic and construction activities to the south of the Hirwaun Welfare Ground.	High	Minor adverse	Slight adverse
	Operation: A slight loss in amenity is anticipated, as a result of new wide views over the off-line road section south of Hirwaun.	High	Minor adverse	Slight adverse
Footpath HIR/42/2	**Construction:** No impact is predicted during construction.	High	Negligible	Neutral
	Operation: No impact is predicted during the operational phase.	High	Negligible	Neutral
Footpath HIR/42/1	**Construction:** No impact is predicted during construction.	High	Negligible	Neutral
	Operation: No impact is predicted during the operational phase.	High	Negligible	Neutral
Footpath HIR/44/1	**Construction:** The footpath would be severed by construction of the off-line section at Hirwaun and by the temporary road provided to the south of the proposed scheme, with access temporarily lost.	High	Minor adverse	Slight adverse
	Operation: The route would be severed by the new road alignment south of the Hirwaun Welfare Ground, with NMUs re-routed around the newly aligned footpath HIR/44/4.	High	Moderate adverse	Moderate adverse
Footpath HIR/44/4	**Construction:** There would an adverse effect on the amenity of the footpath as a result of construction activities south of the Hirwaun Welfare Ground.	High	Minor adverse	Slight adverse
	Operation: There would a loss in amenity as a result of the new off-line road alignment south of Hirwaun. The footpath would re-routed by approximately 50 m to the south of the	High	Minor adverse	Slight adverse

Facility	Description of change from baseline during the construction and operational phases	Sensitivity as NMU route	Magnitude of change	Significance of effect
RHI= Rhigos, HIR= Hirwaun, AUN= Penywaun				
	proposed scheme, where it would adjoin footpath HIR/40/1.			
Footpath HIR/39/1	**Construction:** No impact is predicted during construction.	Very high	Negligible	Neutral
	Operation: No impact is predicted during the operational phase.	Very high	Negligible	Neutral
Footpath 3/19/1	**Construction:** No impact is predicted during construction.	Negligible	Negligible	Neutral
	Operation: No impact is predicted during the operational phase.	Negligible	Negligible	Neutral
Footpath HIR/21/1	**Construction:** No impact is predicted during construction.	Medium	Negligible	Neutral
	Operation: No impact is predicted during the operational phase.	Medium	Negligible	Neutral
Footpath HIR/40/4	**Construction:** No impact is predicted during construction.	Low	Negligible	Neutral
	No change in route alignment, with a slight loss of amenity anticipated.	Low	Negligible	Neutral
Footpath HIR/40/1	**Construction:** The footpath would be severed by the temporary road provided to the south of the off-line section at Hirwaun during construction, with access temporarily lost.	Low	Major adverse	Slight adverse
	Operation: A slight loss of amenity is anticipated; however the footpath is routed along the Mynydd Bwllfa Wind Farm access road at present, and as such has a relatively low amenity value.	Low	Negligible	Neutral
Footpath HIR/23/1	**Construction:** Access through the Trewaun Tramway would be maintained throughout construction.	Very high	Negligible	Neutral
	Operation: The footpath would be re-routed by approximately 30 m across the new Trewaun Tramway overbridge. Ramps would be provided for vulnerable users. The construction of an overbridge would remove the anti-social behaviour issues associated with the existing Trewaun Tramway underpass. The footpath would be suitable for use by pedestrians, cyclists and equestrians.	Very high	Moderate beneficial	Moderate beneficial
Footpath AUN/3/4	**Construction:** Access through the Trewaun Tramway would be maintained throughout construction.	Very high	Negligible	Neutral
	Operation: The footpath would be re-routed by	Very high	Moderate	Moderate

Facility	Description of change from baseline during the construction and operational phases	Sensitivity as NMU route	Magnitude of change	Significance of effect
RHI= Rhigos, HIR= Hirwaun, AUN= Penywaun				
	approximately 30 m across the new Trewaun Tramway overbridge. Ramps would be provided for vulnerable users. The construction of an overbridge would remove the anti-social behaviour issues associated with the existing Trewaun Tramway underpass. The footpath would be suitable for use by pedestrians, cyclists and equestrians.		beneficial	beneficial
Footpath AUN/6/1	**Construction:** The footpath may experience slight views of the construction works through hedgerows at its southern extent; however, this is not anticipated to be significantly adverse.	Low	Negligible	Neutral
	Operation: Glimpsed views of the proposed scheme may be seen from the footpaths southern extent, however, this is not anticipated to be significantly adverse.	Low	Negligible	Neutral
Footpath AUN/7/1	**Construction:** There would be an adverse effect on the amenity value of the footpath, as a result of long distance views of the construction activities south of Hirwaun.	Low	Minor adverse	Slight adverse
	Operation: The footpath would experience long distance views over the proposed scheme south of Hirwaun.	Low	Minor adverse	Slight adverse
Footpath AUN/10/2	**Construction:** The footpath may experience glimpsed views of the construction of the off-line section south of Hirwaun; however this is not anticipated to be significant.	Negligible	Negligible	Neutral
	Operation: The footpath may experience glimpsed views of the proposed scheme; however, this is not anticipated to be significant.	Negligible	Negligible	Neutral
Footpath AUN/10/1	**Construction:** There would be an adverse effect on the amenity value of the footpath, as a result of long distance views of the construction activities south of Hirwaun.	Low	Minor adverse	Slight adverse
	Operation: The footpath would experience long distance views over the proposed scheme south of Hirwaun.	Low	Minor adverse	Slight adverse
Footpath 3/35/1	**Construction:** No impact is predicted during construction.	Low	Negligible	Neutral
	Operation: No impact is predicted during the operational phase.	Low	Negligible	Neutral
Footpath AUN/4/1	**Construction:** This footpath would experience glimpsed, long distance views of construction activities around the Croesbychan junction.	Low	Major adverse	Moderate adverse

Facility	Description of change from baseline during the construction and operational phases	Sensitivity as NMU route	Magnitude of change	Significance of effect
RHI= Rhigos, HIR= Hirwaun, AUN= Penywaun				
	Operation: The footpath is anticipated to experience glimpsed long distance views of the new Croesbychan junction.	Low	Minor adverse	Slight adverse
Footpath AUN/3/3	**Construction:** There would be an adverse effect on the amenity value of the route as a result of construction activities at Croesbychan junction.	Very high	Minor adverse	Slight adverse
	Operation: The footpath would experience glimpsed open views of the Croesbychan junction, with a slight loss of amenity expected.	Very high	Minor adverse	Slight adverse
Footpath HIR/6/1	**Construction:** Access to the southern part of the footpath would be temporarily disrupted during the demolition and reconstruction of the A465 underpass.	Low	Minor adverse	Neutral
	Operation: No impact is predicted during the operational phase.	Low	Negligible	Neutral
Footpath AUN/1/1	**Construction:** Access to the northern part of the footpath and the crossing would be temporarily disrupted during construction of the new drainage pond access road and demolition and reconstruction of the A465 underpass. There would be an adverse effect on the amenity value of the route as a result of construction activities at Croesbychan junction.	Low	Moderate adverse	Slight adverse
	Operation: The northern section of this footpath would be rerouted along the new drainage pond access road prior to crossing the A465. A slight loss of amenity is anticipated with long distance views over Croesbychan junction introduced.	Low	Minor adverse	Slight adverse
Footpath HIR/3/1	**Construction:** Access would be maintained throughout construction, with a slight loss of amenity anticipated.	High	Minor adverse	Slight adverse
	Operation: The footpath would be re-routed by approximately 50 m through the new Nant Moel Reservoir access road underpass. The route would be an improvement for vulnerable users as it would be an underpass rather than an overbridge. The footpath would experience glimpsed, long distant views over the Baverstock and Croesbychan junctions; however, this is not anticipated to be significant. The footpath would be suitable for use by pedestrians, cyclists and equestrians.	High	Negligible	Neutral
Footpath HIR/5/2	**Construction:** Access to the crossing of the	Negligible	Minor	Slight

Facility	Description of change from baseline during the construction and operational phases	Sensitivity as NMU route	Magnitude of change	Significance of effect
RHI= Rhigos, HIR= Hirwaun, AUN= Penywaun				
	A465 is likely to be temporarily disrupted.		adverse	adverse
	Operation: The footpath would be rerouted onto the shared NMU facility provided through Croesbychan junction, providing a safe crossing across the junction and removing the need for NMUs to cross the trunk road at-grade.	Negligible	Major beneficial	Slight beneficial
Footpath HIR/4/1	**Construction:** Access to the crossing of the A465 is likely to be temporarily disrupted.	Negligible	Minor adverse	Slight adverse
	Operation: The northern 58 m of the footpath would be rerouted west onto the shared NMU facility provided through Croesbychan junction, providing a safe crossing across the junction and removing the need for NMUs to cross the trunk road at-grade.	Negligible	Major beneficial	Slight beneficial
Footpath HIR/4/2	**Construction:** Access to the crossing of the A465 is likely to be temporarily disrupted.	Negligible	Minor adverse	Slight adverse
	Operation: The footpath would be rerouted onto the shared NMU facility provided through Croesbychan junction, providing a safe crossing across the junction and removing the need for NMUs to cross the trunk road at-grade.	Negligible	Major beneficial	Slight beneficial
Footpath HIR/7/1	**Construction:** The footpath would be maintained throughout construction of the Croesbychan junction, however.an adverse effect on amenity is anticipated during the construction period.	High	Minor adverse	Slight adverse
	Operation: The footpath would be re-routed by approximately 20 m from where it adjoins Crematorium Road, along the new access road to Gellitarw Farm and a shared use facility provided through Croesbychan junction. As the length of change is so minimal, it is not anticipated that it would significantly affect vulnerable users. The footpath would experience a loss of amenity, with clear views of Croesbychan junction.	High	Minor adverse	Slight adverse
Footpath AUN/2/1	**Construction:** There would be an adverse effect on the amenity value of the route as a result of construction activities at Croesbychan junction.	Low	Minor adverse	Slight adverse
	Operation: A slight loss of amenity is anticipated with long distance views over Croesbychan junction introduced.	Low	Minor adverse	Slight adverse
Footpath HIR/5/1	**Construction:** Access to the crossing of the A465 is likely to be temporarily disrupted.	Negligible	Minor adverse	Slight adverse

Facility	Description of change from baseline during the construction and operational phases	Sensitivity as NMU route	Magnitude of change	Significance of effect
RHI= Rhigos, HIR= Hirwaun, AUN= Penywaun				
	Operation: The footpath would be rerouted onto the shared NMU facility provided through Croesbychan junction, providing a safe crossing across the junction and removing the need for NMUs to cross the trunk road at-grade.	Negligible	Major beneficial	Slight beneficial
Footpath HIR/4/3	**Construction:** There is the potential for the footpath to experience glimpsed views through woodland of construction activities at the Croesbychan junction.	Negligible	Minor adverse	Slight adverse
	Operation: There would be no change in the physical condition of the route; however, the footpath may experience glimpsed views of the new Croesbychan junction through woodland.	Negligible	Minor adverse	Slight adverse
Footpath OED/6/1	**Construction:** An adverse effect on the amenity value of the footpath is anticipated towards the footpaths northern extent, as a result of construction activities at the Baverstock junction.	High	Minor adverse	Slight adverse
	Operation: The footpath would experience views over the Baverstock junction towards its northern extent.	High	Minor adverse	Slight adverse
Footpath OED/9/3	**Construction:** No impact is predicted during construction.	Low	Negligible	Neutral
	Operation: No impact is predicted during the operational phase.	Low	Negligible	Neutral
Footpath OED/9/4	**Construction:** No impact is predicted during construction.	Low	Negligible	Neutral
	Operation: No impact is predicted during the operational phase.	Low	Negligible	Neutral
Footpath OED/9/2	**Construction:** No impact is predicted during construction.	Low	Negligible	Neutral
	Operation: No impact is predicted during the operational phase.	Low	Negligible	Neutral
Footpath OED/9/1	**Construction:** No impact is predicted during construction.	Low	Negligible	Neutral
	Operation: No impact is predicted during the operational phase.	Low	Negligible	Neutral
HIR/24/1	**Construction:** No impact is predicted during construction.	Low	Negligible	Neutral
	Operation: No impact is predicted during the operational phase.	Low	Negligible	Neutral
Footpath 111/43	**Construction:** The construction of the new	Low	Major	Slight

Facility	Description of change from baseline during the construction and operational phases	Sensitivity as NMU route	Magnitude of change	Significance of effect
RHI= Rhigos, HIR= Hirwaun, AUN= Penywaun				
	A465 eastbound slip road would lead to a loss of amenity along the footpath. The construction footprint would directly impact the footpath, with potential for temporary disruption or loss of access.		adverse	adverse
	Operation: Footpath 111/43 would be re-routed to the north of the eastbound carriageway, reducing the length of the path by approximately 60 m. The footpath would also experience open views of the new A470 junction, creating a loss of amenity.	Low	Minor adverse	Slight adverse
Footpath 111/25	**Construction:** There would be a loss of amenity associated with the construction of the A470 junction.	Negligible	Minor adverse	Neutral
	Operation: The footpath would experience glimpsed views of the A470 junction.	Negligible	Minor adverse	Neutral
Footpath 111/45	**Construction:** The demolition of the Cefn Coed subway would result in the footpath being stopped up on either side of the carriageway, with a diversion provided across Cefn Coed High Street.	Low	Minor adverse	Slight adverse
	Operation: Footpath 111/45 would be re-routed across Cefn Coed High Street as the Cefn Coed subway is demolished, resulting in a diversion of approximately 380 m. Overall a slight adverse effect has been anticipated, as although NMUs journey length would increase, the current route is seldom used given the dark nature of the subway, with NMUs preferring to utilise the Cefn Coed High Street bridge to connect communities north and south of the trunk road.	Low	Minor adverse	Slight adverse
Footpath 111/27	**Construction:** There would be a loss of amenity associated with the construction of the A470 junction.	Low	Minor adverse	Neutral
	Operation: The footpath would experience long distance views over the A470 junction.	Low	Minor adverse	Neutral
Footpath 111/31	**Construction:** There would be a loss of amenity associated with the construction of the A470 junction.	High	Minor adverse	Slight adverse
	Operation: The footpath would experience long distance views over the proposed A470 junction.	High	Minor adverse	Slight adverse
Footpath 111/26	**Construction:** No impact is predicted during construction.	Low	Negligible	Neutral

Facility	Description of change from baseline during the construction and operational phases	Sensitivity as NMU route	Magnitude of change	Significance of effect
RHI= Rhigos, HIR= Hirwaun, AUN= Penywaun				
	Operation: No impact is predicted during the operational phase.	Low	Negligible	Neutral
Footpath 111/34	**Construction:** NMUs along the footpath would experience views of the Taf Fechan viaduct construction. Slight loss of amenity would occur due to the presence of a construction compound immediately east of the footpath.	High	Minor adverse	Slight adverse
	Operation: The footpath would experience glimpsed views of the new Taf Fechan viaduct; however, this is not anticipated to significantly alter the existing amenity value of the footpath.	High	Negligible	Neutral
Footpath 111/35	**Construction:** Access to the 40 m of footpath immediately north of the proposed scheme would likely be disrupted or due to the presence of a construction compound. In addition, NMUs along the footpath would experience views of the Taf Fechan viaduct construction.	Low	Minor adverse	Slight adverse
	Operation: The footpath would experience glimpsed views of the new Taf Fechan viaduct and the new road through the Greenie Galon Uchaf Road; however, this is not anticipated to significantly alter the existing amenity value of the footpath.	Low	Negligible	Neutral
Footpath 111/23	**Construction:** NMUs along the footpath would experience views of the Taf Fechan viaduct construction.	Medium	Minor adverse	Slight adverse
	Operation: There would no direct change to the route. The route would experience views of the new Taf Fechan structure; however, this is not anticipated to be significantly different from the existing views experienced.	Medium	Negligible	Neutral
Footpath 111/33	**Construction:** There would be a slight loss of amenity from the footpaths southern extent with views of the Taf Fechan viaduct.	Medium	Minor adverse	Slight adverse
	Operation: The footpath would experience glimpsed views of the new Taf Fechan viaduct at its southern extent; however, this is not anticipated to significantly alter the existing amenity value of the footpath.	Medium	Negligible	Neutral
Claimed PRoW	**Construction:** There would be adverse effects on the amenity value of all claimed PRoW, with access halted on routes through Dowlais Top and the new Prince Charles Hospital junction.	Medium	Moderate adverse	Slight adverse
	Operation: The Prince Charles Hospital junction would sever two claimed PRoW.	Medium	Minor adverse	Slight adverse

Facility	Description of change from baseline during the construction and operational phases	Sensitivity as NMU route	Magnitude of change	Significance of effect
RHI= Rhigos, HIR= Hirwaun, AUN= Penywaun				
	However, the shared use facility provided through the junction would provide an alternative route, with only minor diversion anticipated. The claimed PRoW at Dowlais Top would be permanently stopped up.			
Footpath 102/14	**Construction:** Access across the A465 would be lost. However, it is not anticipated that the footpath is well used and therefore this effect is not anticipated to be significant.	Negligible	Minor adverse	Neutral
	Operation: This footpath would be stopped up either side of the proposed scheme. The section of the footpath north of the proposed scheme would be diverted east into Pant Industrial Estate. Footpath 102/14 would experience clear views of the proposed scheme from its most northern extent; however, this is not anticipated to be significantly different to its current views of the A465.	Negligible	Minor adverse	Neutral
Footpath 102/13	**Construction:** There would be a loss of amenity with the widening of the A465 through Galon Uchaf.	Medium	Minor adverse	Slight adverse
	Operation: The footpath would have open views of the carriageway widening through Ifor Park, however this is not anticipated to significantly alter the amenity of the footpath.	Medium	Negligible	Neutral
Footpath 105/1	**Construction:** No impact is predicted during construction.	Very High	Negligible	Neutral
	Operation: No impact is predicted during the operational phase.	Very High	Negligible	Neutral
Footpath 102/12	**Construction:** No impact is predicted during construction.	Low	Negligible	Neutral
	Operation: No impact is predicted during the operational phase.	Low	Negligible	Neutral
Footpath 105/7	**Construction:** There would a loss of amenity as a result of significant construction activity around Dowlais Top.	Low	Minor adverse	Neutral
	Operation: There would be no direct impact to the footpath; however, a loss of amenity is anticipated with the widening of the A465 through the Pen-y-wern Ponds.	Low	Minor adverse	Neutral
Footpath 105/8	**Construction:** There would a loss of amenity as a result of significant construction activity around Dowlais Top.	Medium	Minor adverse	Slight adverse

Facility	Description of change from baseline during the construction and operational phases	Sensitivity as NMU route	Magnitude of change	Significance of effect
RHI= Rhigos, HIR= Hirwaun, AUN= Penywaun				
	Operation: There would be no direct impact to the footpath; however, a slight loss of amenity is anticipated with the widening of the A465 through the Pen-y-wern Ponds.	Medium	Minor adverse	Neutral
Footpath 102/3	**Construction:** Access to the crossing of the A465 is likely to be temporarily disrupted.	Medium	Moderate adverse	Slight adverse
	Operation: The northernmost 40 m of the footpath would be stopped up. The footpath would then tie in with the new overbridge between the Pen-y-wern ponds, providing a safe crossing of the trunk road and removing the need for NMUs to cross at-grade. The overbridge would be suitable for pedestrians only and would represent a significant improvement for vulnerable users, for example providing a safe crossing for disabled users. However, the footpath would have a clear view of the proposed scheme as vegetation to the south of the existing carriageway would be removed.	Medium	Major beneficial	Large beneficial
Footpath 105/6	**Construction:** There would be a loss of amenity as a result of significant construction activity around Dowlais Top.	Low	Minor adverse	Neutral
	Operation: There would be no direct impact to the footpath; however, a loss of amenity is anticipated with clear views of the Dowlais Top flyover expected.	Low	Minor adverse	Neutral
Footpath 102/2	**Construction:** Access to the northern extent of the footpath would be temporarily lost.	Medium	Minor adverse	Slight adverse
	Operation: The northern 98 m of the footpath would be re-routed east to tie in with footpath 102/4 at the base of the new NMU crossing. The footpath would have clear views of the proposed scheme. The re-route would represent a slight increase for vulnerable users.	Medium	Minor adverse	Slight adverse
Footpath 105/5	**Construction:** Access to the crossing of the A465 is likely to be temporarily disrupted.	Medium	Moderate adverse	Slight adverse
	Operation: The southern 5 m of the footpath would be severed, with the footpath instead re-routed over the overbridge between the Pen-y-wern ponds. This would remove the need for pedestrians to cross the A465 via the current uncontrolled at-grade crossing.	Medium	Major beneficial	Large beneficial
Footpath 102/5	**Construction:** A loss of amenity is anticipated with construction activities around Dowlais Top.	High	Minor adverse	Slight adverse

Facility	Description of change from baseline during the construction and operational phases	Sensitivity as NMU route	Magnitude of change	Significance of effect
RHI= Rhigos, HIR= Hirwaun, AUN= Penywaun				
	Operation: The footpath would be rerouted along the new shared use path linking footpath 102/4 to the new overbridge, with no significant change in length. This footpath would be exposed to views of the proposed scheme as vegetation is removed to the south of the carriageway.	High	Negligible	Neutral
Footpath 102/6	**Construction:** A loss of amenity is anticipated with construction activities around Dowlais Top.	High	Minor adverse	Slight adverse
	Operation: The footpath would be exposed to views of the proposed scheme as vegetation is removed to the south of the carriageway.	High	Minor adverse	Slight adverse
Footpath 102/4	**Construction:** A loss of amenity is anticipated with the widening of the road through the Pen-y-wern Ponds. The footpath would be temporarily diverted south of the proposed scheme.	High	Minor adverse	Slight adverse
	Operation: The footpath would be stopped up by approximately 75 m at its northernmost. The footpath would instead adjoin the shared use new NMU overbridge between the Pen-y-wern ponds. The footpath would have clear views of the new road as vegetation is removed.	High	Major beneficial	Large beneficial
Footpath 105/10	**Construction:** There would a loss of amenity as a result of significant construction activity around Dowlais Top. The at-grade crossing of the trunk road is also likely to be lost with diversions put in place.	Low	Moderate adverse	Neutral
	Operation: Footpath 105/10 would be stopped up by approximately 10 m from where it adjoins the existing trunk road. A designated NMU crossing would be provided approximately 280 m west. The footpath would experience open views of the proposed scheme, as vegetation currently surrounding the road is removed.	Low	Moderate adverse	Neutral
Footpath 105/4	**Construction:** Access to the crossing of the A465 is likely to be temporarily disrupted.	Low	Minor adverse	Slight adverse
	Operation: Approximately 10 m of the footpath would be stopped up where it adjoins the A465. A designated NMU crossing would be provided approximately 440 m west. The footpath would experience open views of the proposed scheme, as vegetation currently surrounding the road is removed.	Low	Moderate adverse	Neutral
Footpath 102/10	**Construction:** Access to the crossing of the A465 is likely to be temporarily disrupted.	Low	Minor adverse	Slight adverse

Facility	Description of change from baseline during the construction and operational phases	Sensitivity as NMU route	Magnitude of change	Significance of effect
RHI= Rhigos, HIR= Hirwaun, AUN= Penywaun				
	Operation: The footpath would be severed by the proposed scheme and would be diverted east along the new NMU provision to the south of the proposed scheme to adjoin footpath 102/4, at the base of the new NMU crossing. The footpath would experience open views of the proposed scheme, as the vegetation currently surrounding the road is removed.	Low	Major beneficial	Moderate beneficial
Footpath 102/8	**Construction:** A loss of amenity is anticipated with construction activities around Dowlais Top.	Medium	Minor adverse	Slight adverse
	Operation: The footpath would be exposed to views of the proposed scheme as vegetation is removed to the south of the carriageway.	Medium	Minor adverse	Slight adverse
Footpath 102/9	**Construction:** A loss of amenity is anticipated with construction activities around Dowlais Top.	High	Minor adverse	Slight adverse
	Operation: The footpath would have clear views of the proposed scheme as vegetation is removed which currently acts as a screen.	High	Minor adverse	Slight adverse
Footpath 102/7	**Construction:** A loss of amenity is anticipated with construction activities around Dowlais Top.	Medium	Minor adverse	Slight adverse
	Operation: Footpath 102/7 would be exposed to views of the proposed scheme, particularly that of the proposed Dowlais Top flyover	Medium	Minor adverse	Slight adverse
Footpath 102/1	**Construction:** Access to the crossing of the A465 is likely to be temporarily disrupted.	Low	Minor adverse	Slight adverse
	Operation: The footpath would be stopped up by approximately 65 m at its most northern extent and would instead be diverted to the south of the proposed scheme to tie in with footpath 102/11. A new overbridge crossing would be constructed approximately 350 m west of the footpath, providing a safe crossing of the trunk road. The footpath would have a clear view of the proposed scheme as vegetation currently screening the A465 would be removed.	Low	Moderate adverse	Slight adverse
Footpath 102/11	**Construction:** A loss of amenity is anticipated with the construction of the Dowlais junction.	Medium	Minor adverse	Slight adverse
	Operation: The amenity of footpath 102/11 would be adversely affected, with clear views of the proposed Dowlais Top fly-over. The northern-most 55 m of the footpath would be diverted south of the embankments.	Medium	Minor adverse	Slight adverse
Footpath 102/22	**Construction:** The footpath may experience long distant views of the Dowlais Top flyover;	Negligible	Negligible	Neutral

Facility	Description of change from baseline during the construction and operational phases	Sensitivity as NMU route	Magnitude of change	Significance of effect
RHI= Rhigos, HIR= Hirwaun, AUN= Penywaun				
	however, this is not anticipated to significantly alter the amenity of the path.			
	Operation: The footpath may experience long distant views of the Dowlais Top flyover; however, this is not anticipated to significantly alter the amenity of the path.	Negligible	Negligible	Neutral
Footpath 102/34	The footpath is currently suspended and has therefore not been considered further as part of this assessment.	Negligible	Negligible	Neutral
Footpath 102/35	The footpath is currently suspended and has therefore not been considered further as part of this assessment.	Negligible	Negligible	Neutral
Footpath 102/36	The footpath is currently suspended and has therefore not been considered further as part of this assessment.	Negligible	Negligible	Neutral
Footpath 102/37	The footpath is currently suspended and has therefore not been considered further as part of this assessment.	Negligible	Negligible	Neutral
Footpath 102/38	The footpath is currently suspended and has therefore not been considered further as part of this assessment.	Negligible	Negligible	Neutral
Footpath 102/39	The footpath is currently suspended and has therefore not been considered further as part of this assessment.	Negligible	Negligible	Neutral
Footpath 102/40	The footpath is currently suspended and has therefore not been considered further as part of this assessment.	Negligible	Negligible	Neutral
Gelligaer FP95	**Construction:** The footpath would be severed at its northern extent by the widening of the existing A465 at Dowlais Top, and by the proposed lapwing mitigation area located east of Galon Uchaf. Given the lack of use of the footpath, it is not anticipated that a diversion would be put in place.	Low	Major adverse	Slight adverse
	Operation: The footpath would stopped up either side of the proposed lapwing mitigation area, however given the lack of use of this path, the overall impact is deemed to be slight adverse.	Low	Major adverse	Slight adverse
Gelligaer FP100	**Construction:** No impact is predicted during construction.	Low	Negligible	Neutral
	Operation: No impact is predicted during the operational phase.	Low	Negligible	Neutral
Gelligaer FP107	**Construction:** The footpath is anticipated to	Low	Minor	Neutral

Facility	Description of change from baseline during the construction and operational phases	Sensitivity as NMU route	Magnitude of change	Significance of effect
RHI= Rhigos, HIR= Hirwaun, AUN= Penywaun				
	experience views of the construction of cuttings, with an effect on the amenity value of the footpath.		adverse	
	Operation: Gelligaer FP107 is only anticipated to see a small section of the proposed scheme to its western extent, as the road would be in cutting as, as well as the proposed Ogilvie Terrace overbridge. This would be a slight improvement to the current view seen from the western extent, which sees long distance views of the A465, as well as clear views of the Ogilvie Terrace overbridge.	Low	Minor beneficial	Neutral
Gelligaer FP98	**Construction:** No impact is predicted during construction.	Low	Negligible	Neutral
	Operation: No impact is predicted during the operational phase.	Low	Negligible	Neutral
Gelligaer FP106	**Construction:** No impact is predicted during construction.	Low	Negligible	Neutral
	Operation: No impact is predicted during the operational phase.	Low	Negligible	Neutral
Gelligaer FP105	**Construction:** No impact is predicted during construction.	Low	Negligible	Neutral
	Operation: No impact is predicted during the operational phase.	Low	Negligible	Neutral
Gelligaer FP104	**Construction:** The footpath is anticipated to experience views of the construction of cuttings, with an effect on the amenity value of the footpath.	Low	Negligible	Neutral
	Operational: The proposed scheme would be in cutting towards the eastern end, meaning the footpath would experience no change in amenity. There would no change to the route of the bridleway either.	Low	Negligible	Neutral
Gelligaer FP102	**Construction:** The footpath is anticipated to experience views of the construction of cuttings, with an effect on the amenity value of the footpath.	Low	Negligible	Neutral
	Operation: The proposed scheme would in cutting towards the eastern end, meaning the footpath would experience no change in amenity. There would no change to the route of the bridleway either.	Low	Negligible	Neutral

Table 15D.2 Impact assessment of all cycle routes available within the study area

Facility	Description of change from baseline during the construction and operational phases	Sensitivity as NMU route	Magnitude of change	Significance of effect
NCN Route 478	**Construction:** No change is anticipated during construction.	High	Negligible	Neutral
	Operation: No change is anticipated during operation.	High	Negligible	Neutral
NCN Route 46	**Construction:** Temporary diversions would be expected through the Hirwaun and Baverstock junctions, however, access would be maintained.	High	Moderate adverse	Slight adverse
	Operation: The cycle route would be incorporated into the proposed scheme as follows: • re-routing through Hirwaun junction of approximately 115 m, with traffic islands provided to ensure safe access; • provision of new overbridge along the Trewaun Tramway; • completion of the missing link between Baverstock junction and Swansea Road (Gellideg); and • shared use facility provision along Old Rhymney Road between Dowlais junction and Rhymney. The proposals would be a significant improvement for vulnerable users as they would provide much safer crossings of the A465.	High	Major beneficial	Very large beneficial
NCN Route 8 (Taff Trail)	**Construction:** Temporary diversions are anticipated whilst the existing A465 overbridge is demolished and a new bridge constructed, however access would be retained throughout construction.	High	Moderate adverse	Slight adverse
	Operation: The existing crossing of the A465 would be demolished and replaced with a new crossing from New Church Street, which would then run parallel with the eastbound A465 carriageway for approximately 80 m, before adjoining the existing NCN Route 8. The re-aligned overbridge would remove the need for cyclists to travel along the narrow access road adjacent to the St. John the Baptist Church.	High	Major beneficial	Very large beneficial

Table 15D.3 Impact assessment of all bridleways and bridleways / byways available within the study area

Facility	Description of change from baseline during the construction and operational phases	Sensitivity as NMU route	Magnitude of change	Significance of effect
HIR/34/3	**Construction:** No impact is predicted during construction.	Low	Negligible	Neutral
	Operation: No impact is predicted during the operational phase.	Low	Negligible	Neutral
Bridleway 111/37	**Construction:** The construction activities associated with the A470 junction would affect the amenity of the bridleway.	Medium	Minor adverse	Slight adverse
	Operation: The bridleway would experience glimpsed views of the new A470 junction.	Medium	Minor adverse	Slight adverse
Bridleway 111/44	**Construction:** The presence of construction activities associated with the A470 junction would affect the amenity of the bridleway.	Low	Minor adverse	Neutral
	Operation: The bridleway would experience clear views of the A470 junction.	Low	Minor adverse	Neutral
Bridleway 113/3	**Construction:** The presence of construction activities associated with the A470 junction would affect the amenity of the bridleway as it traverses the Grade II* Cefn Coed viaduct.	High	Minor adverse	Slight adverse
	Operation: The bridleway would experience clear views of the A470 junction as it crosses the Grade II* Cefn Coed viaduct.	High	Minor adverse	Slight adverse
Bridleway / byway 113/999 (part of the Taff Trail)	**Construction:** Temporary delays are anticipated as the Taff Trail is overbridge is demolished and replaced, however access would be retained throughout construction.	Very high	Minor adverse	Slight adverse
	Operation: The stretch of bridleway / byway that runs alongside the St. John the Baptist Church would be re-routed west along New Church Street to access the new Taff Trail overbridge. Re-routing the bridleway / byway avoids the use of the narrow path alongside the St. John the Baptist Church. This would be particularly beneficial for disabled users, with the new route allowing sufficient space for wheelchairs and mobility scooters.	Very high	Moderate beneficial	Large beneficial
Bridleway 111/24	**Construction:** No change.	High	Negligible	Neutral
	Operation: No change.	High	Negligible	Neutral
Bridleway 111/38	**Construction:** Temporary disruption is anticipated with the construction of a new NMU overbridge, which would carry the bridleway and NCN Route 8 (Taff Trail) across the A465, however access would be retained throughout construction.	Very high	Minor adverse	Slight adverse
	Operation: The bridleway would be diverted by	Very high	Moderate	Large

Facility	Description of change from baseline during the construction and operational phases	Sensitivity as NMU route	Magnitude of change	Significance of effect
	approximately 75 m west from where it currently crosses the A465. A new overbridge would be provided, creating a link to New Church Street. Re-routing the bridleway avoids the use of the narrow path alongside the St. John the Baptist Church. This would be particularly beneficial for disabled users, with the new route allowing sufficient space for wheelchairs and mobility scooters.		beneficial	beneficial
Bridleway 111/32	**Construction:** The construction activities associated with the A470 junction and the Taf Fechan viaduct would affect the amenity of the bridleway.	High	Minor adverse	Slight adverse
	Operation: The bridleway would experience long-distance views of the A470 junction.	High	Minor adverse	Slight adverse
Bridleway / byway 103/1	**Construction:** Goitre Lane underpass would be infilled, with access halted.	High	Major adverse	Large adverse
	Operation: The bridleway / byway would be re-routed east along the proposed shared use facility through Prince Charles Hospital junction, re-joining Goitre Lane to the south of the A465. The proposed new route involves a diversion of approximately 320 m. Equestrian facilities would be provided through the new Prince Charles Hospital junction. Crossing points would be provided to aid vulnerable users through the junction.	High	Moderate adverse	Moderate adverse
Bridleway 105/9	**Construction:** The bridleway is likely to experience views of the construction activities, with an adverse effect anticipated on the amenity value.	High	Minor adverse	Slight adverse
	Operation: The route would experience clear views of the new dualled section through the Pen-y-wern ponds as well as the new junction at Dowlais.	High	Minor adverse	Slight adverse
Bridleway 105/13	**Construction:** The bridleway is likely to experience views of the construction activities, with an adverse effect anticipated on the amenity value.	Low	Minor adverse	Neutral
	Operation: Bridleway 105/13 would see glimpsed views of the proposed Prince Charles Hospital junction at its highest extent, as the footpath experiences long distant views to the south.	Low	Minor adverse	Neutral
Gelligaer BR103	**Construction:** The footpath would experience views of construction activities and construction traffic.	Low	Minor adverse	neutral

Facility	Description of change from baseline during the construction and operational phases	Sensitivity as NMU route	Magnitude of change	Significance of effect
	Operation: The proposed scheme would be in cutting towards the eastern end, meaning the bridleway would experience no change in amenity. There would no change to the route of the bridleway either.	Low	Negligible	Neutral

Table 15D.4 Impact assessment of all local roads available within the study area

Facility	Description of change from baseline during the construction and operational phases	Sensitivity as NMU route	Magnitude of change	Significance of effect
Rhigos Road	**Construction:** There would be some disruption along NCN Route 46 through the Hirwaun roundabout with the construction of the new junction. Access would be maintained throughout the construction phase, however minor delays are anticipated and / or temporary diversions may be necessary.	High	Moderate adverse	Slight adverse
	Operation: NCN Route 46 would be re-routed along the newly aligned Rhigos Road, before crossing Hirwaun junction via a shared use facility. The shared facility would be suitable for use by pedestrians and cyclists. The cycle route would re-routed by approximately 115 m. The route would provide a much safer crossing of the junction, with traffic islands and a shared use facility provided.	High	Major beneficial	Very large beneficial
A4059	**Construction:** There would be temporary disruption in access from the A465 and Rhigos Road during the construction of the new Hirwaun roundabout.	Low	Minor adverse	Neutral
	Operation: No change is anticipated during operation.	Low	No change	Neutral
Hirwaun Road	**Construction:** Diversions would be put in place with the construction of the new Trewaun junction, however access would be retained throughout construction.	Very high	Negligible	Neutral
	Operation: A new shared use facility would be provided through the new Hirwaun Road overbridge, replacing the existing Trewaun underpass. The facility would be suitable for use by pedestrians and cyclists.	Very high	Moderate beneficial	Moderate beneficial
Tower Road	**Construction:** The road would be stopped up immediately to the north of the proposed scheme, preventing access to Tower Colliery. There would some loss of amenity with the construction of the proposed scheme south of Hirwaun Welfare	High	Minor adverse	Slight adverse

Facility	Description of change from baseline during the construction and operational phases	Sensitivity as NMU route	Magnitude of change	Significance of effect
	Ground.			
	Operation: Footpath HIR/43/1 would be re-routed along Tower Road to the north of the proposed scheme. There would no access along the road for vehicle traffic. The route would be an extension of the existing footpath. If the route was deemed too long for vulnerable users, they would still have the opportunity to turn back on themselves and follow the existing footpath to the south-east of the Welfare Ground.	High	Minor beneficial	Slight beneficial
Brecon Road	**Construction:** Diversions would be put in place with the construction of the new Trewaun junction, however access would be retained throughout construction.	Very high	Negligible	Neutral
	Operation: A new shared use facility would be constructed through the new Brecon Road overbridge, replacing the existing Trewaun underpass.	Very high	Moderate beneficial	Moderate beneficial
Swansea Road (Hirwaun)	**Construction:** The construction of the new and Croesbychan junction would result in a significant number of construction vehicles utilising the road, as well as a significant amount of construction activity in the surrounding area, adversely affecting the amenity value. Access however would be maintained.	Low	Minor adverse	Slight adverse
	Operation: NMU provision would be provided through Croesbychan junction, providing a safe crossing of the A465 for NMUs at this location. The NMU provision would continue along a small stretch of Swansea Road and would be suitable for use by pedestrians, cyclists and equestrians.	Low	Major beneficial	Moderate beneficial
Crematorium Road	**Construction:** The amenity value of the road would be reduced with construction works associated with the new Croesbychan junction to the west and Baverstock junction to the east. Temporary diversions are anticipated for NCN Route 46 where it adjoins Baverstock junction.	High	Moderate adverse	Slight adverse
	Operation: A new shared use facility would be provided from Crematorium Road, through Baverstock junction and onto Swansea Road (Gellideg). This would complete the missing link in NCN Route 46, and encourage cyclists to use the new NMU provision along the A465.	High	Major beneficial	Very large beneficial
Merthyr Road	**Construction:** A loss of amenity would be anticipated with the construction of the Baverstock junction, with the potential for temporary diversions in access.	Low	Moderate adverse	Slight adverse
	Operation: Merthyr Road would be re-routed to	Low	No	Neutral

Facility	Description of change from baseline during the construction and operational phases	Sensitivity as NMU route	Magnitude of change	Significance of effect
	the west to adjoin the new Baverstock junction layout, where it would connect into the NMU facility provided through the junction. A loss of amenity is anticipated with the with the new Baverstock junction.		change	
Access road to Jah-Jireh Care Home	**Construction:** Temporary disruption in access is likely with the construction of the new Baverstock junction.	Low	Moderate adverse	Slight adverse
	Operation: The access road would be re-located to the west, branching off from the new Baverstock junction. A shared use facility, suitable for pedestrians, cyclists and equestrians, would be located along the access road, providing a link to a key riding route for equestrians. The shared use facility would extend through the Baverstock junction, providing a safe means of crossing the A465 for equestrians.	Low	Major beneficial	Moderate beneficial
Swansea Road (Gellideg)	**Construction:** Access would be maintained throughout the construction phase; however a slight loss of amenity is anticipated.	High	Minor adverse	Slight adverse
	Operation: The existing missing link in NCN Route 46 between Swansea Road (Gellideg) and Baverstock junction would be completed through a shared use facility. The facility would be suitable for use by pedestrians, cyclists and equestrians.	High	Major beneficial	Large beneficial
Grawen Lane	**Construction:** No change as the pavement along the road would remain.	High	Negligible	Neutral
	Operation: No change as the pavement along the road would remain.	High	Negligible	Neutral
Cefn Coed High Street	**Construction:** Cefn Coed High Street overbridge would be demolished and replaced, with north to south access provided for NMUs through a diversion to the west, following the grassed land behind Cilsanws Houses.	Very high	Major adverse	Large adverse
	Operation: No impact is predicted during operation, with footways provided along the new Cefn Coed High Street overbridge.	Very high	Negligible	Neutral
Lower Vaynor Road	**Construction:** The pedestrian underpass which connects Lower Vaynor Road with Vaynor Road would remain open throughout construction. There would be a slight loss of amenity due to the placement of site compounds to the north and south of the underpass.	Medium	Negligible	Neutral
	Operation: There would be no change as the pedestrian underpass which connects Lower Vaynor Road with Vaynor Road would be	Medium	Negligible	Neutral

Facility	Description of change from baseline during the construction and operational phases	Sensitivity as NMU route	Magnitude of change	Significance of effect
	retained.			
Goitre Lane	**Construction:** Goitre Lane underpass would be infilled, with access halted.	High	Major adverse	Large adverse
	Operation: The bridleway / byway would be re-routed east along the proposed shared NMU facility through Prince Charles Hospital junction, re-joining Goitre Lane to the south of the A465. The proposed new route involves a diversion of approximately 320 m. The shared facility would be suitable for use by pedestrians, cyclists and equestrians. Equestrian facilities would be provided through the new Prince Charles Hospital junction. Crossing points would be provided to aid vulnerable users through the junction.	High	Moderate adverse	Moderate adverse
Bryniau Road	**Construction:** Bryniau Road bridge would be demolished and replaced, with temporary diversions anticipated through a temporary roundabout approximately 200 m east.	Very high	Moderate adverse	Moderate adverse
	Operation: A shared use facility would be provided along the new Bryniau Road bridge, suitable for use by pedestrians and cyclists.	Very high	Minor beneficial	Slight beneficial
Pant Road	**Construction:** Pant viaduct would be demolished and replaced, with the junction between Pant Road and Pontsarn Road realigned to the north of the proposed scheme. Access along Pant Road would be maintained throughout the construction phase, however there would be a loss of amenity due to the presence of a construction compound located immediately east of the road.	Very high	Negligible	Neutral
	Operation: The pavement along the road would be retained.	Very high	Negligible	Neutral
Jones Street	**Construction:** The overbridge at Jones Street would be demolished and replaced, with diversions put in place.	Medium	Negligible	Neutral
	Operation: The pavement along the road would be retained.	Medium	Negligible	Neutral

Appendix 15E – Effects on Public Transport

Table 15E.1 Assessment of effects on bus travellers

Current bus stops	Description of impacts	Residual significance of effect
Health Centre (north-west bound and south bound), Brecon Road, Hirwaun Health Centre, Hirwaun Stagecoach South Wales Service 7: Glynhafod – Penderyn, Stagecoach South Wales Service 8: Glynhafod - Morfa Glas via Aberdare,Stagecoach South Wales Service 9: Glynhafod – Merthyr Tydfil and New Adventure Travel Service 89 Merthyr Tydfil – Aberdare and Aberdare – Merthyr Tydfil.	**Construction:** There would be disruption in access due to the construction of the new Trewaun roundabout and the severance of the Trewaun subway. **Operation:** The bus stop would remain in the same location, with NMU provision through the new Trewaun junction maintaining access.	**Construction:** Moderate adverse **Operation:** Neutral
Trewaun (south-east bound), Hirwaun Road, Hirwaun Stagecoach South Wales Service 7: Penderyn – Glynhafod, Stagecoach South Wales Service 8: Morfa Glas – Glynhafod and South Wales Service 9: Merthyr Tydfil – Glynhafod.	**Construction:** There would be disruption in access due to the construction of the new Trewaun roundabout and the removal of the Trewaun subway. **Operation:** Bus stop would be reinstated in a similar location to at present, with NMU provision through the new Trewaun junction maintaining access.	**Construction:** Slight adverse **Operation:** Neutral
Heads of the Valleys Road (north-east bound), Swansea Road, Hirwaun Stagecoach South Wales Service 9: Glynhafod - Merthyr Tydfil and New Adventure Travel Service 89 Merthyr Tydfil - Aberdare	**Construction:** Disruption in access from north and south with the construction of the new Croesbychan junction. **Operation:** Bus stop would be reinstated in a similar location to the baseline. The construction of an NMU route through the new Croesbychan junction would improve access to the stop from the east.	**Construction:** Large adverse **Operation:** Slight beneficial
Heads of the Valleys Road (south-west bound), Swansea Road, Hirwaun Stagecoach South Wales Service 9: Merthyr Tydfil – Glynhafod and New Adventure Travel Service 89 Aberdare – Merthyr Tydfil.	**Construction:** Disruption in access from north and south and / or temporary loss of stop due to construction of the new Croesbychan junction and location of site compound adjacent to the bus stop. A temporary bus stop would be put in place during the construction phase if the bus stop was temporarily lost. **Operation:** The bus stop would be maintained during operation, with the construction of an NMU route through the new Croesbychan junction improving access to the stop from the east.	**Construction:** Slight adverse **Operation:** Slight beneficial
Baverstocks Hotel, Heads of the	**Construction:** Disruption in access and	**Construction:** Slight

Current bus stops	Description of impacts	Residual significance of effect
Valleys Road, Llwydcoed Stagecoach South Wales Service 6: Aberdare – Merthyr Tydfil and New Adventure Travel Service 89: Merthyr Tydfil – Aberdare.	/ or temporary loss of bus stop due to construction of new Baverstock junction and widening of existing carriageway. **Operation:** Bus stop would be permanently relocated to a safe location away from the dual carriageway. The construction of an NMU route through Baverstock junction would provide a safe access to and from the Jah-Jireh Care Home. Discussions would take place between the contractor, the local council and Stagecoach to find a suitable replacement location.	adverse **Operation:** Slight beneficial
Baverstocks Hotel, Head of The Valleys Road, Fairfield Place, Llwydcoed Stagecoach South Wales Service 6: Merthyr Tydfil – Aberdare, Stagecoach South Wales Service 9: Merthyr Tydfil – Glynhafod and First Call Travel Service X75: Merthyr Tydfil – Resolven	**Construction:** Disruption in access and / or temporary loss of bus stop due to construction of new Baverstock junction. **Operation:** Discussions would take place between the contractor, the local council and Stagecoach to find a suitable replacement location.	**Construction:** Slight adverse **Operation:** Neutral
Baverstocks Hotel, A465, Clwydfagwyr Stagecoach South Wales Service 6: Aberdare – Merthyr Tydfil, Stagecoach South Wales Service 9: Glynhafod - Merthyr Tydfil, New Adventure Travel Service 89: Aberdare – Merthyr Tydfil and First Call Travel Service X75: Resolven – Merthyr Tydfil	**Construction:** Disruption in access and / or temporary loss of bus stop due to construction of new Baverstock junction and widening of existing carriageway. **Operation:** Bus stop would be permanently relocated to a safe location away from the dual carriageway. The construction of an NMU route through Baverstock junction would provide a safe access to and from the Jah-Jireh Care Home. Discussions would take place between the contractor, the local council and Stagecoach to find a suitable replacement location.	**Construction:** Slight adverse **Operation:** Slight beneficial
School bus stop – Cefn Coed High Street bridge	**Construction:** Detours and disruption would be anticipated as the Cefn Coed High Street bridge was demolished and replaced. **Operation:** No significant difference as the stop would remain in the same location.	**Construction:** Slight adverse **Operation:** Neutral
Drovers Arms, Cefn Coed High Street (north-west bound and south-east bound) Stagecoach Service 25: Merthyr Tydfil – Merthyr Tydfil via Trefechan,	**Construction:** Detours and disruption would be anticipated for individuals wishing to access the stops from north of the A465, as the Cefn Coed High Street bridge was demolished and	**Construction:** Slight adverse **Operation:** Neutral

Current bus stops	Description of impacts	Residual significance of effect
Stagecoach Service 26: Merthyr Tydfil – Merthyr Tydfil via Trefechan and New Adventure Travel Service 89: Aberdare – Merthyr Tydfil.	replaced. **Operation:** No significant difference as the bus stop would remain in the same location.	
Cloth Hall Lane (south-west bound and north-east bound) Stagecoach Service 25: Merthyr Tydfil – Merthyr Tydfil via Trefechan, Stagecoach Service 26: Merthyr Tydfil – Merthyr Tydfil via Trefechan	**Construction:** Temporary detours and disruption would be anticipated for individuals wishing to access the bus stops from the south of the A465, as the Cefn Coed High Street bridge was demolished and replaced. **Operation:** No significant difference as the bus stops would remain in the same location.	**Construction:** Slight adverse **Operation:** Neutral
Lupin Close (south-west bound), Gurnos Circle, Gurnos Stagecoach South Wales Service 27	**Construction:** There would no effect on bus travellers during construction. **Operation:** The effect on bus travellers during operation would be neutral.	**Construction:** Neutral **Operation:** Neutral
Police Station (east bound and west bound), Gurnos Circle, Gurnos Stagecoach South Wales Service 3 Stagecoach South Wales Service 28	**Construction:** Slight disruption in access and / or temporary loss of stop due to the temporary diversion of A465 trunk road traffic along Gurnos Ring Road. **Operation:** The effect on bus travellers during operation would be neutral.	**Construction:** Slight adverse **Operation:** Neutral
Wellingtonia Close (west bound), Gurnos Circle, Gurnos Stagecoach South Wales Service 3 Stagecoach South Wales Service 27	**Construction:** The effect on bus travellers during construction would be neutral. **Operation:** Re-location of bus stop approximately 105 m west of the current location.	**Construction:** Slight adverse **Operation:** Neutral
Wellingtonia Close (south bound), Goitre Lane, Gurnos Stagecoach South Wales Service 27	**Construction:** Disruption in access and / or temporary loss of bus stop during construction of new shared use facility and temporary diversion of A465 trunk road traffic along Gurnos Ring Road. **Operation:** The effect on bus travellers during operation would be neutral.	**Construction:** Slight adverse **Operation:** Neutral
Crossroads (north bound), Twelfth Avenue, Galon Uchaf Crossroads, Galon Uchaf Crossroads (south bound), Twelfth Avenue, Galon Uchaf Crossroads, Galon Uchaf Stagecoach South Wales Service 33	**Construction:** The effect on bus travellers during construction would be neutral. **Operation:** The effect on bus travellers during operation would be neutral.	**Construction:** Neutral **Operation:** Neutral
ASDA superstore Stagecoach Service 1: Merthyr Tydfil – Bargoed via Rhymney / Bargoed – Merthyr Tydfil via Rhymney,	**Construction:** Temporary disruption and / or diversions anticipated for individuals wishing to access the bus stop from Dowlais, with the construction	**Construction:** Slight adverse **Operation:** Neutral

Executive Summary

A Water Framework Directive (WFD) compliance assessment has been undertaken to support the Environmental Impact Assessment (EIA) for the 17.7 km dualling of Sections 5 and 6 of the A465 Heads of the Valleys road. Section 5 and 6 run from Dowlais Top to Hirwaun. The WFD (2000/60/EC) came into force in 2000 and was transposed into UK law under the Water Environment (Water Framework Directive) (England and Wales) Regulations 2003 and amended under the Water Environment (Water Framework Directive) (England and Wales) (Amendment) Regulations 2015. The overarching objective of the WFD is to enable all waterbodies in Europe to attain good or high ecological status/potential. In addition, under the legislation any modification to a waterbody should not lead to deterioration in the status of a waterbody or any of the quality elements. Natural Resources Wales (NRW) is the competent authority in Wales for delivering the WFD. They take a holistic approach to managing the water environment and ensure that ecological, social and economic values are considered in decision-making.

There are three key WFD environmental objectives:

1) Protect the water environment from deterioration;

2) Achieve the wider objectives of other European Directives; and

3) Aim to achieve good overall status for surface and ground waters

The WFD compliance assessment baseline conditions were established and the potential impacts evaluated. Geomorphological and ecological constraints and opportunities were used to inform the engineering and emerging drainage design to ensure impacts of the proposed scheme were addressed through embedded mitigation to ensure WFD compliance. Additional mitigation measures were also identified to reduce impacts of the scheme.

Proposals that impact watercourses include: bridge expansions; new bridges; culvert extensions; new culverts; earthworks; additional volumes of road drainage; and proposed channel realignments.

Within the study area, 58 watercourses are crossed by the existing A465 or came within 50 m of the proposed new alignment. These fall within seven WFD waterbodies, across two River Basin Management Plans; Western Wales and River Severn. All the main watercourses that lend their name to the WFD waterbodies are crossed by the proposed scheme, with the tributaries that also form the WFD waterbodies also crossed. The Nant Morlais is extensively culverted under the existing road, with all the other main watercourses being open channels.

The Main Rivers potentially affected by the proposed scheme are the Afon Cynon, Taf Fechan and Taf Fawr. Significant tributaries of the Afon Cynon are Nant y Bwlch and Nant Melyn. Nant Ffrwd is a significant tributary of Afon Taf Fawr. Another significant watercourse potentially affected by the proposed scheme, that has its own waterbody status, is Nant Morlais.

The majority of the 58 watercourses within the study area were assigned a low vulnerability to change. This was primarily a result of the small or artificial nature of the watercourse or due to bedrock or valley sides confining the lateral and vertical movement of the watercourse. Eleven were assigned a medium or high vulnerability.

To mitigate the impact of channel and floodplain modification the following key principles were adhered to during the design development:

- bridges were provided where culverts are not considered appropriate for the vulnerability of the watercourse;
- the length of the culverts were reduced where possible, the upstream and downstream gradient was considered within the culvert design to enable appropriate energy dissipation, so that additional bank and bed protection was minimised;
- pipe culverts would be replaced with depressed invert culverts, where practicable, to ensure formation of a natural bed, more natural flow patterns and to enable passage of species;

- application of best practice design principles for the scheme design;
- realignments were designed to encourage natural fluvial processes and would not detrimentally change the sediment regime of the watercourse;
- outfalls were flush with the banks, set at an appropriate height and angle to the flow of the river so not to create scour of the bed or banks; and
- sustainable urban drainage systems (SuDS) were designed to reduce suspended sediments and pollutants from road runoff being transferred to the receiving watercourse and discharge from the ponds would not significantly change the flow hydrograph of the receiving watercourse.

Compliance with the WFD and a commitment to SuDS design principles have been central tenets of the design process. Improvements to the water quality, through the inclusion of a comprehensive sustainable road drainage system, were established at the start of the proposed scheme. Then through the EIA process, full understanding of the geomorphology, ecology, water quality (physico-chemical) and flood risk has been gained. In turn, this has been fed back to the structures and drainage design teams through several interactive workshops and an iterative design approach and incorporated into the proposed scheme design as embedded mitigation. Taking this integrated approach has enabled the proposed scheme design to be sensitive to the water environment. Adverse impacts have been avoided where possible, or otherwise minimised.

The proposed scheme has been designed to mitigate adverse water environment impacts. Thus it is considered neither to cause a deterioration in the status/potential of any of the seven WFD waterbodies within the study area, nor is the scheme assessed to prevent any of the waterbodies from achieving Good Ecological Status/Potential in future. Consequently there would be no impact on downstream waterbodies within the same River Basin District (RBD). Furthermore, the upgrade to existing culverts from pipe culverts to depressed invert culverts improves both the biological and hydromorphological conditions in comparison to the existing baseline. Improvements include: more naturalised quantity and dynamics of flow through the upgraded culverts; more naturalised substrate and structure of the channel bed; improved longitudinal connectivity and improved passage for fish and other species. These upgrades in culvert design and operation provide mitigation for the extension of the existing culvert.

Habitat enhancements also form part of the embedded design and mitigation strategy. Improvements include creation of fritillary habitat, riparian enhancements and wetlands.

The introduction of a sustainable drainage system is a significant benefit of the proposed scheme. The SuDS would result in an improvement in water quality both within the receiving waterbody and in downstream waterbodies. This would help to move the waterbodies towards achieving Good Ecological Status / Potential, by reducing the amount of pollutants entering the local watercourses and by improving water quality. This in turn would also deliver benefits to the biological and hydromorphological quality elements due to less pollution and reduction in fine sediments (silt).

Impacts of physical modifications have been mitigated through the following means:

- replacement of existing pipe culverts with depressed invert box culverts. These allow the formation of a natural bed and remove/alleviate barriers to fish migration;
- box culverts designed for otter, bat and amphibian passage;
- channel diversions to avoid the need for culverts, including the removal of some watercourses out of culverts into a diversion. Redundant culverts would be retained for mammal passage;
- culverts for mammal passage are designed to guide mammals through the culvert;
- culvert lengths are reduced where practicable and;
- energy dissipation is designed within culverts / culvert outlets, where required

Thus the proposed scheme contributes to the measures set out in the Western Wales RBMP and Severn RBMP to address the significant water management issues of physical modification and pollution from towns, cities and transport. The proposed box culverts to replace existing pipe culverts would deliver improvements to the

condition of the channel bed; deliver easement of barriers to fish migration; modification of existing culverts to incorporate current best practice design; removal of some structures; and improvement of the riparian zone.

These combined improvements, delivered through the scheme, thus do not cause deterioration in the WFD status or quality elements for either impacted waterbodies or downstream waterbodies. In addition, the improvements delivered by the proposed scheme remove some of the existing barriers and constraints that presently affect WFD status and the achievement of WFD objectives. Thus, these proposed improvements would assist in the future achievement of WFD objectives.

1. Introduction

This Water Framework Directive (WFD) compliance assessment has been undertaken to support the Environmental Impact Assessment for the 17.7 km dualling of Sections 5 and 6 of the A465 Heads of the Valleys road. Sections 5 and 6 run from Dowlais Top to Hirwaun. The Figure in Annex A shows the watercourses affected by the proposed scheme. Volume 1 of the ES provides a comprehensive description of the proposed scheme.

Natural Resources Wales (NRW) requires an assessment of the impact of any works/modification to water bodies in the United Kingdom under the European Union (EU) Water Framework Directive (WFD) 2000, which was transposed into UK law under the Water Environment (Water Framework Directive) (England and Wales) Regulations 2003 and amended under the Water Environment (Water Framework Directive) (England and Wales) (Amendment) Regulations 2015.

Through the WFD compliance assessment, baseline conditions are established and potential impacts evaluated. Geomorphological and ecological constraints and opportunities were used to inform the emerging engineering and drainage design to ensure impacts of the proposed scheme were addressed through embedded mitigation to ensure WFD compliance. Additional mitigation measures were also identified to reduce the impacts of the proposed scheme.

Proposed work that could impact watercourses includes: bridge widening; new bridges; culvert extensions; new culverts; earthworks; additional volumes of road drainage and channel realignments.

2. Assessment Background

The WFD (2000/60/EC) is a significant piece of EU water legislation that came into force in 2000, which was transposed into UK law under the Water Environment (Water Framework Directive) (England and Wales) Regulations 2003 and amended under the Water Environment (Water Framework Directive) (England and Wales) (Amendment) Regulations 2015. The WFD has the overarching objective of enabling all waterbodies in Europe to attain good or high ecological status/potential. In addition, under the legislation any modification to a waterbody should not lead to deterioration in the status of a waterbody or any of the quality elements that define waterbody status. Natural Resources Wales (NRW) is the competent authority in Wales for delivering the WFD. NRW takes a holistic approach to managing the water environment and ensure that ecological, social and economic values are considered in decision-making.

For surface waterbodies to achieve overall 'good ecological status' (GES) or 'good ecological potential' (GEP), ecological and chemical parameters must be judged to be at least 'good'. GES refers to situations where the ecological characteristics show only a slight deviation from natural / near natural conditions. Artificial and heavily modified waterbodies (A/HMWB) have a target to achieve GEP, recognising their important uses, whilst making sure the waterbody is protected as far as possible.

Good quality water is recognised as being essential for wildlife, agriculture and business to thrive and is one of the means for boosting regeneration, recreation and tourism. River Basin Management Plans (RBMPs) set out how organisations, stakeholders and communities would work together to improve the water environment across 11 river basin districts in England and Wales. In 2015, the second round of RBMPs were published. They set out how the water environment would be improved over the next six years and support the government's framework for the 25-year environment plan.

There are three key WFD environmental objectives:

1) Protect the water environment from deterioration;
2) Achieve the wider objectives of other European Directives; and
3) Aim to achieve good overall status for surface and ground waters.

Where a scheme is considered to cause deterioration, or where it could contribute to a failure of the waterbody to meet GES/GEP, then an Article 4.7 assessment is required. Should a modification or change meet all of the conditions set out in Article 4.7 then it is considered as being WFD compliant.

The RBMPs outline a programme of measures to protect and improve beneficial use of the water environment and prevent deterioration of a waterbody. Key to transport infrastructure projects are physical modifications to the water environment and managing pollution from towns, cities and transport.

Physical modifications such as widening, deepening and straightening rivers allow the water environment to be used and valued for many purposes, but can sometimes be at the expense of the water environment. While many modifications are, and would continue to be, important to society, their potential harmful impacts can be reduced and the resilience of aquatic communities improved. Management of physical modification for transport infrastructure is therefore required to prevent deterioration. This is achieved through the consideration of hydromorphology and the associated links to aquatic ecology within the impact assessment.

Ways to achieve GES or GEP include: reducing the extent of channel and floodplain modification; improving water quality of road drainage; and restoring the natural function of the river and development of associated habitats. When designing new road schemes, or upgrading existing ones, reducing the number watercourses impacted should be the first priority. Where watercourses need to be crossed, the design of crossings should minimise the length of channel and floodplain impacted to be in line and compliant with the WFD.

Rainwater draining from roads and pavements can carry many pollutants. These include metals, vehicle emissions residue, silt, grit, bacteria from animal faeces and oil. Dealing with pollution from towns, cities and transport is a complex task. Incorporating sustainable drainage systems into new and upgraded transport infrastructure is the main way in which pollution of waterbodies is managed.

3. Method

A high level review of the current WFD waterbody status from the relevant River Basin Management Plans, as well as a review of contemporary Ordnance Survey maps, aerial imagery and a site visit to the majority of watercourses potentially affected by the scheme, was undertaken to determine the baseline environment.

3.1 Study Area and Baseline Environment

The study area was defined by the western and eastern extent of the proposed A465 scheme between Hirwaun and Dowlais Top and 50 m either side of the new alignment.

A combined ecological and geomorphological description of the Main and Significant Rivers within the study area are provided in Section 4: Baseline Summary. Also provided with the Baseline Summary are the Cycle 2 WFD waterbody classifications. The description of the Main and Significant Rivers is based on a high-level desk study and short walkover surveys. The desk study comprised primarily a review of aerial imagery and ordnance survey mapping, which was supported by the walkover surveys. Data to characterise the baseline conditions for the wider river catchment area, impacted waterbodies and the downstream waterbodies was extrapolated from OS maps and aerial imagery to substitute the field data collected.

3.2 Watercourse Vulnerability

A vulnerability score was assigned to each watercourse depending on its susceptibility or potential to change following channel or flow modifications and the change to ecology (Annex B). The vulnerability of the watercourses to change is dependent on a number of factors, including gradient, size of channel, bank material and profile, vegetation cover, existing modifications and dominant geomorphological processes. The overall inherent stability of the channel is assessed. For example, clay-bed or bedrock river would be considered stable compared to a mobile gravel bed, alluvium river, that has a history of migrating across the floodplain. The latter is considered to be in dynamic equilibrium and would be assigned a high vulnerability whereas bedrock bound, boulder bed rivers would have a low vulnerability. Watercourse vulnerability is presented in Section 4: Baseline Summary.

3.3 Impact Assessment

The impact assessment has been split into four stages:

- generic impacts;
- embedded mitigation – built into the design;
- resultant magnitude of impact; and
- overall significance of impact.

Firstly, the generic impacts on the hydromorphological, biological and physico-chemical quality elements for each element of the proposed scheme were considered. Then site specific geomorphological, ecological, physico-chemical and flood risk constraints were identified. These were presented at several interactive design workshops, during which the alignment of the scheme and drainage design was modified to accommodate WFD requirements and to mitigate and reduce impacts on the water environment. The water environment constraints and design modifications (termed here as embedded mitigation) are presented in Section 5.2.

The resultant impacts to the channel were assigned a magnitude, depending on the type and extent of the new modification.

The magnitude of impact is considered at the local scale, typically in the same ‘reach’ of the modification. A reach is a length of channel that has similar characteristics, such as dominant process (such as erosion or deposition which would infer the dominant function as a sediment source or sink for sediment), land use and level of modification. In addition, the impacts of the scheme were also assessed on the waterbody scale and whether or not the impact has the potential to cause deterioration in either WFD status or of the quality

elements, or prevent the waterbody, and / or upstream or downstream waterbodies from achieving WFD objectives.

Long term and short term impacts from both the construction and operation of the proposed scheme were considered within the assessment. However, only long term permanent impacts were considered for overall compliance with the WFD. These are impacts that exist beyond the construction phase, such as hard river engineering. Short term impacts arise only during the construction of the scheme, such as fine sediment release, temporary diversions and vegetation removal. Where the proposed works include mitigation, such as planting, which requires time to mature but would in the short to medium term recover, the impact is considered to be short term.

The level of significance was then calculated using the vulnerability of the watercourse and the magnitude of impact (Table 3.1). The impact assessment is presented in Section 6: Impact Assessment.

Any watercourses with a residual significance greater than moderate were assessed further and the results presented in Section 7.

Table 3.1 Matrix for determination of impact significance

Magnitude / Vulnerability	Negligible	Minor	Moderate	Major
High	Neutral	Moderate	Large	Very large
Medium	Neutral	Slight	Moderate	Large
Low	Neutral	Neutral	Slight	Moderate

4. Baseline Summary

4.1 WFD Status

Within the study area, 58 watercourses were crossed or came within 50 m of the proposed new alignment (Annex A). These fell within seven WFD waterbodies (see Table 4.1), across two River Basin Management Plans (RBMPs); Western Wales and River Severn. All of the larger watercourses that lend their name to the WFD waterbodies are crossed by the scheme. It should be noted that Nant Morlais is extensively culverted under the existing road, whereas all the other larger watercourses are open channels.

Table 4.1 Affected WFD waterbodies, current waterbody status and number of watercourses potentially affected by the scheme

Waterbody ID	Waterbody name	Hydromorphological designation	WFD status	Elements causing less than Good	Number of watercourses potentially affected
GB110058032320	Sychryd - headwaters to confluence with Mellte	Not designated A/HMWB	Poor (2015)	Fish (Poor) Phosphate (Poor).	1

Waterbody ID	Waterbody name	Hydromorphological designation	WFD status	Elements causing less than Good	Number of watercourses potentially affected
	confluence Nant Bargod Rhymni				

The Main Rivers potentially affected by the scheme are the Afon Cynon, Taf Fechan and Taf Fawr. Significant tributaries of the Afon Cynon are Nant y Bwlch and Nant Melyn. Nant Ffrwd is a significant tributary of Afon Taf Fawr. Another significant watercourse potentially affected by the scheme that has its own waterbody status is Nant Morlais. Section 4.1 below contains a description of the Main Rivers and Significant watercourses potentially impacted by the scheme. High level information of all 58 watercourses affected by the scheme is presented in Annex B, with accompanying photographs provided in Annex C. Those watercourses considered to have a medium or high vulnerability are listed in Section 4.2.

Significant water management issues stated within the Western Wales and River Severn RBMPs (NRW, 2015a and Environment Agency, 2015) include:

- physical modification; and
- pollution from towns, cities and transport.

In the Western Wales RBMP, 25% of waterbodies are impacted by physical modification as a significant water management issue. Within the Severn RBMP, 27% are impacted by physical modification. Pollution from towns, cities and transport impacts 12% within both Western Wales RBMP and the Severn RBMP (NRW, 2015 and Environment Agency, 2015).

Physical modifications may alter the natural flow condition, water levels and sediment regime; these impacts may also have an adverse effect on biological communities and physical habitat. Transport links, towns and villages have often been constructed in close proximity to the water environment, thus posing significant pressure on the water environment. Where these physical modifications may be contributing or causing a failure of WFD objectives, practical and reasonable mitigation measures are required to assist in the achievement of WFD objectives. Measures to mitigate physical modifications include ensuring that future modifications do not cause deterioration and to increase the extent of buffer zones and river side corridors alongside inland waters to increase resilience to other pressures, including climate change (NRW, 2015a). Improvements to fish habitat, invertebrates and aquatic flora are specified as mitigation to aid the achievement of WFD objectives (Environment Agency, 2015). For pollution from towns, cities and transport, NRW (2015a) state that SuDS should be used. This includes promoting and implementing SuDS in new and existing developments in both urban and rural areas to achieve environmental, water quality, social and flood risk benefits (NRW, 2015a).

Measures envisaged necessary to achieve the objectives for physical modifications include:

- improvement to the condition of channel bed;
- removal or easement of barriers to fish migration;
- removal or modification of engineering structures; and
- improvement to the condition of riparian zone and / or wetland habitats (Environment Agency, 2015).Baseline Conditions: Main Rivers and Significant Watercourse Descriptions.

4.1.1 Afon Cynon (Main River within 'Afon Cynon – source to confluence Aman River' WFD waterbody)

The Afon Cynon (chainage (ch.) 3882) is a large watercourse with a wide (approximately 8 m) channel, with varying depths. There was evidence of some erosion of the banks. The watercourse flows through a woodland and areas of rough pasture, which has the potential to provide inputs, such as detritus and large woody debris which can benefit macroinvertebrate communities. It had a meandering planform but little variation in flow type

was observed on site. Flow type was predominantly fast flowing rapids. However, at the time of survey, the catchment had recently received prolonged, heavy rainfall which would have impacted the flow of water and obscured the bed and marginal habitats.

Ecologically, within the stretch of watercourse surveyed, there was considered to be a lack of habitat and flow diversity is unlikely to provide species rich ecological communities within the sections of the watercourse surveyed. However, records from National Resource Wales indicate Atlantic salmon (*Salmo salar*), brown/sea trout (*Salmo trutta)* and European eel (*Anguilla anguilla*) are present within the Afon Cynon River. Atlantic salmon and brown/sea trout are Species of Principal Conservation Importance (as listed in Section 42 of the Natural Environment and Rural Communities (NERC) (Wales) Act 2006) and are migratory species, thus able to move through the watercourse which is crossed by the A465. It is likely that the stretches in proximity to the A465 crossing are transient stretches for these species due to lack of suitable habitat for spawning. European eel are a regionally important species (and protected under the European eel Regulations (England and Wales, 2009)) though are unlikely to be residing within the section crossed by the A465 due to lack of suitable habitat.

4.1.2 Nant y Bwlch (Significant watercourse within 'Afon Cynon – source to confluence Aman River' WFD waterbody)

Nant y Bwlch (ch. 2320) has been extensively realigned through open cast workings to the southwest. The river is consequently perched above the floodplain, has a low sinuosity, is embanked on either side and has a homogeneous profile with no variation in width.

Where the works are proposed the watercourse becomes steeper in gradient and far more natural and sinuous, creating areas of erosion and deposition. Substrate is diverse, predominantly cobbles, with boulders, pebbles, gravel and sand. The channel width is wide (between 3 and 5 m) and sits within a section of confined valley, up to 3 m deep. The river meanders between the valley sides with floodplain on alternate sides of the channel. Water depth was shallow (less than 25 cm). The natural, diverse habitat in this section of the Nant y Bwlch is likely to provide a rich environment for ecological communities; diversity of flow and substrate provides greater variation in aquatic habitats providing greater opportunity for species richness.

4.1.3 Nant Melyn (Significant watercourse within 'Afon Cynon – source to confluence Aman River' WFD waterbody)

Nant Melyn (ch. 5440) flows through a wooded area both upstream and downstream of the existing A465 crossing. The watercourse typically had a pool-riffle sequence, with sections of longer runs consisting of exposed cobbles. The downstream section had some steps in gradient with erosion of the banks. Mid-channel bars were observed at several locations. The habitat was varied with a substantial vegetated riparian zone. The channel's width varied but on average was approximately 3 m. Upstream of the existing cross the channel was shallow, with banks approximately 0.3 m deep. However the channel was confined by steep bedrock banks within a gorge under the existing A465.

The watercourse is provided with inputs including large woody debris and detritus from the surrounding woodland and is beneficial for macroinvertebrate communities. The variation in flow and substrate (cobbles, boulders, gravel) downstream of the A465 road crossing provides habitat which provides opportunity for species richness.

4.1.4 Taf Fawr (Main River within 'Afon Taf Fawr – source to confluence Taf Fechan' WFD water body)

The Taf Fawr (ch. 10850) is a large watercourse (approximately 15 m wide) cut into bedrock in a tree-lined gorge. Through the study reach the watercourse had a naturally straight course confined by geology. Banks (valley sides) are steep (up to 40 m high on the right bank) and there varied flows (torrents, rapids, runs) were observed. The channel typically had a pool-riffle sequence. The channel banks were natural, except for a short length downstream of the A465, beyond the gorge, where houses backed onto the river and banks were protected by brick and stone walls. The banks were tree-lined, with exposed tree roots, exposed earth and moss at the water's edge. The immediate land use is natural, wooded habitat with a small number of residential

houses further downstream. Due to the large expanse of the watercourse, overhanging trees provided marginal cover and inputs.

Records from National Resource Wales indicate Atlantic salmon (*Salmo salar*) and brown/sea trout (*Salmo trutta)* are present in the Taf Fawr River. Atlantic salmon and brown/sea trout are Species of Principal Conservation Importance (as listed in Section 42 of the NERC (Wales) Act 2006) and are migratory species, thus able to move through the watercourse which is crossed by the A465. It is likely that the stretches in proximity to the A465 crossing are transient stretches for these species.

4.1.5 Nant Ffrwd (Significant watercourse within 'Afon Taf Fawr – source to confluence Taf Fechan' WFD waterbody)

The Nant Ffrwd (ch. 10310) was observed to be a medium sized, sinuous and natural watercourse. Immediately upstream of the existing A465 was a waterfall approximately 15 m high, followed by a gorge which the existing road bridge spanned. The valley sides become incredibly steep (approximately 30 m high) downstream of the A465. The channel sides were composed of exposed bedrock.

Upstream of the waterfall, the river bed substrate was coarse compromising predominantly of boulders and cobbles and to a lesser extent pebbles and gravel, with areas of sand and silt in the margins. Flow type varied from fast flowing runs and riffles to some slower flowing areas in the margins. The watercourse flows through a steep, wooded valley, surrounded by rough and improved pasture, which acts as a source of large woody debris, detrital inputs and exposed tree roots in-stream. The diverse nature of the habitat is likely to support a diverse macroinvertebrate community here. Immediately upstream of the A465 road, the watercourse then proceeds to cascade over a large waterfall, approximately 20 m high. Macrophytes were not present within this upstream section of the river and although habitat could support fish species, the large waterfall would impede fish movement.

4.1.6 Taf Fechan (Main River within 'Taf Fechan – source to confluence Afon Taf Fawr' WFD waterbody)

The Taf Fechan (ch. 11482) is a large watercourse approximately 8 m-12 m wide and with a water depth at the time of survey greater than 0.5 m. The river has a sinuous planform confined by bedrock, as the river flows through a gorge (up to 40 m deep). The sinuosity of the river reduces downstream of the A465, and the river has a relatively straight course to the confluence with Taf Fawr. The left bank immediately upstream of the existing A465 has been historically quarried (Gyrnos Quarry).

The bed substrate consisted predominantly of exposed bedrock, boulders and cobbles, with some sand and gravel observed. The flow types were primarily dominated by rapids and runs. The watercourse banks consisted of sections of exposed bedrock and were continually tree lined on the right bank with a footpath located along sections of the left bank with a semi-continuous tree lining. The aquatic habitat upstream and downstream of the A465 was typical of a high velocity watercourse. There were a few habitat features, including some discrete areas of woody debris in the channel. The lack of sinuosity of the watercourse results in poor flow diversity and may provide little habitat diversity for a variety of aquatic species.

Records from National Resource Wales indicate Atlantic salmon (*Salmo salar*), brown/sea trout (*Salmo trutta)* and European eel (*Anguilla anguilla*) present in the Taf Fechan River. Atlantic salmon and brown/sea trout are Species of Principal Conservation Importance (as listed in Section 42 of the NERC (Wales) Act 2006) and are migratory species, thus able to move through the watercourse which is crossed by the A465. It is likely that the stretches in proximity to the A465 crossing are transient stretches for these species. European eel are a regionally important species (and protected under the European eel Regulations (England and Wales, 2009)) and are unlikely to be residing within the section crossed by the A465 due to lack of suitable habitat.

Historic records from the Biodiversity Records Centre (Welsh Invertebrate database) indicate the introduction of white clawed crayfish (*Austropotamobius pallipes*) into the Taf Fechan from Afon Llyni. The white clawed crayfish is the only species of crayfish native to the British Isles, is currently endangered (IUCN, 2016) and protected under several current legislations (EU Habitat Directive (Annex II), a Species of Principal Conservation Importance (NERC Section 42 (Wales, 2006)) and a UK Biodiversity Action Plan Priority Species).

4.1.7 Nant Morlais (Significant watercourse within 'Nant Morlais – source to confluence Afon Taf' WFD waterbody)

Nant Morlais (ch. 14550) and its valley are extensively modified. A significant amount of its valley has been filled in and built upon. Consequently Nant Morlais is extensively culverted, and north of the A465 drops down through a large cattle grid structure into a culvert. For a small length of channel the bed substrate typically consisted of coarse substrate and the flow type was dominated by cascades and runs suggesting a moderate gradient. A medial channel bar formed in a wider section of the channel, suggesting some material is transported through the upstream culvert.

The Upper Penywern Pond appeared to discharge into the Nant Morlais culvert rather than remaining within the 'Taf – confluence to Taf Fechan to Confluence Afon Cynon waterbody (Plate 4.1).

Plate 4.1 Discharge from Upper Penywern Pond.

The heterogeneous nature of the 'natural' channel suggests it would support a diverse macroinvertebrate community without the extensive modifications. However, the concrete lined channel and large barrier created by the significant drop in channel as the watercourse is being culverted under the road provides a large obstacle for fish and provides poor aquatic habitat.

4.2 Vulnerability

Vulnerability was assigned based upon the geomorphological and ecological character of the watercourse, as described in Section 4.2 and Annex B. The majority of the 58 watercourses within the study area were assigned a low vulnerability to change. This was primarily a result of the small or artificial nature of the watercourse or due to bedrock or valley sides confining the lateral and vertical movement of the watercourse. Those watercourses considered to have a medium or high vulnerability are listed in Table 4.2.

Table 4.2 Watercourses with a medium or high vulnerability

Chainage	Watercourse ID	Photograph	Watercourse name	Vulnerability	Principal reason for vulnerability
2224	6		Tributary of Nant y Bwlch	High vulnerability	Sinuous channel with evidence of erosion and deposition observed.
3882	14		Afon Cynon	Medium vulnerability	Large watercourse with diversity of flow types, natural channel substrate and bank material, and diversity of physical habitats.
5440	22		Nant Melyn	High vulnerability	Sinuous channel with a diversity of flow types and physical habitat, although under existing A465 channel is cut into bedrock reducing vulnerability.
7448	28		Tributary of Nant y Gwyddel	Medium vulnerability	Evidence of erosion and deposition processes operating.
7548	29		Tributary of Nant y Gwyddel	Medium vulnerability	Sinuous channel with erosion and deposition processes observed.

Chainage	Watercourse ID	Photograph	Watercourse name	Vulnerability	Principal reason for vulnerability
8760	32		Nant y Gwyddel	Medium vulnerability	Sinuous channel with erosion and deposition processes observed.
9303	34		Tributary of Nant Ffrwd	Medium vulnerability	A low sinuosity channel with some evidence of channel incision – erosion and deposition observed.
9640	35		Tributary of Nant Ffrwd	Medium vulnerability	Incising stream.
9933	36		Tributary of Nant Ffrwd	Medium vulnerability	Incising stream.
10310	38		Nant Ffrwd	Medium vulnerability	Channel stabilised by vegetation, but there are steep gradient valley sides and 20 m waterfall.
17210	56		Nant Carno	Medium vulnerability	Meandering channel with erosion and deposition observed; highly sinuous channel.

5. Impact Assessment

The impacts of the scheme are split into two tables: Table 5.1 and Table 5.3. Table 5.1 describes the generic impacts that are likely to occur for each aspect of the scheme for the three WFD quality elements; hydromorphological, biological and physico-chemical. Hydromorphological impacts are considered first as these modify the physical boundaries of the channel and / or the flow and sediment dynamics, from which biological and physico-chemical impacts arise. Table 5.3 then details the different aspects of the scheme that would impact watercourses, showing their magnitude and whether the impacts would be short term or long term.

In between these two tables is the list of embedded mitigation that was built into the design to reflect the geomorphological and ecological design constraints (Table 5.2)

5.1 Generic Impacts

Table 5.1 Potential generic effects of the proposed scheme on WFD quality elements – without mitigation

Proposed works	Hydromorphological quality elements	Physico-chemical quality elements	Biological quality elements
New Culvert and culvert extension	Impact on longitudinal connectivity altering the transfer of flow and sediment downstream. Change to sediment and flow dynamics due to impacts on longitudinal connectivity. Removal of natural bed and substrate leading to changes in exiting processes and flow dynamics. Removal of natural bank causing disconnection from the floodplain. Removal of natural bed and banks leading to changes in flow variation and patterns of erosion. Potential for blockage causing variations in sediment transportation and patterns of erosion. Alteration to both longitudinal and lateral connectivity of the watercourse with both upstream and downstream fluvial processes and the floodplain, including the potential for fragmentation of in-stream and bank-side habitats. Habitat fragmentation within the riparian zone, which may impact on species passage and habitat corridors. NB: Extension of culvert typically has a lesser impact than a new culvert, but it is dependent on the length of watercourse impacted.	Changes in flow variations could alter the dissolved oxygen levels. Changes in temperature as a result of changes in flow variation and channel shading.	Changes to habitat, flow, channel morphology, channel substrate composition and bank structure. Fragmentation and potential barrier to migration. Localised reduction in quality of aquatic environment.

Proposed works	Hydromorphological quality elements	Physico-chemical quality elements	Biological quality elements
New Bridge (clear span) or bridge expansion	Removal of riparian zone leading to potential for impact on lateral connectivity with the floodplain. Potential for flow alterations, particularly during high flow events, from removal of riparian zone. NB: Bridge expansion is considered to have a lesser impact than a new bridge, typically because there would less vegetation clearance required.	None anticipated.	Removal of riparian vegetation.
Drainage (new outfall structures and change to discharge)	Localised removal of river bank by outfall structure. Increased discharges leading to changes in composition of bed substrate. Increased discharges leading to changes in localised and downstream erosion of banks. Localised impacts to the cross-section altering width variations and the channel bed and banks.	Increased road surface, increases surface run-off and potential discharge into watercourses. Potential changes to flow patterns during and following periods of rainfall, potentially causing changes to dissolved oxygen levels and temperature.	Removal of riparian habitats around structures. Potential changes to flow and substrate may impact on biological quality elements.
Realignment	Creation of a new channel, potentially causing a change in planform, cross-section and lateral (floodplain) connectivity. Changes in the channel length could alter sediment and flow processes and fluvial dynamics, for example, bed/bank erosion occurring where channel gradient is steepened due to the realignment or sediment deposition with potential for low energy channels to become choked with vegetation where channel gradient is reduced due to the realignment. Removal of natural channel cross-section, bed substrate or banks could alter the morphological forms and processes.	None anticipated.	Temporary loss of habitat and a change from baseline environment could affect aquatic flora and fauna (such as changes in abundance and composition of benthic fauna if the bed is altered). Change in lengths of realigned channel could change flow regime and result in alterations to species assemblages.

Proposed works	Hydromorphological quality elements	Physico-chemical quality elements	Biological quality elements
Earthworks	Exacerbate fine sediment delivery (short-term) leading to changes in bed structure and substrate. Potential for erosion from runoff and surface flow processes.	Potential for changes in thermal conditions due to reduce sunlight caused by greater turbidity from fine sediment delivery. Short-term pathway for fine sediment delivery leading to changes in oxygenation, nutrient conditions and water quality parameters.	No long-term impacts during operational stage of structures.

5.2 Embedded Mitigation

To mitigate the impact of channel and floodplain modification the following key design principles were adhered to:

- bridges are chosen where culverts are not considered appropriate for the vulnerability of the watercourse;
- the length of the culverts would be reduced where possible, the upstream and downstream gradient would be considered within the culvert design, so that additional bank and bed protection is minimised;
- realignments are designed to encourage natural fluvial processes and would not detrimentally change the sediment regime of the watercourse;
- outfalls would be flush with the banks, set at an appropriate height and angle to the flow of the river so not to create scour of the bed or banks; and
- sustainable urban drainage systems would be designed to reduce suspended sediments and pollutants from road runoff being transferred to the receiving watercourse and discharge from the ponds would not significantly change the flow hydrograph of the receiving watercourse.

Design alterations in response to geomorphological and ecological constraints and opportunities are presented in Table 5.2.

Sustainable drainage system would reduce the release of pollutants (including sediments) into the watercourse, thus improving water quality and reducing the impact on ecological communities (fish, aquatic macroinvertebrates, macrophytes). Thus this provides an improvement on current baseline conditions.

Culverts and other structures would be designed following DMRB guidance (The Highways Agency, 2004, 2009a and b) and current best practice, including CIRIA guidance.

Table 5.2 Embedded mitigation

Watercourse ID	Chainage	Watercourse name	Online / offline impact	Type of long term impact	Embedded mitigation (water environment design constraints considered in the development of the detailed design)
Sychryd - headwaters to confluence with Mellte (GB110058032320)					
1	-50	Camnant	Online	Existing culvert retained.	None – no long term impact.
Afon Cynon - source to confluence Aman River (GB109057033110)					
2	950	Hirwaun ponds	Online	Bridge extension Discharge from SuDS pond.	Extension mirrors existing crossing structure to avoid flow impacts.
3	1612	Tributary of Nant y Cnapiau	Online	Existing culvert retained.	The Blaen Cynon SAC/Cors Bryn-y-gaer SSSI is downstream of this crossing and therefore any water quality impacts need to be avoided. This has been ensured through the drainage system design, which does not discharge to at this location. Stream currently flows through scrubland and with potentially boggy ground in the area of proposed culvert extension. Increased hard standing and new drainage system could see a larger point source of discharge, during wet conditions, compared to the likely diffuse source of water.
4	1750	Nant y Cnapiau	Online	Existing culvert retained. 12 m gap between culverts enclosed to connect culverts.	None – watercourse is concrete lined and extensively culverted.
5	1955	Tributary of Nant y Cnapiau	Offline	New box culvert (118 m). Channel realignment and incorporation into road drainage.	There is a change in gradient at the upstream side of the new offline section, the stream also sinks and becomes marshy ground. Realignment is required and stream would be incorporated into road drainage. Watercourse arises a short distance upstream of A465; the channel is small with no geomorphological diversity. Culvert design is suitable for bats and otters. Additional earthworks to ensure mammals are guided into depressed culvert.
6	2224	Tributary of	Offline	New box culvert (40 m).	Culvert design is suitable for bats and otters. Additional earthworks to

Watercourse ID	Chainage	Watercourse name	Online / offline impact	Type of long term impact	Embedded mitigation (water environment design constraints considered in the development of the detailed design)
		Nant y Bwlch			ensure mammals are guided into depressed culvert. This is a highly sinuous wooded stream with active erosion present on the downstream side of the proposed road alignment. Straightening the channel and increasing the gradient through a culvert could accelerate erosion. Culvert would have a depressed inverted bed to encourage a natural bed to develop and reduce the impact of the culvert. The use of step-pools would dissipate energy at the culvert outlet. Length of culvert has been reduced.
7	2280	Tributary of Nant y Bwlch	Offline	Watercourse realigned into Nant y Bwlch.	Short stream flows through a marshy area. Existing channel is more like a marshy depression leading to a pond, possibly of artificial origin. As a consequence there is no need to provide culvert. SuDS pond created to north of A465 to attenuate flows.
8	2320	Nant y Bwlch	Offline	New bridge Discharge from SuDS pond.	This is a significant watercourse (due to size, gradient and velocity of flow in spate) and should be a free span bridge to minimise geomorphological impact and impact on freshwater communities. Clear span bridge to be installed to retain meanders and reduce impact on an already heavily modified channel (recently watercourse has been realigned around open cast works). The dimension of the bridge should be set in relation to an assessment of potential flood flow rates and levels and with an aspiration to bridge 1 % AEP flood extent. Outfall for SuDS pond should be away from meander bends, and angled so flow is directed downstream and not perpendicular to river banks.
9	2330	Tributary of Nant y Bwlch	Offline	Road drainage discharged into watercourse.	None – watercourse is a minor field drain.
10	2770	Tributary of	Offline	Incorporated into drainage system – realigned to connect	None – watercourse is a marshy depression in the ground, possibly artificially deepened to improve field drainage. Culvert is not require as

Watercourse ID	Chainage	Watercourse name	Online / offline impact	Type of long term impact	Embedded mitigation (water environment design constraints considered in the development of the detailed design)
		Afon Cynon		up with watercourse 11.	insufficient flow to justify cost. Surface runoff to be captured in road drainage and directed to the east (watercourse 11).
11	3288	Tributary of Afon Cynon	Offline	Replace existing culvert (186 m). Road drainage discharged into watercourse.	None – watercourse has a concrete, stepped (steep) channel.
12	3594	Tributary of Afon Cynon	Online	Existing culvert retained. Road drainage discharged into watercourse.	Existing culvert to be retained, with no increase in length. Should culvert be replaced, a natural bed is recommended.
13	3830	Tributary of Afon Cynon	N/A	Surface water channel outfall.	Watercourse is very small and bank protection should be avoided where surface water channel connects to existing watercourse.
14	3882	Afon Cynon	Online	Bridge extension. Road drainage and SuDS pond discharged into watercourse.	New structure would not increase flood risk downstream. Impact on floodplain has been reduced.
15	3945	Tributary of Afon Cynon	Online	Watercourse realigned into Afon Cynon north of A465. Existing culvert is retained for mammals.	Existing culvert is retained for mammals. Very little flow through culvert, only at times of high rainfall, so culvert not required. Upstream of A465 channel is ephemeral and poorly defined. Suggest road drainage flows into this channel rather than a fourth outfall into the Cynon.
16	4131	Tributary of Afon Cynon	Online	Culvert extension (2 m). Road drainage discharged into watercourse.	None – extensively modified in vicinity of A465 (straightened, perched and embanked).
17	4224	Tributary of Afon Cynon	Online	New culvert. Road drainage discharged into watercourse.	New culvert should be designed in consultation with a geomorphologist with a depressed invert to allow a natural bed, appropriate energy dissipation and for appropriate gradient and sizing.
18	4491	Tributary of	Online	Existing culvert retained.	None – artificial watercourse that runs along the top of the railway

Watercourse ID	Chainage	Watercourse name	Online / offline impact	Type of long term impact	Embedded mitigation (water environment design constraints considered in the development of the detailed design)
		Nant Hir		Road drainage discharged into watercourse.	embankment.
19	4250	Tributary of Afon Cynon	Online	Road drainage and SuDS pond discharged into watercourse.	Steep valley just south of SuDS pond – exact location of SuDS pond outfall would need to take steep gradient into consideration at detailed design stage.
20	4824	Tributary of Nant Hir	Online	Existing pipe culvert replaced with box culvert and length of culvert extended (102 m), plus two additional box culverts (47 m and 42 m) under Croesbychan Junction. Road drainage discharged into watercourse.	Existing pipe culvert would be removed and replaced with box culvert for bat and otter mitigation. If technically feasible, a natural bed would help reduce the impact of the culverts – to be confirmed at detailed design.
21	5021	Tributary of Nant Hir	Online	Existing culvert retained. Road drainage discharged into watercourse.	Existing culvert to be retained, with no increase in length. Should culvert be replaced, a natural bed is recommended.
22	5440	Nant Melyn	Online	New bridge. Road drainage and SuDS pond discharged into Nant Melyn.	Existing structure is large but clear span bridge, with abutments set back from the channel, reduces the impact on flooding, morphology and ecology. Retaining walls would be used rather than embankments at Croesbychan Junction to prevent requirement to realign watercourse. Channel and bank of the river would be avoided.
23	5969	Tributary of Nant Hir	Online	Existing pipe culvert replaced with box culvert and length of culvert extended (15 m). Road drainage and SuDS pond discharged into watercourse.	Existing pipe culvert would be removed and replaced with a box culvert for bat and otter mitigation. Watercourse to be realigned to reduce angle entering culvert. Box culvert with depressed inverted bed would encourage a natural bed and reduce the adverse impact of the culvert.
24	6500	Tributary of	Online	None.	None - there is no existing culvert and the channel is dry on the

Watercourse ID	Chainage	Watercourse name	Online / offline impact	Type of long term impact	Embedded mitigation (water environment design constraints considered in the development of the detailed design)
		Nant Hir			downstream side (south) of the A465.
25	6690, 4800	Tributary of Nant Hir		Extension to Nant Hir Reservoir Viaduct. SuDS pond discharged into Nant Hir watercourse at Croesbychan Junction.	Methodology for construction needs to be mindful of the high sensitivity of the water feature below with respect to pollution. The timing of the construction works in this area should be agreed with Welsh Water to avoid periods when they expect it may use Nant Hir Reservoir as a resource. Recommend geomorphologist is involved in design of Nant Hir outfall at Croesbychan Junction.
26	6980	Tributary of Nant Hir	Online	Culvert extension (40 m).	None – minor watercourse. Pathway to reservoir does not appear to be active - overgrown channel, with no flow and not connected to main stream.
27	7080	Tributary of Nant Hir	Online	Culvert removed and watercourse realigned to ch. 6980 (watercourse 26) (incorporated into road drainage).	This area has been identified for creation/improvement of Marsh Fritillary habitat. There is an opportunity here to create marshy sward/flush habitat through creation of dispersed discharge. This is to be confirmed at detailed design.
28	7448	Tributary of Nant y Gwyddel	Online	Existing pipe culvert replaced with box culvert and length of culvert extended (45 m). Road drainage discharged into watercourse.	Existing pipe culvert would be removed and replaced with a box culvert for bat and otter mitigation. Box culvert with inverted bed would encourage development of a natural bed and reduce impact of culvert. Gradient of culvert would need energy dissipation at the outlet with a step-pool.
29	7548	Tributary of Nant y Gwyddel	Online	Culvert extension (60 m). Road drainage discharged into watercourse.	Box culvert with inverted bed would encourage development of a natural bed and reduce impact of culvert. Gradient of culvert would need energy dissipation at the outlet with a step-pool. Valley to north of A465 is dry and therefore major earthworks would not impact active watercourse.
30	7770	Tributary of Nant y	N/A	Realignment of watercourse in line with habitat creation.	This area has been identified for creation/improvement of Marsh Fritillary habitat. There is an opportunity here to create marshy

Watercourse ID	Chainage	Watercourse name	Online / offline impact	Type of long term impact	Embedded mitigation (water environment design constraints considered in the development of the detailed design)
		Gwyddel			sward/flush habitat through targeted works to realign the channel which is currently artificially straight. Channel should be slightly realigned to a more natural planform which would have a slight benefit to the watercourse. The new channel should be designed in consultation with a geomorphologist.
31	8038	Tributary of Nant y Gwyddel	Online	Culvert and channel removed (incorporated into drainage system).	None – most of flow likely to arise from road runoff.
32	8760	Nant y Gwyddel	Offline	New box culvert (40 m).	Culvert to be large and have natural bed to reduce the impact on the watercourse, which currently has a sinuous planform and natural bed and banks.
Afon Taf Fawr - source to confluence Taf Fechan (GB109057033170)					
33	9290	Tributary of Nant Ffrwd	Online	Existing culvert removed (not required).	None – watercourse is to the north of the works area.
34	9303	Tributary of Nant Ffrwd	Online	Existing pipe culvert replaced with box culvert and length of culvert extended (69 m). Road drainage and SuDS pond discharged into watercourse.	Existing pipe culvert would be removed and replaced with a box culvert for bat and otter mitigation. Gradient of culvert would need energy dissipation at the outlet with a step-pool. Mining spoil would need to be removed for construction of SuDS pond.
35	9640	Tributary of Nant Ffrwd	Online	Increase culvert capacity.	Erosion of track and artificial waterfall upstream of A465 needs to be considered in detailed design. Culvert has a very steep gradient and further consideration for energy dissipation would be required at detail design, such as a step-pool at the outlet. It is recommended that geomorphologist is included in design of culvert and outlet structure.
36	9933	Tributary of Nant Ffrwd	Online	Culvert extension (19 m).	Watercourse is steep and further consideration for energy dissipation required at detail design, such as a step-pool at the outlet. It is recommended that geomorphologist advise on culvert design and

Watercourse ID	Chainage	Watercourse name	Online / offline impact	Type of long term impact	Embedded mitigation (water environment design constraints considered in the development of the detailed design)
					outlet because of proximity to Nant Ffrwd.
37	10124	Tributary of Nant Ffrwd	Online	Culvert removed and watercourse realigned.	Given the steep gradient of the culvert extension and the possibility of erosion of Nant Ffrwd the decision has been taken to realign the watercourse on the south side of the new A465 alignment. Channel realignment should be sinuous and it is recommended that geomorphologists advise on the alignment at detailed design.
38	10310	Nant Ffrwd	Online	New bridge	Proposed alignment runs parallel to and very close to Nant Ffrwd and would extend down the steep flanks of this valley. Design has sought to minimise impact on Nant Ffrwd, avoiding realignment. Abutments to be set back from watercourse edge. Road alignment at this point need to ensure that it does not damage the waterfall which an important geomorphological feature. No part of the structure would be in the watercourse.
39	10290	Tributary of Nant Ffrwd	Online	Retain existing culvert.	Extension of culvert has been avoided, which is beneficial to the watercourse and stability of the culvert, given the very steep gradient downstream.
40	10670	Tributary of Nant Ffrwd	Online	Culvert removed. Ditch to be incorporated into drainage design.	None - existing channel is an artificial drainage channel with concrete bed and sides.
41	10850	Taf Fawr	Online	Bridge extension - two additional bridges for slip roads.	Viaduct piers would span the watercourse and there would be a buffer zone from the top of bank. Structures in floodplain have been avoided.
Taf Fechan - source to confluence Afon Taf Fawr (GB109057033160)					
42	11482	Taf Fechan	Online	Bridge extension.	Viaduct piers would span the watercourse and there would be a 15 m buffer zone from the top of bank (to be confirmed). Structures in floodplain have been avoided.
43	11510	Taf Fechan Mill Leat	Online	Bridge extension.	Viaduct piers would span the watercourse. Structures in floodplain have been avoided.

Watercourse ID	Chainage	Watercourse name	Online / offline impact	Type of long term impact	Embedded mitigation (water environment design constraints considered in the development of the detailed design)
44	12545	Tributary of Taf Fechan – culverted drainage channel	Online	Existing pipe culvert to be extended (25 m).	None – culverted outfall.
45	12545-12830	Tributary of Taf Fechan	Online	None.	None - no long term impact identified.
46	13200	Tributary of Taf Fechan	Online	Existing culvert retained. Road drainage and SuDs pond discharged into watercourse.	Watercourse has gravel bed and therefore greatest care needs to be taken during construction (short term impact).
47	13440	Tributary of Taf Fechan	Online	Culvert removed (not required).	None - existing watercourse is depression that has been severely trampled.
Nant Morlais - source to confluence Afon Taf (GB109057033150)					
48	14010	Tributary of Nant Morlais – Road drainage	Online	SUDs pond discharged into watercourse.	None - existing channel is a dry, large grass trapezoidal swale (road drainage channel).
49	14460	Tributary of Nant Morlais, road drainage	N/A	Incorporated into new drainage system, including SuDS pond.	None – existing channel is artificial and has concrete slab bed and banks.
50	14550	Nant Morlais	Online	Culvert extension and earthworks (and possible realignment).	None - Nant Morlais enters an extended culvert around 200 m upstream of the road alignment and passes beneath the road, surfacing around a kilometre downstream to the southwest. The alignment, depth and baring load for this culvert would need to be determined to ensure that the works do not damage it.

Watercourse ID	Chainage	Watercourse name	Online / offline impact	Type of long term impact	Embedded mitigation (water environment design constraints considered in the development of the detailed design)
Taf – confluence to Taf Fechan to confluence Afon Cynon (GB109057033100)					
51	15198	Relict channel – Tributary of Nant Morlais	Online	No culvert required.	None - this is a relict, perched channel, which is higher than the road and the land on the south side of the road. There is no hydraulic need for a culvert.
52	15400	Tributary of Afon Taf – culverted connecting two reservoirs	Online	None.	None – no long term impact identified.
53	15812	Relict channel – Tributary of Nant Morlais	Online	No culvert modification required. Incorporate surface runoff into drainage design.	An unofficial SuDS pond/wet woodland forms during heavy rainfall and needs to be taken into account in drainage design.
54	16000	Tributary of Afon Cynon	Online		None – minor watercourse.
Rhymney River - Source to confluence Nant Bargod Rhymni (GB109057033130)					
55	16800	Tributary of Afon Rhymney	Online	None.	None - new alignment away from watercourse and at grade.
56	17210	Nant Carno	Online	Existing culvert.	None - scheme makes use of an existing structure.
57	17210	Tributary of Nant Carno	N/A	None.	None - new alignment at grade with no extension of culvert.
58	17300	Tributary of	Online	Earthworks (culvert extension is	None - new alignment at grade with no extension of culvert.

Watercourse ID	Chainage	Watercourse name	Online / offline impact	Type of long term impact	Embedded mitigation (water environment design constraints considered in the development of the detailed design)
		Nant Carno		same as 48, no double count).	

5.3 Resultant Magnitude of Impact

Table 5.3 presents the duration of impact and the overall magnitude of impact for each design element of the scheme. The potential magnitude of impact primarily considers the localised impacts on the watercourses. An assessment at a WFD waterbody scale is then provided in Section 6 where impacts of Moderate or above have been identified. The magnitude presented below assumes that mitigation is embedded into the design of the proposed work aspect.

Table 5.3: Magnitude of impact for each aspect of the scheme (localised impacts, per watercourse)

Proposed work aspect	Channel modification and assumptions	Duration	Magnitude for each quality element	Overall magnitude (with embedded mitigation)
New Culvert or large culvert extension (over 10 m)	Replacement of natural bed and banks with culvert and associated scour protection.	Long term	Hydromorphology: **Moderate adverse**	**Minor adverse** **Moderate adverse if more than one large culvert**
			Physico-chemical: **Minor adverse**	
			Biology: **Minor adverse**	
Minor culvert Extension (up to 10 m)	Typically minor extension of existing culvert. In some places this would require wholescale replacement of existing culverts.	Long term	Hydromorphology: **Minor adverse**	**Negligible**
			Physico-chemical: **Negligible**	
			Biology: **Negligible**	
New Bridge (clear span)	Bridge structure is not considered to infringe on the bed or banks, however there would be a removal of tree cover. A new bridge is considered for only one watercourse (Nant Bwlch), and at the location of the bridge the watercourse is disconnected from its floodplain.	Long term	Hydromorphology: **Negligible**	**Negligible**
			Physico-chemical: **Negligible**	
			Biology: **Negligible**	
Bridge Expansion (clear span)	Existing bridge structure is extended. No adjustment to abutments or piers. Vegetation clearance would be only impact.	Long term	Hydromorphology: **Negligible**	**Negligible**
			Physico-chemical: **Negligible**	
			Biology: **Negligible**	
Realignment	Creation of new channel course.	Long term	Hydromorphology: **Negligible – Minor positive**	**Negligible – Minor positive**
			Physico-chemical: **Negligible – Minor positive**	

Proposed work aspect	Channel modification and assumptions	Duration	Magnitude for each quality element	Overall magnitude (with embedded mitigation)
			Biology: **Negligible – Minor positive**	
Drainage	Slight increase in runoff from increased hard standing because width of road has increased. No current drainage system is in place, therefore the scheme would deliver an improvement in water quality.	Long term	Hydromorphology: **Minor positive**	**Minor positive**
			Physico-chemical: **Minor positive**	
			Biology: **Minor positive**	
Earthworks	Earthworks along new alignment, from construct the road in cutting or on embankments, including removal of trees.	Short term	Hydromorphology: **Negligible – Minor adverse**	**Negligible – Minor adverse**
			Physico-chemical: **Negligible – Minor adverse**	
			Biology: Negligible – **Minor adverse**	

At an individual watercourse level the majority of the works were considered to have a negligible magnitude. The exceptions are new culverts and large culvert extensions (over 10 m), which are considered to have a minor impact with embedded mitigation. Whilst it is possible to reduce the likelihood of erosion or deposition as a result of the new structure, the structure itself replaces the natural bed and banks of the watercourse. However, in many instances, existing pipe culverts are being replaced with depressed invert box culverts, which allow the formation of natural bed through the structure. In addition, this allows for more natural flow conditions, removes/alleviates barriers to fish migration and have been designed for both bat and otter passage. Some watercourse have also been diverted and taken out of their existing culvert, delivering significant improvement to the water environment. In some instances, these redundant culverts for water conveyance would be retained for mammal passage. Bridges have a reduced impact however they are not considered financially feasible for all watercourses, particularly minor watercourses (high order streams).

5.4 Significance of Impact

The significance of impact was considered for all 58 watercourses identified within the study area. Fifty of the watercourses are considered to have a Neutral significance and seven have a Slight significance. Only one watercourse, a tributary of Nant y Bwlch (ch. 2224), had a resultant impact significance of Moderate.

As a consequence a more detailed assessment was undertaken of the tributary of Nant y Bwlch to determine whether the impact of the scheme could be reduced further or whether additional mitigation would be required.

6. Further Assessment

The impact on Tributary of Nant y Bwlch that arises from a new culvert has been assigned a Moderate significance. Consequently the impact of the works on the receiving WFD waterbody is considered as part of a detailed WFD assessment.

The tributary of the Nant y Bwlch was observed to be a small sinuous stream passing through areas of woodland, upstream of the A465 road. The gradient was steep in places, which provided a varied flow pattern and diverse habitat for aquatic fauna; riffle-run-pool complexes dominated the survey reach. The substrate was also diverse, ranging from finer particles such as sand and silt to coarser substrates such as pebbles and cobbles. Although the walkover was during the winter months, there was a lack of in-stream vegetation, which is likely due to the moderate shading of the channel, which would inhibit plant growth during the summer months. Bank features include exposed tree roots, providing cover for fish, whilst large wood accumulations were noted in-stream, providing habitat for macroinvertebrates. The diversity of the habitat, flow and inputs / characteristics from the surrounding land provides a heterogeneous habitat in which a diverse ecological community could thrive. This watercourse was assessed as being highly vulnerable; this is due to the nature of the natural, diverse aquatic environment which is easily susceptible to long-term change from the proposed new culvert.

The Tributary of the Nant y Bwlch has been assessed as highly vulnerable, with a minor adverse impact from the proposed new culvert, resulting in an overall Moderate significance of impact. Given the small size of watercourse it was not considered financially feasible to install a bridge rather than a culvert. However, the design of the culvert has been modified to incorporate a natural bed and as such reduce the impact of the culvert on the watercourse. Whilst the implementation of the proposed new culvert would affect the aquatic environment at a local scale, upstream and downstream of the culvert, the significance of this impact at a waterbody scale is likely to be negligible. At present the Afon Cynon waterbody is failing WFD status with Poor Ecological Potential but the proposed new culvert on Tributary of the Nant y Bwlch is not considered to cause further deterioration of the whole ‘Afon Cynon – source to confluence Aman River’ waterbody. Therefore further mitigation is not considered a requirement of the scheme to be compliant with the WFD.

7. Overall Compliance

As explained in Section 1.1.1, for WFD compliance the proposed scheme must compromise the following three key WFD environmental objectives:

1) Protect the water environment from deterioration

2) Achieve the wider objectives of other European Directives

3) Aim to achieve good overall status for surface and ground waters

Compliance with the WFD has been sought throughout the design process. Improvements to the water quality, through the inclusion of a comprehensive sustainable road drainage system, were established at the start of the scheme. Then, through this Environmental Impact Assessment, full understanding of the geomorphology, ecology, water quality (physico-chemical) and flood risk constraints and opportunities have been gained. This has been fed back to the structural and drainage design teams through several interactive workshops, design iteration and incorporated into the final scheme. Taking this integrated approach has enabled the scheme design to be sensitive to the water environment. Adverse impacts have been avoided where possible, or otherwise minimised.

The proposed scheme has been designed to mitigate water environment impacts, with embedded mitigation also delivering environmental improvements to the water environment and ecology, taking into consideration all quality elements of the WFD. Thus the scheme is neither considered to cause deterioration at a waterbody scale in the status/potential of any of the seven WFD waterbodies within the study area nor prevent any of the WFD waterbodies from achieving Good Ecological Status / Potential. Consequently there would be no impact on other WFD waterbodies within the same RBD.

The introduction of a sustainable drainage system would help to move the WFD waterbodies towards achieving Good Ecological Status/Potential, by improving the water quality (physico-chemical quality element) in reducing the amount of pollutant entering the local watercourses. This in turn would also deliver benefits to the biological and hydromorphological quality elements due to less pollution and reduction in fine sediments (silt).

Impacts of physical modifications have been mitigated through the following means:

- Replacement of existing pipe culverts with depressed invert box culverts. These allow the formation of a natural bed and remove/alleviate barriers to fish migration;
- Box culverts designed for otter and bat passage;
- Channel diversions to avoid the need for culverts, including the removal of some watercourses out of culverts into a diversion. Redundant culverts would be retained for mammal passage;
- Culverts for mammal passage are designed to guide mammals through the culvert;
- Culvert lengths are reduced where practicable and;
- Energy dissipation is designed within culverts/culvert outlets, where required.

Therefore, the scheme contributes to the measures set out in the Western Wales RBMP and Severn RBMP to address the significant water management issues of physical modification and pollution from towns, cities and transport. The proposed box culverts to replace existing pipe culverts would deliver improvements to the condition of the channel bed; deliver easement of barriers to fish migration; modification of existing culverts to incorporate current best practice design; removal of some structures; and improvement of the riparian zone.

Annex B. Individual Watercourse Vulnerability

Chainage	Watercourse ID	Watercourse name	Size of watercourse	Gradient	Planform	Dominant process	Dominant function	Existing modifications (seen on site / within study reach)	Vegetation along bank top	Vulnerability
Sychryd - headwaters to confluence with Mellte (GB110058032320)										
-50	1	Camnant	Medium	Low	Straight	Stable	Transfer	Realigned, culverted, overdeep, straight	Tree lined	Low
Afon Cynon - source to confluence Aman River (GB109057033110)										
950	2	Hirwaun ponds	Small	Moderate	Straight	Aggrading	Sink	Mining settlement ponds, straightened, culverted, bridge piers, embanked	Tree lined	Low
1612	3	Tributary of Nant y Cnapiau	Small	Low	Low sinuosity (network of drains)	Stable	Transfer	Culverted	Marshy, tree lined, wet woodland in high flows	Low
1750	4	Nant y Cnapiau	Small	High	Straight (artificial)	Stable (artificial)	Transfer (sink upstream)	Artificial concrete lined channel from settlement pond, extensively culverted	Grass and shrubs	Low
1955	5	Tributary of Nant y Cnapiau	Small	High	Low sinuosity (sinks into ground)	Stable	Sink	Culverted, localised poaching	Grass and shrubs	Low
2224	6	Tributary of	Small	Moderate	Meandering	Laterally	Exchange	Culverted	Tree lined	High

Chainage	Watercourse ID	Watercourse name	Size of watercourse	Gradient	Planform	Dominant process	Dominant function	Existing modifications (seen on site / within study reach)	Vegetation along bank top	Vulnerability
		Nant y Bwlch				migrating				
2280	7	Tributary of Nant y Bwlch	Small	Low	Low sinuosity (undefined marshy channel)	Aggrading (assuming sediment carried to pond)	Sink (pond)	Pond	Marsh, isolated trees	Low
2320	8	Nant y Bwlch	Medium	Moderate	Meandering	Stable (geology)	Transfer	Realigned, perched and embanked through open mined area upstream. Culverted under existing road	Tree lined	Low (geology)
2330	9	Tributary of Nant y Bwlch	Small	Moderate	Straight	Stable	Transfer	Straightened, field ditch	Grass and shrubs	Low
2770	10	Tributary of Afon Cynon	Small	Low	Straight (large marshy channel)	Stable	Sink (marshy channel, little flow)	Culverted, realigned	Marsh	Low
3288	11	Tributary of Afon Cynon	Small	High	Sinuous	Stable	Transfer	Grazed, localised poaching, concrete steps leading to culvert	Shrubs and tree lining	Low
3594	12	Tributary of Afon Cynon	Small	Moderate	Sinuous	Stable (geology - gorge, bedrock outcrop)	Transfer	Culverted, urbanised	Tree lined	Low

Chainage	Watercourse ID	Watercourse name	Size of watercourse	Gradient	Planform	Dominant process	Dominant function	Existing modifications (seen on site / within study reach)	Vegetation along bank top	Vulnerability
3830	13	Tributary of Afon Cynon	Small	Low	Sinuous	Stable	Transfer	Culverted (not crossed by scheme)	Tree lined	Low
3882	14	Afon Cynon	Large	Low	Meandering	Stable	Transfer	Open span bridge, embankment on floodplain	Tree lined on right bank, grass on left	Medium
3945	15	Tributary of Afon Cynon	Small	Low	Low sinuosity	Stable	Transfer	Culverted	Left bank tree lined, right bank grass	Low
4131	16	Tributary of Afon Cynon	Small	High	Straight	Stable	Transfer	Straightened, perched and embanked, urbanised, culverted	Tree lined	Low
4224	17	Tributary of Afon Cynon	Small (ephemeral)	Moderate	Straight	Stable	Transfer	Overdeep, poached	Grass	Low
4491	18	Tributary of Nant Hir	Small	Low	Straight	Stable	Transfer	Straight, drainage channel along top of railway embankment	Marsh and grass	Low
4250	19	Tributary of Afon Cynon	Small	Moderate	Straight	Stable (dry)	None	Overdeep and embankment	Right bank scattered tree lining, left bank grass	Low
4824	20	Tributary of	Small	Low	Low	Stable	Transfer	Realigned	Tree lined	Low

Chainage	Watercourse ID	Watercourse name	Size of watercourse	Gradient	Planform	Dominant process	Dominant function	Existing modifications (seen on site / within study reach)	Vegetation along bank top	Vulnerability
		Nant Hir			sinuosity			alongside road (acts as road drainage), culverted		
5021	21	Tributary of Nant Hir	Small	Low	Straight (sinks into ground)	Stable	Sink	Realigned	Grass, scattered tree lining	Low
5440	22	Nant Melyn	Medium	Moderate	Meandering	Laterally migrating	Exchange	Open span bridge	Tree lined	High
5969	23	Tributary of Nant Hir	Small	Moderate	Straight	Stable (short term) / Incising (series of knick points downstream)	Transfer	Straightened, culverted	Grass and scattered tree lining upstream of A465, tree lined downstream	Low
6500	24	Tributary of Nant Hir	Small (watercourse starts south of road and is dry)	Low	Straight (artificial)	Stable (field/road drainage)	Transfer	Geotextile lined channel	Tree lined on left bank, grass and scrub on right bank	Low
6690, 4800	25	Nant Hir reservoir	Large (Reservoir)	Low	Reservoir	Aggrading (settlement of sediment along bed of reservoir)	Sink	Dammed	Tree lined	Low
6980	26	Tributary of Nant Hir	Small (dry)	Low	Straight	Stable (overgrown, dry)	Sink	Overdeep, embankment, drainage channel	Rough pasture (long grass)	Low

Chainage	Watercourse ID	Watercourse name	Size of watercourse	Gradient	Planform	Dominant process	Dominant function	Existing modifications (seen on site / within study reach)	Vegetation along bank top	Vulnerability
7080	27	Tributary of Nant Hir	Small	Low	Straight	Stable (overgrown, dry)	Sink	Disturbed ground, overdeep channel	Rough pasture (long grass)	Low
7448	28	Tributary of Nant y Gwyddel	Small	Moderate	Sinuous	Laterally migrating	Exchange	Forestry settlement pond, culverted	Tree lined upstream, grass downstream	Medium
7548	29	Tributary of Nant y Gwyddel	Small	Moderate	Sinuous	Laterally migrating	Exchange	Forestry settlement pond, culverted	Tree lined upstream, grass downstream	Medium
7770	30	Tributary of Nant y Gwyddel	Small	Moderate	Sinuous	Stable	Transfer	Culverted	Scrub	Low
8038	31	Tributary of Nant y Gwyddel	Small	Moderate	Sinuous	Stable	Transfer	Starts as road drainage (no channel marked upstream)	Scrub	Low
8760	32	Nant y Gwyddel	Small	Moderate	Meandering (within straight two stage channel)	Laterally migrating	Exchange	Embanked, overdeep	Scrub	Medium
Afon Taf Fawr - source to confluence Taf Fechan (GB109057033170)										
9290	33	Tributary of Nant Ffrwd	Small	Low	Straight	Stable	Transfer	Straightened (artificial drain?)	Scrub	Low
9303	34	Tributary of	Small	Moderate	Low	Laterally	Exchange	Mining spoil in	Grass	Medium

Chainage	Watercourse ID	Watercourse name	Size of watercourse	Gradient	Planform	Dominant process	Dominant function	Existing modifications (seen on site / within study reach)	Vegetation along bank top	Vulnerability
		Nant Ffrwd			sinuosity	migrating/incising (knick point downstream of road)		headwaters, disturbed ground, realigned, culverted		
9640	35	Tributary of Nant Ffrwd	Small	Moderate	Straight	Incising	Source	Mining spoil, realignment, urbanisation, ford, culverted	Grass	Medium
9933	36	Tributary of Nant Ffrwd	Small	High	Straight	Incising	Source	Overdeep, urbanised	Shrubs and tree lining	Medium
10124	37	Tributary of Nant Ffrwd	Small	High	Low sinuosity	Stable	Transfer	Culverted	Grass	Low
10310	38	Nant Ffrwd	Medium	High	Meandering	Stable (incising – 20 m waterfall)	Transfer	Open span bridge (over gorge)	Tree lined	Medium
10290	39	Tributary of Nant Ffrwd	Small	High	Straight	Stable	Transfer	Straightened, culverted	Grass, some tree lining downstream	Low
10670	40	Tributary of Nant Ffrwd	Small	High	Straight (artificial)	Stable (field/road drainage)	Transfer	Artificial concrete lined channel, extensively culverted	Tree lined	Low
10850	41	Taf Fawr	Large	Moderate	Straight (geology)	Stable (geology)	Transfer	Open span bridge (over gorge)	Tree lined	Low
Taf Fechan - source to confluence Afon Taf Fawr (GB109057033160)										
11482	42	Taf Fechan	Large	Low	Straight (geology)	Stable (geology)	Transfer	Open span bridge (over gorge),	Tree lined	Low

Chainage	Watercourse ID	Watercourse name	Size of watercourse	Gradient	Planform	Dominant process	Dominant function	Existing modifications (seen on site / within study reach)	Vegetation along bank top	Vulnerability
								historically quarried		
11510	43	Taf Fechan mill leat	Small	Low	Straight (artificial)	Stable (hard bank and bed)	Transfer	Mill leat	Grass	Low
12545	44	Piped outfall, road drainage	Small	Low	Outfall (piped)			Extensively culverted/road drainage	Culverted	Low
12545-12830	45	Tributary of Taf Fechan	Small	Low	Low sinuosity	Stable (dry)	None	Extensively poached	Grass	Low
13200	46	Tributary of Taf Fechan - it is unclear where culvert outlet is (i.e. which waterbody flow is discharged to)	Small	Low	Low sinuosity	Stable	Transfer (clean gravels)	Extensively poached	Grass, scattered trees	Low
13440	47	Tributary of Taf Fechan	Small	Low	Straight	Stable (dry)	Source	Extensively poached	Grass	Low
Nant Morlais - source to confluence Afon Taf (GB109057033150)										
14010	48	Tributary of Nant Morlais, road drainage	Small	High	Straight (artificial drainage channel)	Stable (dry)	None	Artificial, oversized, trapezoidal channel - road drainage	Grass	Low

Chainage	Watercourse ID	Watercourse name	Size of watercourse	Gradient	Planform	Dominant process	Dominant function	Existing modifications (seen on site / within study reach)	Vegetation along bank top	Vulnerability
		south of A465								
14460	49	Tributary of Nant Morlais, road drainage south of A465	Small	Moderate (increasing to high away from road)	Straight (artificial)	Stable (artificial)	Transfer	Concrete lined channel	Tree lined on right bank, grass on left	Low
14550	50	Nant Morlais	Large	Moderate	Culverted	Stable (artificial)	Transfer	Extensively culverted, concrete lined open channel	Tree lined	Low
Taf - confluence Taf Fechan to confluence Afon Cynon (GB109057033100)										
15198	51	No watercourse – relict channel	None	N/A						N/A
15400	52	No watercourse – possibly culverted channel connecting reservoirs	None	N/A						N/A
15812	53	Flows into reservoir, then into Nant Morlais	Small	Low	Straight (artificial, ASDA car park	Stable	Sink	Straightened, embanked, perched unofficial SuDS pond	Tree lined, wet woodland following	Low

Chainage	Watercourse ID	Watercourse name	Size of watercourse	Gradient	Planform	Dominant process	Dominant function	Existing modifications (seen on site / within study reach)	Vegetation along bank top	Vulnerability
		culvert			drainage)				high rainfall	
16000	54	Tributary of Afon Taf	Small	Low	Straight	Stable	Transfer	Straight, possibly road drainage, extensively culverted	Grass and shrub	Low
Rhymney River - Source to confluence Nant Bargod Rhymni (GB109057033130)										
16800	55	Tributary of Nant Carno	Small	Low	Straight	Stable (artificial)	Transfer	On side of hill slope, assume to be hard lined (like reservoir catchwater)		Low
17210	56	Nant Carno	Small	Moderate	Meandering	Laterally migrating	Exchange	Culverted	Grass and shrubs	Medium
17210	57	Tributary of Nant Carno	Small	Moderate	Straight (artificial drainage channel)	Stable	Transfer	Straightened, culverted, fly tipping	Grass and marsh	Low
17300	58	Tributary of Nant Carno	Small	Moderate	Low sinuosity	Stable	Transfer	Culverted, connects to road drainage	Grass and marsh	Low

Appendix 17B – Detailed Description of Baseline Assessment

Water feature (WF) chainage / name / area	Attribute	Indicator of quality	Importance
WF01, -50 Cammant <1 km^2	Hydrology and flood risk	This water feature rises in the Hirwaun industrial estate flowing south to north and is not modelled by NRW (Natural Resources Wales). Surface water flood maps indicate the industrial estate is at risk of flooding to a presumed unused grassy area to the north. The risk areas do not intersect with any residential properties or infrastructure.	Low
	Fluvial geomorphology	This water feature has restricted lateral and vertical migration and is heavily artificial in nature.	Low
	Water quality / supply	WFD (Water Framework Directive) Status Poor. Surrounding land use: predominantly industrial and it is in close proximity to mining works. Potential pollution sources: unmanaged road drainage.	Low
	Dilution and removal of waste products	This water feature is of medium size and currently receives a maximum daily discharge of 2268 m^3 of sewage; however it is downstream of the scheme.	Medium
	Biodiversity	No designated fisheries.	Low
WF02, 950 Hirwaun Ponds 2.71 km^2	Hydrology and Flood Risk	This water feature flows south to north draining the Tower Colliery Mine discharging into Afon Cynon, it is not modelled by NRW and there are no residential properties or infrastructure shown to be at risk.	Low
	Fluvial geomorphology	This water feature has restricted lateral and vertical migration and is	Low

Water feature (WF) chainage / name / area	Attribute	Indicator of quality	Importance
		heavily artificial in nature.	
	Water quality / supply	WFD Status Poor. Surrounding land use: predominantly industrial and received mine drainage from upstream. Potential pollution sources: unmanaged road and mine drainage.	Low
	Dilution and removal of waste products	This water feature is of medium size and currently receives a maximum daily discharge of 3.00 m^3 of mine waste; while upstream of the scheme the amounts of discharge are relatively low.	Low
	Biodiversity	Surrounding designated areas: Cors Bryn-y-Gaer SSSI (Site of Special Scientific Interest) / Blaen Cynon SSSI and SAC (Special Area of Conservation).	Very High
WF03, 1612 Tributary of Nant y Cnapiau <1 km^2	Hydrology and Flood Risk	This water feature flows south to north draining the Tower Colliery Mine, is culverted beneath the A465 and discharges into Afon Cynon, it is not modelled by NRW and there are no residential properties or infrastructure shown to be at risk.	Low
	Fluvial geomorphology	This water feature has restricted lateral and vertical migration and is heavily artificial in nature.	Low
	Water quality / supply	WFD Status Poor. Surrounding land use: predominantly unused grassy area bordered by the A4059, A465 and Hirwaun Ponds mine drainage. Potential pollution sources: unmanaged road and mine drainage.	Low
	Dilution and removal of	This water feature does	Low

Water feature (WF) chainage / name / area	Attribute	Indicator of quality	Importance
	waste products	not currently receive any discharge or effluent.	
	Biodiversity	Surrounding designated areas: Cors Bryn-y-Gaer SSSI / Blaen Cynon SSSI and SAC.	Very High
WF04, 1750 Nant y Cnapiau 1 km^2	Hydrology and Flood Risk	This water feature flows south to north draining the Tower Colliery Mine discharging into Afon Cynon. This water feature is extensively culverted and it is not modelled by NRW and there are no residential properties or infrastructure shown to be at risk.	Low
	Fluvial geomorphology	This water feature has restricted lateral and vertical migration and is heavily artificial in nature.	Low
	Water quality / supply	WFD Status Poor. Surrounding land use: predominantly unused grassy area between bordered by the A4059, A465 and Hirwaun Ponds mine drainage. Potential pollution sources: unmanaged road and mine drainage.	Low
	Dilution and removal of waste products	This water feature does not currently receive any discharge or effluent.	Low
	Biodiversity	Surrounding designated areas: Cors Bryn-y-Gaer SSSI / Blaen Cynon SSSI and SAC.	Very High
WF05, 1955 Tributary of Nant y Cnapiau <1 km^2	Hydrology and Flood Risk	This water feature flows south to north draining the Tower Colliery Mine discharging into Afon Cynon it is not modelled by NRW and there are no residential properties or infrastructure shown to be at risk.	Low
	Fluvial geomorphology	This water feature has restricted lateral and	Low

Water feature (WF) chainage / name / area	Attribute	Indicator of quality	Importance
		vertical migration and is heavily artificial in nature.	
	Water quality / supply	WFD Status Poor. Surrounding land use: predominantly industrial and mine drainage received from upstream. Potential pollution sources: unmanaged road and mine drainage.	Low
	Dilution and removal of waste products	This water feature does not currently receive any discharge or effluent.	Low
	Biodiversity	Surrounding designated areas: Cors Bryn-y-Gaer SSSI / Blaen Cynon SSSI and SAC.	Low
WF06, 2224 Tributary of Nant y Bwlch <1 km^2	Hydrology and Flood Risk	This water feature flows south to north and is assumed to drain the Tower Colliery Mine discharging into Nant y Bwlch south of the A465. It is not modelled by NRW and there are no residential properties or infrastructure shown to be at risk.	Low
	Fluvial geomorphology	This water feature was assessed as highly vulnerable due to significant active erosion and deposition as well as active migration of the channel.	Very High
	Water quality / supply	WFD Status Poor. Surrounding land use: predominantly industrial and mine drainage received from upstream. Potential pollution sources: unmanaged road and mine drainage.	Low
	Dilution and removal of waste products	This water feature does not currently receive any discharge or effluent.	Low
	Biodiversity	No designated land.	Low
WF07, 2280 Tributary of	Hydrology and Flood Risk	This water feature flows	Low

Water feature (WF) chainage / name / area	Attribute	Indicator of quality	Importance
Nant y Bwlch <1 km^2		south to north and is assumed to drain the Tower Colliery Mine discharging into Nant y Bwlch currently it flows into Nant y Bwlch south of the A465. It is not modelled by NRW and there are no residential properties or infrastructure shown to be at risk.	
	Fluvial geomorphology	This water feature has restricted lateral and vertical migration and is heavily artificial in nature.	Low
	Water quality / supply	WFD Status Poor. Surrounding land use: predominantly industrial and mine drainage received from upstream. Potential pollution sources: unmanaged road and mine drainage.	Low
	Dilution and removal of waste products	This water feature does not currently receive any discharge or effluent.	Low
	Biodiversity	No designated land.	Low
WF08, 2320 Nant y Bwlch 1.86 km^2	Hydrology and Flood Risk	This water feature flows south to north and is currently culverted beneath the A465. The current culvert is undersized and poses flood risk to 195 properties.	Very High
	Fluvial geomorphology	This water feature has restricted lateral and vertical migration and is heavily artificial in nature.	Low
	Water quality / supply	WFD Status Poor. Surrounding land use: predominantly industrial and mine drainage received from upstream. Potential pollution sources: unmanaged road and mine drainage.	Low
	Dilution and removal of	This water feature does	Low

Water feature (WF) chainage / name / area	Attribute	Indicator of quality	Importance
	waste products	not currently receive any discharge or effluent.	
	Biodiversity	No designated land.	Low
WF09, 2330 Tributary of Nant y Bwlch <1 km^2	Hydrology and Flood Risk	This water feature flows south to north and is assumed to drain the Tower Colliery Mine discharging into Nant y Bwlch it is not modelled by NRW and there are no residential properties or infrastructure shown to be at risk.	Low
	Fluvial geomorphology	This water feature has restricted lateral and vertical migration and is heavily artificial in nature.	Low
	Water quality / supply	WFD Status Poor. Surrounding land use: predominantly industrial and mine drainage received from upstream. Potential pollution sources: unmanaged road and mine drainage.	Low
	Dilution and removal of waste products	This water feature does not currently receive any discharge or effluent.	Low
	Biodiversity	No designated land.	Low
WF10, 2770 Tributary of Afon Cynon <1 km^2	Hydrology and Flood Risk	This water feature flows south to north and is culverted beneath the A465. It is not modelled by NRW and there are no residential properties or infrastructure shown to be at risk.	Low
	Fluvial geomorphology	This water feature has restricted lateral and vertical migration and is heavily artificial in nature.	Low
	Water quality / supply	WFD Status Poor. Surrounding land use: Sparse residential and agricultural. Potential pollution sources: unmanaged road drainage, agricultural	Low

Water feature (WF) chainage / name / area	Attribute	Indicator of quality	Importance
		pollution including pesticides, nutrients and fertilisers.	
	Dilution and removal of waste products	This water feature does not currently receive any discharge or effluent.	Low
	Biodiversity	No designated land.	Low
WF11, 3288 Tributary of Afon Cynon <1 km^2	Hydrology and Flood Risk	This water feature is culverted beneath the A465 / A4059 junction flowing south to north. It is not modelled by NRW and there are no residential properties or infrastructure shown to be at risk.	Low
	Fluvial geomorphology	This water feature has restricted lateral and vertical migration and is heavily artificial in nature.	Low
	Water quality / supply	WFD Status Poor. Surrounding land use: Sparse residential and agricultural. Potential pollution sources: unmanaged road drainage, agricultural pollution including pesticides, nutrients and fertilisers.	Low
	Dilution and removal of waste products	This water feature does not currently receive any discharge or effluent.	Low
	Biodiversity	No designated land.	Low
WF12, 3594 Tributary of Afon Cynon <1 km^2	Hydrology and Flood Risk	This water feature flows south to north and is culverted beneath the A465 befor discharging into Afon Cynon. It is not modelled by NRW and there are no residential properties or infrastructure shown to be at risk.	Low
	Fluvial geomorphology	This water feature has restricted lateral and vertical migration and is heavily artificial in nature.	Low
	Water quality / supply	WFD Status Poor. Surrounding land use:	Low

Water feature (WF) chainage / name / area	Attribute	Indicator of quality	Importance
		Sparse residential and agricultural. Potential pollution sources: unmanaged road drainage, agricultural pollution including pesticides, nutrients and fertilisers.	
	Dilution and removal of waste products	This water feature does not currently receive any discharge or effluent.	Low
	Biodiversity	No designated land.	Low
WF13, 3830 Tributary of Afon Cynon <1 km^2	Hydrology and Flood Risk	This water feature is culverted beneath a minor road south of the A465 but does not cross the scheme. It is not modelled by NRW and there are no residential properties or infrastructure shown to be at risk.	Low
	Fluvial geomorphology	This water feature has restricted lateral and vertical migration and is heavily artificial in nature.	Low
	Water quality / supply	WFD Status Poor. Surrounding land use: Sparse residential and agricultural. Potential pollution sources: unmanaged road drainage, agricultural pollution including pesticides, nutrients and fertilisers.	Low
	Dilution and removal of waste products	This water feature does not currently receive any discharge or effluent.	Low
	Biodiversity	No designated land.	Low
WF14, 3882 Afon Cynon 28.85 km^2	Hydrology and Flood Risk	This water feature is modelled by NRW and is considered to pose flood risk to approximately 100-150 properties upstream of the bridge. It acts as a flood throttle, possibly providing some alleviation to properties downstream of this point. Because of	Very High

Water feature (WF) chainage / name / area	Attribute	Indicator of quality	Importance
		this the water feature is considered extremely vulnerable to change with vulnerable receptors upstream and downstream of the crossing with the A465.	
	Fluvial geomorphology	This water feature is moderately vulnerable to change primarily due to its size and natural banks.	Medium
	Water quality / supply	WFD Status Poor. Surrounding land use: Sparse residential and agricultural. Potential pollution sources: unmanaged road drainage, agricultural pollution including pesticides, nutrients and fertilisers.	Low
	Dilution and removal of waste products	This water feature does not currently receive any discharge or effluent.	Low
	Biodiversity	No designated land.	Low
WF15, 3945 Tributary of Afon Cynon <1 km^2	Hydrology and Flood Risk	This water feature flows north to south and is culverted beneath the A465 before flowing into Afon Cynon. It is not modelled by NRW and there are no residential properties or infrastructure shown to be at risk.	Low
	Fluvial geomorphology	This water feature has restricted lateral and vertical migration and is heavily artificial in nature.	Low
	Water quality / supply	WFD Status Poor. Surrounding land use: Sparse residential and agricultural. Potential pollution sources: unmanaged road drainage, agricultural pollution including pesticides, nutrients and fertilisers.	Low

Water feature (WF) chainage / name / area	Attribute	Indicator of quality	Importance
	Dilution and removal of waste products	This water feature does not currently receive any discharge or effluent.	Low
	Biodiversity	No designated land.	Low
WF16, 4131 Tributary of Afon Cynon <1 km^2	Hydrology and Flood Risk	This water feature flows north to south and is culverted beneath the A465 before flowing into Afon Cynon. It is not modelled by NRW and there are no residential properties or infrastructure shown to be at risk.	Low
	Fluvial geomorphology	This water feature has restricted lateral and vertical migration and is heavily artificial in nature.	Low
	Water quality / supply	WFD Status Poor. Surrounding land use: Sparse residential and agricultural. Potential pollution sources: unmanaged road drainage, agricultural pollution including pesticides, nutrients and fertilisers.	Low
	Dilution and removal of waste products	This water feature does not currently receive any discharge or effluent.	Low
	Biodiversity	No designated land.	Low
WF17, 4224 Tributary of Afon Cynon <1 km^2	Hydrology and Flood Risk	This water feature is an ordinary watercourse flowing north to south culverted under the A465 but is not modelled by NRW and there are no residential properties or infrastructure shown to be at risk. This water feature is identified as ephemeral.	Low
	Fluvial geomorphology	This water feature has restricted lateral and vertical migration and is heavily artificial in nature.	Low
	Water quality / supply	WFD Status Poor. Surrounding land use: Sparse residential and	Low

Water feature (WF) chainage / name / area	Attribute	Indicator of quality	Importance
		agricultural. Potential pollution sources: unmanaged road drainage, agricultural pollution including pesticides, nutrients and fertilisers.	
	Dilution and removal of waste products	This water feature does not currently receive any discharge or effluent.	Low
	Biodiversity	No designated land.	Low
WF18, 4491 Tributary of Nant Hir <1 km^2	Hydrology and Flood Risk	This water feature is culverted beneath the A465 and is not modelled by NRW there are no residential properties or infrastructure shown to be at risk. This water feature acts as a drainage channel, the current capacity of the culvert is a two year event, surface water maps reflect the likelihood of the culvert backing up, however there are no risk receptors upstream of the culvert.	Low
	Fluvial geomorphology	This water feature is a drainage channel with minimal variation in morphology and restricted vertical and lateral migration.	Low
	Water quality / supply	WFD Status Poor. Surrounding land use: Nearby residential and railway. Potential pollution sources: unmanaged road drainage, agricultural pollution including pesticides, nutrients and fertilisers.	Low
	Dilution and removal of waste products	This water feature does not currently receive any discharge or effluent.	Low
	Biodiversity	No designated land.	Low
WF19, 4250 Tributary of	Hydrology and Flood Risk	This water feature is flows north to south from the	Low

Water feature (WF) chainage / name / area	Attribute	Indicator of quality	Importance
Nant y Bwlch <1 km^2		railway away from the A465, it is not modelled by NRW and there are no residential properties or infrastructure shown to be at risk.	
	Fluvial geomorphology	This water feature has restricted lateral and vertical migration and is heavily artificial in nature.	Low
	Water quality / supply	WFD Status Poor. Surrounding land use: Nearby residential and railway. Potential pollution sources: unmanaged road drainage, agricultural pollution including pesticides, nutrients and fertilisers.	Low
	Dilution and removal of waste products	This water feature does not currently receive any discharge or effluent.	Low
	Biodiversity	No designated land.	Low
WF20, 4824 Tributary of Nant Hir <1 km^2	Hydrology and Flood Risk	This water feature acts as a drainage channel and is culverted beneath the A465. It is not modelled by the EA no residential properties or infrastructure are considered to be at risk.	Low
	Fluvial geomorphology	This water feature is realigned alongside the road acting as drainage. Its lateral and vertical migration is restricted and is minimally vulnerable to change.	Low
	Water quality / supply	WFD Status Poor. Surrounding land use: Predominantly agricultural. Potential pollution sources: unmanaged road drainage, agricultural pollution including pesticides, nutrients and fertilisers.	Low

Water feature (WF) chainage / name / area	Attribute	Indicator of quality	Importance
	Dilution and removal of waste products	This water feature does not currently receive any discharge or effluent.	Low
	Biodiversity	No designated land.	Low
WF21, 5021 Tributary of Nant Hir <1 km^2	Hydrology and Flood Risk	This water feature flows north to south away from the A465. it is not modelled by NRW and there are no residential properties or infrastructure shown to be at risk.	Low
	Fluvial geomorphology	This water feature has restricted lateral and vertical migration and is heavily artificial in nature.	Low
	Water quality / supply	WFD Status Poor. Surrounding land use: Predominantly agricultural. Potential pollution sources: unmanaged road drainage, agricultural pollution including pesticides, nutrients and fertilisers.	Low
	Dilution and removal of waste products	This water feature does not currently receive any discharge or effluent.	Low
	Biodiversity	No designated land.	Low
WF22, 5440 Nant Melyn 3.91 km^2	Hydrology and Flood Risk	This water feature flows north to south from the Nant Moel Reservoir, it is considered to be at risk from reservoir flooding and 300 m south of the A465 there are approximately six residential properties at risk.	High
	Fluvial geomorphology	This water feature is considered vulnerable to change as it does exhibit some lateral migration across the floodplain, however it incises into bedrock lacking sediment and so is not considered “very high”	High

Water feature (WF) chainage / name / area	Attribute	Indicator of quality	Importance
	Water quality / supply	WFD Status Poor. Surrounding land use: Predominantly agricultural. Potential pollution sources: unmanaged road drainage, agricultural pollution including pesticides, nutrients and fertilisers.	Low
	Dilution and removal of waste products	This water feature does not currently receive any discharge or effluent.	Low
	Biodiversity	No designated land.	Low
WF23, 5969 Tributary of Nant Hir <1 km^2	Hydrology and Flood Risk	This water feature flows north to south and is culverted beneath the A465 (5969CP). The current provision has the capacity to pass a ten to 25 year event. At this point the road is incised so overtopping is likely during any events of higher magnitude than a 25 year event. There are no residential or industrial properties at risk.	Very High
	Fluvial geomorphology	This water feature has restricted lateral and vertical migration and is heavily artificial in nature.	Low
	Water quality / supply	WFD Status Poor. Surrounding land use: Predominantly agricultural. Potential pollution sources: unmanaged road drainage, agricultural pollution including pesticides, nutrients and fertilisers.	Low
	Dilution and removal of waste products	This water feature received maximum 1 m^3 of domestic effluent per day; however it is downstream of the scheme.	Low

Water feature (WF) chainage / name / area	Attribute	Indicator of quality	Importance
	Biodiversity	Surrounding designated areas: Tir Mawr a Dderi Hir SSSI and SAC.	Very High
WF24, 6500 Tributary of Nant Hir <1 km^2	Hydrology and Flood Risk	This water feature flows north to south into Nant Hir downstream of the reservoir and is geotextile lined. It is not modelled by NRW and there are no residential properties or infrastructure shown to be at risk.	Low
	Fluvial geomorphology	This water feature has restricted lateral and vertical migration and is heavily artificial in nature.	Low
	Water quality / supply	WFD Status Poor. Surrounding land use: Predominantly agricultural. Potential pollution sources: unmanaged road drainage, agricultural pollution including pesticides, nutrients and fertilisers.	Low
	Dilution and removal of waste products	This water feature does not currently receive any discharge or effluent.	Low
	Biodiversity	No designated land.	Low
WF25, 6690 Nant Hir Reservoir 1.58 km^2	Hydrology and Flood Risk	This water feature is a reservoir that spans the A465, it is not modelled by NRW and there are no residential properties or infrastructure shown to be at risk. However the area to the south of the reservoirs is at risk from reservoir flooding.	Low
	Fluvial geomorphology	This water feature has restricted lateral and vertical migration and is heavily artificial in nature.	Low
	Water quality / supply	WFD Status Poor. Surrounding land use: Predominantly agricultural.	Low

Water feature (WF) chainage / name / area	Attribute	Indicator of quality	Importance
		Potential pollution sources: unmanaged road drainage, agricultural pollution including pesticides, nutrients and fertilisers.	
	Dilution and removal of waste products	This water feature does not currently receive any discharge or effluent.	Low
	Biodiversity	No designated land.	Low
WF26, 6980 Tributary of Nant Hir <1 km^2	Hydrology and Flood Risk	This water feature flows north to south away from the A465. During the site visit it was dry and overgrown, it is not modelled by NRW and there are no residential properties or infrastructure shown to be at risk.	Low
	Fluvial geomorphology	This water feature has restricted lateral and vertical migration and is heavily artificial in nature.	Low
	Water quality / supply	WFD Status Poor. Surrounding land use: Predominantly agricultural. Potential pollution sources: unmanaged road drainage, agricultural pollution including pesticides, nutrients and fertilisers.	Low
	Dilution and removal of waste products	This water feature does not currently receive any discharge or effluent.	Low
	Biodiversity	No designated land.	Low
WF27, 7080 Tributary of Nant Hir <1 km^2	Hydrology and Flood Risk	This water feature is not modelled by NRW and there are no residential properties or infrastructure shown to be at risk.	Low
	Fluvial geomorphology	This water feature has restricted lateral and vertical migration and is heavily artificial in nature.	Low
	Water quality / supply	WFD Status Poor. Surrounding land use:	Low

Water feature (WF) chainage / name / area	Attribute	Indicator of quality	Importance
		Predominantly agricultural. Potential pollution sources: unmanaged road drainage, agricultural pollution including pesticides, nutrients and fertilisers.	
	Dilution and removal of waste products	This water feature receives 22.37 m^3 of Package Treatment Plant (PTP) effluent from a hospital per day and an additional 0.5 m^3 from an industrial estate, it is discharged upstream of the scheme.	Medium
	Biodiversity	No designated land.	Low
WF28, 7448 Tributary of Nant y Gwyddel <1 km^2	Hydrology and Flood Risk	This water course flows north to south and is culverted (7448CE) beneath the A465, the current provision is between a two and five year event. While the A465 is not at risk due to being raised, there is a crematorium downstream that should be considered during impact assessment.	Medium
	Fluvial geomorphology	This water feature is sinuous and exhibits some lateral migration and is moderately vulnerable to change.	Medium
	Water quality / supply	WFD Status Poor. Surrounding land use: Predominantly agricultural. Potential pollution sources: unmanaged road drainage, agricultural pollution including pesticides, nutrients and fertilisers.	Low
	Dilution and removal of waste products	This water feature receives 22.37 m^3 of PTP effluent from a hospital per day and an additional	Medium

Water feature (WF) chainage / name / area	Attribute	Indicator of quality	Importance
		0.5 m^3 from an industrial estate, it is discharged upstream of the scheme.	
	Biodiversity	No designated land.	Very High
WF29, 7548 Tributary of Nant y Gwyddel <1 km^2	Hydrology and Flood Risk	This water feature flows north to south and is culverted (7548CE) beneath the A465. The culvert is capable of conveying a 100 year event. Downstream of this water feature there is a crematorium in close proximity to the channel.	Medium
	Fluvial geomorphology	This water feature is sinuous and exhibits some lateral migration and is moderately vulnerable to change.	Medium
	Water quality / supply	WFD Status Poor. Surrounding land use: Predominantly agricultural. Potential pollution sources: unmanaged road drainage, agricultural pollution including pesticides, nutrients and fertilisers.	Low
	Dilution and removal of waste products	This water feature does not currently receive any discharge or effluent.	Low
	Biodiversity	Surrounding designated areas: Bryncarnau Grasslands SSSI.	Very High
WF30, 7770 Tributary of Nant y Gwyddel <1 km^2	Hydrology and Flood Risk	This water feature flows North to south away from the A465. It is culverted beneath a minor road to the south of the A465. It is not modelled by NRW and there are no residential properties or infrastructure shown to be at risk.	Low
	Fluvial geomorphology	This water feature has restricted lateral and vertical migration and is heavily artificial in nature.	Low

Water feature (WF) chainage / name / area	Attribute	Indicator of quality	Importance
	Water quality / supply	WFD Status Poor. Surrounding land use: Predominantly agricultural. Potential pollution sources: unmanaged road drainage, agricultural pollution including pesticides, nutrients and fertilisers.	Low
	Dilution and removal of waste products	This water feature does not currently receive any discharge or effluent.	Low
	Biodiversity	Surrounding designated areas: Bryncarnau Grasslands SSSI.	Very High
WF31, 8038 Tributary of Nant y Gwyddel <1 km^2	Hydrology and Flood Risk	This water feature flows North to south away from the A465. It is culverted beneath a minor road to the south of the A465. It is not modelled by NRW and there are no residential properties or infrastructure shown to be at risk.	Low
	Fluvial geomorphology	This water feature has restricted lateral and vertical migration and is heavily artificial in nature.	Low
	Water quality / supply	WFD Status Poor. Surrounding land use: Predominantly agricultural. Potential pollution sources: unmanaged road drainage, agricultural pollution including pesticides, nutrients and fertilisers.	Low
	Dilution and removal of waste products	This water feature does not currently receive any discharge or effluent.	Low
	Biodiversity	No designated land.	Low
WF32, 8760 Nant y Gwyddel 1.58 km^2	Hydrology and Flood Risk	This water feature flows North to south away from the A465. It is culverted beneath a minor road to the south of the A465. It is	Low

Water feature (WF) chainage / name / area	Attribute	Indicator of quality	Importance
		not modelled by NRW and there are no residential properties or infrastructure shown to be at risk.	
	Fluvial geomorphology	This water feature is meandering within a straight channel and is deemed moderately vulnerable to change.	Medium
	Water quality / supply	WFD Status Poor. Surrounding land use: Predominantly agricultural. Potential pollution sources: unmanaged road drainage, agricultural pollution including pesticides, nutrients and fertilisers.	Low
	Dilution and removal of waste products	This water feature receives 4.6 m^3 of effluent per day from a manufacturing plant, the discharge point is significantly far downstream of the scheme.	Low
	Biodiversity	Surrounding designated areas: Bryncarnau Grasslands SSSI.	Very High
WF33, 9290 Tributary of Nant Ffrwd <1 km^2	Hydrology and Flood Risk	This water feature flows south to north away from the A465, a desk based survey suggests that this water feature is a field drain. It is not modelled by NRW and there are no residential properties or infrastructure shown to be at risk.	Low
	Fluvial geomorphology	This water feature has restricted lateral and vertical migration and is heavily artificial in nature.	Low
	Water quality / supply	WFD Status Moderate. Surrounding land use: Predominantly agricultural. Potential pollution	Medium

Water feature (WF) chainage / name / area	Attribute	Indicator of quality	Importance
		sources: unmanaged road drainage, agricultural pollution including pesticides, nutrients and fertilisers.	
	Dilution and removal of waste products	This water feature does not currently receive any discharge or effluent.	Low
	Biodiversity	No designated land.	Low
WF34, 9303 Tributary of Nant Ffrwd <1 km^2	Hydrology and Flood Risk	This water feature flows south to north away from the A465, it is culverted (9303CP) beneath the highway with capacity to carry a 100y CC flow. There is a farm property (Ty'n-y-Coedcae) to the north of the A465 crossing shown to be at surface water flood risk.	High
	Fluvial geomorphology	This water feature is laterally migrating / incising and exhibits some sinuosity, it is deemed moderately vulnerable to change.	Medium
	Water quality / supply	WFD Status Moderate. Surrounding land use: Predominantly agricultural. Potential pollution sources: unmanaged road drainage, agricultural pollution including pesticides, nutrients and fertilisers.	Medium
	Dilution and removal of waste products	This water feature does not currently receive any discharge or effluent.	Low
	Biodiversity	No designated land.	Low
WF35, 9640 Tributary of Nant Ffrwd <1 km^2	Hydrology and Flood Risk	This water feature flows south to north and is culverted beneath the A465. It is not modelled by NRW and there are no residential properties or infrastructure shown to be at risk.	Low

	Biodiversity	No designated land.	Low
WF47, 13340 Tributary of Taf Fechan <1 km^2	Hydrology and Flood Risk	This water feature flows south to north away from the A46, it is not modelled by NRW and there are no residential properties or infrastructure shown to be at risk.	Low
	Fluvial geomorphology	This water feature has restricted lateral and vertical migration and is heavily artificial in nature.	Low
	Water quality / supply	WFD Status Moderate. Surrounding land use: Agricultural. Potential pollution sources: unmanaged road drainage, agricultural pollution including pesticides, nutrients and fertilisers.	Medium
	Dilution and removal of waste products	This water feature does not currently receive any discharge or effluent.	Low
	Biodiversity	No designated land.	Low
WF48, 14010 Tributary of Nant Morlais <1 km^2	Hydrology and Flood Risk	This water feature flows alongside Rocky Road to the north of the A465 as road drainage. It is not modelled by NRW and there are no residential properties or infrastructure shown to be at risk.	Low
	Fluvial geomorphology	This water feature has restricted lateral and vertical migration and is	Low

Water feature (WF) chainage / name / area	Attribute	Indicator of quality	Importance
		heavily artificial in nature.	
	Water quality / supply	WFD Status Moderate. Surrounding land use: Forest and Rocky Road. Potential pollution sources: unmanaged road drainage.	Medium
	Dilution and removal of waste products	This water feature does not currently receive any discharge or effluent.	Low
	Biodiversity	No designated land.	Low
WF49, 14460 Tributary of Nant Morlais <1 km^2	Hydrology and Flood Risk	This water feature flows alongside Rocky Road to the north of the A465 as road drainage. It is not modelled by NRW and there are no residential properties or infrastructure shown to be at risk.	Low
	Fluvial geomorphology	This water feature has restricted lateral and vertical migration and is heavily artificial in nature.	Low
	Water quality / supply	WFD Status Moderate. Surrounding land use: Forest and Rocky Road. Potential pollution sources: unmanaged road drainage.	Medium
	Dilution and removal of waste products	This water feature does not currently receive any discharge or effluent.	Low
	Biodiversity	No designated land.	Low
WF50, 14550 Nant Morlais 2.62 km^2	Hydrology and Flood Risk	This water feature flows north to south on the north side of the A465. NRW modelling suggests that less than ten residential properties are shown to be at low risk and significant out of bank flow is likely during storm events.	High
	Fluvial geomorphology	This water feature has restricted lateral and vertical migration and is heavily artificial in nature.	Low

Water feature (WF) chainage / name / area	Attribute	Indicator of quality	Importance
	Water quality / supply	WFD Status Moderate. Surrounding land use: Public Park. Potential pollution sources: unmanaged road drainage.	Medium
	Dilution and removal of waste products	This water feature does not currently receive any discharge or effluent.	Low
	Biodiversity	No designated land.	Low
WF51, 15198 No watercourse <1 km^2	Hydrology and Flood Risk	This water feature is a relict channel and is not modelled by NRW therefore there are no residential properties or infrastructure shown to be at risk.	Low
	Fluvial geomorphology	This water feature has restricted lateral and vertical migration and is heavily artificial in nature.	Low
	Water quality / supply	WFD Status Moderate. Surrounding land use: Reservoir. Potential pollution sources: unmanaged road drainage.	Medium
	Dilution and removal of waste products	This water feature does not currently receive any discharge or effluent.	Low
	Biodiversity	No designated land.	Low
WF52, 15332 No watercourse <1 km^2	Hydrology and Flood Risk	This water feature is a culverted connection between two reservoirs, it is not modelled by NRW therefore there are no residential properties or infrastructure shown to be at risk.	Low
	Fluvial geomorphology	This water feature has restricted lateral and vertical migration and is heavily artificial in nature.	Low
	Water quality / supply	WFD Status Moderate. Surrounding land use: Reservoir. Potential pollution	Medium

Water feature (WF) chainage / name / area	Attribute	Indicator of quality	Importance
		sources: unmanaged road drainage.	
	Dilution and removal of waste products	This water feature does not currently receive any discharge or effluent.	Low
	Biodiversity	No designated land.	Low
WF53, 15812 Inflow to Upper Penywern Pond <1 km^2	Hydrology and Flood Risk	This water feature flows in the Upper Pennywern Pond and then into the Nant Morlais culvert. It is not modelled by NRW and there are no residential properties or infrastructure shown to be at risk.	Low
	Fluvial geomorphology	This water feature has restricted lateral and vertical migration and is heavily artificial in nature.	Low
	Water quality / supply	WFD Status Moderate. Surrounding land use: Roads. Potential pollution sources: unmanaged road drainage.	Medium
	Dilution and removal of waste products	This water feature does not currently receive any discharge or effluent.	Low
	Biodiversity	No designated land.	Low
WF54, 16100 Tributary of Taff <1 km^2	Hydrology and Flood Risk	This water feature flows from north to south away from the A465. It is not modelled by NRW and there are no residential properties or infrastructure shown to be at risk.	Low
	Fluvial geomorphology	This water feature has restricted lateral and vertical migration and is heavily artificial in nature.	Low
	Water quality / supply	WFD Status Moderate. Surrounding land use: Sparse residential. Potential pollution sources: unmanaged road drainage.	Medium
	Dilution and removal of waste products	This water feature does not currently receive any	Low

Water feature (WF) chainage / name / area	Attribute	Indicator of quality	Importance
		discharge or effluent.	
	Biodiversity	No designated land.	Low
WF55, 16800 Tributary of Nant Carno <1 km^2	Hydrology and Flood Risk	This water feature flows predominantly parallel to the A465, It is artificial and not modelled by NRW and there are no residential properties or infrastructure shown to be at risk.	Low
	Fluvial geomorphology	This water feature has restricted lateral and vertical migration and is heavily artificial in nature.	Low
	Water quality / supply	WFD Status Good. Surrounding land use: Agricultural. Potential pollution sources: unmanaged road drainage, agricultural pollution including pesticides, nutrients and fertilisers.	High
	Dilution and removal of waste products	This water feature receives a maximum of 0.5 m^3 of effluent from a domestic property per day at a point upstream of the scheme.	Low
	Biodiversity	No designated land.	Low
WF56, 17210A Nant Carno <1 km^2	Hydrology and Flood Risk	This water feature flows in a southerly direction before meeting water feature 57 and being culverted beneath the A465. The A465 at this point is significantly raised and no properties are considered to be at risk.	Low
	Fluvial geomorphology	This water feature is laterally migrating and meandering and is deemed moderately vulnerable to change.	Medium
	Water quality / supply	WFD Status Good. Surrounding land use: Agricultural. Potential pollution sources: unmanaged road	High

Water feature (WF) chainage / name / area	Attribute	Indicator of quality	Importance
		drainage, agricultural pollution including pesticides, nutrients and fertilisers.	
	Dilution and removal of waste products	This water feature does not currently receive any discharge or effluent.	Low
	Biodiversity	No designated land.	Low
WF57, 17210B Tributary of Nant Carno <1 km^2	Hydrology and Flood Risk	This water feature flows in a southerly direction before meeting water feature 56 and being culverted beneath the A465. The A465 at this point is significantly raised and no properties are considered to be at risk.	Low
	Fluvial geomorphology	This water feature has restricted lateral and vertical migration and is heavily artificial in nature.	Low
	Water quality / supply	WFD Status Good. Surrounding land use: Agricultural. Potential pollution sources: unmanaged road drainage, agricultural pollution including pesticides, nutrients and fertilisers.	High
	Dilution and removal of waste products	This water feature does not currently receive any discharge or effluent.	Low
	Biodiversity	No designated land.	Low
WF58, 17300 Tributary of Nant Carno <1 km^2	Hydrology and Flood Risk	This water feature flows north to south away from the A465 on the south side. It is not modelled by NRW and no properties or infrastructure is shown to be at risk.	Low
	Fluvial geomorphology	This water feature has restricted lateral and vertical migration and is heavily artificial in nature.	Low
	Water quality / supply	WFD Status Good. Surrounding land use:	High

Water feature (WF) chainage / name / area	Attribute	Indicator of quality	Importance
		Agricultural. Potential pollution sources: unmanaged road drainage, agricultural pollution including pesticides, nutrients and fertilisers.

Surface Water Quality Monitoring Report

| Final

7 October 2015

Contents

Executive Summary **2**
1. Introduction **3**
2. Methodology **4**
2.1 Surface water monitoring locations 4
2.2 Surface water monitoring parameters 6
2.3 Field survey method 6
3. Results **8**
3.1 In-situ monitoring 8
3.2 Channel observations 9
3.3 Sampling results 10
4. Discussion **15**
4.1 In-situ parameters and general inorganics 15
4.1.1 Temperature 15
4.1.2 pH 15
4.1.3 Dissolved Oxygen 15
4.1.4 Electrical conductivity 16
4.1.5 Redox Potential 16
4.1.6 Turbidity and suspended solids 16
4.1.7 Sulphide 17
4.1.8 Chloride 17
4.1.9 Dissolved Organic Carbon 17
4.1.10 Hardness ($CaCO_3$) 17
4.2 Polycyclic Aromatic Hydrocarbons (PAHs) 18
4.3 Metals 18
4.3.1 Copper 19
4.3.2 Mercury 19
4.3.3 Nickel 20
4.3.4 Zinc 20
4.3.5 Calcium & Magnesium 20
4.4 Petroleum Hydrocarbons 21
5. Conclusions **22**
5.1 Impacts of mining activities 22
5.2 Impact of the A465 22

Annex A. Mapped monitoring locations
Annex B. In-situ monitoring data
Annex C. Full laboratory results
Annex D. Relevant environmental standards

Executive Summary

Jacobs have been commissioned to undertake baseline water quality monitoring to inform the Environmental Impact Assessment (EIA) of the proposed improvements to the A465 Heads of the Valleys Road (Sections 5 and 6). The aim of the monitoring was to gain a greater understanding of the physiochemical quality of surface watercourses that have the potential to be impacted by the proposed scheme. The study area is focussed on the sections of the proposed scheme between Hirwaun in the west through to the junction of the A465 and A4060 just north east of Merthyr Tydfil as shown in Annex A.

This report records the methodology used for the baseline water quality monitoring programme and presents the results of the four monitoring rounds.

A total of 44 locations across the area of proposed works were monitored for water quality using in-situ field measurements and observations. Of these, 25 locations were also subject to water sampling and laboratory analysis. Sampling locations were located on watercourses that were assessed to be significant in terms of size; the location of sensitive downstream receptors (such as abstractions or Sites of Special Scientific Interest; or were downstream of potential contamination from historic land uses.

No grossly contaminated watercourses have been identified as a result of the monitoring undertaken to date, however the results do suggest that both the existing A465 and historical mining activities are having an adverse impact on water quality.

It should be noted that further monitoring will probably be required to prior to, during and following the proposed road widening scheme to further establish the baseline conditions and to ensure that the road widening works are not impacting significantly upon water quality in the study area. Increased monitoring should be undertaken at locations downstream of historic and current mining activities and any existing or proposed drainage outfall. This monitoring should be informed by the conclusions of the Environmental Statement that will need to be prepared in support of the proposals.

1. Introduction

Jacobs were commissioned to undertake baseline water quality monitoring to inform the environmental impact assessment of proposed improvements to the A465 Heads of the Valleys Road (Sections 5 and 6). The aim of the monitoring was to gain a greater understanding of the physiochemical quality of surface watercourses that have the potential to be impacted by the proposed development. The study area is focussed on the section of the proposed scheme between Hirwaun in the west through to the junction of the A465 and A4060 just north east of Merthyr Tydfil as shown in Annex A.

The route of the A465, as its local name suggests, cuts across the heads of the numerous valleys which drain the Brecon Beacons National Park to the north. As such, there are a significant number of surface watercourses that have the potential to be impacted by the proposed development including the Afon Cynon, Afon Taf Fawr, Taf Fechan, Nant Morlais and their tributaries. The convergence of these watercourses downstream, to form the Afon Taf, means that there is potential for significant cumulative impacts to occur downstream resulting from relatively minor impacts along the length of the development. Therefore, an understanding of the baseline situation is considered essential to assessing the sensitivity of these watercourses and the potential significance of any impacts resulting from the development both to individual watercourses and to the wider Taf catchment.

This report records the methodology used for the baseline water quality monitoring programme and presents the results of the four monitoring rounds. The first two monitoring rounds were carried out in February and March 2015 (winter monitoring round); the 3rd and 4th monitoring rounds (summer monitoring) were carried out in July and September 2015.

2. Methodology

2.1 Surface water monitoring locations

With a large number of watercourses within the vicinity of the proposed works, the need to gather as much data as possible on the quality of watercourses across the study area had to be balanced against the need for a pragmatic and economical approach. Therefore, the monitoring methodology was developed following a desk based study to identify all watercourses along the route and to identify their relative importance, sensitivity and level of potential risk from the proposals. This desk based study used the following sources of information:

- Design proposals of A465 widening Sections 5 and 6;
- Ordnance Survey Mapping;
- A465 Abergavenny to Hirwaun Dualling (Heads of the Valleys Road) Environmental Statement, 1997[1];
- Mapping of geological features and contaminated land[2];
- Natural Resources Wales (NRW) River Basin Management Plans - Rivers[3];
- Countryside Council for Wales (CCW) Protected Sites and Landscapes map[4]; and
- Consultation with Rhondda Cynon Taf and Merthyr Tydfil County Borough Councils.

Site access permission across the entire study area had not been achieved at the beginning of the study, and therefore the desk study also considered the access agreements as well as health and safety considerations.

Following the desk study, monitoring locations identified were then visited during a site walkover study (24th February 2015) to confirm the findings of the desk study. As a result of the site walkover visit, some proposed locations were deemed to be un-necessary whilst some additional locations were considered to offer useful information. Therefore, the location ID numbers do not always run sequentially and start at -1 rather than 1. Following the desk study and walkover, a total of 25 primary monitoring locations were identified at which samples for laboratory analysis was retrieved in addition to in-situ field testing for key physiochemical water quality parameters. Sampling locations were determined as those with the following characteristics:

- Larger named watercourses and reservoirs, including those assessed for Water Framework Directive (WFD) classification;
- Locations downstream of mining areas that may be disturbed by road scheme earthworks, or other potentially contaminating land uses such as industrial estates;
- Locations upstream of, or within, a Site of Special Scientific Interest (SSSI); and
- Locations upstream of private or public water supplies.

In addition to these sampling locations, a further nineteen locations were identified that would be subject to in-situ field testing for key physiochemical water quality parameters only. These locations typically had the following characteristics:

- Minor and potentially ephemeral watercourses;
- Tributaries of larger watercourses that were targeted by primary monitoring locations.

All monitoring locations are listed in Table 1 below, including the National Grid Reference (NGR), watercourse description, and whether sampling was undertaken. These monitoring locations are shown in Annex A.

SW32	SO0298007702	Afon Taf Fawr	Yes	Yes	Main river
SW33	SO0347407965	Cwm Taf Fechan (DS of A465)	Yes	Yes	Main river & SSSI
SW34	SO0358007848	Cwm Taf Fechan Leat - feeding lake	Yes	No	-
SW35	SO0412608611	Very small trib. of Taf Fechan, runs parallel	Yes	Yes	-
SW35.1	SO0413108612	Small field drain from Gurnos Farm	Yes	No	-
SW35.2	SO0413108610	Culvert inflow from road - likely road drainage	Yes	No	-
SW36	SO0498408637	Small trib. of Afon Taf origin at Bryniau Quarries	Yes	Yes	Mining
SW39	SO0605408190	Nant Morlais (western branch at confluence)	Yes	No	-
SW40	SO0726908484	Dowlais Top Northern Reservoir	Yes	Yes	Reservoir
SW41	SO0724808222	Dowlais Top Reservoir (southern)	Yes	Yes	Reservoir

2.2 Surface water monitoring parameters

The water quality parameters that were determined at each location were those considered likely to be associated with the impacts of road drainage as set out in the Design Manual for Roads and Bridges (DMRB)[5] and pollutants associated with the identified potentially contaminating land uses within the study area. The physiochemical parameters include metals, Polycyclic Aromatic Hydrocarbons (PAHs) and other non-metal analytes. A full list of the determinants is provided in Table 2.

Table 2 Surface Water quality parameters recorded

Physiochemical parameters determined by field measurement in-situ	Physiochemical parameters and specific pollutants to be identified by laboratory analysis		
	Metals (dissolved & total)	PAH Suite	Other
Temperature	Copper	Total Fluoranthene	Hardness ($CaCO_3$)
pH	Zinc	Total Pyrene	Suspended solids
Conductivity	Cadmium	Total Anthracene	Dissolved Organic Carbon (DOC)
Dissolved oxygen	Lead	Total Phenanthrene	pH
Turbidity	Nickel	Benzo(a)pyrene	Chloride (Cl^-)
Visual sheen check	Mercury	Total PAHs (total)	Total Petroleum Hydrocarbon (TPH)
	Chromium (+ hexavalent)		Sulphide (S^{2-})
	Arsenic		
	Selenium		

2.3 Field survey method

Four monitoring visits have been undertaken, the first two were undertaken during the winter months and the second two undertaken in the summer. The water quality monitoring was undertaken on these dates to check for any seasonable variation in physiochemical parameters due to flow and temperature fluctuations. The dates of the water quality monitoring, the sampling locations visited, and weather conditions on each day of monitoring are summarised in Table 3.

During the first two rounds, monitoring locations were visited from west to east. For the second and third rounds monitoring began at SW23 and moving west to SW-1, before doubling back to SW25 and going east. The monitoring pattern was switched so that Nant Hir Reservoir could be monitored, which required the presence of a Welsh Water representative for access.

Samples were collected in containers provided by the laboratory (I2 Analytical) direct from the watercourse or, where access was restricted, by a plastic bucket. Field measurements were recorded using the following equipment:

- Hanna HI991300 pH/EC/temperature meter;
- Hanna HI93703 Portable Microprocessor Turbidity meter;
- Hanna Oxidation Reduction Potential HI98120 meter;
- Hanna, HI9146 Microprocessor Dissolved Oxygen Meter.

Observations were made of:

- Visual/olfactory evidence of contamination;

5 Design manual for roads and bridges HD 45/09 Volume 11 section 3 part 10 (2009)

- Channel dimensions based on approximate width and depth; and
- Estimated velocity.

Table 3 Summary of monitoring visits

Round	Date	Locations monitored	Weather and flow conditions	Notes
1	25/02/15	SW-1 to SW26	Dry but overcast with light wind. Temperature 5 - 10 °C. Previous week was wet resulting in relatively high flows.	No access to Nant Hir Reservoir, sample taken at SW17.2[6] on river below outfall
	26/02/15	SW27 to SW41	Heavy and persistent rain falling throughout the morning clearing towards the afternoon. Temperature between 5 and 10 °C. Previous week was wet with relatively high flows.	
2	10/03/15	SW-1 to SW27.1	Dry and bright with light winds. Early frost before warming to approx. 15°C during the day. Dry previous week resulting in relatively low flows.	Access to Nant Hir reservoir obtained (SW17.1)
	11/03/15	SW30 to SW41	Dry but overcast with light wind. Temperature between 5 and 10 °C. Dry previous week with light shower previous night. Relatively low flows.	
3	28/07/15	SW-1 to SW27.1	Warm and overcast, with a light shower in the afternoon around 4 pm. Temperature between 15 and 20°C. Previous two weeks were wet, with showers the previous events. Moderately low flows.	No access to SW9, SW11 or SW13 as unable to contact landowners.
	29/07/15	SW30 to SW41	Dry for the majority of the day, with some very light showers through the morning. Heavy rain the previous night, and wet over the previous fortnight. Moderately low flows.	
4	10/09/15	SW-1 to SW 27.1	Dry all day with mostly clear skies, hot in the afternoon with temperatures reaching 25°C. Dry previous week resulting in low flows.	Unable to access SW9. SW16 was not monitored due to H&S concerns.
	11/09/15	SW30 to SW41	Overcast and colder, with temperatures of between 15 – 20°C. No rain, however humid. Dry previous week resulting in low flows.	

6 SW17.2 on Nant Hir outfall, monitoring undertaken at approximately NGR SN98770 06312

3. Results

3.1 In-situ monitoring

The results of the in-situ field measurements from round one to four are presented in full in Annex B and are summarised in Table 4 to Table 7 below.

Results that are considered to be potentially anomalous are highlighted in orange on the collated results in Annex B whilst known errors with field equipment are highlighted in yellow.

Table 4 In-situ field results from round one

Parameter	Min	Max	Mean	Notes
pH	6.05	7.95	7.10	
EC (µS)	51	1164	303.7	
Temperature (°C)	5.3	19	9.1	SW30 – SW41 recorded temperatures more than twice as warm as in other locations indicating potentially anomalous results
Turbidity (NTU)	0.0	265	15.8	SW0 and SW2 recorded results an order of magnitude greater than other results but weren't observed to be unusually turbid indicating a potentially anomalous result. Damage to sample containers in transit meant that a Suspended solids result was not available for SW0 and no sampling was undertaken for SW2.
Redox (mV)	1.2	621	156.8	Lowest values at SW5 and SW9.1, no negative values.
Dissolved Oxygen (%)	84.5	107.1	98.1	Very high values; correspond to observed white water conditions.

Table 5 In-situ field results from round two

Parameter	Min	Max	Mean	Notes
pH	6.81	8.84	7.82	
EC (µS)	49	1106	293.9	Highest value at SW4.
Temperature (°C)	4.1	11.2	6.9	
Turbidity (NTU)	0.0	25.0	5.2	Problems were encountered with the turbidity meter therefore results could not be collected from SW0 – SW5 and SW8 – SW10 this round.
Redox (mV)	-4	146	94.6	Negative value at SW5, all others positive.
Dissolved Oxygen (%)	76.5	110.6	94.9	

Table 6 In-situ field results from round three

Parameter	Min	Max	Mean	Notes
pH	5.80	8.67	7.90	
EC (µS)	81	1924	336.4	Highest value at SW4, SW1 conductivity was 1024.
Temperature (°C)	10.9	15.7	13.1	
Turbidity (NTU)	0.0	7.25	0.58	Problems were encountered with the turbidity meter; results could not be collected from SW30 – SW41.
Redox (mV)	88	193	121.4	All values positive, however no value was recorded at SW5 due to user error.
Dissolved Oxygen (%)	3.5	90.5	12.9	Very low values including for large watercourses which were observed to be free flowing, potentially an issue with the equipment.

Table 7 In-situ field results from round four

Parameter	Min	Max	Mean	Notes
pH	5.83	8.58	7.82	
EC (µS)	67	1878	394.9	Highest value at SW4, exceeded 1000 at SW1 and SW3
Temperature (°C)	11.1	17.8	13.7	
Turbidity (NTU)	0.0	172.0	40.5	Exceeded 100 NTU at SW35.1, SW35.2 and SW26. SW35.1 and SW35.2 were observed to be dark and cloudy, while SW26 was observed to have a lot of little and soil within the pools of water measured. Considered to be accurate results.
Redox (mV)	-12	162	125.0	Negative value at SW22, all other results positive.
Dissolved Oxygen (%)	64.2	64.2	64.2	Problems encountered with the Dissolved Oxygen meter resulting in no results for all sites except SW22, which gave a reading of 64.2%.

3.2 Channel observations

Channel observations from the four rounds are presented alongside the field parameter measurements in **Annex B**. Channels were typically semi-natural or slightly modified at monitoring locations. However, significantly modified reaches were observed including at SW3, SW8 and SW25 with concrete channels and SW14 with a cobbled culvert construction. Multiple channels had large boulders within the stream causing monitoring of dimensions and flow to be challenging.

The approximate flows for each location across the monitoring rounds are shown in Table 8; these have been estimated by multiplying the observed channel width by the estimated depth and 0.8 of the estimated surface velocity. Values are presented to one significant figure only to demonstrate the very approximate nature of the estimation process and are only contained as a quantitative indicator of the prevailing hydrological conditions during each round.

Table 8 Approximate estimated flow

Site ID	Indicative estimated flow (l/s)				Notes
	Feb-15	Mar-15	Jul-15	Sep-15	
SW-1	1000	200	200	100	Dimensions estimated from bank
SW0	-	-	-	20	Channel flooded due to grate the first three rounds, unable to measure the flow during these rounds.
SW1	300	30	20	0.6	
SW2	20	10	0	0	Channel viewed from other side of a fence
SW3	100	30	10	6	
SW4	20	7	7	3	
SW5	1000	100	200	20	
SW7	8	2	0	0	Dry the last two monitoring rounds, no water
SW8	60	30	3	2	
SW9	40	10	-	-	Unable to access this location during 3rd and 4th round
SW9.1	50	30	6	1	
SW9.2	7	2	0	0	No flow / practically dry during the 3rd and 4th monitoring round
SW10	4000	1000	1000	200	
SW11	10	0.4	-	0	No access for 3rd round. No flow for 4th round.
SW12	300	200	6	10	

SW13	20	3	-	0	No access for 3rd round. Dry during 4th monitoring round.
SW14	300	800	3	3	
SW14.1	40	8	1	1	
SW14.2	9	4	0	0	Practically no flow during 3rd and 4th monitoring round.
SW15	1000	800	60	20	
SW16	30	20	3	-	No access during 4th monitoring round due to H&S
SW17	700	-	-	-	Measured downstream of outfall the 1st monitoring round, then from within the reservoir (no observed flow within reservoir).
SW18	30	40	7	0	Very low flows, not able to measure.
SW19	40	40	20	2	
SW20	80	10	10	0.8	
SW21	200	40	60	15	
SW21.1	0	0	0	0	Ponded spring, no measurable flow. Completely dry 4th round.
SW22	3	2	0.1	0.0	No measurable flow 4th monitoring round.
SW23	20	8	10	0.0	Dry with no flow during 4th monitoring round.
SW25	40	10	20	8	
SW26	60	1	8	0.2	
SW27	40	10	10	0	No measurable velocity during 4th monitoring round
SW27.1	100	0.5	0.1	0	Completely dry 4th monitoring round.
SW30	2000	200	200	100	Estimated from bank due to H&S 1st & 2nd rounds.
SW32	3000	3000	1000	1000	Estimated from bank due to H&S.
SW33	10000	4000	2000	500	Estimated from bank due to H&S
SW34	100	100	100	100	
SW35	300	20	5	2	
SW35.1	200	10	1	1	
SW35.2	-	6	2	0.5	Outflow from pipe, measured with bucket method.
SW36	90	30	2	0	No observed flow during 4th monitoring round.
SW39	50	0	0	0	No measurable flow during 2nd and 3rd round, completely dry during 4th.
SW40	-	-	-	-	Reservoir – no observed flow
SW41	-	-	-	-	Reservoir – no observed flow

Litter and fly tipped waste were observed at a number of locations including SW-1, SW8, SW10 and SW14. The only evidence of hydrocarbon pollution was visible sheens observed at SW16 during round 2 and at SW22 during round 4. There is potential that the sheen observed at SW22 was due to peat, given the soil in the region. No odour was observed at either location.

3.3 Sampling results

The results of the laboratory analysis of samples collected during the all four rounds of monitoring are presented in full in **Annex C** and are summarised in Table 9.

The screen threshold values applied for the analysis are outlined in detail in **Annex D**. Exceedances of these screening thresholds have been highlighted in red on the collated results in **Annex C**.

Table 9 Chemical analysis results for samples from round one

Analyte	Min	Max	Threshold standard*	Number of exceedances	Notes
pH	7	8.6	6-9	0	
Sulphide (µg/l)	<5.0	<5.0	N/A		None detected.
Chloride (mg/l)	7.6	130	250	0	SW41 nearly twice as high as other values, however doesn't exceed drinking water standard.
Dissolved Organic Carbon (mg/l)	0.36	6.33	N/A		
Total Suspended Solids (mg/l)	<2	160	25	3	SW35 has maximum value with SW 30 and SW 27 also exceeding the threshold.
Hardness – $CaCO_3$ (mg/l)	16.7	279	N/A		Highest values (above 200) at SW1, SW3 and SW4.
Total EPA-16 PAHs	<0.2	0.36	Varies	1	SW35 has a minor exceedance for Benzo(b)fluoranthene and total PAHs, along with detectable levels of other PAH compounds. SW40 exceeds the total PAHs with detectable levels of other compounds. No result available from SW0 due to broken sample containers.
Arsenic (dissolved) (µg/l)	<0.15	1.9	50	0	
Cadmium (dissolved) (µg/l)	<0.02	0.15	0.45–1.5	2	SW15 and SW18 exceed the annual average threshold limit, however both well within the maximum allowance concentration exceedance.
Copper (dissolved) (µg/l)	6.7	17	1 - 28	23	Majority of samples fail to meet the requirement for 'Good' quality with respect to this analyte.
Lead (dissolved) (µg/l)	0.3	1.3	7.2	0	No exceedances but lead detected at all sites.
Mercury (dissolved) (µg/l)	<0.05	0.36	0.07	4	Minor exceedances of the maximum allowable concentration threshold at SW3 & SW30, with major exceedances at SW35 and SW41. SW1 and SW5 both exceed the average annual threshold level, however are less than the maximum allowable concentration.
Nickel (dissolved) (µg/l)	0.5	100	20	2	Major exceedances at SW0 (five times limit) and SW3 (two times limit).
Selenium (dissolved) (µg/l)	<0.6	2.8	10	0	No exceedances. All except SW1, SW3 and SW4 were below the limit of detection.
Zinc (total) (µg/l)	6.8	57	8 - 125	9	Exceedances generally occurring in samples with low hardness values SW5, SW14, SW15, SW17, SW18, SW27, SW30, SW32 and SW40.
Calcium (dissolved) (mg/l)	5.47	54.9	N/A		
Magnesium (dissolved) (mg/l)	0.73	47	N/A		Highest at SW1, SW3 and SW4, order of magnitude greater than other sites.
TPH1 (C10 - C40) (µg/l)	<10	<10	N/A		None detected.

*See Annex D for relevant screening threshold values applied

Table 10 Chemical analysis results for samples from round two

Analyte	Min	Max	Threshold standard*	Number of exceedances	Notes
pH	7.6	8.1	6-9	0	
Sulphide (µg/l)	<5.0	<5.0	N/A		
Chloride (mg/l)	6.4	130	250	0	SW41 nearly twice as high as other values, however doesn't exceed drinking water standard.
Dissolved Organic Carbon (mg/l)	1.25	5.87	N/A		
Total Suspended Solids (mg/l)	<2	21	25	0	Highest value at SW1, however no exceedances of standards.
Hardness – $CaCO_3$ (mg/l)	17.3	414	N/A		Highest values (over 300) at SW1, SW3 and SW4.
Total EPA-16 PAHs	<0.2	<0.2	Varies	0	No PAH compounds above limit of detection
Arsenic (dissolved) (µg/l)	<0.15	1.11	50	0	
Cadmium (dissolved) (µg/l)	<0.02	0.06	0.45–1.5	0	All below the annual average value threshold.
Copper (dissolved) (µg/l)	2.4	22	1 - 28	14	Majority of samples fail to meet the requirement for 'Good' quality with respect to this analyte
Lead (dissolved) (µg/l)	<0.2	2.1	7.2	0	No exceedances, many samples below level of detection.
Mercury (dissolved) (µg/l)	<0.05	<0.05	0.07	0	All samples below limit of detection
Nickel (dissolved) (µg/l)	<0.5	200	20	2	Major exceedances at SW1 (ten times threshold value) and SW3 (two times threshold value).
Selenium (dissolved) (µg/l)	<0.6	2.7	10	0	No exceedances. All except SW1, SW3 and SW4 were below the limit of detection
Zinc (dissolved) (µg/l)	2.2	23	8 - 125	1	Minor exceedance in SW17, due to a low hardness value. Highest value at SW40, but due to hardness well within the screening threshold.
Calcium (dissolved) (mg/l)	5.4	76.7	N/A		
Magnesium (dissolved) (mg/l)	0.93	67	N/A		Highest at SW1, SW3 and SW4, order of magnitude greater than other sites.
TPH1 (C10 - C40) (µg/l)	<10	<10	N/A		None detected at any location, including at SW16 which had a visible sheen.

*See Annex D for relevant screening threshold values applied

Table 11 Chemical analysis results for samples from round three

Analyte	Min	Max	Threshold standard*	Number of exceedances	Notes
pH	7.5	8.2	6-9	0	
Sulphide (µg/l)	<5	<5	N/A		None detected
Chloride (mg/l)	3.3	55	250	0	SW41 highest followed by SW35. None exceed drinking water standards.
Dissolved Organic Carbon (mg/l)	1.66	10.4	N/A		
Total Suspended Solids (mg/l)	<2	67	25	2	Major exceedance at SW1, minor exceedance at SW0
Hardness – $CaCO_3$ (mg/l)	21.8	521	N/A		Highest values (over 300) at SW1, SW3 and SW4.
Total EPA-16 PAHs	<0.2	<0.2	Varies	0	No PAH compounds above limit of detection
Arsenic (dissolved) (µg/l)	0.26	2.53	50	0	
Cadmium (dissolved) (µg/l)	<0.02	0.18	0.45–1.5	0	All values below the annual average threshold and maximum allowable threshold.
Copper (dissolved) (µg/l)	4.6	18	1 - 28	15	Majority of samples fail to meet the requirement for 'Good' quality with respect to this analyte.
Lead (dissolved) (µg/l)	<0.2	2.5	7.2	0	No exceedances, all samples detected lead except SW4.
Mercury (dissolved) (µg/l)	<0.05	0.14	0.07	2	Major exceedance at SW35 of twice the maximum allowable concentration. Minor exceedance of the maximum allowable concentration at SW17. All other locations below the limit of detection.
Nickel (dissolved) (µg/l)	<0.5	200	20	1	Significant exceedance at SW1 at ten times the threshold value.
Selenium (dissolved) (µg/l)	<0.6	3.6	10	0	No exceedances. All except SW1, SW3, SW4, SW21, SW23 and SW27 below the limit of detection
Zinc (dissolved) (µg/l)	4.8	34	8 - 125	2	Minor exceedances at SW17 and SW25 due to low hardness values. Highest value at SW1, however due to hardness within screening threshold.
Calcium (dissolved) (mg/l)	7.1	88	N/a		
Magnesium (dissolved) (mg/l)	0.99	73	N/a		Highest at SW1, SW3 and SW4.
TPH1 (C10 - C40) (µg/l)	<10	<10	N/a		None detected

*See Annex D for relevant screening threshold values applied

Table 12 Chemical analysis results for samples from round four

Analyte	Min	Max	Threshold standard*	Number of exceedances	Notes
pH	7.3	8.3	6-9	0	
Sulphide (µg/l)	<5.0	<5.0	N/A		
Chloride (mg/l)	5.0	46.0	250	0	SW41 highest value, however does not exceed threshold.
Dissolved Organic Carbon (mg/l)	1.47	11.8	N/A		
Total Suspended Solids (mg/l)	<2	100	25	2	Major exceedance at SW14, SW27 and SW36, minor exceedances at SW35 and SW40. These exceedances may be partially due to shallow water within the channels resulting in some bed disturbance while collecting samples.
Hardness – $CaCO_3$ (mg/l)	18.2	637	N/A		Highest values (above 500) at SW1, SW3 and SW4
Total EPA-16 PAHs	<0.2	<0.2	Varies	0	No PAH compounds above limit of detection
Arsenic (dissolved) (µg/l)	<0.15	1.62	50	0	
Cadmium (dissolved) (µg/l)	<0.02	0.11	0.45–1.5	0	All samples below the maximum allowable concentration screening threshold value. SW17 exceeds the annual average value but not the maximum allowable concentration.
Copper (dissolved) (µg/l)	4.4	9.6	1 - 28	5	Most samples achieve 'Good' within threshold value, SW14, SW15, SW17, SW25 and SW32 exceeded screening threshold.
Lead (dissolved) (µg/l)	<0.2	1.5	7.2	0	No exceedances, many samples below level of detection.
Mercury (dissolved) (µg/l)	<0.05	<0.05	0.07	0	All samples below limit of detection
Nickel (dissolved) (µg/l)	<0.05	160	20	2	Significant exceedance at SW1 at eight times the threshold value. Many sites below the level of detection.
Selenium (dissolved) (µg/l)	<0.6	3.0	10	0	No exceedances. All except SW1, SW3, SW4, SW21 and SW27 below the limit of detection
Zinc (dissolved) (µg/l)	<0.5	61	8 - 125	1	Significant exceedance at SW17, due to high value (61 µg/l) and low hardness.
Calcium (dissolved) (mg/l)	6	110	N/A		
Magnesium (dissolved) (mg/l)	0.75	91	N/A		Highest at SW1, SW3 and SW4.
TPH1 (C10 - C40) (µg/l)	<10	<10	N/A		None detected at all locations, including SW22 where a sheen was observed.

*See Annex D for relevant screening threshold values applied

4. Discussion

The results of the physiochemical parameters are discussed below; this includes all in-situ recorded measurements and analytes tested in the laboratory. Annex D contains details of the screening threshold values applied to each physiochemical parameter within the report.

Additionally many of these parameters are considered within the Water Framework Directive [7] (WFD) assessments undertaken by Natural Resources Wales who apply standards specified by the United Kingdom Technical Advisory Group (UKTAG). The classification system detailed within these standards is a five point system with High indicating the highest quality ranging to Good, Moderate, Poor and Bad.

4.1 In-situ parameters and general inorganics

4.1.1 Temperature

Water temperatures were higher during the summer monitoring rounds and lower during the winter as expected. There are no water quality standards for water temperature.

4.1.2 pH

pH was recorded in-situ and also tested in the laboratory. All of the laboratory results from each monitoring rounds were recorded to be between six and nine. The pH recorded in-situ was also almost always within this same range with the exception of two locations:

- SW21.1 recorded a pH of 5.80 during the 3rd monitoring round; and
- SW22 recorded a pH of 5.83 during the 4th monitoring round.

These locations were not sampled and therefore the results cannot be verified, however these are both minor watercourses / springs which were not flowing at the time of monitoring (i.e. testing occurred in an isolated pool of water remaining within the channel). Therefore all flowing surface water locations met the screening thresholds applies which are indicative of meeting the 'High' pH classification as detailed in the WFD (between 6 and 9).

4.1.3 Dissolved Oxygen

Dissolved Oxygen (DO) was recorded in-situ:

- For the first two monitoring rounds DO was consistently greater than 75% and indicative of a 'Good' if not 'High' standard. This is in line with observed flows within the watercourses.
- The DO probe registered values of between 3.5 to 15.2% for the majority of sites for the 3rd round, however this is not in line with observations, which included white water within the Cwm Taf Fechan (recorded 11.4% DO). Therefore these results are considered to be anomalous and are discounted.
- The DO probe was broken for the 4th monitoring round, and therefore no values could be obtained.

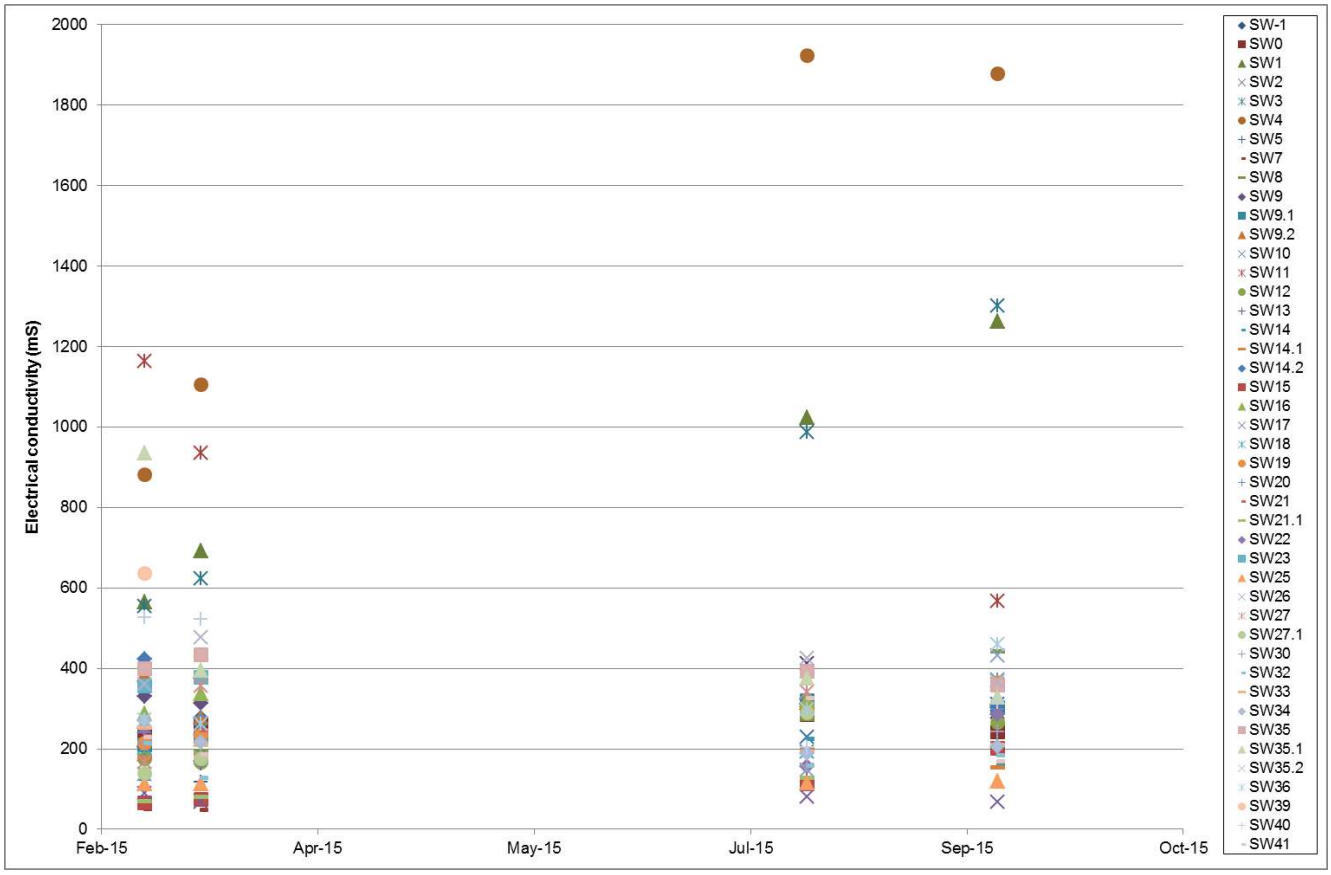
Given the DO probe recording anomalous results during the 3rd monitoring round, and the probe not working for the 4th, there is no reliable data for DO during the summer monitoring period. Observations of watercourses during the summer monitoring round suggested that the larger watercourses remained well aerated due to white water / turbulence created by the steep channel gradients.

7 UK Technical Advisory Group, Water Framework Directive, 2008

4.1.4 Electrical conductivity

There are no standards for electrical conductivity; however as shown on Figure 1 compared to the majority of the data set anomalously high values were consistently recorded at a number of. The majority of recorded values were between 50 and 750 µS/cm. However higher values were found at SW1, SW3 and SW4, which are all downstream of mining activity.

Figure 1 Recorded electrical conductivity



4.1.5 Redox Potential

There are no environmental standards for Redox Potential. Generally Redox values were within a range of -12 to 240 mV. There is one significant outlier during the first monitoring round; SW3 recorded a very high value of 621 UNITS.

4.1.6 Turbidity and suspended solids

There is no environmental standard for turbidity; however observed values are within the range of 0 to 265 mg/l.

Turbidity is typically used as a proxy for suspended sediment concentration that can be readily measured in the field. Recorded turbidity does not however correlate well with the laboratory suspended solids, indicating either that the suspended solid encountered across the catchments is very different from one place to the next or faults with the turbidity meter. Given the number of issues with the turbidity probe throughout the monitoring, equipment error is considered to be more likely, therefore in this instance the turbidity readings haven't been discussed, however the suspended solids are discussed below.

Suspended solids are highest during the first monitoring round and the forth monitoring around. The first occurred during a rainfall event (SW27 – SW41), which is likely to be associated with runoff from surrounding

fields. High values were also found for the 4th monitoring round, during a period of very low flows. This is probably due to disturbance of the stream / river bed during sampling which is more likely when water depths are shallow.

4.1.7 Sulphide

Sulphide was not detected at any location during the entire monitoring period and therefore is not of a concern in relation to the WFD quality of the watercourses.

Generally sulphide within water indicates pollution from industrial processes. Only four monitoring rounds were undertaken, and as such the presence of sulphide downstream of industrial processes cannot be ruled out, however given that none was detected it is likely that there is no significant source of sulphide pollution within, or upstream of, the areas monitored.

4.1.8 Chloride

Chloride was detected at all sites throughout the monitoring period, with the highest values experienced during winter (130 mg/l). At no time during monitoring did the Chloride concentration exceed the threshold value of 250 mg/l. This is the UK Standard for drinking water abstractions. Therefore Chloride does not pose a risk to the WFD status of any watercourse in the study area.

The higher values during the winter months are located downstream of the A465 (SW14, SW16, SW18, SW23, SW27, SW35 and SW41) and therefore may be related to factors such as salt from road grit. The highest chloride concentrations were experienced at SW41 which is Dowlais Top reservoir located down-gradient of the A465.

4.1.9 Dissolved Organic Carbon

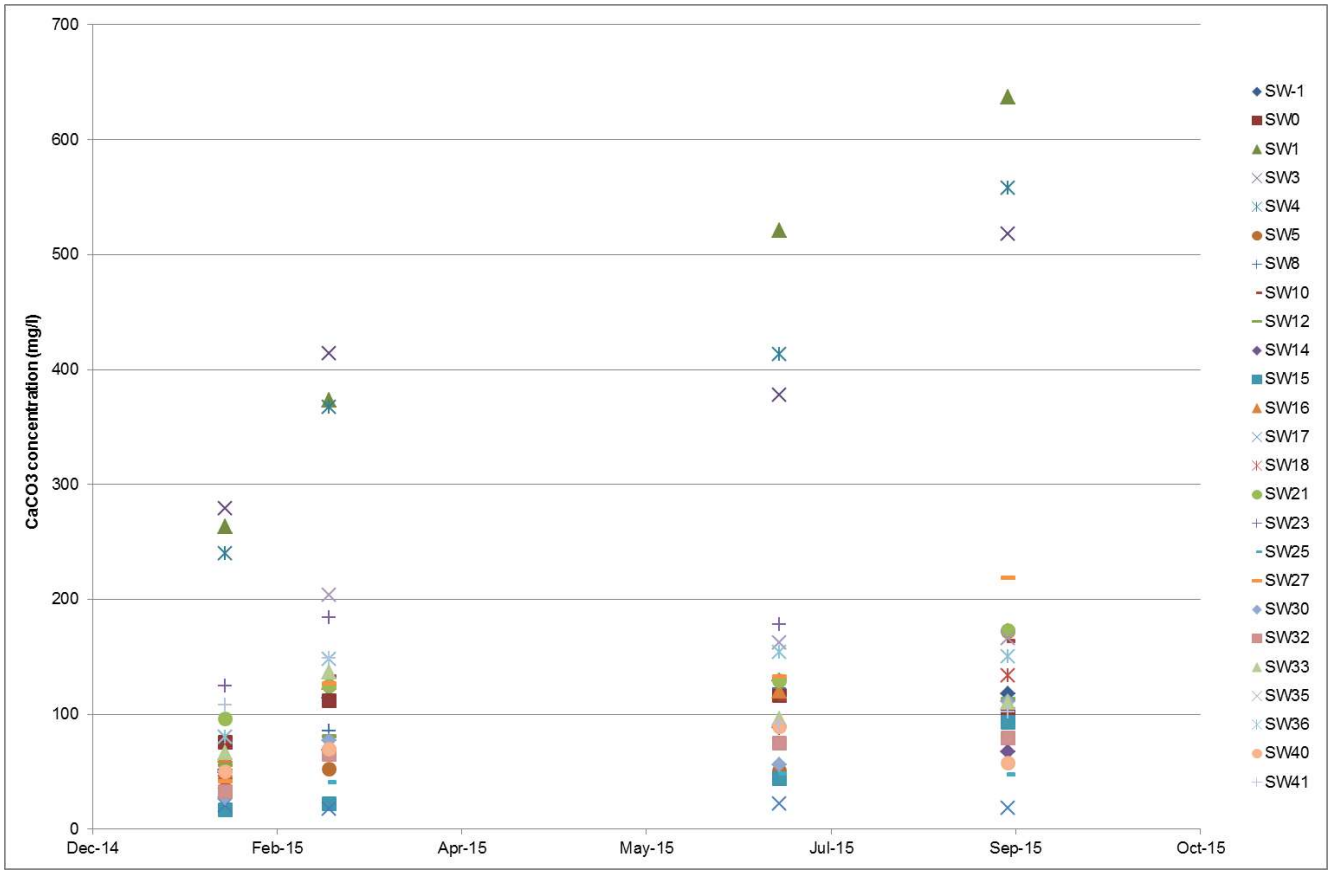
There is no environmental standard for Dissolved Organic Carbon (DOC). Generally the values are low without any major trends across the area. The values are slightly higher in the summer, which is likely due to increased plant material.

4.1.10 Hardness ($CaCO_3$)

There is no environmental standard for Hardness. The recorded hardness is however generally within the typical range for UK upland watercourses in non-calcareous areas and values were approximately similar throughout the monitoring period.

As shown in Figure 2 some very high values of $CaCO_3$ were however recorded at SW1, SW3 & SW4 for all monitoring rounds. The hardness of the water at these three locations becomes higher throughout the drier summer months indicating that the input is probably groundwater based. These locations are all downstream of historic mining activities.

Figure 2 Hardness values for all sites across monitoring period



4.2 Polycyclic Aromatic Hydrocarbons (PAHs)

During round one, the levels of PAH compounds were below the level of detection in most of the samples analysed with the following exceptions:

- SW 35 recorded detectable levels of several PAH compounds including an exceedance of the threshold value (**Annex D**) for Benzo(b)fluoranthene and an exceedance for total PAHs.
- SW40 recorded detectable levels of several PAH compounds and exceeded the threshold value (**Annex D**) for total PAHs.
- SW 36 and SW27 all had detectable levels for Floranthene and Pyrene. No EQS values are available for these compounds.
- SW12 had a detectable concentration of Napthalene but this was below the threshold value (**Annex D**).

No PAH compounds were detected during the 2nd, 3rd or 4th monitoring rounds, indicating that these were probably source inputs associated with a significant rainfall event prior to the monitoring. All of the locations where PAH compounds were detected are located either downstream of, or immediately adjacent to, the A465. This is consistent with rainfall event causing pollution from the A465 to be washed into adjacent watercourses.

4.3 Metals

Concentrations of Arsenic, Cadmium, Lead and Selenium were all consistently below the threshold values (**Annex D**) across all four rounds:

- Arsenic appeared in low concentrations at all monitoring points throughout the four rounds, suggesting that there is a natural diffuse source of arsenic within the study area.
- Cadmium concentrations were generally very low, and always significantly below the screening threshold value for the maximum allowable concentration. During the 1st monitoring round SW15 and SW18 had values greater than the annual average threshold value, however given that during the other monitoring rounds Cadmium was not detected, the average value is assessed to be within the annual average value.
- Lead appeared in low concentrations at all monitoring points during the first monitoring round, with concentrations of lead below detection levels at many sites during the second, third and fourth monitoring rounds.
- Selenium was below the level of detection at most locations, and was only detected consistently across all monitor rounds at locations downstream of mining activities (SW1, SW3 and SW4).

4.3.1 Copper

The latest UK Standard for copper only relates to the WFD standard of "Good" (Annex D). There is no banding and therefore waters which do not achieve good standard are identified as 'not good'.

Copper concentrations exceeded the level required for a "Good" WFD classification at numerous locations in all monitoring rounds, with more values failing to achieve "Good" in the winter months. This is at odds with the findings of the WFD assessment for the main rivers in these catchments which recorded that water quality with respect to this specific pollutant was 'High'.

Generally the values recorded were similar at all locations for all monitoring rounds. Given the fact that the Copper threshold value is based upon the hardness of the water, the monitoring locations that failed to attain "Good" status tended to be associated with lower hardness concentrations.

Given that copper concentration is generally similar across the entire study area it is considered that there is no point source of Copper pollution. Coal mining was carried out historically in the area of Merthyr Tydfil, therefore there is potential of historic mining activities causing elevated Copper concentrations across the entire study area. Additionally the higher Copper concentration could be from a natural occurrence of copper in soils or bedrock.

4.3.2 Mercury

Mercury concentrations were generally below the screening threshold value for the protection for surface water quality (**Annex D**). Mercury concentrations exceeded the screening threshold value for some locations during the 1st and 3rd monitoring rounds. There were no exceedances of the screening threshold values during the 2nd or 4th monitoring rounds.

Mercury has two threshold values, the first is for the maximum allowable concentration and the second for the annual average value as discussed below.

- SW1 and SW5 both exceeded the annual average threshold value, but not the maximum allowable concentration during the first monitoring round. Mercury was not detected at these locations during the other monitoring rounds, therefore the average value was below the threshold value.
- SW3 and SW30 both slightly exceed the maximum allowable concentration during the 1st monitoring round. Mercury is not detected at either of these locations the other three monitoring rounds.
- SW17 slightly exceeds the maximum allowable concentration during the 3rd monitoring round, but is not detected during the other monitoring rounds.
- SW41 significantly exceeds the maximum allowable concentration for the 1st monitoring round, but it not detected during the other three monitoring rounds.

- SW35 significantly exceeded the maximum allowable concentration for both the 1st and 3rd monitoring round. Mercury was not detected at this location during the 2nd or 4th monitoring rounds.

Mercury exceedances occurred during the monitoring rounds which were following or during heavy rain; Mercury was not detected during the two monitoring rounds which occurred in dryer conditions. This suggests that Mercury contamination is mobilised by rainfall. SW35 includes flows from what appears to be a drainage outfall of the A465, while SW41 is a reservoir adjacent to the A465.

Conclusions cannot be drawn based upon two monitoring rounds, however it appears that there is potential that Mercury contamination, derived from the road, is impacting upon these watercourses during rainfall events.

4.3.3 Nickel

Nickel was recorded to be below the threshold screening value (**Annex D**) on all occasions at the majority of locations. Exceedances of the threshold value were however observed at two locations:

- SW1 recorded the highest concentration of Nickel, with high values (five to ten times the screening threshold value) across all monitoring rounds.
- SW3 displayed high values for the winter monitoring rounds (approximately two times the screening threshold value), however in the summer months this reduced to below the threshold.

Both SW1 and SW3 are downstream of mining activities, suggesting that there is a source of Nickel contamination within the mining areas.

4.3.4 Zinc

The latest UK Standard for Zinc only relates to the WFD standard of "Good" (**Annex D**). There is no banding and therefore waters which do not achieve good standard are identified as 'not good'.

Zinc concentrations exceeded the screening threshold value (**Annex D**) required for a 'Good' WFD classification during the first monitoring round for nine locations; however all locations except SW17 achieved a 'Good' classification for the 2nd, 3rd and 4th monitoring rounds.

SW17, the Nant Hir Reservoir, failed to achieve a 'Good' classification for all four monitoring rounds. The Zinc threshold value is related to the hardness, and given that SW17 has a low concentration of $CaCO_3$ the failure to meet the standard is partially explained by this. However for the 4th monitoring round the recorded concentration of Zinc is notably higher than on other occasions. This suggests that there is a source of Zinc contamination feeding into the reservoir.

The WFD assessment for the main rivers in these catchments recorded that water quality with respect to Zinc was 'High'. The results suggest that this is not necessarily true during rainfall events (1st monitoring round) however may be achieved for the majority of the year.

4.3.5 Calcium & Magnesium

There is no EQS for Magnesium or Calcium. Both Calcium and Magnesium concentrations are however within the natural ranges for surface watercourses[8]:

- Calcium generally displays a range from 5 – 100 mg/l, with higher values experienced in the summer months. Calcium concentrations are highest downstream of mining activities (SW1, SW3 and SW4).

8 World Health Organisation, "*Hardness in Drinking-water*", Background document for development of WHO *Guidelines for Drinking-water Quality*. 2011, Available online < http://www.who.int/water_sanitation_health/dwq/chemicals/hardness.pdf>

- Magnesium concentrations are generally below 20 mg/l except for sites downstream of mining activities (SW1, SW3 and SW4) which displayed values of up to 91 mg/l.

4.4 Petroleum Hydrocarbons

Petroleum hydrocarbons were not detected at any location during any monitoring round.

At two locations (SW16 during 2nd round and SW22 during 4th round) sheens were visually observed during a monitoring round; however given that petroleum hydrocarbons were not detected, the sheen may have been due to another source such as peat or algae.

5. Conclusions

Given that only four rounds of monitoring were carried out it is difficult to confirm typical baseline water quality parameters due to a variety of factors including variability in flow and temperature and the potential discrete pollution events. This section draw some initial conclusions based upon the available information.

It should be noted that further monitoring will probably be required to prior to, during and following the proposed road widening scheme to further establish the baseline conditions and to ensure that the road widening works are not impacting significantly upon water quality in the study area. Increased monitoring should be undertaken at locations downstream of historic and current mining activities and any existing or proposed drainage outfall. This monitoring should be informed by the conclusions of the Environmental Statement that will need to be prepared in support of the proposals.

5.1 Impacts of mining activities

As a summary of the discussion above, it has been found that the historic mining activities and ongoing restoration works which are occurring upstream of SW1, SW3 and SW4, has some impact upon water quality. The impacts upon water quality include:

- High electrical conductivity at SW1, SW3 and SW4;
- Increased hardness ($CaCO_3$) at SW1, SW3 and SW4;
- Very high Nickel concentrations at SW1 and SW3;
- Elevated Mercury concentrations at SW1 and SW3 during the 1st monitoring round.
- Selenium detected at SW1, SW3 and SW4;
- Magnesium and Calcium concentrations are high at SW1, SW3 and SW4.
- Copper and Zinc concentrations are elevated at SW1, SW3 and SW4, the concentrations are similar to other locations within the study area; however given the hardness of the water the screening threshold values were not exceeded.

This indicates some sources of contamination exist within the mining areas to the west of Hirwaun. This has only lead to exceedances of the screening threshold value in respect to Nickel; however has also led to very high hardness and conductivity. It should be noted however, that sulphide was not detected at any of these locations.

It should also be noted that the hardness of the water discharging from this area reduces the bio-availability of certain metals. This is reflected in the screening thresholds that are applied and as a result apparently elevated concentrations for some metals are not considered to be of concern. Consequently any activities that result in a future reduction in hardness, that do not also address the source of metal contamination would be of potential concern.

In addition to these three locations, historic mining activities are known to have occurred in other parts of the study area and that this may be a contributory source for elevated levels of metals such as copper and zinc, which are prevalent across the entire study area.

5.2 Impact of the A465

Based on the results available from the four monitoring rounds, it appears that the A465 may potentially be impacting upon the water quality of some of the watercourses in the vicinity of the site. The results are not conclusive, however based upon the results some potential impacts have been identified:

- Chloride is high in locations adjacent to the road, especially during winter months when road grit is potentially in use;
- PAHs were detected in some locations adjacent to the road following high rainfall events, with some exceedances of the screening threshold values. This is potentially due to PAHs along the road becoming mobilised by the rainfall.
- Mercury was observed to be high at four locations downstream of the road following rainfall events. During the first monitoring round the threshold value was exceed at SW30, SW35 and SW40; during the fourth monitoring round the threshold value was exceeded at SW17 and SW35.
- Zinc concentrations during the first monitoring round failed to achieve a 'High' status for Zinc for a number of locations, during a high rainfall event. The Zinc concentrations across the study area may be due to historic mining activity across the region or due in part to runoff from the A465.

Although there appears to be some contamination associated with the A465 no location had detectable levels of petroleum hydrocarbons, although only four spot monitoring rounds were undertaken.

SW41	11/09/2015	11:30	8.56	169	15.20	64.00	134	-	No pollution, algal blooms	-	-	-	-	No dimensions, reservoir	

Weather	
10/09/2015	Dry all day and hot in the afternoon (25*C), reportedly dry the previous week.
11/09/2015	Overcast and cold, no rain but humidity with almost drizzle.

**Dissolved oxygen probe not working throughout the majority of the monitoring period, equipment continued to turn off immediately after starting, and therefore unable to take any readings.

Annex C. Full laboratory results

Follow Up Flag: Follow up
Flag Status: Completed

Hi Kate

Yes that is correct. The reservoir is maintained as an emergency supply for drought purposes. It is not used as a daily source

Kind regards

Barry

To: Cotter Barry; Howls Steve; Burr Andy
Cc: Watson, Daniel; A465 Sections 5 & 6
Subject: Nant Hir Reservoir Operation

******** External Mail ********
Dear sirs,

I am currently writing the environmental statement for the A465 Sections 5 and 6 road widening scheme in relation to the water environment. As you are aware the A465 currently passes above the Dwr Cymru Nant hir reservoir, with road widening operations to occur across and in the vicinity of the reservoir.

Through a previous discussion with Gwyn Thomas, who inducted me on the site for water quality monitoring, I understand that this reservoir is an emergency supply reservoir. I assume that this means that during times of drought the reservoir supplies public drinking water, however is usually not in operational use. Could you confirm whether this is the case, or whether it is in regular use?

Kind regards,

Kate

Appendix 17H – Good Construction Practice

Construction methodology

The risk of pollution to the water environment during construction can be reduced through the adoption of good working practices. The Pollution Prevention Guidelines (PPG)[1] were withdrawn in December 2015, however, still provide suitable good practice advice. Certain aspects of the guidance for pollution prevention (GPP) were updated in 2017 and have been considered in the writing of this advice including:

- GPP2: Above ground oil storage tanks;
- GPP5: Works and maintenance in or near water; and
- GPP13: Vehicle washing and cleaning.

Additionally the CIRIA construction guidance details pollution prevention best practice, specifically:

- CIRIA C532 Control of water pollution from construction sites; and
- CIRIA C648 Control of water pollution from linear construction projects – technical guidance.

Information on general construction mitigations can be found in Chapter 5: Scheme Description and the CEMP, and is supplemented by consideration of the relevant water environment in this section. This section will review and consider specific construction mitigation relating to surface water quality, groundwater quality, flood risk, attenuation, abstractions, discharges and ecology.

Construction Environmental Management Plan (CEMP)

A draft CEMP has been compiled to provide targeted guidance for the construction phase. The CEMP includes targeted sediment control and erosion considerations to meet the requirement in HD45/09. The CEMP should be finalised by the principle contractor and approved by NRW and the LAs prior to construction commencing.

Once complete the CEMP will cover the following critical areas that will assist in limiting and managing pollution impacts to the water environment:

- construction drainage strategy;
- sediment management strategy;
- works to watercourses;
- management of historic contamination;
- materials inventory;
- material storage and handling requirements;
- construction monitoring requirements; and
- pollution response plan.

Construction drainage strategy

The construction drainage strategy could be designed to treat surface water runoff for sediment and to reduce any significant increases in runoff associated with construction. Prior to the commencement of any major soil stripping activities or earthworks in a given area, temporary construction drainage should be installed then monitored and maintained until works along that section have been completed. Where practicable the temporary drainage should retain surface water runoff within the site boundary. Ideally this should be stored to assist in dust suppression during dry periods.

[1] Environment Agency, website< https://www.gov.uk/government/collections/pollution-prevention-guidance-ppg>, Accessed May 2016.
Merthyr Tydfil Angling Association, website < http://www.mtaa.co.uk/>, Accessed February 2016.

The temporary construction drainage would incorporate features such as cut-off ditches at the tops of embankments. These ditches could direct surface water runoff to storage lagoons and hence stop the runoff from entering earthworks areas. Where practicable, permanent drainage arrangements could utilise the temporary construction drainage system.

The temporary construction drainage could discharge to watercourses either via existing road discharge points or new discharge points. The design will depend upon an assessment of each point to determine the impact. A full drainage survey of the existing road could be undertaken to confirm the location of existing discharge points. The use of existing outfalls could be considered further in detail following the detailed design.

During construction there is a risk of seepage from cut slopes. Additionally this may occur when perched groundwater within lenses is encountered during excavation. To mitigate against this, additional drainage features or temporary pumping may be required to take groundwater away. Where groundwater is encountered NRW could be consulted and any required consents obtained to allow removal of perched water. In areas where shallow groundwater is known to be an issue, work could, where practicable, take place from May to October when ground water flows and levels are typically lower.

Mitigation of surface runoff from compounds or other temporary surfaces could be agreed with the relevant drainage authority and NRW. Except in areas where it is otherwise required for pollution control construction, compounds could be constructed with permeable materials to prevent significant changes in runoff. Runoff from compounds could all pass through pollution control systems such as settlement ponds prior to discharge. These will also attenuate flows.

All temporary discharges (either directly or via attenuation features) could be directed to surface waters where practicable and could be subject to consent from NRW. Where discharges to groundwater were required, these could be undertaken only with the consent of NRW.

Sediment management strategy

A detailed sediment and erosion plan will be developed which will set out measures to limit silt entering the watercourses. This could include provisions relating to the construction site layout and sediment control measures which could include:

- ensuring site compounds and other significant construction activities could be sited a minimum distance from all water features, following best practice guidance of a buffer of 15 m from top of bank for main rivers, and 8 m from top of bank for ordinary watercourses. This could be applied in all areas unless there is a clear requirement for works to approach a channel such as in relation to an outfall or a watercourse crossing;
- minimising the length of time that stripped ground is exposed;
- providing toe drains or silt fences at the toe of any significant areas where excavated material was stored;
- temporarily divert clean water from the construction site to minimise the potential volume of contaminated water;
- preventing runoff flowing across exposed or excavated ground through the provision of diversion drains to channel runoff from up-gradient areas, around any construction areas or areas disturbed as a result of construction works;
- carrying out regular water quality monitoring of receiving watercourses to ensure construction phase EQS's set by NRW are met;
- re-vegetating, or otherwise stabilising disturbed areas as soon as possible following completion of works. Providing impermeable mats (e.g. plastic sheeting) as covers to mounded excavated material during periods of heavy rainfall. Applying mulching and binders to unprotected exposed soil on the site where necessary. Providing silt fencing alongside and within watercourses as required. In the event of dissolved solids becoming difficult to control, consulting with NRW and considering the deployment of flocculation or other bespoke silt management techniques such as *Siltbuster*;

- providing wheel washing facilities at the site exit to prevent soils being spread onto public roads beyond the boundary of the site and provision for road sweeping vehicles if required;
- consulting with NRW where excavations are below the water table to determine if an abstraction licence for dewatering is required;
- obtaining consent from NRW for any abstractions required for provision of water for dust suppression or site works;
- avoiding work on steep slopes above watercourses without first implementing additional provision for sediment management; and
- taking additional care with regard to work during the construction near to Penywern Ponds and during works to the bridge crossing of Nant Hir Reservoir.

Vehicle washing

Responsible washing of vehicles acts to minimise contamination from excavations and other construction pollutants. However it can also mobilise vehicle specific pollutants such as oils, brake dust and traffic film residue which can be hazardous to the surrounding environment. An essential building block to responsible vehicle washing is a well thought out and fully functioning construction drainage strategy. Specifically relating to vehicle washing:

- washing bays should be designed to minimise runoff by covering, using appropriate ditches and gullies and utilise silt traps or other sediment management measures prior to discharging;
- reduce the volume of water used in washing to minimise the waste generated; and
- where possible connect to an appropriate foul sewer and obtain the relevant consent.

Works to watercourses

Works in or within 8 m of channels / watercourses may be subject to separate consent from the appropriate land drainage authority. These works could be subject to further sediment and pollution control measures which will cover exposed ground and stockpiles, plant washing, roads and river crossings, dredging and de-watering/pumping excavations including:

- minimising work in the watercourse;
- working in highly sensitive water features during the period May - September inclusive. No works to any water features could be undertaken if heavy rainfall has recently occurred or is forecast;
- ensuring temporary works consent is obtained from the relevant drainage authority if work involves blockage of the channel;
- if it is necessary to block a minor watercourse during culvert construction, this will be done in accordance with pollution control measures and water could be over-pumped to preserve downstream flows;
- timing works in or near watercourses to avoid interfering with migrating or spawning fish; and
- sediment control measures being installed downstream of any construction activities at the upstream end of drainage runs, adjacent to or over any water features.

Management of historic contamination

As outlined within this Chapter and Chapter 12: Geology and Soils, it is likely that there are significant areas of pollution within the study area which could be mobilised through the construction of the proposed scheme. The mitigation for this is contained within Chapter 12: Geology and Soils, however, the main mitigation will involve:

- testing of made ground and soils to identify any contamination along the route, in material that may be excavated and re-used as fill, specifically at Dowlais Top and Hirwaun; and
- removal or treatment of contaminated soils to prevent the mobilisation of contaminated sediment or leaching of contaminated water to the water environment.

Material inventory

The CEMP will include a detailed inventory of all materials contained within the construction site compound, where each material is stored and the relevant pollution control measures associated. This will include a list of:

- machinery, vehicles and other plant;
- oils, fuels and other polluting materials;
- cementitious materials;
- excavated material;
- soil or plant material from areas of non-native invasive species;
- construction materials;
- any stored contaminated land; and
- waste including wastes from construction compounds.

Material storage and handling requirements

Within the CEMP a detailed plan of the materials stored on site could be developed, as well as specific methodologies to prevent pollution to the water environment. Consideration could be given to existing drainage pathways when storing materials and plant.

Where practicable, site compounds could be located away from watercourses and buffer zone areas of no works could be applied for all water features. Particular care could be taken with regard to work during the construction near to sensitive watercourses, Penywern Ponds and during works to the bridge crossing of Nant Hir Reservoir.

The site compounds could contain designated areas for refuelling which could be bunded and sealed to contain spillages at source. Specifications of storage containers should be in line with the GPP2 guidelines and the checklist for oil storage tanks be utilised to ensure full compliance with regulations. These could be sited on hardstanding and away from watercourses to prevent pollution to surface water and groundwater. All contaminated material could be removed and disposed from the area. Any oil or contaminants retained could be pumped into tankers at regular intervals for disposal off site. Storage of any potentially polluting materials should avoid areas:

- within 50 m of a spring, well or borehole;
- within 10 m of a watercourse;
- places where spilt oil could enter open drains, loose fitting manhole covers or soak into the ground where it could pollute groundwater;
- places where a spill could run over hard ground to enter a watercourse or soak into the ground where it could pollute groundwater;
- places where tank vent pipe outlets cannot be seen from the filling point;
- above roof level, as spilt oil can run unseen into guttering connected to surface water systems; and
- Source Protection Zones (SPZs) where groundwater is particularly vulnerable.

Additional mitigation measures could be applied through construction methodologies and timings to mitigate against pollution to surface water and groundwater. These could include:

- ensuring that wet cement / concrete does not come into contact with surface water or groundwater particularly at proposed bridge crossings;
- not storing large volumes of construction materials on the floodplain;
- securing plant and materials to ensure minimal impediment of conveyance or blockage of channels;

- using drip trays under mobile plant;
- storing oils, fuels and chemicals within site compounds on hard standing with appropriate bunding;
- ensuring that suitable insurance is acquired to cover cost incurred as a result of accidental oil spillage. The policy should also provide cover in the event of vandalism;
- providing specific wash-down areas for plant and equipment used for cement work and containing/locating these on defined areas of hardstanding; and
- prior to discharge, neutralising any cement wash-down water and agreeing such discharges with NRW.

Construction monitoring requirements

An Ecological Clerk of Works (ECoW) could be employed during the construction of the proposed scheme. Daily visual inspections of local watercourses and the ground could be carried out by the ECoW for evidence of contamination, for example, sheens and increased turbidity. These could be focus particularly on areas around site compounds, near working plant and watercourses where new or extended bridges and culverts are being provided.

A detailed monitoring plan could be developed for watercourses adjacent to or downstream of construction activities. This could include the requirement of taking and inspecting water samples prior to, during and following construction to ensure that the pollution control measures outlined within the CEMP were successful.

Pollution response plan

A pollution response plan could be developed prior to construction and kept on site throughout construction to inform contractors of required actions in the event of a pollution event. This could include the provision on-site of spill kits including absorbent material and inflatable booms. All site personnel could be briefed on the importance of the water environment, action to protect it and trained in the use of spill kits.

The plan could be in place to deal with any issues as soon as they occur for a particular site and to ensure that works are undertaken with the utmost care, especially where they have potential to lead to pollution of surface water or groundwater. Emergency planning could also include measures to prevent contamination caused by severe weather events. It is also advisable that a suitable insurance policy be taken out in order to manage additional cost and ensure an appropriate response is planned.

Flood risk measures

During construction there is a risk of flooding of the proposed works from a number of sources and there is also a potential impact on flooding elsewhere as a result of these works.

Fluvial risk

The construction activities associated with the A465 project present multiple risks to the site works from fluvial sources;

- works in the floodplain will temporarily decrease floodplain storage, impacting risk elsewhere;
- excavated materials stored in the floodplain could become mobilised during flood events, potentially damaging receptors downstream; and
- temporary access bridges may constrict flows and reduce floodplain storage.

Working within the floodplain

Culvert, bridge, outfall and realignment works will take place within the floodplain. This poses a risk to works and personnel in the floodplain. At these locations further mitigation will be required in order to minimise the risk detailed below.

All works affecting a Main River or Ordinary Watercourse could require a consent from NRW.

The contractor could prepare a risk assessment and method statement for works within the floodplain, following the EA's Flood Risk Standing Advice (FRSA) to minimise risks to personnel, equipment and materials. In addition to the FRSA, it is recommended that the method statement also includes the following mitigation to minimise the impacts of flooding:

- avoidance of work near watercourses during periods of heavy rainfall;
- timing of works – works within the area could be scheduled to minimise the risk of flood events occurring during the construction period. The works could be undertaken during the summer months;
- duration of works – the length of time between topsoil stripping and reinstatement could be minimised to reduce the opportunity of a flood event occurring whilst the surfaces are stripped. Topsoil removal can increase the risk of silt mobilisation during floods;
- monitoring of local weather conditions and stopping work (if required);
- not storing plant and materials in the channel or floodplain, particularly overnight and during shutdown periods;
- ensuring that all areas of the site have a safe access and egress route during high water levels;
- introducing a flood warning and evacuation procedure during the construction period to provide advance warning of predicted flooding and provide details of safe access and egress routes. The contractor could register for NRW Flood Warnings, where available;
- area of ground to be stripped of topsoil could be minimised as much as possible in floodplain areas;
- the length of time between topsoil stripping and reinstatement could be minimised to reduce the risk of a flood event occurring during construction activity;
- the timing of works could be carefully considered, works within the flood risk areas could be scheduled so as to minimise the risk of flood events occurring during the construction period; and
- where practicable, vegetated strips could be retained adjacent to watercourses within floodplains to impede surface water run-off and to catch sediment.

Channel diversions and construction of culverts

There are many minor watercourses throughout the scheme that will be diverted to nearby watercourses or culverts either temporarily or permanently. The following mitigation, in line with the recommendations in CIRIA C689, will be implemented to minimise the risk of adverse impacts on the watercourses:

- construction time within the watercourse could be kept to a minimum;
- where flumes are required to temporarily divert the watercourse, flume pipes could be of a sufficient length to span the trench width and ensure they are not undermined during trench excavation. They could also be sized to avoid placing the works and personnel at risk of flooding;
- where flumes are required, suitable over-pumping equipment could be on standby in case of any unforeseen issues;
- over pumping equipment could be of sufficient capacity to deal with significant volumes of water; and
- in the event of an unforeseen (no-notice) flood, planned for safe refuges and access routes could be provided on site.

It is not known at this stage whether pipe jacking will be implemented during any of the proposed culvert installations. Where pipe jacking is considered it is recommended that consideration be given to the placement of launch and reception pits so that construction works and personnel are not placed at risk of flooding.

Surface water

Surface water flooding may compromise the safety of personnel and damage construction materials and works. The following mitigation measures could be implemented;

- assessing likely surface water flow paths;
- installing temporary drainage systems of sufficient capacity to prevent the works, materials and construction personnel being inundated with surface water runoff;
- registering for severe weather warnings and monitor weather forecasts to provide notice of future heavy rainfall events;
- when equipment vulnerable to water ingress is required, construction works could only take place when low or no rainfall is forecast and equipment could be stored in compounds when not in use;
- an emergency evacuation procedure could be developed for removal of works items and contractor staff during heavy rainfall;
- where the installation of temporary drainage is not considered feasible, pumping equipment could be on standby to remove surface water from the works area; and
- constructing temporary bunds with regular spaces between bunds to prevent surface water backing up behind the bund and being re-directed elsewhere.

Groundwater

Groundwater has been identified as a potential contributing risk to other sources of flooding. At locations where groundwater has the potential to be an independent source of flooding there are the following risks:

- groundwater seeping into excavations where sub-surface flow paths are encountered;
- groundwater flooding from cutting points where sub-surface flow paths are intercepted; and
- groundwater flooding due to the above reasons coinciding with other sources of flooding.

The following mitigation measures could be implemented in order to minimise the risk:

- making groundwater dewatering available for works that are in groundwater risk zones;
- over-pumping equipment could be available on standby to remove groundwater that may seep into the excavation sites; and
- where there is a risk of groundwater flooding, surface water management plans and temporary drainage could have additional capacity in order to accommodate the possibility of multiple types of flooding.

Land drainage systems

During the construction period, it is likely that a high number of land drainage systems will be encountered due to the length of the scheme. Although the likelihood of encountering such systems is high, the low flow volumes associated with these structures and the use of appropriate site investigations and planning could help to minimise the risks.

Given the unrecorded nature of land drainage, it is not feasible to assess each of these assets individually. However, it can be assumed that at some point during construction, these systems have the potential to be accidentally removed, filled in or damaged, therefore increasing flood risk to the surrounding area. It is therefore advised that land drains are appropriately identified prior to construction and rerouted for the duration of construction, following completing of the construction phase it is recommended that the land drains are reinstated to the original rout and capacity. By identifying and intercepting existing land drainage systems ahead of any open excavations and creating thorough risk assessments and detailed site investigations, the risks from land drainage flooding can be reduced.

Pre-construction drainage could be designed by a drainage engineer and installed using a drainage contractor. Where land drains are encountered and / or have the potential to be damaged during trenching operations, a cut off or header drain could be installed to divert flow around the works, in order to prevent the works from being inundated with water when excavated. This will minimise the risks to workers within excavations during pipeline construction.

Flooding from reservoirs

As discussed within the FCA the proposed scheme is potentially at risk from the following reservoirs flooding;

- Nant Moel Reservoir (grid ref: SN 98148, 07102);
- Nant Hir Reservoir (grid ref: SN 98902, 06894);
- Beacons Reservoir (grid ref: SN99707, 17286);
- Cantref Reservoir (grid ref: SO 99871 15971);
- Llwyn-on Reservoir (grid ref: SO 00760, 12042);
- Upper Neuadd Reservoir (grid ref: SO03500 17300);
- Pentwyn Reservoir (grid ref: SO 05316, 14964);
- Ponsticill Reservoir (grid ref: SO 05611, 13259);
- Upper Penywern (grid ref: SO 07054, 08602); and
- Lower Penywern (grid ref: 07209, 08292).

This risk is also applicable during the construction phase. The likelihood of reservoir failure is extremely low, but as a precautionary measure, contact could be made with Merthyr Tydfil County Borough Council (MTCBC) and Rhondda Cynon Taf County Borough Council (RCTCBC) (the local authorities responsible for Emergency Planning) and Welsh Water's reservoir and safety inspection team. They could be informed about the presence of a large temporary workforce in the floodplain, and lines of communication established in the event of a reservoir flood warning being received. The reservoir undertakers could be informed that there is work planned downstream to prevent any drawdown works (maintenance / testing) during this period that could place staff and site at risk.

Appendix 17I – Proposed Site Compounds Flood Risk Summary

1. Surface Water Flood Risk

There are few proposed compound locations along the A465 scheme which are at a significantly high risk of surface water flooding. The majority of proposed sites which interact with the surface water flood outlines do so to a limited extent with only a small proportion of the proposed site compound area at risk. The proposed compound locations have been assessed for the surface water flood risk using the updated Flood Map for Surface Water (uFMfSW)

The proposed site compound 1870-2220_0 appears to be the compound which is at greatest risk. Surface water flow paths originating from the west flow through the site compound and collect on the existing A465. There are two main flow paths which put the proposed compound at risk, one at the north-west end and one at the south-east end (Plate 1-1), both these flow paths flow from south-west to north-east. The uFMfSW classes the level of risk for both these flow paths as low.

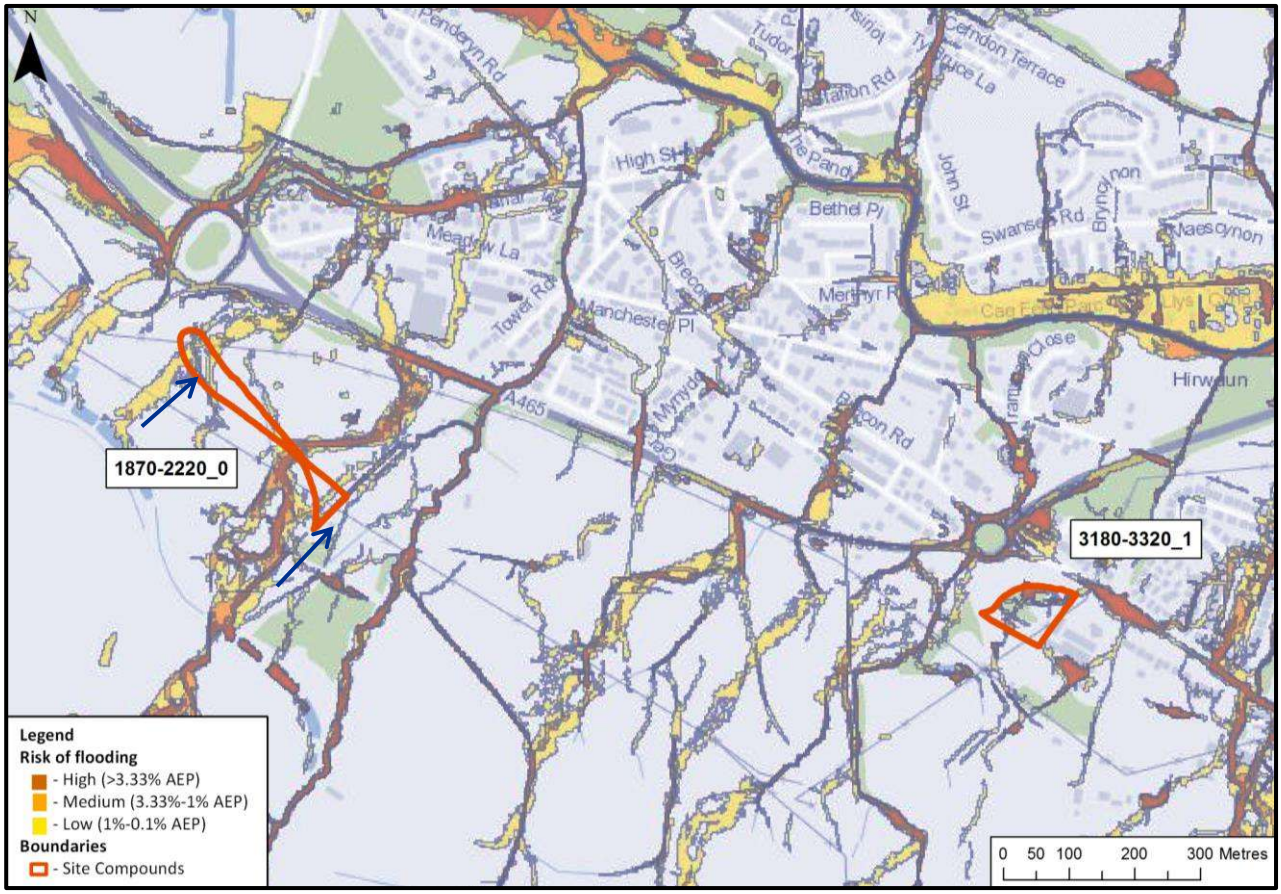

Plate 1-1. Surface water flood risk for proposed site compounds 1870-2220_0 and 3180-3320_1. Blue arrows show the likely flow paths. (Source: https://naturalresources.wales/our-evidence-and-reports/maps/flood-risk-map/?lang=en)

There are two further proposed compounds that demonstrate a notable interaction with the surface water flood extents; compounds 10220-10370_8 (Plate 1-2) and 14720-14820_15 (Plate 1-3). For both of these proposed compounds it is clear that the risk is related to a surface water flow path moving through the site. The risk to the site at proposed compound 10220-10370_8 is classed as a medium risk, according to the uFMfSW, whilst the risk at proposed compound 14720-14820_15 is low. There are a number of other potential sites which have a flow path passing directly through them; proposed compounds 7460-7700_5, 7860-8340_6 and 7880-8140_7. The flow paths at these locations are relatively small compared to that at proposed compound 14720-14820_15,

but should still be considered as being a risk. Proposed compounds 7460-7700_5 and 7860-8340_7 have flow paths flowing from north to south, straight through the centre with a low and medium risk respectively. The proposed compound 7880-8140_7 has a flow path flowing from south to north, which is classified as a low flood risk according to the uFMfSW. These proposed compounds are shown in Plate 1-4 below.

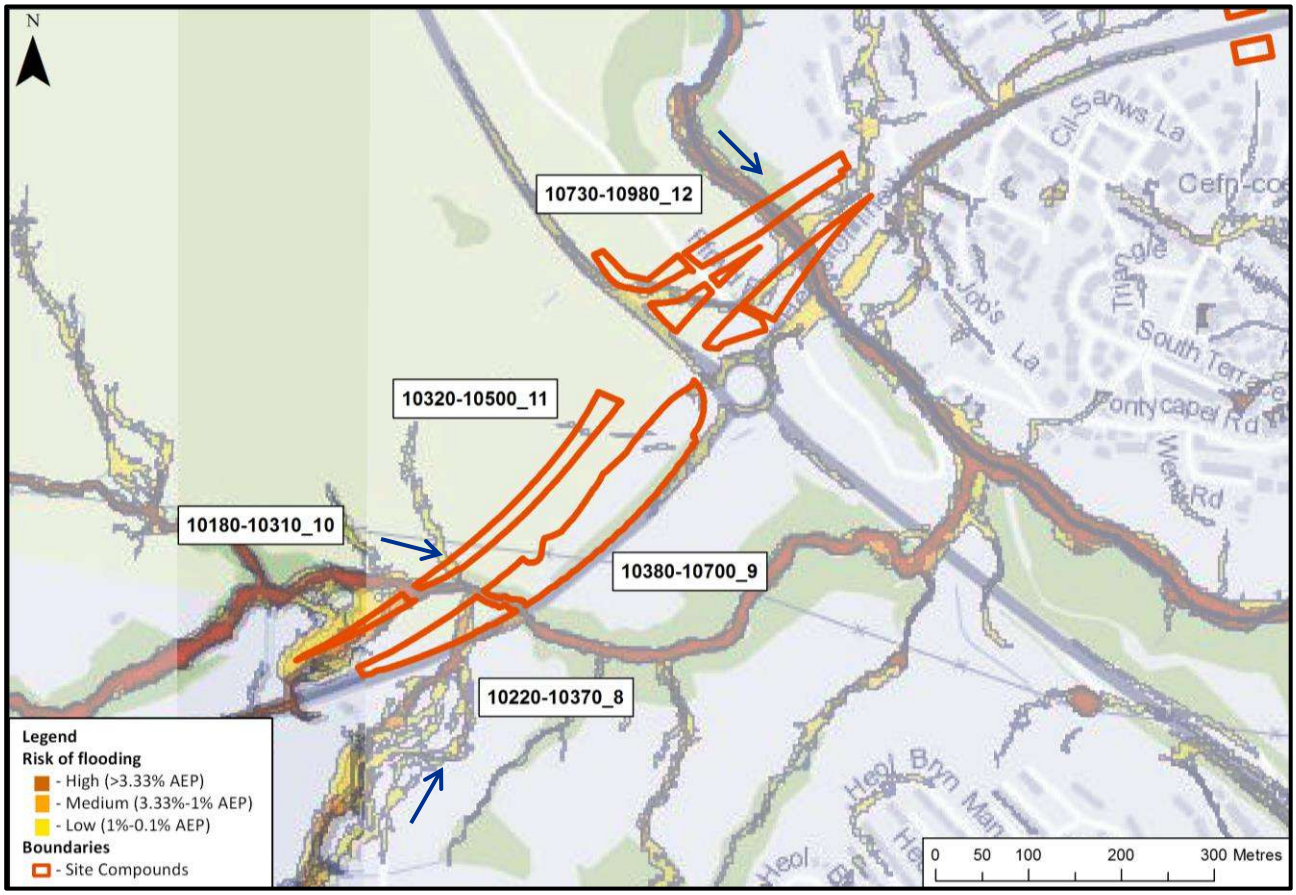

Plate 1-2. Surface water risk between chainage 9,000 and 11,000. Likely flow paths indicated by the blue arrows. (Source: https://naturalresources.wales/our-evidence-and-reports/maps/flood-risk-map/?lang=en)

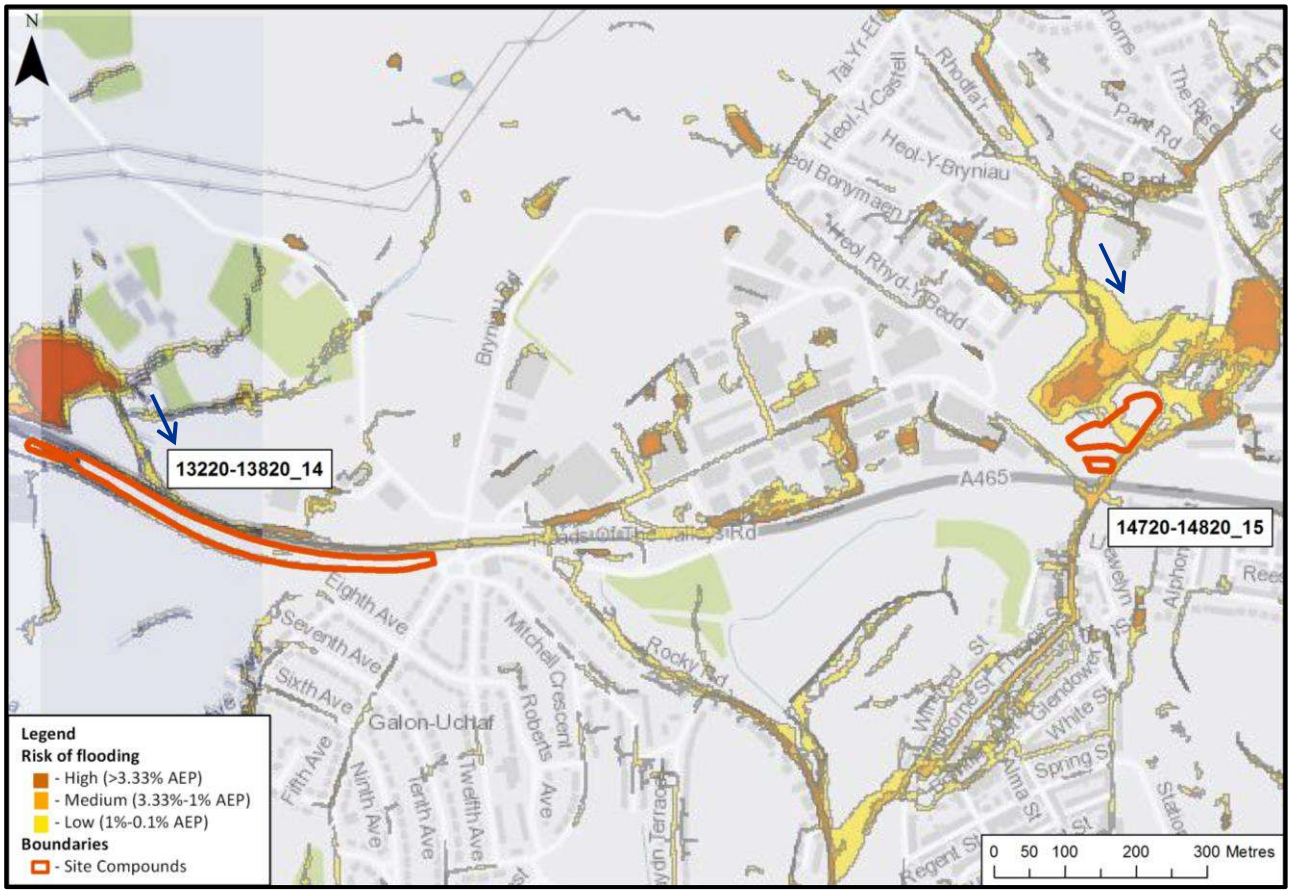

Plate 1-3. Surface water risk between chainage 13,000 and 15,000. Likely flow paths are indicated by the blue arrows. (Source: https://naturalresources.wales/our-evidence-and-reports/maps/flood-risk-map/?lang=en)

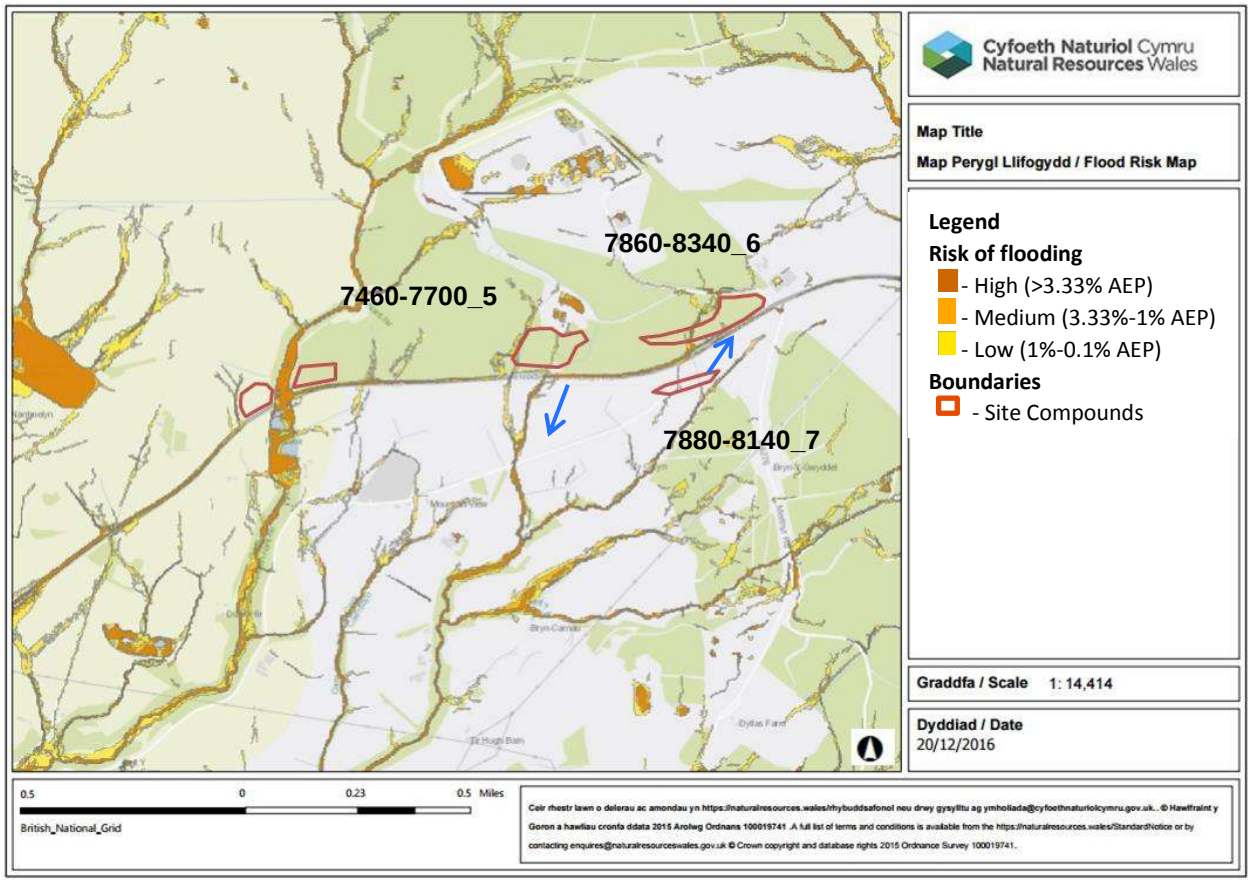

Plate 1-4. Surface water risk between chainage 6,000 and 9,000. Blue arrows indicate the likely flow paths. (Source: https://naturalresources.wales/our-evidence-and-reports/maps/flood-risk-map/?lang=en)

There is one potential instance of surface water ponding occurring within a proposed site compound, this being proposed compound 14720-14820_15. According to the surface water mapping, surface water is likely to pond around the eastern end of the proposed compound, between chainage (ch.) 13220 and 13300 (Plate 1-3), and is likely to pose a high risk during a flood event.

2. Fluvial Flood Risk

There is very limited fluvial risk to the proposed site compounds. The majority of potential sites have been located away from watercourses and their flood plains. However there are three watercourses which pass in close proximity to some of the proposed compounds. These are, Nant Ffrwd, Taf Fawr and Taf Fechan.

2.1 Nant Ffrwd

There are four proposed compounds between ch. 10,000 and 10,700 which may be at fluvial risk due to their close proximity to Nant Ffrwd. The proposed construction compounds 10220-10370_8, 10380-10700_9, 10180-10310_10 and 10320-10500_11 have been designed as separate compounds to accommodate the Nant Ffrwd watercourse which passes through them. However, there is still potential for the proposed compound to be at risk from the 1 % AEP fluvial flood event, refer to Plate 2-1 below.

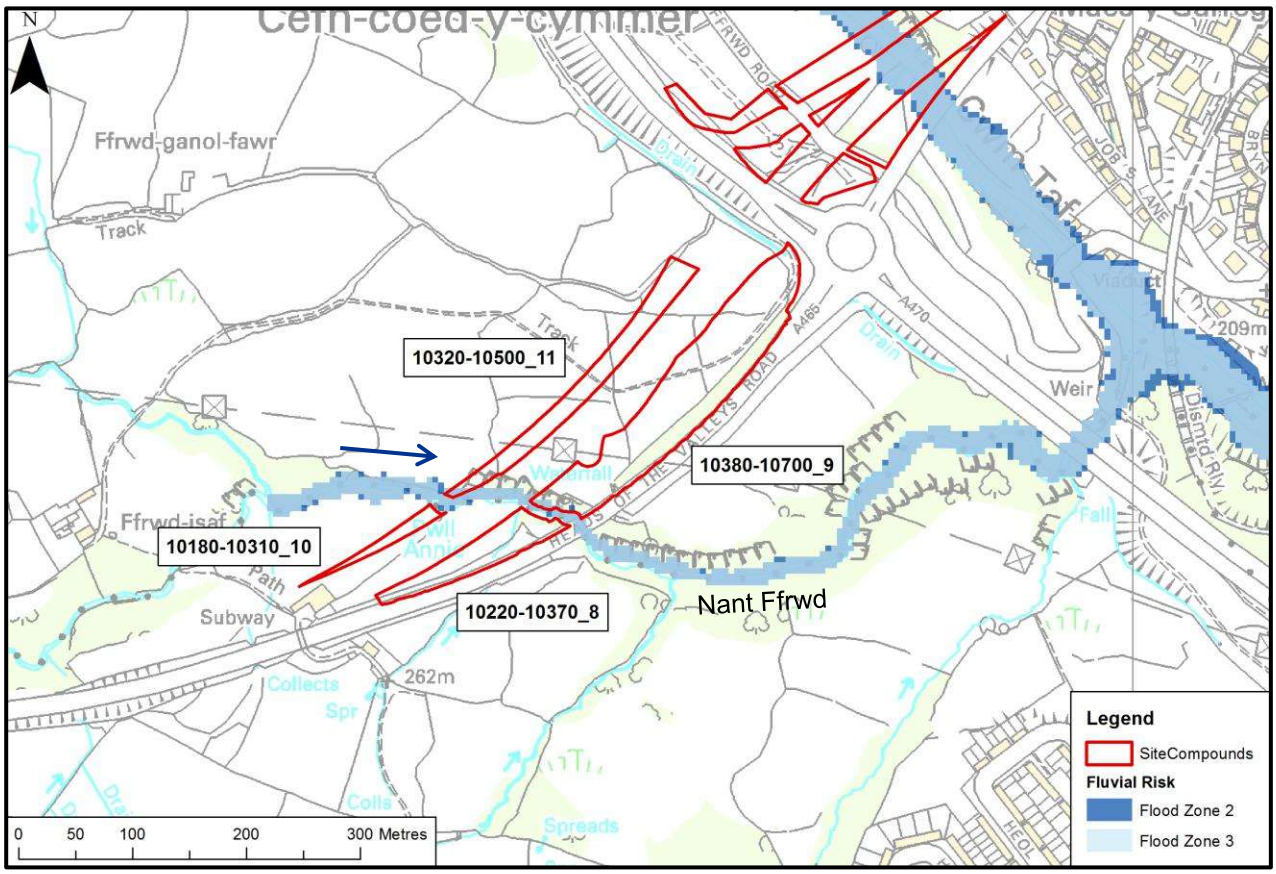

Plate 2-1. Fluvial risk associated with Nant Ffrwd.

2.2 Taf Fawr

Further east, proposed compound 10730-10980_12 has been split into six different sites to accommodate the Ffrwd road, two of these sites pass directly over the Taf Fawr. The existing A465 is a bridge at this point and the proposed compound is located here for the purpose of construction on the bridge. If the proposed sites are located on the bridge then the risk will likely be minimal due to the height above the watercourse. However, if based at ground level then the proposed sites will need to be split to account for the path of the watercourse. During the construction phase, there will be a risk when moving equipment, materials and construction personnel between the proposed compounds.

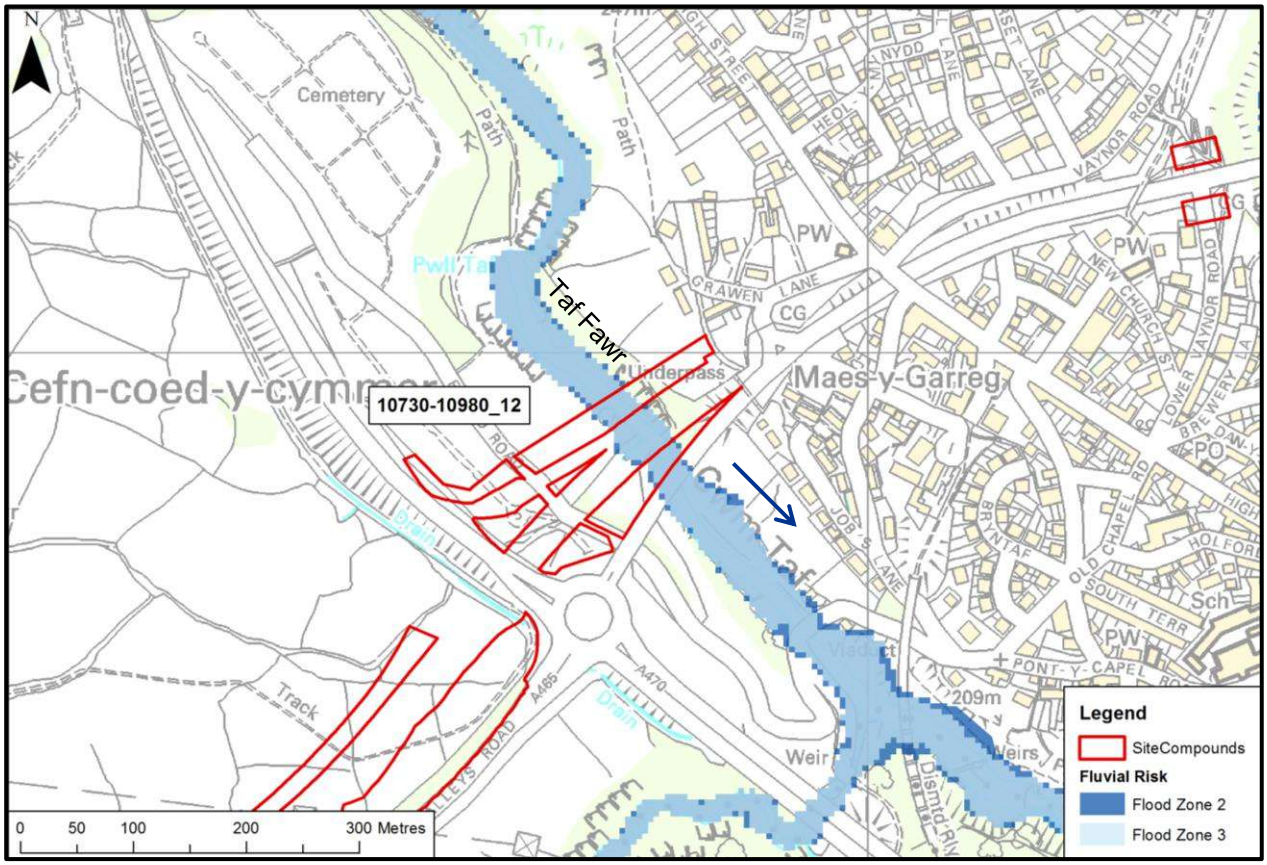

Plate 2-2. Fluvial risk associated with Taf Fawr.

2.3 Taf Fechan

The final watercourse, Taf Fechan, is located at ch. 11520. There are no proposed compounds located within the risk area associated with this watercourse. However, the four proposed compounds at 11420-11580_16 are in close proximity and may be at risk of flooding if they are any different from the layout indicated in Plate 2-3, or if they are located any closer to the watercourse.

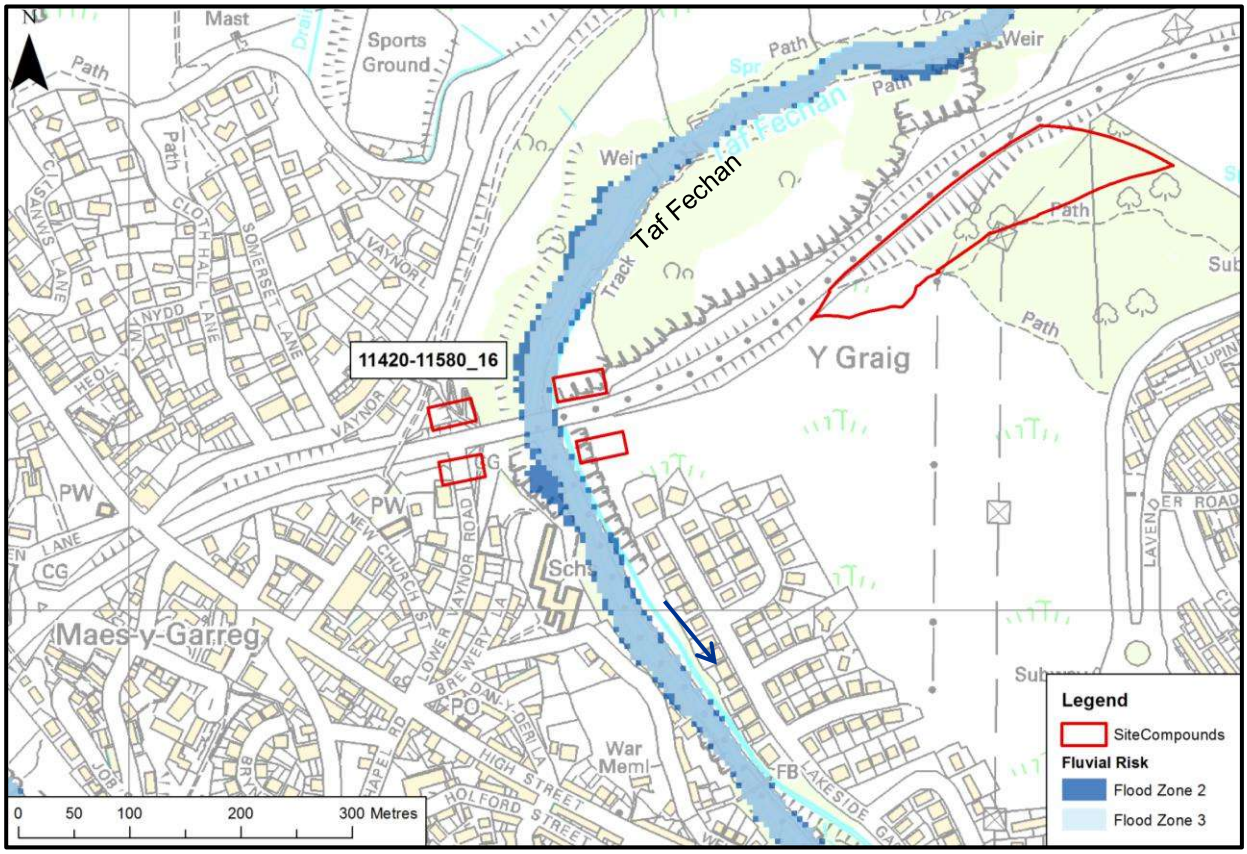

Plate 2-3. Fluvial risk associated with the Taf Fechan.

3. Groundwater Flood Risk

The risk of flooding from groundwater risk is not as straightforward to assess in comparison to surface water and fluvial flood sources. The risk is instead given as a general indication of potential flooding locations. The local information on groundwater flooding is limited in this area but the Merthyr Tydfil Flood Risk Management Plan (MTCBC, 2015) indicates that flooding from groundwater is not a major problem. However, information in the Rhondda Cynon Taf Draft Flood Risk Management Plan (RCTCBC, 2015) contradicts this, identifying that groundwater flooding is commonly experienced where developments have been cut into the hillsides without appropriate land drainage, and also that groundwater has been noted to occur from mines following the cessation of pumping. As part of the A465 Preliminary Sources Study Report (PSSR) a sample of over 100 boreholes was undertaken, ranging from 0.90 m to 35 m in depth. The sampling encountered groundwater at most locations, at various depths ranging from 0 m to 20.2 m below ground level (bgl) across the proposed scheme.

Out of all the potential construction compound locations, there are nine proposed locations which could be affected by groundwater risk. The area of Hirwuan, which is located at the western end of the scheme, is highly susceptible to groundwater flooding and, therefore, proposed compounds 1870-2220_0 and 3180-3320_1, which are in close proximity to Hirwaun, are likely to be at risk. Proposed compound 1870-2220_0 is located in the Hirwuan area and the PSSR found that the groundwater level was almost at the level of the proposed carriageway, but was unlikely to directly contribute to flood risk. Proposed compound 3180-2220_1 is in the Afon Cynon and Trewuan area, the groundwater here is above the level of the proposed scheme and could directly contribute towards flooding.

Proposed compounds 6560-6880_4 and 7460-7700_5 are located within the Nant Hir reservoir area, where groundwater is higher than the proposed route. Within this location groundwater was encountered as standing water in six boreholes and seepage was found in two of these. The sandstone layers within the Lower Coal Measures were also found to contain water as closed aquifers. As there have been previous incidents of seepage there is the likelihood that groundwater could directly contribute towards flooding of these proposed compounds.

The proposed compounds 7860-8340_6 and 7880-8140_7 are within the Bryn Y Gwyddel area. Groundwater here was encountered in nine boreholes between 0.9 m to 17.5 m. In two of these boreholes there were incidents of groundwater reaching the surface overnight. As the maximum groundwater level recorded along the route is above the level of the proposed scheme there is the likelihood that groundwater could directly contribute towards flooding of the proposed compounds.

Proposed compounds 10220-10370_8, 10380-10700_9, 10180-10310_10, 10320-10500_11 and 10730-10980_12 are all located within the Nant Ffrwd area. Standing water was recorded overnight in nine boreholes at this location. Due to the groundwater level being above the level of the proposed carriageway, groundwater could directly contribute towards flooding at these proposed sites.

The final proposed compound which is at risk of groundwater flooding is 13220-13820_14. This would be located within the Gurnos area, where overnight standing water was recorded during the PSSR, along with water recorded in the glacial till and the bedrock. The maximum recorded groundwater level is above the level of the proposed scheme's, indicating a high risk of groundwater flooding.

Groundwater of varying depths was recorded in the vicinity of all of the remaining proposed compounds. However, for proposed compounds 11780-12140_13 and 11420-11580_16, located within the Cefn-coed-y-cymmer area, the maximum groundwater level was approximately 8.3 m below the level of the proposed scheme, indicating that groundwater is unlikely to have a contribution to any sources of flooding. An overview of the compounds at risk from groundwater flooding is provided in Plate 3-1 and Plate 3-2.

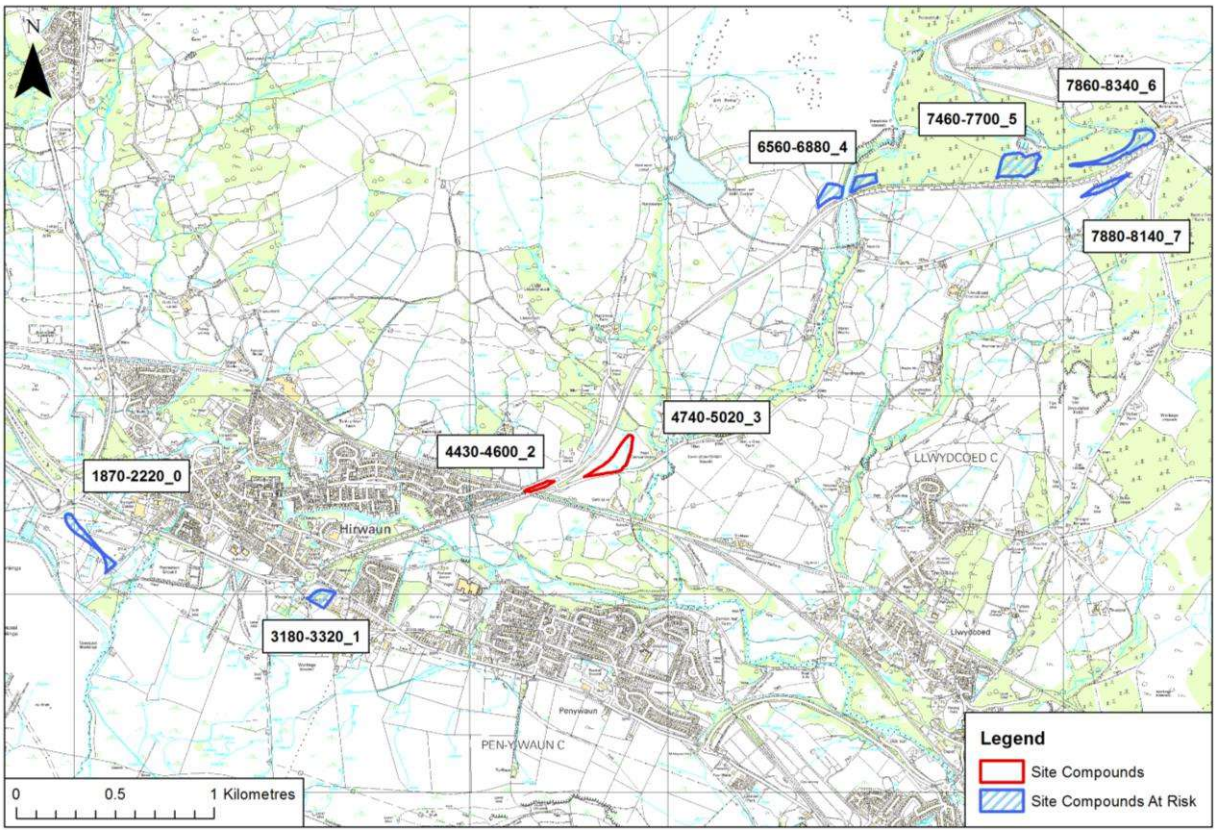

Plate 3-1. Proposed Compounds at risk from groundwater flooding between chainages 1300 and 8500.

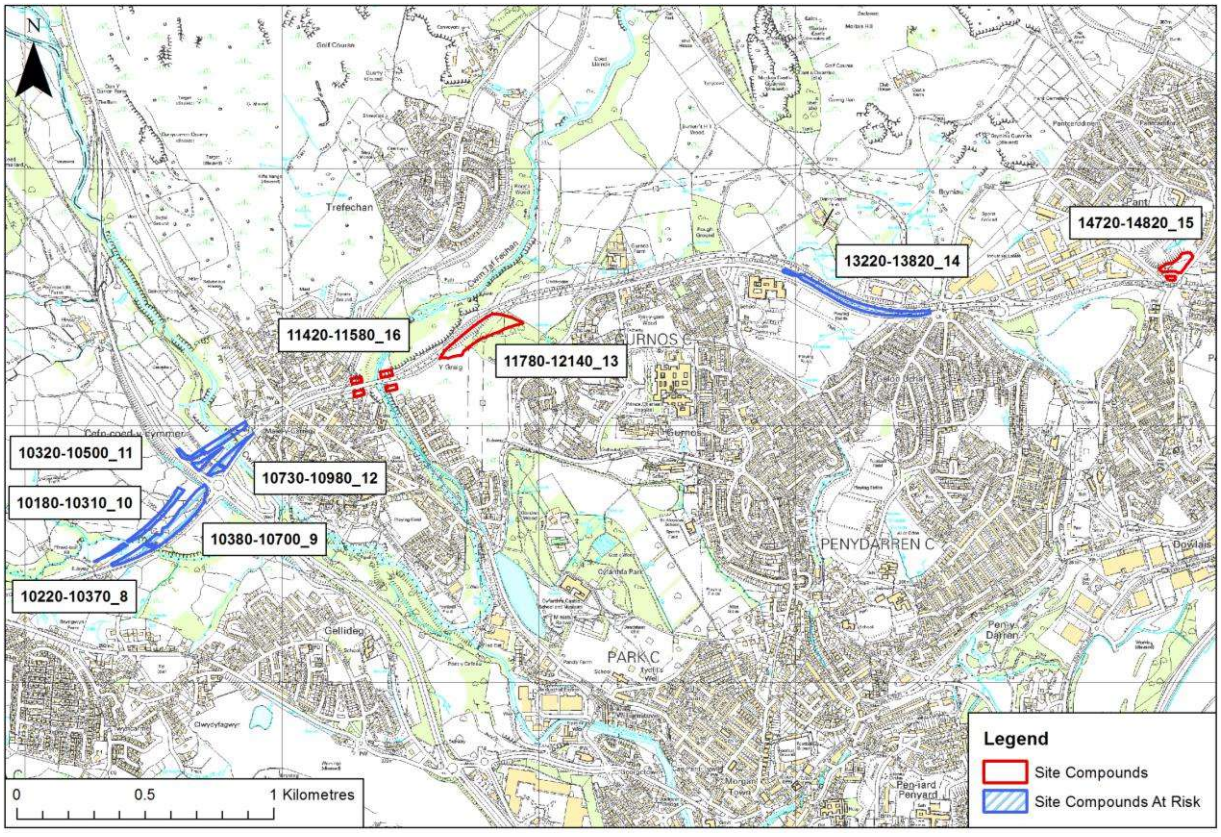

Plate 3-2. Proposed Compounds at risk from groundwater flooding between ch. 10000 and 15000.

4. Summary of Flood Risk to the Proposed Construction Compounds

The flood risk to the proposed construction compounds from fluvial, groundwater and surface water sources has been assessed. The risks to each proposed compound from each source is summarised in Table 17J.1 below.

Table 17J.1 : Summary of flood risk

Proposed Compound (Chainage location followed by Proposed Compound Number)	Fluvial risk?	Surface water risk?	Groundwater risk?
1870-2220_0	✓	✓	✓

Appendix 17J – Detailed Assessment Methodologies

DMRB HD45/09 Annex I assessment methodologies

DMRB HD45/09 Annex I includes six methods to assess the potential impacts from the proposed scheme on the water environment, the five used in this assessment are:

- Method A – Effects of Routine Runoff on Surface Waters;
- Method C – Effects of Routine runoff on Groundwater;
- Method D – Pollution Impacts from Accidental Spillages; and
- Methods E and F – Assessing Flood Impacts.

These tests do not influence the importance of attributes but instead provide a rigorous way to consistently assess the magnitude of impact for some of the more significant and common issue associated with road schemes and the water environment. The test methods are detailed below.

Method A – Simple assessment

Method A determines whether routine runoff is likely to have an ecological impact on receiving water features. This method uses HAWRAT, considering dilution of indicator metals (dissolved copper (Cu) and dissolved zinc (Zn)). All discharges have been tested using HAWRAT, due to high levels of traffic and potentially sensitive water feature receptors.

The methodology for routine runoff involves tests to predict future concentrations of zinc and copper in receiving water features. This is based on Annual Average Daily Traffic (AADT) flow, the size of the road drainage catchment, dilution flow (Q95) and current water quality in the receiving water feature. The Q95 flow is exceeded for 95 % of the time; a low flow that provides a conservative estimate when calculating dilution and water quality impacts as the lower the dilution the greater the concentration of pollutant in the water feature. The Q95 flows have been estimated using the methodology presented in the Institute of Hydrology (IoH) Report 108 *Low Flow Estimation*.

In order to accurately assess the operational impact on the environment, the treatment trains were identified and treatment efficiencies calculated for copper (Cu), zinc (Zn) and suspended sediment.

Treatment of road drainage in the proposed scheme is either via filter drains followed by wet retention ponds or filter drains in isolation. The removal efficiencies for dissolved copper and dissolved zinc have been based on removal rates quoted in the DMRB guidance[1]. Removal of sediment from road drainage is applied in accordance with CIRIA 2015 'The SuDS Manual'[2]. The SuDS Manual does not include performance values for filter drains so DMRB HD 33/16 values have been used. When applying a second level of treatment (retention ponds in this case), the efficiency is halved, in accordance with advice in The SuDS Manual, to conservatively reflect the reduced performance of tertiary treatment measures.

Table 17K.1 illustrates the final treatment efficiency values.

[1] DMRB Volume 4, Section 2, Part 3 'Design of Highway Drainage Systems' HD33/16 (Highways England, Transport Scotland, Welsh Government and Department for Infrastructure, 2016).
[2] Pg 568, Chapter 26, The SuDS Manual C753, CIRIA (2015) Woods Ballard, B., Udale-Clark, H., Illman, S., Scott, T., Ashley, R., and Kellagher, R.

Table 17K.1: The treatment efficiencies used for HAWRAT assessments

Drainage system	Treatment efficiencies (%)		
	Dissolved Cu	Dissolved Zn	TSS
Filter drain	0	45	60
Retention pond (wet)	40	15*	38*
Total system	40	53	75

Method C - Assessment of pollution impacts from routine runoff on groundwaters

Method C gives guidance for a situation where routine runoff discharges to Groundwater. Under this approach pollutants fall into one of two categories; pollutants under List 1 are prohibited from being discharged to groundwater and pollutants in List 2 should be minimised. Remaining pollutants after treatment that are in List 2 are assessed using the matrix in Table C1.1, Annex 1. Each component of the system has a weight, and each receiving system will have an appropriate score for each component. The score for each component equates to the weight multiplied by the score; the overall risk score is the sum of the final component scores. A risk score of:

- less than 150 indicates a low risk of pollution;
- between 150 and 250 indicates a medium risk of pollution; and
- over 250 indicates a higher risk of pollution.

Method D – Assessment of pollution impacts from spillages

This method provides an indication of the risk of a spillage causing a pollution impact on receiving water bodies. The risk assessment methodology assesses the annual probability of a serious accidental spillage reaching the environment based on road length, presence of junctions, AADT flow, percentage of Heavy Goods Vehicles (HGVs), serious spillage rates and emergency services response time. The DMRB incorporates a methodology that uses this data to automate the calculation of spillage risk and the probability of a serious pollution incident.

An assessment was undertaken for each discharge to test whether the probability of an accidental spillage causing a pollution incident represents an unacceptable risk.

Method E – Hydrological assessment of design floods

Method E for the estimation of design floods was applied for water features with risk receptors requiring detailed assessment. The results are detailed in the Flood Consequence Assessment (FCA) which is a stand-alone report and is available on request.

Method F – Hydraulic assessment

This method outlines the approaches to hydraulic assessment of flood flows. It also states that a FCA should comply with TAN15: Development and Flood Risk.

A full FCA has been prepared in accordance with the methodology outlined in TAN15 and following consultation with NRW. The FCA includes the assessment methodology, and is summarised in this chapter. Following detailed design the FCA will be expanded to include the DMRB methodologies.
