Background

Introduction

In September 2020 Welsh Government began sampling wastewater from 19 Wastewater Treatment Works (WwTW) from across Wales in order to detect the levels of SARS-CoV-2. Since then the programme has undertaken work not only to expand the coverage of the wastewater monitoring but also to improve the testing methodology to make it more representative of the catchments served.

Welsh Government intends to monitor up to 50 WwTW catchments across Wales in order to assist in the early detection of changing viral levels and the potential scale of outbreaks to help inform any public health action taken in the management of the pandemic and beyond.

Methods

Wastewater-Based Epidemiology (WBE) provides comprehensive public health information at a community level. To achieve this, wastewater samples are collected at the inflow of sewage treatment plants across Wales. The samples are then analysed to determine the levels of specific pathogens, as well as summarising their physico-chemical characteristics. This data is then mapped against known infection rates and other public health indicators at the regional level.

Individuals with COVID-19 shed SARS-CoV-2 genetic material in their faeces in the form of ribonucleic acid (RNA), regardless of whether they have symptoms or not. Measurements quantify the amount of viral RNA present in wastewater alongside the presence of different mutations associated with SARS-CoV-2. This information therefore provides a representative and unbiased snapshot of the level of COVID-19 infection within a community at any point in time. In summary, WBE has the potential to act as key capability to aid in the surveillance and control of COVID-19.

Currently, a mixture of ‘composite’ and ‘spot’ samples (each comprising 1 litre of wastewater) are collected from each WwTW 5 times a week, Monday to Friday. Spot samples are taken at the same time each day to capture peak flow, while composite samples are collected over a 24-hour period at 15-minute intervals using automatic sampling machines. Welsh Government currently investigates levels of COVID-19 in wastewater at 47 sites across Wales within the Dŵr Cymru Welsh Water (DCWW) and Hafren Dyfrdwy networks.

SARS-CoV-2 Quantification

The reported SARS-CoV-2 wastewater data is the concentration of viral gene copies (gc) detected in the wastewater sample. The viral copy number is obtained using an average of measurements from a single N1 nucleocapsid gene.

Samples are collected from the WwTW and transported at 4°C to laboratories on the day of collection. Samples are clarified to remove solid faecal matter and are subject to a PEG (polyethylene glycol) precipitation process. The quantity of a SARS-CoV-2 RNA present in the wastewater sample is then determined using a RT-qPCR (reverse transcriptase quantitative polymerase chain reaction) laboratory method.

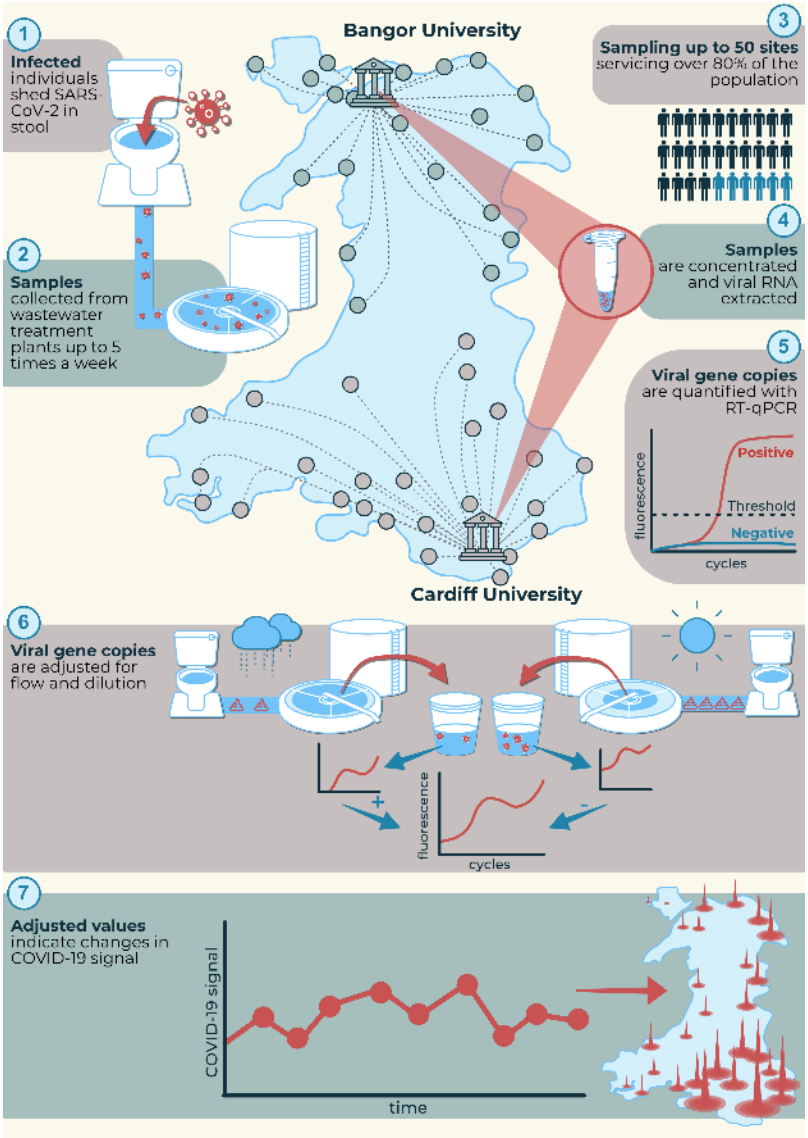

Figure 1 - Process diagram

Data Processing and Modelling

The total amount of SARS-CoV-2 RNA in the sample is corrected for various factors as a result of the RT-qPCR analysis, giving a raw copy number for each target gene. The data is reported as SARS-CoV-2 gene copies per litre (gc/L).

Most sewers in Wales are combined systems that collect waste waters (domestic, industrial, etc.) and stormwater from flooding and rainfall. As such, the collected wastewater samples vary through time and across WwTW. In particular, a sample's dilution can depend on the amount of rain that day. Each WwTW in Wales services a sewage network of different size and population.

The data is 'normalised' to account for variations in dilution and population. To adjust specifically for dilution, we have developed a method for recovering daily flow that is based on daily measures of flow indicators (Ammonium, Electrical conductivity, Orthophosphate concentrations) and dry weather flow. The serviced population at each wastewater site is estimated using the latest ONS population data for its drainage area. With these measures of daily flow dilution and population, we can then report the SARS-CoV-2 signal as a daily rate of gene copies per 100,000 people (gc/day per 100k). This value is then comparable across all the Welsh catchments. Day-to-day variability is smoothed using weekly averaging of the data.

In addition to normalising the data, the data are also studied for samples that could be deemed as 'outliers' on account of being significantly outside of the range of other recent samples. True outliers are then removed from datasets as they could have a negative impact on the trends observed in the figures produced for this report.

Using this Report

Wastewater monitoring is a type of environmental monitoring, so it is difficult to model data around local authorities or health boards. Sewer catchments can receive rainfall or environmental sources of water from anywhere within their relevant geography, which follows the topography of the land. Sewer networks are managed around regions that mostly correspond with river drainage basins and it is these management areas that have been chosen for wastewater regional reporting.

For both National and regional rolling averages the population of all catchments is taken into consideration when reporting the signal per 100,000 people. For example, in Region 4 there are two catchments: one with a population of approximately 400 and the other with a population of approximately 67,100. Individual catchment populations are detailed in Appendix A.

All data relating to wastewater signal (SARS-CoV-2 gc/day per 100k) is represented as an exponential figure ($x10^{12}$) where $1x10^{12}$ = 1,000,000,000,000 unless otherwise stated. The report uses a mixture of line graphs and spark charts; both are based on 10 day rolling averages.

Maps of individual sewer catchments are located in the appendix of this report. Each section of the report contains a map that represents the area that is covered by the region.

Each regional summary is given in the format:

- The trend within the region for the previous four weeks
- The trend within the region compared to the previous week
- Any indicators triggered for the region
- Any inconsistencies or issues in the region

To allow for noise in wastewater signal we only record changes greater than 10% to be decreases or increases.

Any questions on the report, or the Welsh Government Wastewater Programme, can be sent to wastewater@gov.wales.

Alerting Indicators

To highlight potentially concerning changes in wastewater signal, the three following types of alerting indicators are assessed once a week, based on the viral load (gc/day per 100k) measured. The indicator table in the National situation report indicates the number of sites within those regions that have triggered the indicators:

1. The **High Signal Level** indicator highlights the catchment areas where the viral load is high. It corresponds to a situation where the viral loads exceed half of the highest weekly average recorded in the previous 6 months.

2. The **Rapid Increase** indicator highlights the catchment areas where the viral loads have rapidly increased for the last week compared to the previous week. It corresponds to a situation where the weekly average of the viral load has increased by at least 100% since the previous week.

3. The **Increasing Signal Level** indicator highlights the catchment areas where the viral loads are showing signs of continuous increase. It corresponds to a situation where the weekly average of the viral load has increased since the previous week for at least 3 weeks in a row.

'0' corresponds to no alerts present for the region or site, whilst '-' represents no data being available.

To assist in locating which region is relevant for a particular Health Board or Local Authority they are broken down in the tables below.

Wales Situation Report

Since the last report, SARS-CoV-2 viral load has remained level across the country. The signal remained level in 3 regions, decreased in 5 regions and increased in 6 regions.

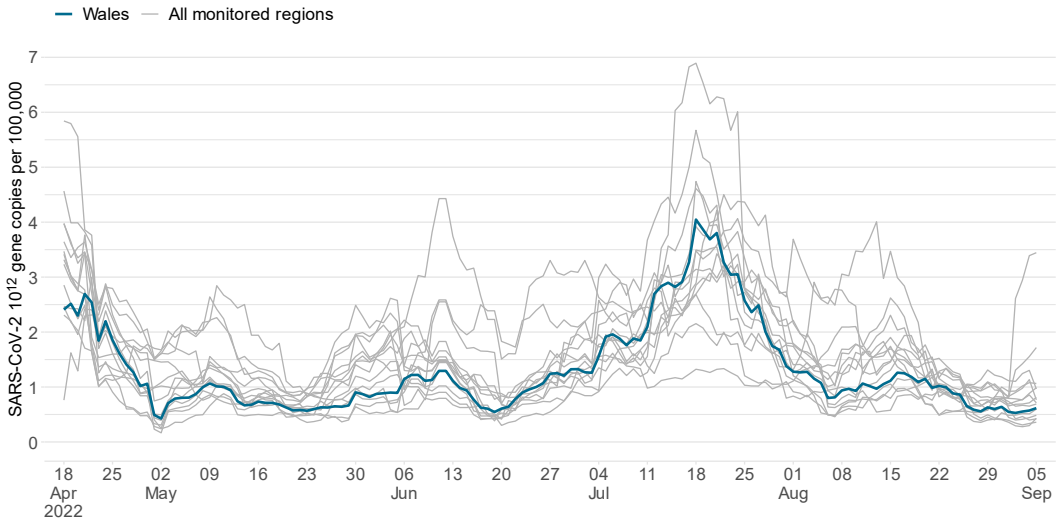

Figure 2 - National (blue lines) and Regions (grey lines) Rolling Mean SARS-CoV-2 gc/day per 100k

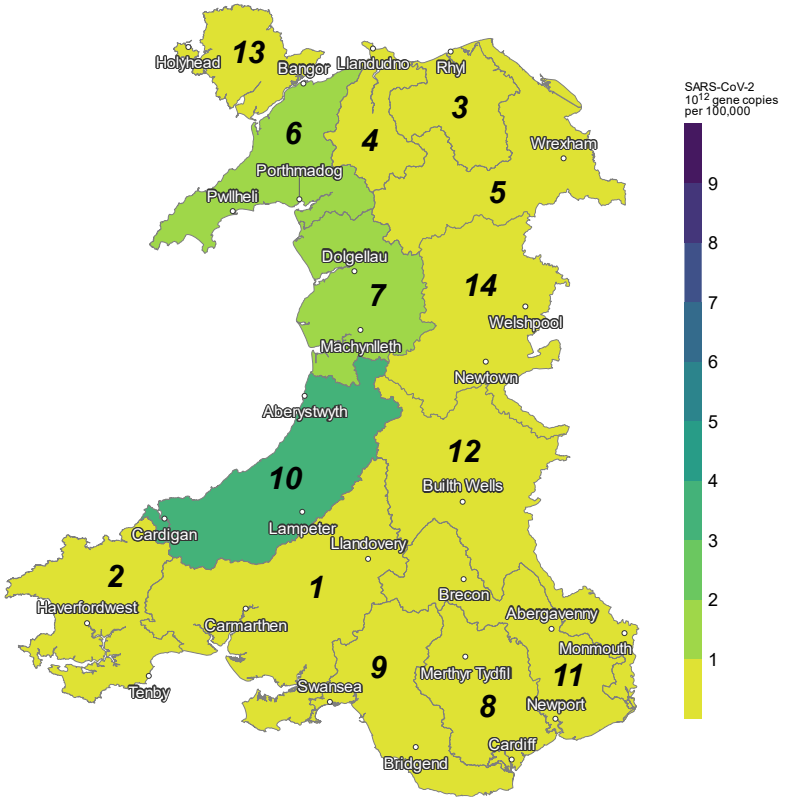

Figure 3 - National Heat Map showing Regional Mean SARS-CoV-2 gc/day per 100k

Wales Situation report:

- The trend in the national mean wastewater signal has been unstable in the last four weeks, with both increases and decreases over that period.
- Since the last report, SARS-CoV-2 viral load has remained level across the country. However, the signal decreased at Cleddau and Pembrokeshire Coastal Rivers, Dee, Usk, Wye and Ynys Môn, and increased at Clwyd, Conwy, Llŷn and Eryri, Meirionnydd, South East Valleys and Teifi and North Ceredigion.

Region name	Number of sites monitored	% regional population covered	No. sites with High level signal	No. sites with Rapid increase	No. sites with Increasing signal level
Region 1: Carmarthen Bay and the Gower	4	57	0	0	0
Region 2: Cleddau and Pembrokeshire Coastal Rivers	4	39	0	1	0
Region 3: Clwyd	2	54	0	1	0
Region 4: Conwy	2	82	0	0	0
Region 5: Dee	4	46	0	0	0
Region 6: Llŷn and Eryri	4	26	0	2	0
Region 7: Meirionnydd	3	34	0	1	0
Region 8: South East Valleys	2	28	0	1	0
Region 9: Tawe to Cadoxton	5	82	0	0	0

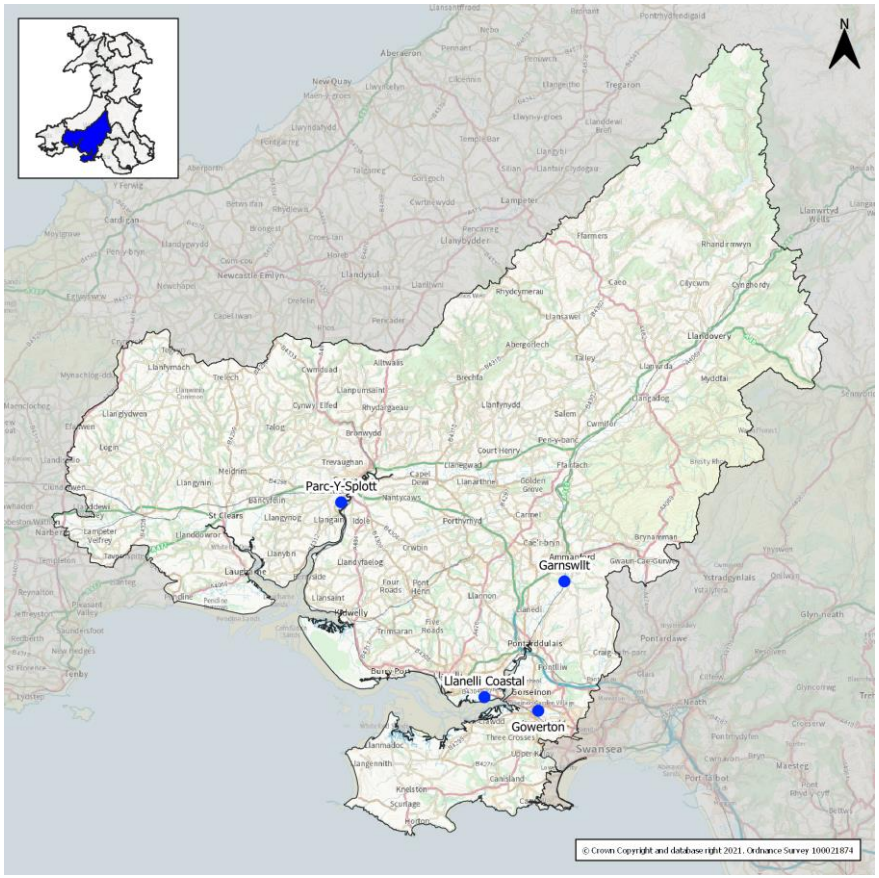

Figure 5 - Region 1 Map

Region 1 situation report:

- Wastewater signal in the region has been unstable, with both increases and decreases over the last four weeks. However, the overall signal change in that period is a decrease.
- Compared with last week, the signal has remained level across the region. However, the signal decreased in Garnswllt and Llanelli Coastal and increased in Gowerton and Parc-Y-Splott.
- No indicators were triggered during the last reporting period.
- There was one sample missing from each of the sites in the region. Access issues at Gowerton between 13 – 27 April resulted in some missing samples causing a break in the series for that site.

Appendix A – Data and Indicators

Site Level Indicators

The following table provides site level detail on the catchment populations, indicators, normalised signal mean for the week relevant for this report and the type of sampling being undertaken (Composite, Spot or Mixed). Sites not currently monitored will have no data.

Table 2 - Site Level Indicators

Site Name	Region	Catchment Population	High Signal Level	Rapid Increase	Increasing signal level	SARS-CoV-2 weekly mean, gc/day per 100k	Sampling Type	Successful Samples (Number / Total Samples)
Garnswllt	Carmarthen Bay and the Gower	28,151	0	0	0	0.67	Composite	4/5
Gowerton	Carmarthen Bay and the Gower	52,162	0	0	0	1.10	Composite	4/5
Llanelli Coastal	Carmarthen Bay and the Gower	52,059	0	0	0	0.32	Composite	4/5
Parc-Y-Splott	Carmarthen Bay and the Gower	17,308	0	0	0	0.61	Composite	4/5
Fishguard	Cleddau and Pembrokeshire Coastal Rivers	5,499	0	1	0	1.97	Composite	4/5
Merlins Bridge	Cleddau and Pembrokeshire Coastal Rivers	15,366	0	0	0	0.27	Composite	4/5
Pembroke Dock	Cleddau and Pembrokeshire Coastal Rivers	16,726	0	0	0	0.21	Mixed	4/5
Tenby	Cleddau and Pembrokeshire Coastal Rivers	9,727	0	0	0	0.47	Mixed	4/5
Kinmel Bay	Clwyd	48,234	0	0	0	1.07	Composite	5/5
Ruthin	Clwyd	5,041	0	1	0	0.17	Composite	4/5
Betws-Y-Coed	Conwy	419	0	0	0	2.53	Composite	4/5
Ganol	Conwy	67,101	0	0	0	0.80	Composite	5/5
Bala	Dee	2,054	0	0	0	0.21	Mixed	4/5
Five Fords (Wrexham)	Dee	93,434	0	0	0	0.80	Composite	5/5
Llanasa (Nr Prestatyn)	Dee	22,066	0	0	0	0.81	Composite	5/5

Site Name	Region	Catchment Population	High Signal Level	Rapid Increase	Increasing signal level	SARS-CoV-2 weekly mean, gc/day per 100k	Sampling Type	Successful Samples (Number / Total Samples)
Queensferry	Dee	29,503	0	0	0	0.66	Composite	5/5
Bangor Treborth	Llŷn and Eryri	25,945	0	0	0	1.22	Composite	5/5
Bethesda	Llŷn and Eryri	4,721	0	1	0	1.66	Composite	5/5
Porthmadog	Llŷn and Eryri	2,908	0	0	0	0.38	Composite	5/5
Pwllheli	Llŷn and Eryri	4,714	0	0	0	0.05	Composite	2/5
Dolgellau	Meirionnydd	2,431	0	0	0	1.05	Composite	5/5
Machynlleth	Meirionnydd	2,158	0	1	0	3.59	Composite	5/5
Tywyn	Meirionnydd	3,363	0	0	0	1.00	Composite	5/5
Cardiff Bay	South East Valleys	612,002	0	0	0	0.60	Composite	4/5
Cilfynydd	South East Valleys	61,721	0	0	0	0.59	Composite	4/5
Cog Moors (Dinas Powys)	Tawe to Cadoxton	204,292	0	0	0	0.21	Composite	4/5
Lletty Brongu (Nr Maesteg)	Tawe to Cadoxton	19,375	0	0	0	0.21	Composite	4/5
Pen-Y-Bont (Merthyr Mawr)	Tawe to Cadoxton	118,106	0	0	0	0.29	Composite	4/5
Swansea Bay	Tawe to Cadoxton	168,225	0	1	-	0.85	Spot	1/5
Ystradgynlais	Tawe to Cadoxton	10,532	0	0	0	0.06	Composite	4/5
Aberystwyth (Glan Yr Afon)	Teifi and North Ceredigion	18,026	0	1	0	4.78	Composite	5/5
Cardigan	Teifi and North Ceredigion	4,509	0	0	0	0.09	Composite	4/5
Lampeter	Teifi and North Ceredigion	3,046	0	0	0	0.53	Composite	4/5
Brecon	Usk	8,172	0	0	0	0.20	Composite	4/5
Llanfoist	Usk	14,830	0	0	0	0.83	Composite	4/5

Site Name	Region	Catchment Population	High Signal Level	Rapid Increase	Increasing signal level	SARS-CoV-2 weekly mean, gc/day per 100k	Sampling Type	Successful Samples (Number / Total Samples)
Newport Nash	Usk	164,985	0	0	0	0.34	Composite	4/5
Ponthir	Usk	91,460	0	0	0	0.51	Composite	4/5
Builth Wells	Wye	2,554	0	0	0	0.14	Composite	4/5
Llandrindod Wells	Wye	5,650	0	0	0	0.10	Mixed	4/5
Monmouth (Wyesham)	Wye	10,817	0	0	0	0.45	Composite	4/5
Talgarth	Wye	1,508	0	1	0	1.02	Mixed	4/5
Benllech Outfall	Ynys Môn	2,605	0	1	0	1.72	Composite	5/5
Holyhead	Ynys Môn	15,719	0	0	0	0.27	Composite	4/5
Llangefni	Ynys Môn	5,824	0	0	0	2.50	Composite	5/5
Llanfyllin	Hafren Dyfrdwy	629	0	1	0	0.84	Composite	5/5
Newtown	Hafren Dyfrdwy	10,184	0	0	0	0.79	Composite	5/5
Welshpool	Hafren Dyfrdwy	5,022	0	1	0	0.53	Composite	5/5

"-" Indicates where no data is available. This could be as a result of no samples being taken or missing metadata.
"Mixed" is used to indicate the weekly mean is made up of both spot and composite samples.

Appendix B – ONS COVID-19 Infection Survey

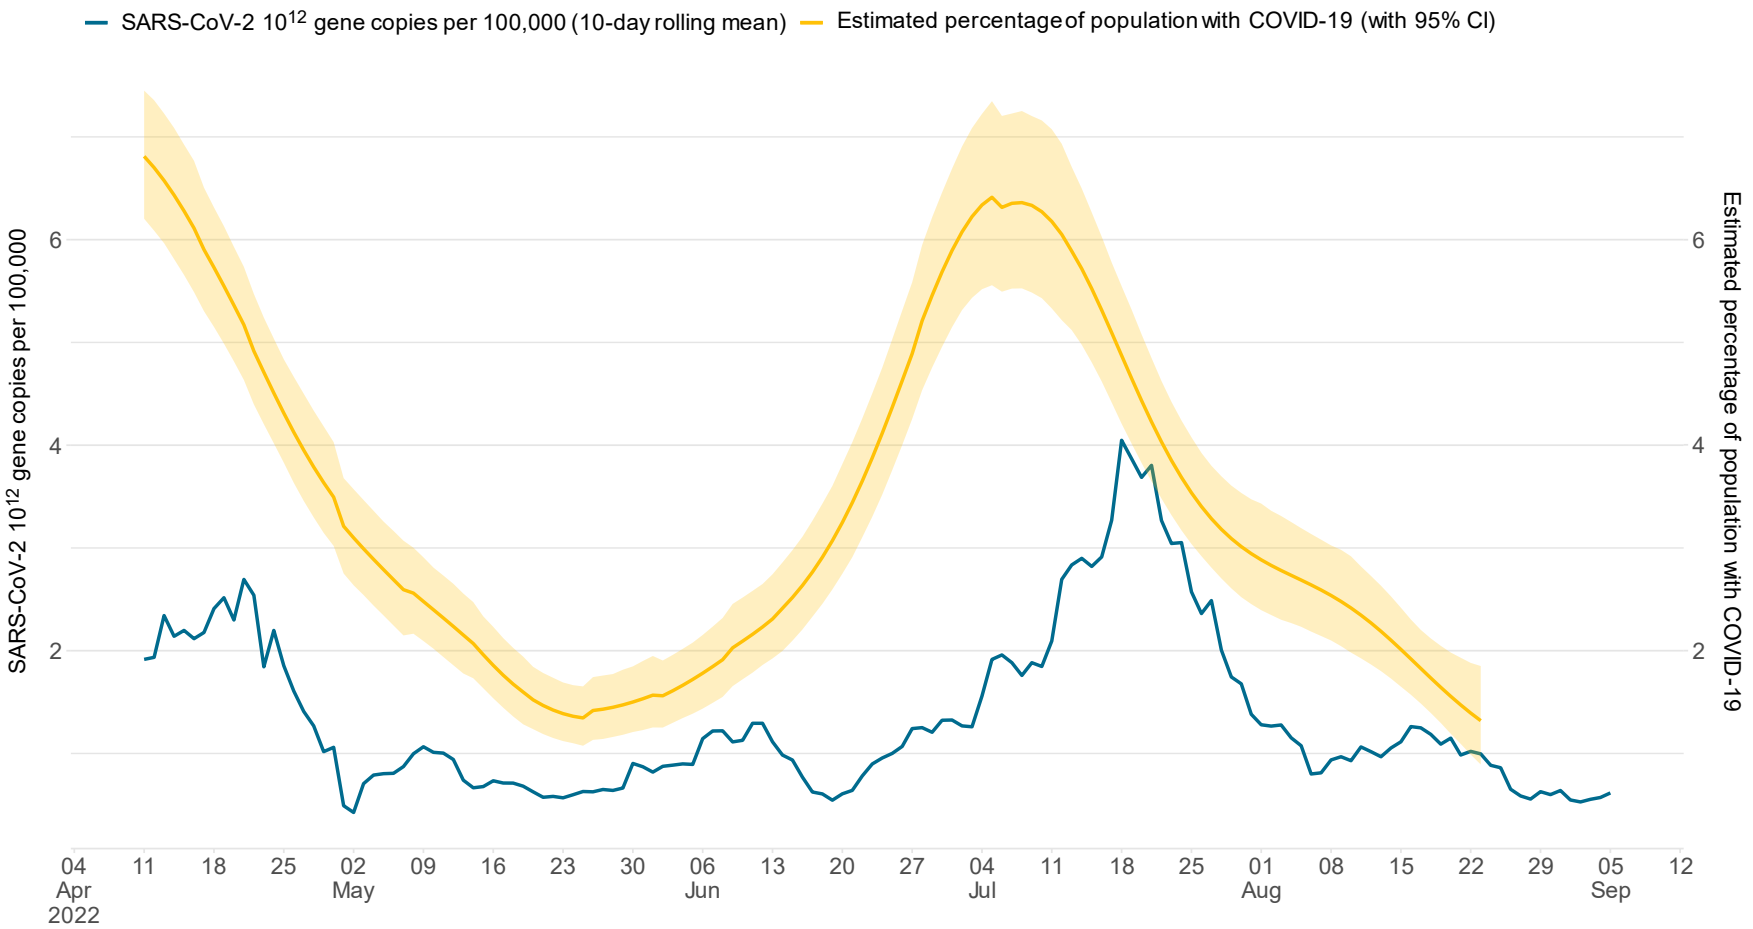

Figure 47 – ONS CIS vs Wastewater National Mean (SARS-CoV-2 gc/day per 100k)

Appendix C – Sewer Catchment Maps

The maps featured in this report may not be used or reproduced without permission from our relevant partners, Dŵr Cymru and Hafren Dyfrdwy.

Maps are reproduced in alphabetical order and have been provided to give context to the physical sewer areas of the monitored wastewater catchments used in this report.
